Movable Glass Structures.—Following the house dinner of the Horticultural Club, to be held at the Hotel Windsor on Tuesday, June 17, at 6.30 p.m., Mr. Arthur Pullen Burry will deliver a lecture entitled "The Efficient Movement of Large Glass Structures and its Economic Value as Applied to Intensive Culture." The lecture will be illustrated with lantern slides. The date of the Horticultural Club's summer outing has been fixed for July 16.

Old English Garden at Battersea Park.—An Old English garden that has been in course of construction for some time at Battersea Park is now completed and open to the public. There is an Old English garden in each of four other parks under the control of the London County Council—viz., at Brockwell Park, Golder's Hill, Peckham Rye Park, and Ravenscourt Park.

Chelsea Show Awards.—The Rev. W. Wilks writes us that the following amendments were made by the Council of the Royal Horticultural Society in their lists of awards given at the Chelsea Show: Silver-gilt cup, in lieu of silver cup, to Sir Jeremiah Colman, for orchids; a silver Banksian medal, in lieu of a bronze Banksian medal, to Messrs. Cooper, Pegler, and Co., for spraying apparatus. The Council also gave a Highly Commended award to Messrs. Barford and Perkins' motor-roller, at their meeting on June 3, under the trial of horticultural sundries.

The Use of High Explosives in Tillage.—On the 3rd inst. a party of agriculturists, horticulturists, and foresters visited the nurseries of Messrs. Dicksons and Co., Craigmillar, Edinburgh, in order to witness some experiments with high explosives in breaking up hard subsoils. The substances used were gelignite and polarite. In the first experiment polarite cartridges were inserted at a depth of 2½ft., and 5ft. apart; and in the second, ordinary gelignite charges were inserted at a depth of 3¼ft., and 6ft. apart; and all were fired by means of safety fuses. So far as the operation of blasting went, everything passed off successfully; but it was soon apparent that tough clay, of which the subsoil in this case consisted, was not easily shattered by this means, and that to do it effectively the charges would require to be placed much more closely than at 5ft. intervals, which, however, would make the cost prohibitive. At the close of the operations, Mr. Massie, of Messrs. Dicksons and Co., expressed the hope that the experiments had proved both interesting and instructive, but he could scarcely agree with those who claimed that the application of explosives to tillage had gone beyond the experimental stage. The operations were carried out by Messrs. Nobel, and were under the personal direction of Mr. Stewart.

National Chrysanthemum Society's Outing.—The annual outing of this society will take place on Monday, July 21, when, by kind permission of Mr. Frank Crisp, a visit will be paid to Friar Park, Henley-on-Thames. The party will start from Paddington at 8.50 a.m., leave Reading, walk from thence to Caversham, where a steam launch will be waiting to take the members and friends to Henley. The return journey will commence at 5 p.m., and the charge for the outing, including fares, luncheons, and tea, is 10s. 6d. Tickets may be obtained from the secretary, Mr. R. A. Witty, 72, Savernake Road, Gospel Oak, N.W.

City of London Rose Society.—The date of this society's exhibition is June 26, and not July 26, as previously stated in our columns.

Fitzgerald Park, one of the most beautiful of the open spaces belonging to the Corporation of Cork, has undergone considerable alterations of late, and now that the deciduous trees and shrubs are in full leaf, the improvements that have been made can be readily appreciated. The vistas afford many delightful views, and the charming lakes, studded with islets and furnished with water lilies and other moisture-loving plants, which have superseded the fish-ponds, form a feature of much interest and highly attractive.

Prizes for Orchids at Manchester.—In connection with the Manchester and North of England Orchid Society an interesting series of competitions has been arranged for the ensuing season. We are glad to notice that the skill of the grower is to be adequately recognised, and five special prizes will be awarded for general excellence, for cypripediums, for odontoglossums, and for cattleyas, and these are being provided by Messrs. R. Ashworth, J. J. Bolton, E. H. Davidson, and J. Evans, and Messrs. Charlesworth and Co. Prizes for groups and arrangement are offered by Messrs. Sander and Sons and Messrs. J. Cypher and Sons, and the Botanic Society of Manchester is adding one of its medals. Full particulars of these competitions may be obtained from the Secretary, Mr. E. Arthur, Pine Villas, Mollington Road, Blackburn.

Regent's Park Enclosures.—Protests have recently been raised in several quarters against the enclosure of certain parts of Regent's Park, and particularly against the lease of certain parts of the land to private persons in earlier years. Following on these protests a public demonstration was held in Regent's Park a few days ago, at which the chief speakers were Dr. Fletcher Little and Mr. V. H. Rutherford, the latter asserting that the park would be one-third larger than it is at present if the buildings around it were removed. The following resolution was carried unanimously: "That in the opinion of this meeting all open spaces to which the public have access should be kept open or restored, both on the grounds of public policy and from the necessities of national health and recreation. That this meeting further declares that it is in violation of a pledge given by a former First Commissioner of Works (Mr. Hanbury) that any building should be allowed to be erected in Regent's Park without

Parliamentary sanction, and urges that a Parliamentary Committee of public inquiry should report on the powers, advised by the Government, as to the disposal of these areas of Regent's Park, and that an address should be presented to the Prime Minister, and that he be asked to receive a deputation."

Summer Bedding in Paris.—Paris is notable among cities for its boulevards, its fine trees, its beautiful parks, and open spaces, and for the brightness of the summer displays in many of the latter. In the gardens of the Tuileries special attention is paid to summer bedding, and our readers who may be including Paris in their holiday trip to the Continent should not omit to visit these famous gardens. Tender plants are very largely used, and the accompanying illustration will serve to indicate the bold manner in which variegated and green-leaved pelargoniums, coleuses, brilliant cannas, heliotropes, etc., are grouped in the very large beds and borders, with standard pelargoniums, heliotropes, etc., rising above the rest, and forming by no means the least pleasing feature of a splendid arrangement of summer flowers.

Window Gardens. — For many years we have advocated a wider cultivation of plants in window boxes, especially in towns, because window gardens add so greatly to the beauty of a street and town, and also because of the refining influence plants and flowers exert upon those who cultivate and love them. We think of Chicago as a town where everything is subservient to moneymaking, therefore it is good to read from a booklet just issued by the Chicago Association of Commerce that: "The use of flower boxes has a favourable effect upon one's trade and one's employees. Progressive manufacturers in Chicago and elsewhere have found that more and better work can be secured from employees when the windows of the working rooms are filled with growing plants. What is true of manufacturers is true of all other lines of business. Those who have tried the plan find that they cannot afford to be without the growing plants. Flower boxes exert an influence both from the inside and from the outside. In other cities tenants in offices too high to be seen from the streets have maintained flower boxes for the influence they seem to have upon their employees and their clients. In a mechanical age, when surrounded on every side by things artificial, the use of growing plants is the one touch of Nature that brings us back to real things."

Horticultural Exhibition at Berne in 1914.—Switzerland is to have a great national exhibition, at Berne, in 1914, from May 15 to October 15. Horticulture is to receive considerable attention, and will form a section under the care of Mr. A. Schenk, curator of the Botanic Garden, Berne. There will be a permanent horticultural exhibition, consisting of ornamental trees and shrubs, fruit trees, hardy plants, plans, books, tools, etc., and special displays will be arranged for each month. Market gardening, floral art, plans and models, and horticultural and botanical literature are classes for which special provision has been made, and many prizes are offered. The Swiss, German Swiss, and French Swiss horticultural societies are combining to make the exhibition a success, and Mr. J. Warren, Altenbergrain, Berne, is the general secretary, from whom full particulars can be obtained.

St. Peter's Square, Hammersmith.—The London County Council have adopted the proposal of the Parks and Open Spaces Committee that £4,000 be contributed towards the acquisition of St. Peter's Square, Hammersmith, as an open space for the use of the public. It appears, however, that the L.C.C. holds £4,000 in trust for Hammersmith from the sale of a portion of Ravenscourt Park, and the Hammersmith authorities consider this £4,000 is not a contribution, consequently a deadlock seems possible. St. Peter's Square is a little over one and three-quarter acres in extent, and it is understood that all interests in the property can be acquired for about £7,500. If the Hammersmith Borough Council and the L.C.C. cannot agree in this matter, the opportunity of providing another much-needed open space for London will speedily disappear.

To Combat Cucumber Diseases the Essex Education Committee have decided to make a substantial annual grant for the equipment and maintenance of a scientific experimental station, where fungoid, insect, and bacterial troubles will be investigated. In the Lee Valley, where cucumbers are so largely grown, this decision has met with warm approval, because soil sickness, eelworm, and other troubles are pressing hard upon many growers. Soil sterilisation will probably be one of the subjects to receive early attention.

Paper Pulp from Bamboos.—A vastly interesting report upon experiments made in Lower Burmah and the West Coast of the Indian Peninsular, for the purpose of proving the quality and cost of paper pulp for bamboos, has been issued as a part of the Indian Forest Records by Mr. R. S. Pearson, I.F.S. Four species of bamboos were considered, i.e., Bambusa arundinacea, B. polymorpha, Cephalostachyan per-gracile and Melocanna bambusoides. The most useful species appears to be Bambusa polymorpha, and the report itself is printed upon paper made from the pulp of this plant. Those interested in the paper pulp industry should secure this report.

VIEW IN THE GARDEN OF THE TUILERIES, PARIS.

DAHLIAS IN THE FLOWER GARDEN.

It is surely a healthy sign of the times that we now find practically all the dahlia specialists including in their catalogues the various types of dahlias recommended specially for use in the garden. Hitherto, many firms have confined themselves almost exclusively to the show, fancy, and cactus sections, and principally to those varieties possessing strong claims for exhibition purposes. Judging this from the commercial point of view, i.e., that there can be no supply without the demand, we may take it that the public are awaking to the value of dahlias for garden decoration.

Herbaceous Borders.

Firstly, it may be taken for granted that there is no garden of reasonable dimensions which does not possess a herbaceous border or borders. Strictly defined, such borders would have no claims to consideration in this article, but it is the exception rather than the rule to find them devoted entirely to the plants to which they are dedicated.

Few people have any desire to wholly confine the borders to hardy plants, but rather prefer the introduction of other suitable subjects for keeping up a display.

Rich as we are in herbaceous plants, to my mind many of the newer types of dahlias supply a long-felt want. Take, for instance, a very large border, with a bold arrangement. Good suitable plants, from 5ft. to 8ft. high, are none too plentiful for the background. There may be plenty of yellow in the helianthus, rudbeckias, etc., but where do we get the pinks, crimsons, whites, and the delicate shades of apricot and salmon which we find in the pæony-flowered dahlia? I do not advise the striped varieties for the borders, preferring to keep to selfs and delicate shades. Judiciously planted with regard to numbers, colour and height, they will give just that character which many borders often lack.

Few borders will need more than three plants in a group, and in most instances, one or two will be sufficient, for it must not be forgotten that it is easy to overdo it with these bold subjects and unbalance the whole.

A few good varieties which grow to 5ft. and upwards are Lady Norman and Mrs. A. Mackellar, terra-cotta; Baronne de Grancy and Mrs. T. A. Weston, white; Holman Hunt, crimson; Liberty, scarlet; King Leopold, lemon-yellow; and Queen Emma, pink. If these are considered too large for borders of average width, a few lovely varieties of about 4ft. in height are: Mrs. Kerr, pale pink; Turner and Mrs. Copeland, pink; Connie Humphreys, white, with pale yellow centre; Peru, crimson; Warrior, ox-blood red; and Colonel Cody, terra-cotta. These could also be planted in very bold borders if required, bringing them more to the front.

In the section classed as "decorative," there is a host of good things, but, on the whole, they are not so graceful as the pæony type, but if space can be found the lovely Delice and Loveliness, pinks; Princess Juliana, the purest of white, which holds its flowers perfectly erect on 18in. to 2ft. stems; Grand Duke Alexis, white, with a faint tinge of lilac, and each floret curiously rolled; and Brentwood Yellow should be planted; they grow from 2½ft. to 4ft. high.

Two varieties which should be grown in the large or the small garden are Glare of the Garden and Orange Glare of the Garden. Their habit is ideal, and when at their best nothing could be more graceful than the way the flowers are disposed, strongly reminding one of a perfectly arranged vase of cut flowers. The flowers are medium to small and the plants grow 2½ft. tall.

Though I consider the pæony dahlias best for borders of good size, I have also a strong liking for the collarettes, but do not advocate their being mixed in the same borders as the first-named. For the amateur and the small garden they are not surpassed, for being less bold they are more in keeping with the surroundings, and take less room. They range in height from 2½ft. to 4ft. The varieties are now numerous; a few of the best are: Holyrood, Maurice Revoire, Souv. de Bernardeau, Souv. de Chabanne, Antwerpia, Albert Maumene, Queen Mary, Queen Bess, and Grandpapa Charmet.

For planting in the very front of a border of any size the dwarf bedding cactus dahlias can be highly recommended, and a few masses of about six plants each will give delightful patches of colour. They can either be planted in groups of one variety, or they can be blended into three groups as follows: Shades of yellow, Perkeo, Citronenvogel, Goldperle, and Zwergsonne, pink and white—Amanda and Edelweiss; shades of red and orange—Quelle, John Mortensen, Faunkonig, and Gluchant.

Beds and Borders.

Few will perhaps be able to devote a garden entirely to dahlias, but, if space can be found for beds, groups, or borders, this will be the best way of showing their true beauty. This method leaves us at liberty to use any of the types. Bold beds of pæony-flowered or decorative varieties, holding from twenty to thirty plants, will create a dazzling mass of colour, but the smaller grower need not be alarmed if unable to find this space. Let him try a mass of, say, a dozen plants of medium growth. I predict that he will not be disappointed with the result. If a circular bed, it may be filled with King Leopold (a tall yellow for centre), grouped around with Turner, Mrs. Kerr, Colonel Cody, and Connie Humphreys; this would give a display of delicate colours. A bed of dark hues, relieved if necessary with yellow or white, may be composed of Holman Hunt (centre), Peru, Warrior, Lullingstone, Countess of Lonsdale, with Cæsar and Baronne de Grancy, yellow and white. Endless examples and selections might be made, but these must suffice.

Really beautiful beds or borders may be made with the collarette dahlias, and here, if one keeps the bluish and purple shades as found in Mme. Poirier, Dr. Gerard, Vilmorin, Andreaux, and a few others, apart from the rest, no serious colour clashings will ensue.

A type of recent introduction, known as the Stars, as well as many of the singles, make very pretty beds, as do the charming little Pompons.

The dwarf bedding cactus dahlias may be utilised in a quite formal bedding scheme, and will be found a great acquisition for this purpose. Their habit can be relied upon, as the plants rarely exceed 20in. in height, and every flower stands most gracefully above the foliage. They should be planted 2ft. apart. Little Othello, a dwarf single, with scarlet flowers, and very dark foliage, if carpeted with a grey plant such as Leucophyton Browni, would at once arrest attention. Barlow's Bedder may also be used with every success.

Possibly the reason one does not see dahlias more used for bedding is that they are considered too late blooming, and here one has to again reiterate the value of large, healthy plants for putting out at the end of May or the early part of June, according to locality and circumstances.

Duffryn Gardens. ARTHUR J. COBB.

THE EARLY POTATO CROP IN SCOTLAND.

The almost tropical temperature prevailing recently has had a most beneficial effect upon the potato crops growing along the sea coasts of the counties of Ayr and Wigtown. This, acting upon a soil well moistened with frequent rains, should assist the tubering process, and greatly help forward the crops, which until recently were considered somewhat backward for the season of the year.

Freedom from damage by frost has been one of the main features of the season, and now that all danger from this source is over, it is anticipated that a bountiful crop will in due time be forthcoming. As a rule, lifting the crops, upon the most highly-favoured land, commences about June 25, a little earlier or later according to the kindliness or otherwise of the weather.

How the plants thrive, or even exist at all, in some of the exposed positions upon which they are planted is, indeed, a mystery. One large field planted in this way which I have passed frequently during the past six weeks rises abruptly from the seashore, where not an atom of shelter from the fierce Atlantic gales is available, is now presenting to the eye as pleasing a picture of fresh, healthy foliage as one could wish to see. Moreover, the season has been noted for gales, some of which were of great severity, and at times the potato tops were so much laid over by the blast that one might be pardoned for thinking that great damage would thereby accrue. Such, however, does not necessarily follow, and in the course of a few hours, when calm is again restored, the tops uplift their heads, apparently none the worse.

With the genial weather now prevailing growers are making efforts in every way possible to assist and forward the crops, anticipating probably handsome prices in due course. It is peculiar that the home-grown potato should have such a hold upon the consumer, who pays a bigger price for the commodity a month hence than what very similar examples, but of foreign growth, can be procured for at the present time in any fairly large town or market. High quality in either case is not an outstanding feature, sound, well-stored examples from last year's crop being, to my taste at least, very much superior. The latter, by the way, after being very reasonable in price, have risen rapidly in value within the last few weeks, and this will go on, as, judging by the ridges or clamps in some of the chief potato-growing districts, stocks are fast vanishing. This, of course, is a good augury for the early-potato men, who anticipate highly remunerative prices for their wares.

JAMES DAY.

SAPONARIAS OR SOAPWORTS.

The Soapwort family comprises several very useful, as well as beautiful, rock and border plants. During the months of May and June the numerous flowers produced by the various varieties of S. ocymoides form lovely sheets of colour, quite obscuring the foliage with a wealth of bloom. About a dozen species are natives of Europe, while others extend into Asia Minor and Syria as well. Many of them are in cultivation, and grown in suitable situations they make very attractive plants. All are very impatient of sour, stagnant soil, and are very subject to damp in winter. But, given a sunny ledge, and planted in deep, well-drained soil, they may be grown with success, and form beautiful masses of flower in early summer.

Most of the different species produce seeds, by which means they may be increased, but the hybrids like S. Boissieri and S. Wienmanni require to be propagated by means of cuttings in July. They root freely in sandy soil, when kept in a close frame. Perhaps the best-known species is the popular biennial S. calabrica, which is used so much in gardens for early spring display. This, sown in the early autumn, produces nice little plants, which come into flower early in May. Most of the perennials are essentially rock plants, and, grown in this way, display themselves to advantage. Species like S. ocymoides make ideal wall plants, providing the roots can penetrate into the soil behind the wall. A few of the best in cultivation are:

S. bellidifolia, a native of Central and Southern Europe, and always found in dry stony places. It forms tufts of leaves in rosettes, and produces flowering stems six inches or more in length. The pale yellowish flowers are borne in dense heads. A form of this sent out under the name of S. Sundermanni, in 1902, has larger pale yellow flowers, and rather larger leaves.

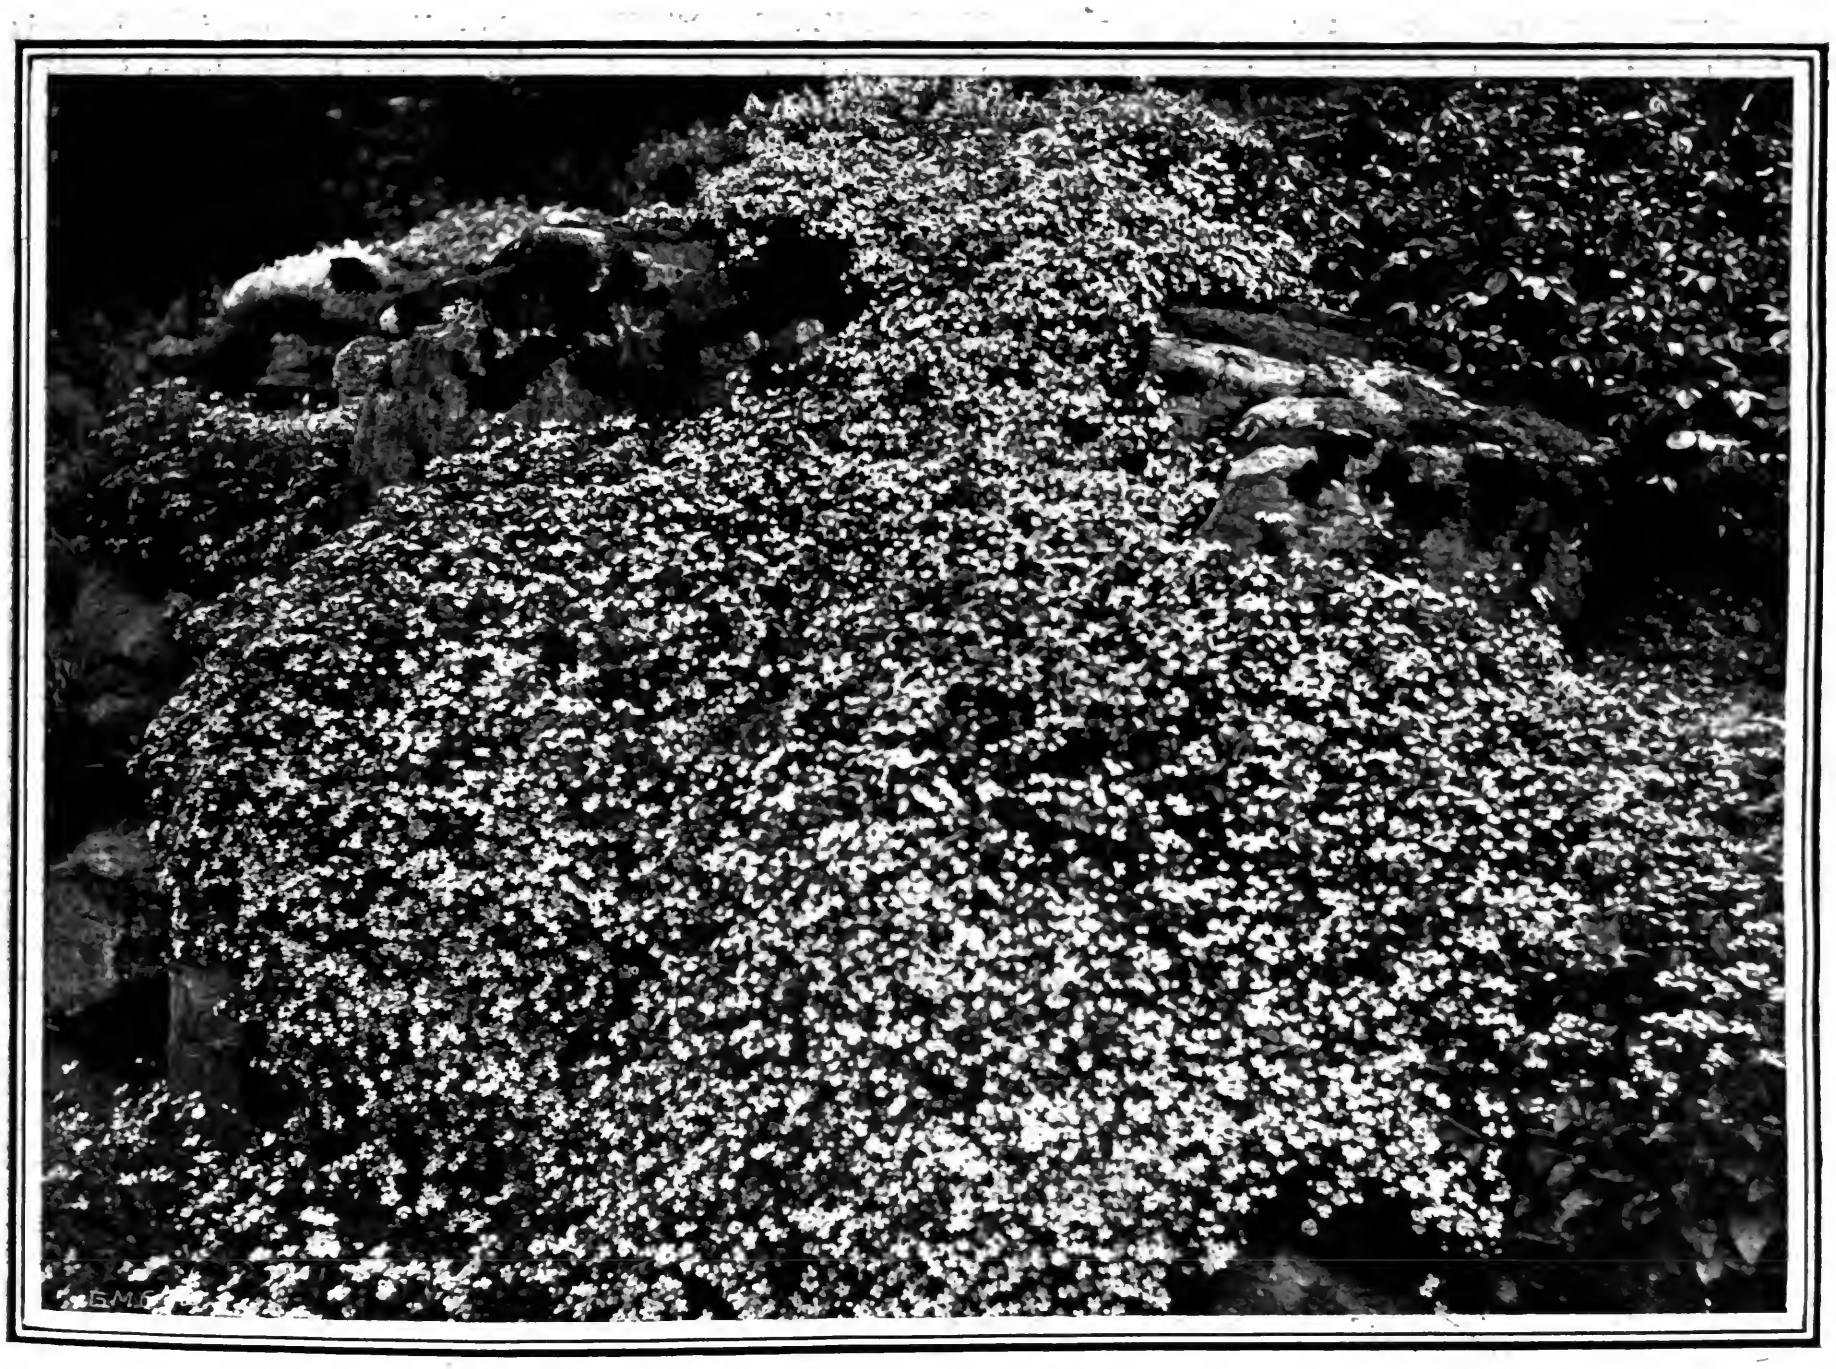
S. Boissieri is a garden hybrid between S. cæspitosa and S. ocymoides. In habit it is nearer to the latter parent, but is more compact in growth and very free branching. At the present time, early in June, it is a mass of rosy pink, the flowers being borne in rather loose clusters. It is a beautiful plant for an open sunny position, planted so that the branching stems can hang down over the face of a stone.

S. cæspitosa comes from the Pyrenees, and is of close tufted habit, bearing umbels of rose-coloured flowers. It is not an easy plant to move when of any size, as it takes some time to get over the shift. Young plants, however, take hold readily when placed in thoroughly well-drained soil of a stony nature. A form, or hybrid, of this species has been sent out under the name of S. Weinmanni, with paler-coloured flowers. It is of a hardier nature than S. cæspitosa, with narrower foliage, and is far more free-flowering. Some plants on a stony slope, facing south-east, have stood here for many years, and always flower very freely, commencing early in May and lasting well into June.

S. lutea is one of the dwarfer kinds, only two inches or so high, with tufts of narrow leaves, and heads of yellow flowers. It is found over most of the western Alps, always in very poor, stony soil. It is less effective than the others, and very liable to damp off in winter. It is more adapted for growing in pans for the alpine house, and kept during winter in the shelter of a cold frame.

S. ocymoides, the well-known Rock Soapwort, is of trailing habit with numerous branching stems, and masses of rosy-pink flowers. It is one of the most useful plants for the rock garden, where it can be displayed to advantage, forming a curtain of colour depending from a rocky ledge. In cultivation there are several colour forms of this plant, while it varies very much in habit. The variety alba is a pure white form of great beauty. It does best in a half-shady position. The variety floribunda, as its name implies, is very free-flowering, while the form called splendens has beautiful, bright, rosy-crimson flowers. The variegated form is also an attractive plant.

S. officinalis, the Common Soapwort, is a useful border and wild garden plant of free habit. It is such a rampant grower that care must be taken not to introduce it where it may become a nuisance. Its sweetly-scented pale-rose-coloured flowers are produced in heads on stems about two



SAPONARIA OCYMOIDES AT MULLABODEN.

A beautiful alpine plant producing an abundance of rosy-pink flowers.

feet high. The double-flowered form is a very attractive plant, valuable for dry banks of a stony nature.

S. pulvinaris is a neat plant from Asia Minor, forming compact little tufts of narrow foliage close to the ground. The small flowers, of a bright rose-pink, are freely produced on much-branched stems, only an inch or two long. It is a plant for a rocky fissure, where it will be dry in the winter. This species is also known as S. libanotica, which is evidently the Lebanon form of it, but cannot be readily distinguished from S. pulvinaris.

Kew. W. IRVING.

A PLEA FOR GREY-FOLIAGED PLANTS.

In these days, when hardy plants are so deservedly popular for the adornment of flower gardens, it is a little surprising that subjects having grey or silvery foliage are not more extensively employed for rockeries, beds, and borders, especially when one considers what a wealth of material is available, and how easy the majority of our hardy grey-foliaged plants are to grow

The glaring colours of geraniums, calceolarias, and other bedding plants do not appeal to everybody, but there is something about the soft colours associated with grey and silvery-foliaged plants that is particularly pleasing. Take, for instance, the soft grey foliage of the old lavender in the winter, or at any time of the year for the matter of that; or the bluey-grey of the southernwoods from the early spring till late autumn. Could anything be more charming?

As I write I have in mind a charming effect obtained by planting Nepeta Mussini and N. violacea just at the back of Artemisia pedemontana and A. Villarsi, the pretty soft blue flowers of the "Cat Mint" mingling with the grey foliage of the artemisias making a pleasing sight, as they do when they are left to grow in their own natural way. Even a dry bank can be made use of for grey-foliaged plants, and white pinks and carnations, with a groundwork of Veronica incana, make up a bed which is very pretty from June to September. The flower stems of the carnations should be neatly tied to stakes made from galvanised wire of about No. 8 gauge, which has had the newness taken off by being weathered somewhat. The stakes then are hardly visible, but if galvanised spiral stakes are used no tying is necessary. If the weather is fairly fine the flower stems of the veronica need no supports. These are two instances among many in which grey plants can be used to make a long and pleasing effect.

Many plants with grey foliage are splendid for growing on walls, where they often thrive better than in the open border. The alyssum, for instance, has proved to be much more lasting and perennial on the wall than in the border, and the same may be said of the rock pinks, which are better on a wall, and safe from the ravages of slugs.

Cerastiums are splendid for wall gardening, and are mostly evergreen. C. alpinum is a great favourite with many, looking, as it does, so sweetly pretty growing out of the wall, the small grey leaves being covered with long silky hairs, which are very beautiful all the year through. C. Biebersteini and C. tomentosum are both very effective, having larger leaves and flowers than C. alpinum, and flowering over a longer period. The grey-foliaged helianthemums are splendid for sunny walls, as also are Santolina incana and S. chamæcyparissus. Lavender must not be passed over, and, like all other plants for growing on a wall, is best planted as the wall is being built. Artemisias in var., anthemis, and Cerastium grandiflora are good deciduous plants with grey foliage. The following is by no means a full list of grey or silvery-foliaged (not variegated) plants, but I can recommend it.

Acæna glauca is a very effective species of the New Zealand Bur, about four inches high, with bluey-grey, small foliage, which is attractive. The plant is most useful between the paving-stones of rock gardens and as a groundwork for taller subjects in a border. Achillea ægyptica has handsomely-cut silvery foliage. The plant is about two feet high, and produces bright yellow flowers from June to September. A. argentea is a very nice plant of a shrubby habit, the edges of the leaves being prettily crimped. It is neat growing, and looks like a silvery rosette. The pure white flowers last from July to September. A. clavennæ, the silvery-leaved Yarrow, is a fine plant for the water garden, having a beautiful hoary appearance, with white flowers in compact heads. It is about nine inches high, and blooms from May to September. A. tomentosa is an evergreen species with woolly foliage close to the ground; the flowers are yellow on stems about one foot high, and last from June to September. This and the other Yarrows are good plants for the rockery, and like a sunny position.

Alyssum argenteum produces yellow flowers from May to July, and is one foot in height. It is a gem, with lovely silvery foliage, and flowers very freely. A. saxatile compactum (Gold Dust) is an old favourite that has bright yellow flowers from April to June, and again later if the old flower stems are removed as soon as the first flowers pass. A double form of this plant flowers very freely. A. s. Lemon Queen is a variety with pale lemon flowers, and is very effective on a wall. A. prostratum is a strong-growing species, and probably the best to plant in the border. A. spinosum must not be forgotten, as it forms a dainty little bush, with silvery-grey foliage, and white flowers on stiff stems, which afterwards form spines. There is also a rose-coloured variety of A. spinosum, which flowers in June and July, and both grow about nine inches to one foot in height.

Androsace foliosa is a very pretty species with broad grey foliage. It is a strong grower, bearing umbels of rosy-lilac flowers from May to September, and grows about nine inches in height. A. lanuginosa and A. sarmentosa are of a trailing habit, with silvery-grey foliage in rosettes, and long stems bearing rose-pink flowers from May to September; six inches high. They are easily propagated by covering the trailing growths with soil.

Antennaria candida (tomentosa) forms dense carpets of white foliage. It is most useful for covering mounds, for edgings of beds, or the rock garden. Its height is three inches, and its curious whitish flowers are produced in June and July. A. dioica minor has very small white foliage, and grows only one inch high, with pink flowers in June. A. margaritacea is a taller species with white, woolly leaves. It is fine for a sunny border. The small white flowers, when dried, are useful for decorations indoors in winter. The plant flowers from June to September, and is 18 inches high.

Anthemis aizoon makes a charming plant for a rock garden, wall, or border. It has very pretty silvery foliage, and heads of white flowers in July and August; height eight inches. A. Biebersteini has divided silvery foliage, and fairly large deep yellow flowers on slender stems in June and July: one foot. A. macedonica also has divided silvery foliage, but with large white flowers lasting from July to October; eight inches.

Artemisia abrotanum is the "Old Man" of cottage gardens, where it is a great favourite, often being used by the cottagers in a cut state to form the greenery in nosegays of flowers for presentation to friends. It has sweetly-scented grey foliage, and grows freely in the open border about two and a half feet high. A. arborea grows four to six feet high, and retains most of its soft-coloured foliage in sheltered places through the winter, and is a very effective shrub. A. argentea is a beautiful species having divided foliage and pale yellow flowers; it delights in a warm place, with rather poor, sandy soil. A. maritima is a British species, with branching habit and divided, downy foliage.

H. PRENTICE.

Hartpury House Gardens.

(To be continued.)

GLOXINIAS.

One of the best-grown batches of plants of gloxinias I have ever seen was kept in a cold frame during the weeks just before and after midsummer. In fact, I might say the plants were grown almost in the open air, for the lights were taken off both night and day, except in showery weather.

The plants I refer to were in a nursery, and I do not think much consideration was given them during their early stages of growth, and they were simply placed in the frames because of lack of room in the houses. But when those responsible for the management saw how good the plants were becoming space was soon found in the houses, and, from time to time, the best specimens were removed so that they might finish their flowering under proper protection, or be sold to admiring customers.

I have myself for years given the gloxinias rather cool greenhouse treatment, while, at the same time, a number of plants have been kept in a stove temperature. Those specimens in the greenhouse always possess the largest and richest-coloured flowers, and, moreover, last in a fresh condition for a long time. The leaves are not large, but very thick and leathery, and of good colour. The leaves of the plants in the stove are larger, but thinner—lacking substance—and the flowers paler, and they damped or dropped off much sooner.

Cultivators who have not had much experience with these plants, and, furthermore, only possess cool, or very moderately heated houses, need not hesitate to grow a batch of plants. Those I refer to in the frames in the nursery were fully exposed to the sunshine, but never scorched, as they had plenty of air.

Gloxinias thrive in a light compost which contains a fair quantity of dried cow manure, if such compost be made firm by hard pressure with the fingers. As the roots are so fine and thread-like strong doses of manure must not be given, but weak ones, frequently applied, after the plants are well rooted, and the flower buds appear, will do much good. Excessive watering in the early stages of growth prevents healthy root action, and checks general progress.

G. B.

NEW PLANTS AND FLOWERS.

PÆONIA L'ESPERANCE.

A beautiful new tree pæony, obtained by crossing Pæonia lutea with a variety of P. Montan. This is the second hybrid from these parents, and it produces a large and beautiful flower with three rows of light sulphur-yellow petals, each with a crimson base, surrounding a large cluster of deep crimson, yellow-tipped filaments. This is practically a single variety, whereas the first-comer, La Lorraine, was double. L'Esperance is a fine addition to the tree pæony group, and should, in due course, become popular where these fine flowering shrubs are successfully cultivated. A.M., R.H.S., June 3. Messrs. J. Kelway and Son, Langport, Somerset.

ODONTOGLOSSUM AIREWORTH, ORCHID DENE VARIETY.

This very handsome orchid was figured on p. 411 of our issue for June 7. In form and colouring it is particularly attractive. The flowers are of fine size, rich red-brown, with rosy-purple margins, the lip being white with numerous bright red spots at the base. A.M., R.H.S., June 3. Mr. E. H. Davidson, Orchid Dene, Twyford.

ODONTOGLOSSUM LAIRESSEI.

A neat and beautiful hybrid, derived from O. Cervantesi and O. Edwardi. The plant bore a branching spike about a foot high, carrying flowers about 1½in. across the upper half of each segment white, and the basal half deep wine-purple. A.M., R.H.S., June 3. Sir Trevor Lawrence, Bart. (grower, Mr. W. H. White), Burford Lodge, Dorking, Surrey.

ODONTOGLOSSUM NEPTUNE ST. FUSCIEN.

A dwarf plant, with bright and attractive flowers, the colours being white, with blotches and spots of very bright and light red-brown. The species concerned in this hybrid are O. crispum and O. nebulosum. A.M., R.H.S., June 3. Mons. H. Graire, St. Fuscien, Amiens.

PRIMULA EXCELSIOR.

A particularly attractive hardy primula, and one that promises to become a great garden favourite, as it is of robust growth, perennial character, and bears tiered spikes of glowing orange-scarlet or vermilion flowers. The parents are P. Unique and P. Cockburniana, and from this cross hundreds of plants were raised, though only one, P. Excelsior, was deemed of sufficient merit to be perpetuated. The original plant was exhibited at the Temple Show of 1911. The flowers are of good size and very effective, and a flowering plant is about 15 or 18 inches high. A.M., R.H.S., June 3. Messrs. Jas. Veitch and Sons, Chelsea.

SALIX MAGNIFICA.

In this very distinct new Chinese willow we have a plant that promises to be a very acceptable addition to our hardy trees. The specimen shown was about 4ft. high, and carried neither flowers or fruits, but its leafage attracted the attention of arboriculturists. The largest leaves were fully six inches long and over three inches broad; deep green, with a faint glaucous tint above, and pale green beneath, firm in substance, and suggesting a magnolia rather than a willow. The purplish leaf-stalks are an additional attraction. A.M., R.H.S., June 3. Hon. Vicary Gibbs (gardener, Mr. E. Beckett, V.M.H.), Aldenham House, Elstree.

PAPAVER PERRY'S UNIQUE.

This striking Oriental poppy is of medium size and brilliant scarlet colouring, with a blackish blotch at the base of each segment. But the great attraction is the deep cutting or fringing of these segments, and this attraction will ensure for the variety a fair share of popularity as a border plant. A.M., R.H.S., June 3. Mr. Amos Perry, Enfield.

IRIS GRACILLIPES.

A neat little species that has long been in

PÆONIA L'ESPERANCE.

A hybrid between P. lutea and P. Moutan. Flowers pale sulphur-yellow, with crimson bases to the segments, and crimson filaments. A.M., R.H.S., June 3. Messrs. J. Kelway and Son, Langport.

cultivation, but is not commonly grown. It has grassy, green foliage, and lilac-mauve, white-crested flowers of modest dimensions. A suitable plant for a favoured position in the rock garden. A.M., R.H.S., June 3. Wargrave Hardy Plant Nursery, The Arcade, Liverpool Street, E.C.

POTENTILLA BOULE DE FEU.

A pretty plant, with an abundance of neat trifoliate leaves, clothed with silvery, silky hairs. The flowers are deep rich crimson, borne on slender branching stems, rather less than a foot high. The parentage is given as P. argyrophylla and P. atrosanguinea. A.M., R.H.S., June 3. Mr. A. Hemsley, Crawley.

DELPHINIUM MRS. F. BREWSTER.

This is a noble variety, producing very large spikes of widely-expanded semi-double flowers. The spikes are not so dense as in some varieties, but this will be regarded by many as an added attraction. The colour is soft lavender-blue, and the largest flowers are two inches broad. A.M., R.H.S., June 3. Mr. R. C. Notcutt, Woodbridge.

STACHYS CORSICA.

Though in no sense a showy subject, this lowly and characteristic Corsican species of Wound Wort will appeal strongly to lovers of alpine and rock gardening. The growths are quite prostrate, clothed with roundish-ovate leaves, and studded freely with white, flesh-tinted flowers that are fairly large for so small a plant. A.M., R.H.S., June 3. Messrs. R. Wallace and Co., Colchester.

HELIOTROPE THE SPEAKER.

This very fine heliotrope makes a grand pot plant, and is already becoming popular with the market growers. The large heads of bloom are rich heliotrope, each flower having a white eye. A.M., R.H.S., May 14. Mr. Philip Ladds, Swanley Junction.

ROSE MISS FLORA MITTEN.

We have previously described this perpetual-flowering, strong-growing rambling rose, and now figure it. The flowers are a lovely shade of soft pink, and have a central cluster of golden stamens; they are three and a-half inches across, and borne in goodly clusters. Rose Brunoni and R. canina are the parents of this useful new rose. A.M., R.H.S., May 14. Mr. J. Elliott, Hassocks.

MAGNOLIA SALICIFOLIA.

The willow-leaved magnolia hails from Japan, has greenish-white flowers that have a close resemblance to those of M. stellata, but in growth the species becomes a slender deciduous tree of elegant outline. It grows from 15ft. to 20ft. high, is quite hardy, and grows well in sandy peat and loam. Bot. Mag., t. 8483.

HELIOTROPE THE SPEAKER.

A fine, fragrant variety, with large heads of rich heliotrope, white-centred flowers. A.M., R.H.S., May 14. Mr. Philip Ladds, Swanley Junction.

Arum Lilies.—When the flowering season is past these plants may be placed outdoors in an exposed situation. There are two methods of treatment after flowering. One is to plant out in a well-prepared piece of ground in the garden, and the other is to give them a resting period by gradually withholding water from them, and keeping them dry for a few weeks during the summer. I think the former method is most suitable for plants which are required to produce flowers very early in the season.—E. HARRISS.

WISTARIAS.

The ordinary Wistaria chinensis has been a familiar feature of our English gardens for so long a period that it may seem at first sight that nothing further need be said in its favour, but, while admitting the good value of W. chinensis for all purposes to which wistarias may be put, I wish especially to emphasise the splendid effect produced by the lesser-known forms which go to make up this splendid family.

W. multijuga is far in advance of W. chinensis, and its long racemes of mauve-violet-hued blossoms are indeed charming when hanging from the open roof of the garden tea house. The drooping trails of blossom are often a yard in length, and the reader can well imagine the glorious beauty of a series of such wistaria trails when well flowered.

There are several forms of W. multijuga, splendid varieties which are worthy of a place in any garden. W. m. alba is a fine white variety, a delightful contrast to the type, and an exceedingly good grower. W. m. fragrantissima is a more highly-perfumed counterpart of the preceding white, being practically identical, save for its heavy, odorous perfume of the bean fields, which makes it one of the grandest subjects for the fragrant garden. W. m. rosea, the pale pink variety, is deserving of notice, and its rarity in Japan, added to the fact that it is almost unknown in English gardens gives it a special interest to those who are on the look-out for novelties. With us it seems as free in growth as the other forms, and we are hoping to make a noteworthy feature of this fine wistaria.

A double form of W. multijuga has made its appearance in our collection, and both the spikes and the individual blossoms are extremely good. The flowers are like large Parma violets, the form and colouring being delightfully similar. The double form of W. chinensis is more common, but even this is little known by the average horticulturist.

In conclusion I must note W. brachybotrys, a fine white wistaria of great merit. The blossoms of this form are very large, but the spikes are much shorter than in W. multijuga. What it lacks in length of the racemes, it makes up in breadth and importance, and the reader may take it for granted that W. brachybotrys is one of the most imposing of all wistarias for decorative purposes.

Of the wistarias with variegated foliage there is, in my opinion, no need to speak, for the variegation does not make for extra beauty. Spring planting is quite successful, and in good, well-worked soil one should experience little difficulty in making the cult of the wistaria a perfect success. P. S. HAYWARD.

ARAUCARIA EXCELSA SILVER STAR.

This araucaria, which has been before the public for two or three years, now seems to have caught on in popular favour. It is an improved form of the old Araucaria excelsa alba spica, and is characterised by the young growths being pure white, which gives it a distinct and striking appearance. In a group of foliage greenhouse plants its tone of colour is very noticeable. There is a variety (elegantissima aurea) whose young shoots are yellowish, but it has not the strikingly characteristic appearance of the variety Silver Star. As Araucaria excelsa is a native of Norfolk Island, these varieties are, of course, only fitted for growing in the greenhouse. T.

TENDER CLIMBERS IN THE SOUTH-WEST.

The best of half-hardy flowering climbers is, without doubt, Solanum jasminoides, whose attractive qualities are widely recognised in Devon and Cornwall, where it is largely grown by rich and poor alike. Its white flower-clusters are extremely beautiful, and were these borne merely for the space of a month or six weeks would entitle the plant to a foremost place amongst climbers. As a matter of fact the solanum enjoys the most extended blooming period of any flowering climber, commencing to expand its blossoms towards the end of April and early days of May, flowering in ever-increasing profusion through the summer months, and reaching the zenith of its display in September, when it forms a veritable sheet of snowy blossoms, while it often retains a portion of its flowers until Christmas or later in open seasons.

The Lapageria succeeds admirably on a north or north-west wall in the open in South Devon and Cornwall, and long trails of waxy-petalled tubular blossoms, white and red, may often be cut as late as November. The white-flowered Physianthus albens also grows freely in some localities, spreading over a wall or sheltered cliff face.

Stauntonia latifolia, although bearing somewhat inconspicuous flowers among its leathery leaves, is valuable on account of the exquisite fragrance emitted by its clustering blooms in the early spring. One neighbouring house is covered to the roof with this stauntonia, and in its flowering season the perfume from its blossoms fills the surrounding air with sweet odour. In the autumn the long, sausage-shaped seed pods, dull crimson in hue, are freely produced. Tacsonia mollissima, a native of Quito, is fairly hardy in Southern Cornwall, where it makes rampant growth, and bears countless long-tubed, pink flowers.

The newly-introduced Polygonum Baldschuanicum is quite hardy, and a plant of great decorative merit, making rapid growth, and being admirably adapted for covering rough trelliswork or old trees, which it will clothe with abundant leafage that for many weeks is shrouded in a wealth of delicate milk-white flower clusters. Akebia quinata is a perennial flowering climber, bearing sweetly-scented flowers of maroon hue.

In specially-sheltered sites in the South-West three beautiful flowering climbers may be grown on warm south walls. The first of these is Plumbago capensis, which bears pale blue flowers. A plant of this growing at the foot of a towering cliff, by which it is protected on the north and east, has passed through several winters without any artificial sheltering, and in the early autumn is a sheet of palest blue. The second is Mandevilla suaveolens, from Buenos Ayres, a handsome greenhouse climber, bearing large white blossoms, deliciously perfumed, in great profusion. In a few spots this grows and flowers well in the open. The third is the ivy-leaved pelargonium, which, in the south-west, is largely used as a wall climber, as may be seen from illustrations that have appeared in these pages. It usually proves sufficiently hardy to withstand the effects of any but an exceptionally severe winter, and sometimes attains a height of over twenty feet. The best variety for use as a wall climber is Madame Crousse, whose pale shell-pink blossoms are most effective when spreading a mantle of tender colour over an expanse of wall.

Abutilon vexillarium, although not strictly speaking a climber, may be grown against a wall with its main growths trained in, when its arching flower-laden shoots bend outwards gracefully, studded along their length with their crimson and yellow blooms, which are borne in quantity throughout the whole summer and autumn, and well into the winter months.

The Flame Nasturtium (Tropæolum speciosum), a native of Chili, is without a rival in the brilliance of its vermilion flower trails. It is, however, seen to better advantage in the north than in the south of England. It is specially adapted for draping yews and other dark-leaved evergreens with its vivid flowers. The New Zealand Clematis indivisa lobata is, when in full flower, one of the loveliest plants it is possible to imagine. It grows well in the open in Devon and Cornwall, and when a forty-feet length of wall is entirely covered with its large white flowers the effect is indescribably beautiful.

This note is far from exhausting the list of charming half-hardy flowering climbers and other plants that may be utilised for beautifying wall and trellis in the warmer districts of our islands, but sufficient have been mentioned to give an idea of the scope afforded by this branch of gardening in the south-west.

WYNDHAM FITZHERBERT.

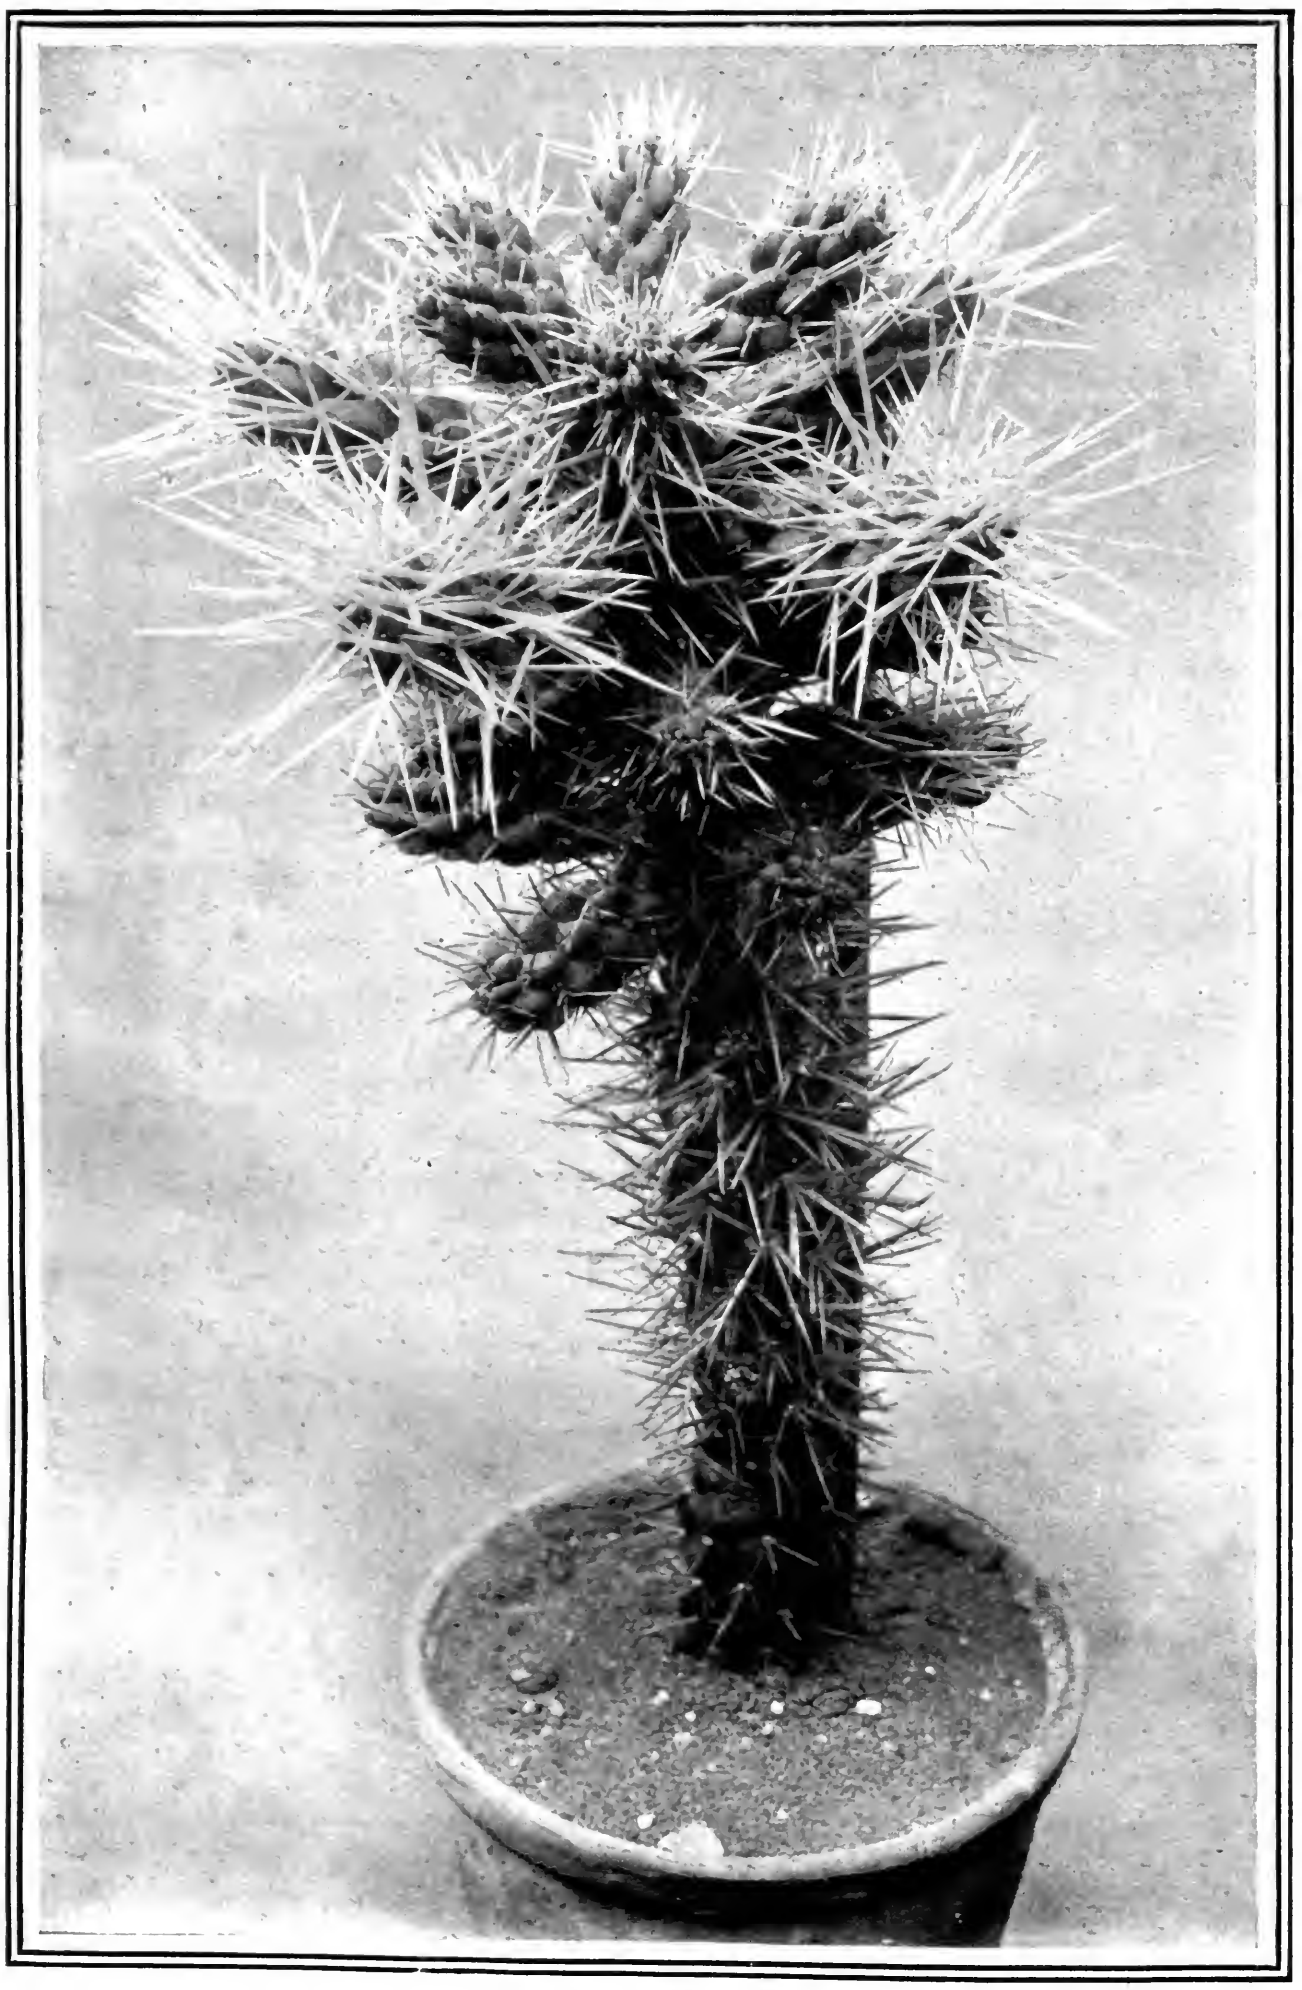
Kingswear.

ROSE MISS FLORA MITTEN.

A perpetual-flowering rambler, with large clusters of beautiful soft pink flowers. A hybrid between R. Brunoni and R. canina. A.M., R.H.S., May 14. Mr. J. Elliott, Hassocks.

SUCCULENT PLANTS FOR AMATEURS.

In a note of this kind it would be impossible to deal fully with all the numerous families of plants having representatives amongst the succulents. It will suffice if I deal with a few of the principal genera, noting a few of the species in each which, from their easy culture, beauty, and interest, may lead others to take up their culture. In passing I may say that many of the plants in the following notes are suitable for culture, either as greenhouse plants, or for growing in a warm, sunny cottage window.



OPUNTIA TUNICATA.
An interesting Mexican species with white spines.

Opuntias.

The genus opuntia is a very large one, containing upwards of 200 species. Most of them have large ovate, elliptic, or terete, fleshy and very spiny stems, sometimes pear-shaped in general outline, and often extremely leaf-like in appearance. The flowers are usually borne on the margins of the lobes or stems, and vary in colour from yellow to orange, red, or purple. Many of the species produce edible fruits, and are esteemed as a delicacy in many tropical countries. Most of the species are extremely tenacious of life, and resist fire, drought, and wet periods to an extraordinary extent. They have been introduced into many tropical and sub-tropical countries, and have spread so rapidly as to become a pest, large sums of money having been spent in trying to exterminate them. They readily thrive under cultivation, and flower freely when quite small. A few of the dwarfer kinds for general cultivation would include O. basilaris, O. tuna, O. Emaryi, O. microdasys, O. tunicata, O. Scheeri, O. mesacantha, O. polyantha, O. fulgida, O. ursina, O. clavarioides, and O. crinifera.

Cereus.

The genus Cereus is variable in habit, some species, such as C. grandiflorus, C. rostratus, C. inermis, C. triangularis, C. nycticalus, and C. Macdonaldiæ, are long twisting or trailing climbers, others are dwarf and gouty, such as C. aggregatus, C. mojavensis, C. Fendleri, and C. viridiflorus; others, again, are of large growth. C. giganteus reaches an enormous size, sometimes as much as fifty or sixty feet high, with thick, fleshy stems one to three feet in diameter, and it is without doubt the giant of the order. A desirable species is C. speciosissimus, with rich scarlet flowers, and of very easy culture and thriving well as a window plant. A fine companion plant is the newer C. amœcaensis, similar in habit, and with large pure white flowers. The Rat's-tail Cactus (Cereus flagelliformis) is one of the best window plants I know, and should be hung up in a pan or basket, and the long pendulous growth allowed to hang down in a natural manner.

Sempervivum.

A few of the shrubby species of this genus, mostly natives of the Canary Islands, are often met with in amateurs' collections. The flowers are borne on large terminal panicles, and are distinctly handsome. They are all readily propagated from either seeds or cuttings. A few of the best are the following: S. holochrysum, S. Haworthii, S. arboreum, S. cuneatum, S. decorum, S. urbicum, S. Paivæ, and the distinct S. tabuliforme.

Phyllocactus.

The phyllocactus are favourite plants with amateurs. They are of very easy culture, and thrive well in an ordinary light window. Numerous very beautiful hybrids have been raised, having a considerable range of colours in the flowers, which are all large and strikingly handsome. The hybrids are such a great improvement on the parent species that it is advisable to grow these in their place. A few fine hybrids are the following: P. albus grandiflorus, a fine pure white; P. Anna Brunow, bright rose; P. Conway's Giant, large-flowering scarlet; P. grandiflorus, red, a large flower; P. Nankin, orange-yellow; P. Ernesti, bright red; P. delicatus, light pink; P. Marcus, rose, shaded with salmon; P. Pytho, orange-scarlet. The small-flowered P. phyllanthoides, a Mexican species, with light rose-coloured flowers, and extremely floriferous habit, is well worth growing

Rhipsalis.

The rhipsalis, or mistletoe cacti, are small-flowered plants, scarcely succulent in habit, but usually grown with them in the same house. They do not like to become dry at the roots for any length of time, and beyond keeping them only

slightly drier during the winter months, they require no decided period of rest. A few of the species are pretty, especially when covered with numbers of their small white flowers, and these are often followed by clusters of creamy-white fruits, having a close resemblance to the common mistletoe when in fruit. The following species are recommended: R. tetragona, R. gracilis, R. Casytha, R. mesembryanthoides, R. funalis, R. crispata, and R. salicornioides.

Epiphyllum.

Making up a genus of about half a dozen species of warm greenhouse or stove shrubs, the epiphyllums are all of dwarf or trailing habit, and devoid of spines. They are of rather slow growth, and are on that account usually grafted upon some quick-growing stock, such as Pereskia aculeata.

E. truncatum, the type of which is bright red, has a large number of very beautiful garden forms in a considerable range of colours, from almost pure white to deep violet and red. P. Russellianum has rich rose-coloured flowers; P. Gaertneri has brilliant scarlet flowers; P. delicatum, a recently-introduced species, has branches deeply lobed at the apex, and delicate pink or rose-coloured flowers. They thrive best if placed in a moist stove during the growing period, afterwards removing them to a warm greenhouse, in a temperature of 50 or 55 degrees F., to ripen their growths. The flowers are pendulous, and borne on the ends of the branches. C. P. RAFFILL.

(To be continued.)

BEGONIA MRS. PETER BLAIR.

Among the many fine begonias exhibited at the great Chelsea Show by Messrs. Blackmore and Langdon, scarcely one attracted so much attention as the variety Mrs. Peter Blair. For size, purity of its whiteness, sturdy habit, and good form it is hard to beat, while its refined symmetry is such that the most conservative florists could find no fault with it. In form the blooms combine the substance and regularity of a camellia with the depth and grace of a fine rose. Mrs. Peter Blair is certainly one of the best of many fine tuberous-rooted begonias introduced by Messrs. Blackmore and Langdon, Twerton-on-Avon, Bath.

BEGONIA MRS. PETER BLAIR.

A very fine white variety exhibited by Messrs. Blackmore and Langdon at the Chelsea Show.

VALUE OF LIQUID MANURE.

There is still much to learn, in the cultivation of both farm and market garden crops, about the uses and the value of liquid manure. Cultivators, as a rule, appreciate its value, and sometimes they use it carelessly, with results that are the reverse of satisfactory. A liquid manure which consists of the drainings from manure heaps, the urine of cows, horses, sheep, and pigs, etc., is always more rapid in its action than a solid manure or an undissolved one, and it often happens that a considerable amount of injury may be done by applying the liquid indiscriminately to grass or field and garden crops, without first diluting it.

Constituents.

There is a large percentage of soluble plant food constituents in the drainings of the farmyard. The liquid excrement of cows, for example, contains on the average, 0.8 per cent. of nitrogen, 0.7 per cent. of phosphoric acid, and 0.6 per cent. of potash. Compared with ordinary dung, which includes the straw and litter, and contains only 0.34 per cent. of nitrogen, 0.18 per cent. of phosphoric acid, and 0.4 per cent. of potash, this liquid manure is therefore worth about double as much, and special note must be taken of the fact that it contains twice as much nitrogen as dung. In fact, the ammoniacal properties of liquid manure from the farmyard are very considerable, but, unfortunately, they are very often allowed to go to waste by careless storage and application. Turning to other animals besides the cow, we find that the urine of horses and sheep is much richer in nitrogen and about equal in potash, while in the case of the horse and the pig, it is poorer in nitrogen but richer in phosphoric acid. Evidently, therefore, the liquid manure which consists of the mixed urine of different classes of stocks—horses, cattle, sheep, and pigs—is much more valuable as a fertilising material than the liquid manure produced by the cow alone. Moreover, the value of the liquid is much greater than the value of the solid manure, as far as nitrogen content is concerned especially, because it is possible to apply the former to the ground directly it is obtained. On the other hand, it is practically impossible to get solid dung under the ground before it has lost some proportion of its original ammoniacal value. Exposure to the weather ruins farmyard manure just as much as it does liquid manure; the urea—which is the most valuable constituent in either manure—quickly changes into carbonate of ammonia, which is easily lost in the atmosphere. Therefore, it will pay cultivators to keep manure heaps under cover, and to preserve the liquid drainings from the yard in a covered tank, where they will not lose their ammoniacal properties so quickly.

Preservation of Liquid Manure.

It is therefore easy to understand that the drainings from a heap of manure which is fully exposed to rain are very much weaker as a fertilising material than those from a heap which is carefully preserved under a covered yard. If the ground is moist, this weak liquid manure may be applied quite safely in an undiluted condition, but the drainings from a covered yard must needs be diluted with from four to six times their bulk of water. On some farms all the liquid manure is drained into a specially constructed iron tank sunk in the ground; or a pit is dug and lined with chalk. Pumps are required for pumping out the liquid into the carts, but the chief difficulty experienced here is that the pumps so often become choked.

For Garden Crops.

It is probable that liquid manure can be put to the most profitable use as a stimulant for various garden crops. Farmers use it largely as a dressing for meadows and pasture land, and sometimes it is applied to mangel crops. A very safe and perfectly effective liquid manure for the garden can be prepared by diluting the liquid excrement from the cow stalls; or a sufficient quantity of good dung may be placed in a barrel of water and left there to soak, until the water eventually assumes a dark, rich brown colour. This is a very simple method of preparing a good liquid manure that possesses none of the caustic properties so commonly associated with many of the chemical and more highly concentrated fertilisers. If sheep or fowl manure is used for this purpose, it will be advisable to steep smaller quantities of the dung in water, as these manures are much richer than cow dung. In the majority of gardens, but particularly in rural districts, there are usually large quantities of house sewage to dispose of. This is very powerful in its action, and few people seem to care about using it. However, the liquid, if properly diluted, is very valuable indeed as a stimulant for fruit trees or for grass.

How to Use Liquid Manure.

It should not, under any circumstances, however, be applied to trees or plants when the soil surrounding them is dry, nor at a time or a season of the year when the roots have not commenced active growth; in the former case it will have the effect of burning up the young roots, and in the latter case it will make the soil exceedingly sour, which will be injurious to the roots when they do commence to grow. The best time to apply liquid manure to ground in which stone fruits are growing is when the ground is moist with rain, and just after the fruit is set; a second watering may be given about a fortnight afterwards before the fruit stones, and if the season is a very dry one a third application will prove beneficial. In very retentive soils, a single watering with liquid manure will usually prove ample. It is not recommended that sewage water should be used for vegetable crops, or for any other garden crops except apples and pears, stone fruits, and all varieties of bush fruits.

Special Liquid Manures.

There are many different varieties of proprietary chemical liquid manures on the market, and the grower can even make a special manure of his own by steeping a small portion of an artificial fertiliser in a tub or a can of water. Care must be taken in the latter case, however, not to give an overdose of the chemical manure, for the results may be very injurious indeed. Sulphate of ammonia or nitrate of soda may be used for the purpose, a suitable liquid manure being made up by steeping, say, ½lb. of either fertiliser in twelve gallons of water; or it is perhaps a safer plan to use a similar quantity of guano instead of the artificials. Another very good plan is to place a bag of soot in a barrel of rain water, packing the soot loosely in the bag, so that the water may easily reach it. This makes a splendid liquid manure for all classes of vegetable crops. Even market gardeners are turning special attention to the use of liquid manures, as well as farmers, chiefly because the supplies of good manure are becoming so scarce owing to the spread of motor power in place of our old friend the horse. It is advised, however, that for use in commercial establishments it is profitable to "cook" all liquid manures, and, therefore, all the yard drainings, etc., should be placed in a tank fitted with steam pipes, so that live steam can be blown into the mixture. Liquid manure may very easily be the means of carrying disease to tomatoes, cucumbers, vines, and other market garden crops, if this precaution is not adopted, and there is no need for us to enlarge on the dangers of eelworm infestation in the houses, or of the virulent diseases set up by the resting spores of fungi which may be harboured in the liquid manure.

J. C. NEWSHAM.

PICEA BREWERIANA.

This is one of the rarest of all spruces, and it has only been in cultivation for a few years. Even now it is grown in very few gardens, and probably the best specimen in Europe is one which may be seen growing in a bed of heaths near the Pagoda at Kew. Even in its native country it is rare, for it has a very local distribution, occurring only on the mountains of the California-Oregon dividing line, the Siskiyon Mountains affording the greatest number of trees. A good account of the tree and its distribution is given by Jepson in his "Silva of California." He there says that it varies a good deal in height, for mature specimens are met with from 20 to 95ft. high, with a trunk diameter of from 6in. to 3½ft. A peculiarity of the tree is its pendant branchlets, which are said to hang down 2 to 4ft. Young specimens do not, however, exhibit much of this character.

The narrow, flattish leaves have a greyish hue. They are about half an inch long and surround the branches. Native cones are 3 to 5in. long, and about 1½in. diameter, but no cones have been produced as yet in this country, the Kew specimen previously alluded to being barely 4½ft. high. Jepson says that the species was originally collected by Mr. Thomas Howell, the pioneer botanist of Oregon, but subsequently it has been recorded by several botanists. Nathaniel Low Britton, in his "North American Trees," refers to it as the rarest and probably most beautiful of the American spruces. He also says that its wood is of good quality, but, owing to the rarity of the tree and its inaccessibility, it has not been applied to any economic purpose.

W. D.

Veronica Hulkeana.—This New Zealand species of veronica is widely removed both from the many garden forms of V. speciosa, as well as those strange-looking species, some of which mimic tiny conifers. Veronica Hulkeana is a loose-growing bush with a profusion of lavender-coloured flowers borne in May and June.—T.

CHRYSANTHEMUMS.

One is often reminded that the best results are obtained from chrysanthemums that are grown on steadily right through the season; and, no doubt, such plants do yield the best blooms. But it is a fact that these plants make more rapid progress after the middle of July than before that date, even when they are not specially fed. It is during the latter part of the summer and the early part of autumn that the bad effects of a too-rich compost, loosely worked in the pots, are to be seen, especially so when the latter part of the season proves to be wet and sunless.

A moderately rich compost, well balanced as regards organic and concentrated manures, made fairly firm, cannot be excelled for use at the final potting. If a rather poor, but porous, compost be used, due feeding will make up for any deficiency of richness. But a too-rich soil may cause the cultivator much trouble. Again, certain varieties require larger pots and richer soils than others; but the inexperienced grower cannot do wrong if he uses smaller pots for the weakly-growing varieties and the larger ones for the strong growers. Example: The weakest do well in 8in. pots, the medium growers in 9½in. pots, and the stronger in 10in. and 11in. ones.

Summer Arrangements.

The wise cultivator will not grow five hundred plants if he has only room for four hundred. I refer to the summer quarters, of course. But it is also necessary to think about the available space under glass which will be needed in the autumn, as undue crowding there will undoubtedly help to undo the good work of the summer time. Plenty of space should be allowed between the plants now. When grown in blocks the rows should run north and south. So arranged, a large collection can be readily attended to as regards watering and feeding; but single rows, placed at the sides of broad paths, generally do well. If the path be a narrow one, a single row on one side will be sufficient. When grown in blocks a space corresponding with the average height of the plants should be left between each row.

Earthworms will always find their way into the pots when the latter are placed on ashes, even when the layer of ashes is a thick one. Slates, tiles, and boards may be used. I prefer boards—failing them, tiles—as pots placed on slates often get waterlogged, because the slates are not as porous as tiles or boards. Old boards with fungus growing on them must not be used.

Supporting Bush or Specimen Plants.

These may also be grown in rows, but they will need ample open space between them. One strand of wire fixed over each row, so that a single stake in each pot can be made secure to it, will be very beneficial, and prevent loss when the strong gales come. But it is just as well to make sure, and, in addition, drive in three short, stout pegs round each pot, so that, when driven in, the top of the stake will rest just below the rim of the pot. When the shoots develop—as they do fast in August and September—the plants become top-heavy, and are easily blown over.

The Leaf-mining Maggot.

I never saw plants attacked worse than they were last year. Mrs. A. T. Miller, I think, suffered the most, but many other varieties were sadly disfigured and much crippled. The pests are not quite as active—or, rather, numerous—this year; but cultivators should very carefully examine their plants, and, when found, crush the maggots with thumb and finger. If regularly attended to in this respect, none of the leaves will be materially damaged, whereas neglect would mean the loss of many basal leaves, and they certainly cannot be spared.

Geo. Garner.

HUMOURING NATURE.

It may be said, in one sense, that there are two main systems in garden practice, with a great gulf between them. Few people adopt either the one or the other exclusively, and not many more probably are conscious that they are adopting either. We see an instance of one in the case of the man with leisure, or money, or both at command, so that he is able to make his conditions suit any subjects which he wishes to grow. Thus, if he wishes to grow orchids brought home from tropical forests, he can go to great labour and expense to provide an approximation to the climatic conditions to which they have been accustomed; while, at the other extreme, if he wishes to grow plants from the high Alps, which in their native habitat are only free from snow for three or four months of the year, he will, in most cases, have to make no small preparation to give these hardy plants the rooting medium in which alone they will live, and even then, perhaps, the majority of the plants he buys at no little cost will succumb to the dryness of the summer or the dampness of the winter. Similarly with water or marsh plants, peat-loving plants, and so on. It all means much labour, as well as expense.

Between these two extremes are many more or less hardy plants which will not grow in the garden for which they have been purchased unless the soil, and sometimes other conditions as well, are first made to their liking, after which they only do moderately well, and then often after a good deal of care and attention has been bestowed upon them.

The other system is simplicity itself when the necessary knowledge has once been obtained, though this, it must be admitted, is often a matter of some considerable time. The essence of it is the finding out of the plants, bulbs, shrubs, etc., for which our conditions are perfectly suited, and growing these, and nothing else. The worst garden that ever was will grow some things well if it is properly cultivated. If the mountain cannot come to Mahomet, the latter must go to the mountain, and if we are not prepared to make such costly preparations for subjects which need it we must grow others, perhaps no less beautiful, which will grow well with the conditions we are able to give them, and with no further outlay in time and money than that necessary to provide what is generally understood by the term good cultivation.

There is an immense amount of pleasure and interest in this form of gardening, with the fascination which comes of drawing from an inexhaustible source, for we shall never discover all the subjects for which our conditions are best adapted, however long we may experiment; and however well certain plants thrive, it will still seem that we may grow them better another year. It is this which gives such a zest to gardening, while the rewards for the outlay are so much greater in this than in the first system described. The time spent in unsuccessful attempts to grow Aquilegia glandulosa or Tropæolum speciosum, if we are placed in the South of England, would produce splendid results with subjects no less beautiful, but prepared to revel in what we provide for them.

Though this latter system is recommended for those with moderate leisure and means, it is not to be supposed for a moment that any thoroughgoing gardener will be content to follow it exclusively, however good the results may be. We all have some plants which are such favourites with us that it will take a long time to convince us that we cannot even grow them properly, or only after a great deal of preparation, and even then, perhaps, only in certain favourable seasons. That, however, does not make the system of no value for us, for in economising our resources in this way in our general garden work we shall have so much the more to devote to the one or two subjects we feel we must grow, and it may easily be that, in devoting all our means for this kind of gardening to one or two things, instead of pottering about with dozens of subjects that will only do even passably well after a deal of care, we may succeed where we should otherwise fail.

The true gardener will find just as much delight in obeying and humouring Nature as in fighting and overcoming her, and will, at the same time, have a consciousness that his resources, in the way of time and money, have been employed to the best advantage.

Alger Petts.

JUGLANS CORDIFORMIS.

There are several interesting points about this Japanese walnut, for it has very large ornamental leaves; its racemes of male flowers sometimes exceed 12in. in length, and its fruits are produced in racemes. A description of the tree occurs in "The Trees of Great Britain and Ireland," by Messrs. Elwes and Henry, whilst an earlier one may be found in Shirasawa's work. It has been in cultivation for a number of years, and fruit-bearing trees are to be found in England. Mature trees in Japan attain a height of 50ft., with a girth of 6ft.

The leaves are often 1½ to 2ft. long, and are made up of from 11 to 13 oblong leaflets, which are covered with a soft, downy pubescence. The male catkins are composed of greenish flowers, and are from 9 to 15in. long. The female catkins are 5 or 6in. in length, and bear from five to twelve flowers. All may not set, but from four to six fruits have been observed on one catkin. The nuts are smaller than those of the ordinary walnut, and are heart-shaped. They are quite as wholesome as the nuts of Juglans regia, and are said to be a regular article of trade in Japan. Like the common walnut, the young growths of this are subject to injury by late frosts in spring, but so far as winter frosts go it is quite as hardy as the commoner tree. In Japan it is recorded as growing along the banks of rivers and being rare on the drier soils of the hilly regions.

W. D.

Blue-flowered Hydrangeas.—Hydrangeas with blue flowers are very much in favour at the present time, and numerous examples of different shades were to be seen at the Chelsea Show. The age of experimenting seems to be past, and there are now two preparations on the market, both of which have yielded satisfactory results. The presence of lime in the soil is very much against the production of the desired blue colour.—S. W.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SEEDLING ODONTOGLOSSUMS. — The seedlings of the various kinds of odontoglossums and the bigeneric hybrids derived from the intercrossing of cochlodas, miltonias, oncidiums, etc., are interesting plants to deal with from the grower's point of view, and when they have so far advanced that the rooting stage is reached in most cases they make rapid progress. The secondary hybrids are even more vigorous than the primary crosses; certainly the seeds germinate more freely and usually more rapidly. If we look for rapid development of growth, the young plants require a good deal of attention, not only in potting, but in freedom from insect pests and slugs. I have on previous occasions advised the pricking off of seedlings as soon as the first leaf has developed, but there are cases where the potting compost has become infested with the maggots of a fly, which not only destroy the seed bed, but also feed on the tender, green, swelling seedlings, and usually attack the larger ones first, leaving nothing but the outer husks of the globular development. Where this is observed it is advisable to remove the seedlings to prepared surfaces in small pots, and, if carefully attended, most of the plants will grow away.

POTTING.—The seedlings that were put into store pans in the late summer and autumn of last year will have made considerable advance, and may now be potted singly in small pots. Too much pot room should be avoided in the early stages, but in dealing with more advanced seedlings, say, eighteen months to two years old (which is about the time of the completion of the first pseudo-bulb), more liberal treatment may be afforded. The pots used should in all cases be clean and well drained; we place a small layer of crocks in the bottom and a liberal amount of chopped bracken roots over this, and up to rather more than one-third the depth of the pots. The compost used must be varied in coarseness according to the size of the plants. In the early stages we find loose potting favourable, and use a compost made by adding plenty of sand and finely broken crocks. We use two parts fibrous peat to one of finely-chopped sphagnum and broken oak or beech leaves. The small plants potted now should make sufficient progress to require potting again towards the end of September, so that if a good compost is selected for early pottings, the plants may be placed in larger receptacles without disturbing the old compost. Carefully shade all freshly potted odontoglossums, and in dry, warm weather spray them overhead two or three times a day should evaporation be rapid. The floors and stages about the plants should also be frequently damped.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

PRIMULAS.—These must be kept in a light, airy structure until they are ready for their final potting. They may then be placed in cold frames and plunged in ashes. Their chief requirements will be careful watering (especially when they have been repotted), careful airing, and shelter from bright sunshine. A pinch of seed may be sown for a later batch of plants. Another sowing of calceolarias and cinerarias may also be made.

BOUVARDIAS.—Although these may be successfully grown in pots during the summer months, perhaps the better method is to plant them out of doors in a well-prepared border. The ground should have been prepared some considerable time previous to planting, and should be liberally enriched with well-rotted manure or leaf-mould. The plants should be put out about 18in. apart, and if the weather be hot at the time of planting they must be shaded during the hottest part of the day until they have become established. Syringe them vigorously morning and evening, and keep them well supplied with water. The young growth must be pinched once or twice during the growing season to encourage a bushy habit. Plants in pots must be placed in cold frames during the summer, and they will appreciate being plunged in ashes.

CLIMBING ROSES.—These must receive timely attention to the thinning and regulating of young growth, which is very active at the present time. Neglect in this matter now will cause the shoots to grow into a confused mass, and will generally weaken the trees. Use the syringe or hose freely during hot weather, and keep the roots well supplied with water. If the roots have not already been mulched with manure this should be done now. They must also have one or two good soakings with liquid manure during the growing season. Plenty of air must be admitted to the house always, and the trees must be well exposed to the sun. A light fumigating with a nicotine compound occasionally will keep them free from aphis.

POT ROSES.—All roses growing in pots should now be placed out of doors, and partially plunged in ashes. The pots being now full of roots, copious supplies of water are needed, and this must be supplemented occasionally by liquid manure and soot water. The foliage must be vigorously washed with the syringe or hose twice a day, and to keep them free from insect pests an insecticide should be used once a week. The plants must be placed in a position well exposed to the sun, so that the young growth may become thoroughly matured by the end of the season. —E. HARRISS, Lockinge Gardens.

HARDY FRUITS.

STRAWBERRIES.—The earliest of these will now be fast colouring, and should be netted. First see that the beds are free from weeds and runners, and the trusses resting on some clean, sweet material. If the roots are in need of water, let this be given freely, so that the soil is made thoroughly moist to a good depth. Lay down traps at intervals along the rows where mice are troublesome. Later varieties, which are heavily cropped and growing on shallow land will need every attention in very dry weather, otherwise the crop will be shortened; when applying moisture let the soil be thoroughly soaked, as one good watering will do much to increase the size and flavour of the fruit, and lengthen the supply.

PEACHES AND NECTARINES.—Keep pace with the thinning and regulating of the young shoots, leaving no more than are necessary for covering wall space and for fruiting next season. The crop this season (with us) is very light, attributable in a great measure to the trees having but little rest during the autumn and winter, and a long spell of cold weather during the time the trees were in flower. Blister was never more troublesome; by frequent hand-picking of the infected parts, and the constant use of the syringe, the foliage is now in a much better state, and the growth more active. Reduce the number of fruits where thickly set and keep the roots well watered.

RASPBERRIES.—The roots of these are mostly near the surface, so that good top-dressings of fresh suitable compost, spread over and about the roots, will do much to encourage sturdy, fruitful canes, following with heavy dressings of well-decayed manure and copious supplies of liquid manure. If the soil is deep and good, and the growth strong, less mulching and feeding will be necessary; attend well to the autumn fruiting kinds, and do not allow overcrowding with weak, unsuitable growths.

AMERICAN BLIGHT.—Apple trees sometimes become badly infested with this pest, and if allowed to increase, the whole of the main branches, etc., are soon covered. I find paraffin emulsion a most efficient insecticide to use if applied according to the directions given on the tins. Nicotine emulsion is also most deadly to all insects, and may be used with safety. Ordinary paraffin and soft soap, well mixed, at the rate of a wineglassful of paraffin to a gallon of water, in which a couple of ounces of soft soap has been dissolved, when well brushed into the infested parts, answers the purpose very well. —H. MARKHAM, Wrotham Park Gardens.

THE KITCHEN GARDEN.

LEEKS.—Plants from the March sowing will now be ready for transplanting. It is usual to plant leeks in trenches rather shallower than those made for the early celery, a four-inch layer of well-rotted manure being laid at the bottom, and covered with a similarly thick layer of soil; the trenches, when ready for planting, being about six inches deep. Allow a space of three feet between the trenches, and a space of nine to ten inches between the plants in the trench; when planting press the soil moderately firm around them, and give a good watering. Where the blanching process is not carried out by means of brown paper collars it should be gradually accomplished as growth proceeds, by drawing the earth up to the plants; this will blanch the plants, but not so satisfactorily as will be the case if paper collars are used. In gardens where labour is limited, a piece of rich ground should be made level, a deep drill drawn with the hoe, and with a thick dibber make holes seven or eight inches deep. The plants should be carefully lifted and dropped into these holes, and as much soil afforded as will cover the roots. Use the hoe often when growth has begun, so as to work the soil into the holes, being careful not to bury the leaves.

ONIONS.—Those who are desirous of producing exhibition specimens will now have to pay special attention to them. Being a moisture-loving plant, abundance of water is required during spells of drought. This is best given towards evening time. Liquid manure from the farmyard tank, applied at frequent intervals, and well washed into the soil, is a safe and excellent stimulant. On soils deficient in potash a dressing of sulphate of potash at the rate of two ounces to the square yard, will prove beneficial as a substitute for liquid manure. Nitrate of soda or sulphate of ammonia may be used at the rate of one ounce per square yard. A second dressing may be given after a fortnight's interval. Each dressing should be well watered in unless the weather is showery. A good dressing of soot once a fortnight may also be applied with advantage, but should not be used at the same time as the nitrate of soda or sulphate of ammonia. The surface soil should be constantly stirred with the hoe to ensure a fine tilth and keep down weeds. The plants should now be finally thinned from sowings made in the open. Should there be any signs of the onion fly do not thin too severely. For ordinary purposes large onions are not desired, and the excessive use of stimulants is therefore unnecessary. Two or three applications during the growing season will be all that is required. If the plants are attacked by mildew spray with a solution of sulphide of potassium, half an ounce to a gallon of water. The solution will better adhere to the plants if the sulphide is added to water in which a good-sized piece of soap has been previously dissolved. A sowing should now be made of the silver-skinned variety for pickling purposes. The plot of ground should be made firm; manure is unnecessary, the object being to obtain small, firm specimens. They may be sown thickly in rows, or broadcast.—W. MESSENGER, Woolverstone Park Gardens.

THE GREEN LEAF.

In the course of an admirable lantern lecture delivered before the North of England Horticultural Society, at Leeds, last month, Professor J. H. Priestley, B.Sc., told his audience that recent years have seen several attempts made to utilise the sun's rays directly for the production of steam power, but it is not always realised that every green leaf represents a successful attempt to harness the sun's rays in the service of manufacture, and with the energy so obtained the leaf is busy in daylight building up foods such as sugar and starch. We therefore indirectly utilise the sun's rays every time we eat a green leaf, and so add this stored energy to our own supply.

The sugar-beet industry, for instance, is an attempt, by the aid of the beet leaf, to utilise the sun's rays to build up sugar for our use, and if in this country we are to compete with the tropical factory, which places its sugar-making agent, the sugar-cane leaf, under the more ardent tropical sunlight, then it will probably only be done by careful attention to subsidiary industries, such as for instance the commercial culture of yeast, which group themselves around the chief product, the sugar-beet.

It can easily be seen that the flat green leaf, as it spreads itself out into the sunlight, is an effective trap for its rays, and by means of pigments it absorbs and utilises the red and blue rays. These, and perhaps especially the red, can easily be shown by experiment to be of great utility to the plant.

Another possibility is thus opened up. During the darker months of the year, a darkness often enhanced by fog and mist in this damp island, could not something be done by means of artificial light to encourage the growth, especially of our indoor plants?

Siemens tried this many years ago, and recently Miss Dudgeon, at Dumfries, has obtained interesting results along these lines. Using the Cooper-Hewitt lamp, with its bluish light, she has obtained astonishing growth in many plants. They often showed a tendency to run too much to foliage, but this winter she has been able to check this largely by the use of a light giving a greater proportion of red rays.

This light, thus utilised by the plant, is turned to account in its task of building up sugars and starch within the plant, substances which are subsequently used in many ways within its tissues.

The great use of sugar to the plant lies in the fact that all the energy that went to its making can be obtained from it again if it be more broken down, and by doing this in the process of respiration, the plant can set free heat, as is shown often in the warm temperature of a flower bud or of germinating seeds.

This energy thus stored in the plant, in the products that it makes with the aid of sunlight, is utilised by us in many ways. Industrial Leeds is now living and working with the energy stored up by past generations of plants, and retained for us in the seams of coal beneath our feet.

We also at our meal tables, either directly as vegetarians, or more indirectly, though we may think more appetisingly, through the medium of a vegetarian animal, are drawing upon these stores of prisoned sunlight.

Nidularium Meyendorfi.—Like many other bromeliads, the long strap-shaped leaves of this species, arranged in a regular vasiform manner, go to form a decidedly ornamental plant. Just now it is in flower, and in this stage is very attractive. It is not, however, the flowers themselves, but their surroundings which form the principal feature. The flowers are borne in a cluster in the centre of the crown, but, being so short, very little is seen of them. The central leaves, however, which are shorter than those borne around the outside, acquire during the flowering period a bright scarlet colour, which renders a good example of this Nidularium a bright and attractive occupant of the stove.—K.

ORCHIDS: THEIR POPULARITY AND CULTURE.

(Continued from page 365.)

Taking into consideration the nature and general character of orchids, especially the epiphytal species, one does not wonder that to master the essentials of their successful cultivation a longer time is required than is the case of other plants. By this I mean that growers fail to recognise the treatment necessary to enable them to keep their plants in a thriving state for an indefintie period. It does not require more than an ordinary acquaintance with orchids to see by the character of their growth that Nature has made a special provision for their continual existence. In the bulbous kinds, such as cattleyas, lælias, dendrobiums, odontoglossums, oncidiums, lycastes, and others, the roots which nourish the plant are confined to the newly-made pseudo-bulbs, while the roots of the old back bulbs die after a lapse of time, but the better the cultivation the slower the decay. The advancing growth, however, suffers in no way by the death of these roots, providing the old pseudo-bulbs are removed, for if allowed to remain they have to be supported by the newer growth, which naturally very seriously hinders the young bulb's formation and maturation. It is in this renewing of the tenure of life that orchids differ from other plants. The removing of the old pseudo-bulbs should be done during the process of repotting, cutting them away from the last three or four leading ones; any that are removed from rare and valuable kinds, will, providing the eyes are sound, eventually start into growth, and, in due time, valuable stock is secured from material which, had it been allowed to remain, would only have been detrimental to the parent plant.

In the bulbless kinds, vandas, aerides, angreæcums, saccolabiums, and phalænopsis, for example, the natural provision for their existence is equally apparent; the lower part of the stems, after the leaves and roots they produced are decayed, dies gradually upwards, but the upper part is quite independent of the dead portion below, which has simply to be removed to enable the plant and its source of nourishment to be again brought into contact. This renewal of its existence is a peculiarity of this type of plant. In evidence of this I may say there are at the present time plants of vanda, aerides, and other distichous-leaved kinds in the Westonbirt collection that have been growing there for over fifty years.

It is impossible to lay down any rules as the best for the culture of orchids. The plants are often found thriving under such very opposite treatment, and as one cannot be certain that the conditions and surroundings are in all cases precisely similar, much more can be done by suggestion than by definite advice. I will, however, venture to say that observation and common sense are very important factors if combined with a system of culture the nearest approach to Nature, which must be the best, and will most probably lead to satisfactory results in the growing and flowering of these plants. The cause of failure, in not a few instances that come under my notice, is traceable to keeping too high a temperature. Nothing is more injurious to the plants, and many would be far better in cooler quarters than are often allowed. A very important matter is to see that a lower temperature is kept at night than in the day, for nothing is more injurious to plant life than high temperature at night, nor is anything more contrary to natural conditions. So sensitive are all plants, and especially orchids, to atmospheric influence, that no matter how well they are treated in other ways, they cannot long continue in a satisfactory condition of cultivation unless a proper atmosphere is maintained about them. Orchids, with few exceptions, do not mind, but thoroughly enjoy, sun heat, if moisture and air are abundant, so long as they can obtain cool night air for recuperation after the heat of the day. The state of the atmosphere is without doubt of equal, if not more, importance, than the potting compost for the plants to root in—a condition that not only applies to orchids but to the majority of other plants. Light is the very life of most plants, but it is less under our control than any other factor. Possibly in no other cultural detail are orchids, and many other plants, so liable to be mismanaged as in respect to shading, and I would urge all young growers to make a special point of grasping the full value of this most essential element, light, for it is of the greatest importance, and nearly all plants pine for it in our dull, sunless winters, of which the recent one is a melancholy example.

Influence of Light.

The great influence that light has upon orchids will be seen in the plants grown in it, for not only are these more free-flowering, but the enduring properties of the blooms are greatly increased, frequently to the extent of lasting twice as long as others grown under more or less dense shade; moreover, the plants are hardier, so to speak, that is, they are not so susceptible to the effects of slight errors of treatment in other ways.

In the case of those kinds that need a high temperature, with the ever-accompanying moist conditions of the atmosphere, it is not always possible to give them air as freely as when growing naturally, but it is possible to a considerable extent to make up for this deficiency by giving the plants as much light as they will safely bear; for, with plants under glass, light has a similar correcting influence over deficiency of air to that which the presence of plenty of air has over an insufficiency of light. I suppose there are few engaged in orchid cultivation today who have not noticed during the past season the healthy vigour and growth of nearly all orchids that benefit by heat and sunshine—sure evidence of how very beneficial was the hot weather of 1911, when during that rare and ideal summer we enjoyed in this country so many months of brilliant sunshine. I fear the season of 1912 will not give us such satisfactory results.

I will not suggest that orchids, except just a few, will bear full exposure to light, but the aim should be to control it in keeping with the plants' requirements. Shading should be employed to break or diffuse the sun's rays, instead of totally obscuring them, as is so often the rule. Light, more than heat, is, in my opinion, most necessary to harden the tissues and to give to the foliage that robust and finished appearance so pleasant to the eye of all good cultivators.

Another important requisite in the culture of all orchids is full and free ventilation, not only during the daytime but also by night, when it can be managed without creating a draught. It needs only to be considered that the greater portion of orchids are epiphytes, growing, in their natural conditions, on the branches of trees and, in many cases, isolated positions on hill sides, to convince anyone that they are subject, in their native home, to a circulation of air, therefore under cultivation they should be supplied with abundance of this very important element, in fact, it is absolutely necessary, for as it is with light so it is with air. If there is any shortage in the supply of either of these factors the whole substance of the plants, leaves, bulbs, and roots, are deficient in the solidity indispensable to keep up a healthy existence. Judicious use, therefore, of the ventilators of the houses is always important at all season of the year.

To freely ventilate the houses on hot, sunny days, and to admit air only by a chink on dull days and by night is, to my mind, a most absurd practice. This close-shutting system, especially at night, with a view to keeping up a desired temperature, produces on plant life an amount of mischief difficult to calculate. I never could see the reason why ventilation, if so beneficial during the day time, should not be equally so during the night. Fresh air all night, with reasonable temperature, must be more conducive to

health and vigour than anything approaching a stuffy atmosphere. The proper atmosphere of an orchid house is one in which the air is constantly changing, keeping the temperature in accordance with the occupants of the house, with sufficient moisture in the air to create a buoyant feeling, so that heat, air, and moisture, to use a familiar expression, "go hand in hand."

Speaking of moisture brings me to a very important matter, and that is the watering of orchids. There is no more important operation connected with their culture, and none oftener mismanaged. Who will say this does not apply to the cultivation of all plants in pots under glass? Even the most experienced practitioner needs all his wits about him if the work is to be done with dispatch. In watering a mixed house of orchids this is especially the case, even when all are in full growth, allowance always being necessary for the condition and quantity of compost about the roots, and the comparative vigour of the plants. The majority of the terrestrial kinds require proportionately more water at the roots than the epiphytal kinds, as they do not possess in a like degree the power of drawing supplies from the atmosphere. This is an interesting faculty which is being considered more and more by growers of the present century. The ability of epiphytal kinds to take up little or much moisture is mainly determined by the amount of air they receive, and also by the light and description of house in which they are grown. Light and air naturally enable any plant to take up more moisture by means of its roots, and these organs of nutrition must be in a suitable medium. Any great excess of moisture will cause young roots in course of formation to die prematurely, and oftentimes result in the death of the older ones. Rain water is preferable for all plants as being purest and most natural, and orchids should receive no other, especially epiphytes, for in their natural state they can never experience the effect of any other kind.

With regard to the roots of orchids, and compost for same, most orchids, when growing naturally, have their roots in a great measure exposed to the air on trees and rocks to which they cling, with the head of the plant extending to the light. Generally decomposed vegetable matter has accumulated within reach of the roots. It is obvious, therefore, that if the roots of such epiphytes are potted in a compost which is at all adhesive, they will very soon perish; at the same time, loosely-potted plants do not grow so strongly as when a more or less substantial material is employed, and firmer potting practised. English peat of the best quality for epiphytal orchids is now almost unobtainable in large quantities. From the early 'nineties there has been an increasing scarcity of this material, but it is only about ten years since osmunda fibre from America and polypodium fibre from the Continent have been proved to be satisfactory substitutes. These materials have gradually found favour, and are now extensively used as a rooting medium for orchids. The early experiments, which led up to its extensive use, were carried out at Westonbirt.

Other necessary materials employed in the potting of orchids are good fibrous peat, fresh sphagnum moss, clean crocks, charcoal, and coarse silver sand. Some good turfy loam of a not too sandy description is required for strong-growing plants, such as cypripediums, calanthes, cymbidiums, phaius, pleiones, and other kinds. The process of potting orchids is not difficult, and cultivators should make it a golden rule never to pot a plant until the roots show signs of activity. When repotting is done just before new roots actually do appear, the compost is fresh and sweet for them, and they seldom fail to take advantage of it. There is no special season for potting orchids, but the observant cultivator watches his plants, affording them fresh food when they need it. Teak-wood baskets, perforated pots and pans, and common garden pots of the usual pattern, are all used as receptacles. Of the three I prefer the latter for the majority of orchids, and shallow teak-wood baskets for phalænopsis and small-growing epiphytes.

One main point is to secure perfect drainage—a point some are apt to overlook, but the fact is, the more water a plant requires the more perfect drainage should be given, otherwise the compost soon becomes stagnant and sour. Over-potting should at all times be avoided, and the rooting material employed should be worked in amongst the roots, pressing it firmly about them, for, as I have already remarked, loosely-potted orchids never thrive well, and loose compost retains too much water. Experience teaches me that it is not the quantity of water afforded a plant which influences it for good or ill, but the amount actually absorbed and retained by the compost, and that the healthiest orchids are those that require water most often; hence the compost should be firm, and on a well-drained base.

Another matter in connection with the cultivation of orchids, and one in which some growers, beginners especially, are liable to make mistakes is the treatment during the resting period. This term "rest" is, I fear, often misunderstood. It does not imply a periodical shrivelling of the plant by withholding water and lowering the temperature, but more of what I may term a compromise as regards temperature and atmospheric condition. The resting period of most orchids is more or less during the winter, a time of year when the temperature is lower and evaporation is not so rapid, and it is then that the plants require less atmospheric moisture and water at the roots. It is principally on this point that a considerable amount of knowledge and experience is required to adapt the varying conditions to meet the needs of the different plants. For example, the distichous-leaved section require more frequent watering during their inactive period than any pseudo-bulbous kinds, vandas, phalænopsis, and similar kinds requiring sufficient moisture in the rooting material to keep the foliage plump and firm. Orchids which are overdried during winter will often lose many of their leaves when the sap begins to circulate freely in the spring. On the other hand, too much moisture when the roots are inactive leads to damping, spot, and other attendant evils. The impression existing in the minds of some growers that a severe drying of cattleyas, lælias, dendrobiums, and other pseudo-bulbous kinds is necessary to induce them to flower is a great mistake. Those orchids that require to be kept dry at the roots during their season of rest benefit to a large extent from the conditions under which they have been grown. If cultivated on common-sense principles, with as much light and air as they require, the leaves and pseudo-bulbs are solid and stout in texture, especially those which are evergreen, and the plants are very much better able to bear a lengthened period of drought without shrivelling.

While there is no royal road to success in orchid culture, other than the long and certain one of observation and practical experience, orchids can be grown, and successfully, by the born gardener who is a good cultivator of ordinary greenhouse plants, if he takes to them and really studies their wants, and, since so many of the most showy and useful kinds are sold so cheaply, a large measure of quiet enjoyment can be derived from these interesting plants without extravagant expenditure.

In conclusion, I will remark that the one matter which has, more than any other, revolutionised orchid culture is the art of hybridising and raising seedling orchids. The important part of orchidology has created an entirely new interest, and fanciers are no longer dependent on importations of plants from foreign countries. At the present day seedling orchids are raised freely, and these home-raised plants, more often than not, are more easily cultivated than imported plants, naturally so because they are acclimatised from birth. This combination of circumstances could scarcely fail to make for advancement, and it is to these, together with the reduction in price of orchids, and last, but not least, to the intelligence and sagacity of our practical growers on whom lay, in the past, the responsibility of cultivating rare and costly collections that the wonderful progress is due, and which has exploded for ever the idea that England is, as Sir Joseph Hooker once observed, "the grave of tropical orchids."

THE REPRODUCTION OF MUSANGA SMITHI.

One of the most striking features of tree life on the West Coast of Africa is the rapidity with which abandoned clearings are covered by the Umbrella tree or Corkwood (Musanga Smithi, P. Beauv.). This is commented on by all travellers, and it is brought to one's notice more especially by the long stretches of hillside covered with this tree which are to be found along the railway round mining centres, and, in fact, wherever any land, which has been stripped of its original forest covering, is left to itself for a few months.

The general appearance of these pure stands of Umbrella tree is that of a young open wood, the trees being all of an even height of about 30ft. Although there may be many acres of such forest, one never sees amongst them any flowers or signs of flowering trees. For these it is necessary to go into the original uncut "bush," and there occasionally an old tree may be found, much larger than those in the open, generally solitary or with a very few of its own kind, and, if it is flowering, in the majority of cases it is found to bear male flowers only.

This fact suggested that a closer examination of the pure stretches of forest composed of this tree should be made, with a view to ascertain the method by which its area is so effectively and so rapidly extended. The stands examined were those at Amokokrom and Boundary Post in the Western Province of Gold Coast Colony.

It was then noticed that the trees towards the outside and exposed parts of the forest put forth adventitious roots from all parts of the stem up to a height of about 10ft. from the ground. Sometimes these roots came away from the stem at a right angle, and after growing out horizontally for about a foot, inclined slightly downwards until they reached the soil. On reaching the soil a shoot was sent up from the end of the root and a new tree was thus formed at some little distance from its parent. In other cases, the adventitious roots inclined downwards at once from their point of origin, in this case striking the soil in the immediate vicinity of the parent tree.

Often the roots were noticed to have been broken in mid air, when in some cases they simply forked, the two rootlets continuing downwards to the soil and forming two new trees; or in other cases a shoot was sent up and a root down from the point of injury, thus starting a new tree in mid air. There seems little doubt, therefore, that these pure stands are extended effectually by vegetative reproduction, at least within the zone of the moist Evergreen Forest, and in consequence the formation of flowers and fruit has fallen into desuetude.—T. F. CHIPP, in the "Kew Bulletin."

Leptospermum scoparium Nicholli. — This distinct variety of the Australian and New Zealand Manuka, which has rich ruby crimson-coloured flowers, instead of the normal white or whitish ones, is now stocked by those nurserymen who make a speciality of rare hardy or half-hardy shrubs. In the favoured parts of the country where it can be grown out of doors, it will undoubtedly form a handsome specimen, while in less favoured districts it will prove of considerable value for the decoration of the greenhouse or conservatory. This leptospermum will be remembered as gaining the cup awarded at the International Show last year for the best new plant.—W.

FOREMOST AMONG MIDLAND SHOWS!

BIRMINGHAM FLORAL FETE,

Friday and Saturday, July 18th & 19th, 1913.

ALL THE LEADING FIRMS ARE SHOWING.

William G. Carradine, F.R.H.S., Secretary, Birmingham.

SALTAIRE, SHIPLEY, AND DISTRICT ROSE SOCIETY.

ELEVENTH ANNUAL EXHIBITION OF ROSES, SWEET PEAS, PANSIES, AND VIOLAS, ETC.
WEDNESDAY, JULY 9TH.
TOTAL PRIZE MONEY, £550.

E. WRIGHT, Hon. Secretary, Rose Dene, The Glen, Saltaire.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY.

GRAND QUARTER CENTURY FLOWER SHOW.
SOPHIA GARDENS, CARDIFF,
WEDNESDAY and THURSDAY, JULY 23 and 24.
Specially good Prizes in every section, amounting in money and plate to nearly £500. Tents lighted by electricity. Popular Prices.
Schedules from the Secretary, Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Edinburgh Royal Botanic Garden Guild.

The first annual general meeting of the above society was held in the Lecture Hall, Royal Botanic Garden, Edinburgh, on Wednesday, June 4. Mr. W. W. Smith, M.A., assistant keeper, occupied the chair. The Chairman stated it gave him great pleasure to see so many past lecturers and past employees supporting the Guild movement. It was in February a suggestion was put forward with the idea of linking past and present members of the staff together. A provisional committee was formed, and its work had been the drafting of rules at present in the hands of all past members whose addresses were known. Various matters regarding the Guild had been discussed and recommended, the result being that the present meeting had been called to approve of the work done, and, if possible, to form a Guild.

Mr. R. L. Harrow, the Curator, before making the final proposal, said that getting in touch with old members would prove to be of the greatest help to the present members of the staff. He was sure that the past and present members would appreciate the efforts of the Guild to bring them together. He had great pleasure in moving that the meeting agree to form a Guild, and he hoped the Guild would always continue to prosper. Mr. W. Smith, superintendent of Holyrood Palace Gardens, seconded the motion, and stated the advantages to be obtained, and wished the effort all possible success. The motion, being submitted to the meeting, was carried unanimously. Mr. B. Kemp, M.A., B.Sc., proposed the rules, as submitted to the meeting, be accepted; this was seconded and approved by the members present.

The following gentlemen were elected: President, Professor I. B. Balfour, F.R.S., Regius Keeper; vice-presidents, Mr. W. W. Smith, M.A., assistant keeper, and Mr. W. Smith, superintendent Holyrood Palace Gardens. Committee—Messrs. R. L. Harrow, L. B. Stewart, C. Dyker, T. Waite, G. Fallow, H. Ellwood, all members of the present staff; A. Veitch, India; W. Waite, America; Alex. McPherson, Uganda; G. Berry, Chief Horticultural Inspector, Board of Agriculture, London; D. Armstrong, Kirknewton House, Midlothian; and W. Davidson, Forester, Panmure Estate, Forfarshire, all past members of the staff.

Mr. L. B. Stewart proposed Mr. H. F. Tagg for the honorary post of editor, and said the first number of the journal, he was certain, would be a success under his guidance. Mr. B. Kemp, M.A., B.Sc., seconded, and the motion was carried with applause. Mr. Samuel Stewart, assistant head gardener, was elected to the post of treasurer, and Mr. W. H. Morland was elected secretary.

The meeting decided that the annual general meeting and dinner should be held in November, about the same time as the Royal Scottish Horticultural Society's Chrysanthemum Show, this being a period when past members would be in the neighbourhood. It was also agreed to hold two or three lectures annually for members, to be given by those who were home from foreign lands, and others who had subjects of interest, the same to be published in the journal.

Mr. R. L. Harrow proposed a hearty vote of thanks to the chairman, which was carried with applause.

Dundee Horticultural Association.

Mr. Wm. Christeson presided at the ordinary monthly meeting on June 6, when Mr. Alexander Duncan, gardener to the St. Andrew's Provincial Committee for the Training of Teachers, at Mains, near Dundee, gave a lecture on "School Gardens and Their Effect upon Horticulture."

After tracing the origin and source of this innovation to France and Germany, and referring to the rapid growth of the movement in this country since 1892, the lecturer proceeded to give an account of the methods, theoretical and practical, which found favour in the gardens where he had charge. By the aid of blackboard sketches and diagrams he showed the general methods of cropping which were adopted for 1st, 2nd, and special course students, who had each their own plot of ground and kit of tools for practical work, and concerning which they received lectures, while the results were tabulated after periodical examinations. The principals of manuring and cropping were taught as well as how to bud, graft, prune, and plant. A lengthy and animated discussion ensued, after which the lecturer was cordially thanked.

A Cultural Certificate was awarded to Mr. Jas. Staward, St. Fort Gardens, for a collection of twelve vases of sweet peas in distinct varieties.

Scottish Horticultural Association.

The monthly meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 3rd inst. Mr. King, the President, was in the chair, and there was an attendance of 56 members.

A paper on "Soil Knowledge" was read by Mr. James K. Brown, Dunnikier Gardens, Kirkcaldy. The author pointed out that humus cannot directly serve as plant food, but that the quantity of it in the soil is an indication of its fertility. The products of the decomposition of humus, however, are highly important to the plant, and its physical properties cannot be overlooked. The work of preparing the food material of the plant is entirely performed by living organisms (bacteria). As a result of their activity carbonic acid gas, which is harmful, is formed, and therefore pure air must be provided in the soil by proper working. A fertile soil is not merely made up of so many independent chemical substances; its fertility depends on the presence of these organisms, and a soil which is devoid of germ life is infertile.

The exhibits were—12 varieties of May-flowering and Darwin tulips, from Mr. R. H. Cockburn, Gartmore Gardens, Perthshire; Lobelia and Fortin's variety of lily of the valley, from Mr. James Bruce, Davidson's Mains; and some of the newer varieties of Viola cornuta, from Messrs. Todd and Co., Edinburgh. Mr. Bruce was awarded a Cultural Certificate for the lily of the valley exhibited by him.

At the meeting on July 1 the selected papers in the essay competition for juniors are to be read.

The Chairman made fitting reference to the death of Mr. John Methven, who was president of the association in 1884, and also to that of Mr. John Anderson, who was an office-bearer in the association for many years, and the secretary was instructed to send letters of condolence to their respective relatives.

East Anglian Horticultural Club.

At the May meeting of this club Mr. F. J. Endersby, gardener to J. H. Carney, Esq., Keswick Hall, Norfolk, read a most practical and well-worded paper upon "Forcing." Although only touching upon the floral side of the subject one felt throughout the reading of the paper that the essayist was master of the whole practice of accelerating plant growth. Admitting that the trade cultivator produces extra good examples of forced material, Mr. Endersby said that the private grower, with his mixed plants and mixed houses, need not be dismayed, for with a little extra trouble many apparent difficulties could be overcome. One first of all should become acquainted with the native habits of any plant which is to be forced, and conditions as near as possible to its natural ones obtained. In forcing any plant it was a mistake to rush it into a high temperature, a gradual development being much better. Numerous subjects, such as bulbs, flowering trees and shrubs, and roses were especially dealt with. The paper was followed by a good discussion.

At the meeting the exhibition tables presented a very bright appearance. Messrs. Daniels Bros., Lim., Norwich, sent up a fine array of forced lilies and other plants appropriate to the subject of the paper. Messrs. A. J. and C. Allen, Norwich, displayed nice vases of roses. Mr. J. W. Chapman, gardener to Baroness Berners, Ashwellthorpe, proved by an exhibit how successful he is with the gloriously-coloured Fortune's Yellow rose. Mr. T. Notley, gardener to E. G. Buxton, Esq., Catton Hall, had a fine example of Cœlogyne Dayana.

At this meeting special prizes were offered for the largest number of queen wasps, and as the result 210 insects were brought by members. This means a reduction in these troublesome pests of many thousands in the summer and autumn months.

Bristol Gardeners' Association.

This society has commenced its seventeenth year's work. At the first meeting of the new season Mr. Baston presided over a very large attendance, and a most instructive lecture was given by Mr. J. C. House on "Alpine Plants." The lecturer said that in making a rockery the chief thing was to have good drainage and provide plenty of moisture, to secure the right kinds of plants for the various positions, and not to have a great show of stones. Some plants needed a lot of attention or they would ramble over others and spoil their beauty. Drip should be avoided or it would soon spoil some of the choicer plants.

The prizes given by Mr. Barnard for a bundle of asparagus were won by Messrs. Taylor and Binfield in the order given.

Mulching.—Trees growing on light, shallow land quickly suffer from drought at the roots, so that it is prudent to apply mulches early, affording water copiously after the mulch has been put on, but this advice, where labour and water is scarce, cannot at times be so well attended to as the fruit grower would like, and the trees in consequence fail to produce a sturdy, fruitful growth.—H. Markham.

OBITUARY.

MR. AMOS PERRY.

After being in failing health for some time past, Mr. Amos Perry, of the Hardy Plant Farms, Enfield, passed away during the morning of Tuesday, June 10, at the age of 72 years. His passing removes from the horticultural world a man whose record as a cultivator, raiser, introducer, and distributor of hardy plants stands very high indeed. Mr. Perry started his business life as a pupil teacher, but, finding horticulture more to his liking, he entered service with Messrs. G. Wingfield and Son, of Gloucester. From thence he came to the nursery of Mr. T. S. Ware, at Hale, Tottenham, where his father was foreman, and where the hardy plants presently came under his own care. He was a great showman, and few could discourse so eloquently upon new introductions and their merits. In 1894 Mr. Perry commenced business on his own account at Winchmore Hill, but as his business developed, and his two sons became associated with him, a larger place, with wider opportunities, was sought and found at Enfield, where thirty acres in an excellent position are now devoted entirely to hardy flowers. Quite a number of popular hardy flowers have been introduced into cultivation through the energy and enterprise of Mr. Amos Perry, and the records of the Royal Horticultural Society show that many of his introductions have secured the awards of that body. Perry's White and Perry's Unique poppies are recent introductions, the latter securing an Award of Merit a fortnight ago. Not a few of the finer irises have been put into commerce by Mr. Perry, who secured numerous hybrids raised by the late Sir Michael Foster. Phlox canadensis Perry's variety, Lithospermum prostratum Heavenly Blue, Achillea ptarmica Perry's White, Heuchera sanguinea Nancy Perry, and such beautiful hybrids from Iris pallida as Wm. Marshall, Sir Trevor Lawrence, and Sir Dighton Probyn occur to mind as a few plants with which Mr. Perry's name will long be associated. Mr. Perry's glorious displays of delphiniums at Holland Park and Olympia, and his exhibits of hardy aquatics are also delightful memories.

Two or three years ago Mr. Perry met with an accident, and was thrown heavily from the little pony trap that was his favourite means of conveyance about Enfield. Although he recovered, he was not subsequently able to take the leading part in the conduct of the business, this falling to Mr. Amos Perry, jun., who, with his brother, will continue to carry on the nursery work. Mr. Amos Perry had a unique personality, a wide knowledge of the histories and needs of hardy plants, and an abiding faith in the great future of hardy plant culture. He took his courage in both hands, and, building upon that faith, he lived to see his business become one of the foremost of its kind in the United Kingdom.

MR. GEORGE McKINLAY.

We learn with regret of the death of Mr. George McKinlay, who for many years was head gardener at Wrest Park, Bedfordshire. Mr. McKinlay took a great interest in hardy fruit culture, and usually exhibited apples and pears at the Royal Caledonian Horticultural Society's autumn exhibitions. He was also a master of the art of summer bedding, and Wrest Park, during the residence of the American Ambassador, afforded him ample scope in this direction. Mr. McKinlay had many friends, and was widely known both north and south of the Tweed.

Lettuce. — Small sowings should be made at frequent intervals, and the resulting plants put out as soon as they are fit to handle. The celery ridges form an ideal position for the purpose. Water should be applied freely to induce quick, tender growth.—W. MESSENGER.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

EXCRESCENCES ON VINE LEAVES.—B. H., Peebles. I enclose some vine leaves for your inspection, and you will see they have minute greenish excrescences on the undersides. Kindly tell me the cause of this trouble and how to cure it. We had a little red spider present in the vinery, but have disposed of it by sulphuring the pipes. Only one vine, a Black Hamburgh, shows the peculiarity referred to.—Some local cause has operated to produce the roughness on the undersides of the vine leaves. Possibly ventilation is not so effective where this particular vine is as in other parts of the house. Some of the leaf cells are ruptured, and the probable cause is the sudden action of bright sunshine while the leaves and atmosphere were heavily charged with moisture, and following a period of dull, cool weather. A sudden and severe restriction of lateral growth will sometimes produce somewhat similar results. A discreet use of fire heat, coupled with extra care in ventilation, will probably put matters right.

THE JUDAS TREE.—F. R. O., Guildford: The Judas Tree (Circis Siliquastrum) does very well in my garden, and I am occasionally asked by my friends for a young plant from it. As it seems to be a particularly good variety, I should like to know how best to propagate it, and any help you can afford me in this connection I shall be grateful for.—The Judas Tree is generally propagated from seeds sown in gentle heat in early spring. Layering is sometimes practised. From seed-sowing the young plants take three or four years to arrive at flowering size, but it is always a good plan to put them in their permanent quarters when they are a couple of years old, because the Judas Tree does not take kindly to transplantation. Place the seeds singly in small pots, harden off the seedlings before they become drawn and weak, pot them early, and give cold frame protection for the first winter, or, at any rate, plunge the pots in ashes in a sheltered place for that season.

WORKING HOURS FOR GARDENERS.—A. C., Norwood: I shall be glad if you will let me know whether the Royal Horticultural Society has fixed a schedule of working hours for its own employees and for the garden employees of the Fellows of the Society.—No doubt there is a schedule of working hours followed by the Society's employees at Wisley, and we imagine such arrangements are in the hands of Mr. S. T. Wright, the superintendent of the gardens. We are not aware, however, that the Society has fixed the working hours for the garden employees of its Fellows.

GEUMS FOR THE ROCK GARDEN.—F. C., Plymouth: At the great Chelsea show of last month I noticed that geums were freely used by many of the exhibitors who arranged rock gardens, but it seemed to me that with one accord they used kinds or varieties which were too strong in growth for the rock garden though very beautiful and suitable for the flower border. It occurs to me that there may be several species suitable for a modest rock garden and if you will name a few of these, just adding the colour of the flowers, you will greatly oblige several of your readers in Plymouth. We shall keep our eyes open for the species you name.—A few dwarf geums suitable for a small rock garden are: G. coccineum, scarlet, rather rare; G. macrophyllum, rich yellow; G. montanum, yellow; G. reptans, soft yellow; G. rhaeticum, bright yellow; and G. triflorum, white and purple.

R.H.S. SCHEDULES. — F. F., Normanton: Please tell me whether the Royal Horticultural Society issues a schedule of the classes arranged for its various exhibitions, or are exhibits of all kinds welcomed?—Each year the Royal Horticultural Society

issues a "Book of Special Schedules," in which the classes arranged for the Daffodil, Tulip, Chelsea, Holland House, Dahlia, Vegetable, and Fruit Exhibitions are set out. In the case of exhibitions held by special floricultural societies, the schedules must be obtained from the respective secretaries of these societies, but the "Book of Schedules" referred to can be obtained from the Secretary, Royal Horticultural Society, Vincent Square, Westminster, London, S.W.

AMERICAN GOOSEBERRY MILDEW.—L. E., Surrey: Kindly tell me how to proceed in the case of a supposed attack of American gooseberry mildew.—The Board of Agriculture advises all gooseberry growers to examine their bushes carefully, and should any sign of disease be found, to spray their bushes with a solution of liver of sulphur (one pound to 32 gallons of water). A leaflet describing the disease and giving directions for dealing with it can be obtained from the Secretary, Board of Agriculture, 4, Whitehall Place, London, S.W., gratis and post free. Letters so addressed need not be stamped. Growers are reminded that by Article 3 of the American Gooseberry Mildew Order of 1911 they are required to report the presence of this disease on their premises to the Board or the Clerk of the Local Authority for the district either directly or through an inspector, and that the failure to report is punishable by a fine.

BOOKS ON GARDENING. — H. B., Peebles: We have referred the matter to our publisher, who will send you a booklet containing prices, sizes, etc., of books dealing with a wide range of horticultural subjects.

NAMES OF PLANTS.

N. D., Cheltenham.—1, Azalea viscosa; 2, Genista saggitalis; 3, Veronica pinguifolia.

M. E. C., Derby.—1, Allium neapolitanum; 2, Dianthus cæsius; 3, Saxifraga cochlearis.

P. L. A., Horsham.—1, Stachys grandiflora; 2, Kalmia latifolia; 3, Leycesteria formosa; 4, Cassiope hynoides.

S. S. D., Upway.—1, Primula sikkimensis; 2, Saxifraga longifolia; 3, Chrysogonum virginianum; 4, Inula Helenium; 5, Platanus orientalis.

G. B., Old Colwyn.—1, Heuchera sanguinea; 2, Cypressus lusitanica; 3, probably Pinus Laricio; 4, Linaria cymbalaria; 5, Sedum acre; 6, Leycesteria formosa.

TRADE NOTE.

There are some articles which, while not coming strictly under the designation of garden implements, yet contribute in no small part to the decorative effectiveness of the garden, so that it may be said no garden is complete without them. In this class may be included the "Eureka" Lawn Sand and Weed Killer, manufactured by Messrs. Tomlinson and Hayward, Lim., Lincoln. One or two applications of the weed killer to paths and walks will not only rid these of present weeds, but ensure the absence of the unwelcome intruders for some time to come. The lawn sand is equally effective in clearing plantains, dandelions, buttercups, daisies, etc., from lawns, and strengthening and improving the growth and quality of the grass. While a "studied disorder" is, under proper conditions, very charming, there can be no doubt that the disfiguring effects of weeds on paths, and weed patches on the lawn, are calculated to mar the most carefully thought-out scheme in the garden, hence the need for removing them promptly.

BIRDS SCARED!—Rotless, Tanned Netting; small mesh, very superior. As supplied BY US to the Royal Gardens. Satisfaction or cash refunded. 100 by 1yd., 3s. 9d.; 2yds., 7s. 6d.; 3yds., 11s. 3d.; 4yds., 15s.; 50 by 6yds., 11s. 3d.; 25 by 8yds., 7s. 6d. Carriage paid. Any length and width supplied. POTTER BROS., Dep. M., Shrewsbury. Estd. 58 years. Awarded 40 Medals.

LAWN MOWERS.—Nothing to equal them, 5 Blades, only 12s. 9d. GARDEN ROLLERS, 24s. Seats, 8s. 6d. BARROWS, 14s. 6d. WATER BARROWS, 20 gall., 25s. 6d. Get our Free List, and save money. POTTER BROS., Dep. M., Shrewsbury.

FORTHCOMING ENGAGEMENTS.

NEXT WEEK.

TUESDAY, June 17.—Royal Horticultural Society; committee meet at 12 o'clock; lecture at 3 p.m. on "The Culture of Plants and the Directivity of Life as shown by Vegetative Structures," by the Rev. Professor G. Henslow, M.A., V.M.H.; Scientific Committee at 4 o'clock.

Exhibition of Gladiolus at the Royal Horticultural Hall.

Meeting to consider the appointment of officers for the Agricultural and Horticultural Branch of the Imperial Business Association, at the Royal Horticultural Hall, Westminster, at 5 o'clock.

WEDNESDAY, June 18.—York Floral Fête and Gala; three days.

Cricket match at Clarence Park, St. Albans, between Messrs. Sander and Sons' and Messrs. Protheroe and Morris' teams; play commences at 12 noon.

THURSDAY, June 19.—Linnean Society meets.

CATALOGUES RECEIVED.

THE GARDENERS' MAGAZINE

NOTE OF THE WEEK.

Indusia.

To such of our readers as have not made a particular study of fern structure the term "Indusia" may be a puzzle, but it simply indicates those little skin-like protective covers for the heaps of spores at the back of the fronds, or such modifications of the frond margins themselves as are formed to serve the same purpose. Thus in our native genera we see the Lastrea or Nephrodium family bearing kidney-shaped indusia attached to the frond by a short stalk, or, rather, elevation, of the frond material at their indentation. Underneath these the spore heaps are concealed in the young state, but as the capsules grow and mature the cover is lifted and pushed aside, so that when ripe for shedding they are exposed, hiding the cover more or less. In the Polystichum family the arrangement is similar, but the indusium is quite round, and is attached by a central stalk, or elevation. By this difference it is easy to determine the genus of any fertile frond with certainty, independently of other particular characters. In the Spleenworts the spore heaps are linear, and protected by a long thin indusium springing from one side, while in the Hartstongue, which is closely allied to them, similar lines are always in pairs, each one of the pair having its indusium on the outside edge, the two indusia edges meeting along the centre when the spores are young, their subsequent development pushing the two indusia apart, and eventually hiding them entirely beneath the long sausage-shaped heap with which we are familiar. In Pteris aquilina, the Common Bracken, we see an example of marginal indusia, formed by the modified edges of the frond divisions. The spore heaps here form continuous lines along the edges, which are folded backwards over them, while in the Maidenhair family (Adiantum) they are similarly arranged, and protected, but the lines are broken up into short segments by the indentations of the edges of the pinnules. In Blechnum spicant, or the Hard Fern, the spore heaps are in uninterrupted lines parallel with the midribs of the pinnæ, and protected by an indusium just within the margin of the much narrowed and lengthened and erect fertile fronds, which also characterise this genus, the barren fronds being much wider and lax in growth, forming a rosette. In Lomaria, with which it is often confounded, even by the botanists, who have determined the genus by the difference, there is no independent indusium, and it is the reversed marginal edge which forms an indusium, instead, as in the Pteris family, from which, however, it is differentiated by the same difference in the character of its barren and fertile fronds, as we see in Blechnum. In the Parsley Fern (Allosorus crispus) we have also differentiated barren and fertile fronds, but on different lines, both being of like habits of growth, but the barren are more foliose and decompound than the fertile. In the Bladder Ferns (Cystopteris) the indusia are dome shaped, like little bladders, whence both the scientific and the popular names. In the Adder's Tongue and Moonwort the spores are borne on quite specialised fertile fronds, formed of comparatively large spore capsules, in the first case compacted into a spike, which, springing from the centre of a plain frond, like a plantain leaf, gives the adder's-tongue resemblance, and, consequently, both its names; and, in the second, resembling a small bunch of grapes, whence the scientific name, while the popular one, the Moonwort, is derived from the crescent form of the barren pinnæ. In these last we have practically no indusia proper, and the same remark applies to the Royal Fern (Osmunda), of which the upper part of the frond is contracted into a cluster of spore capsules, the resemblance of which to faded spiræa clusters has led, of course erroneously, to the name of the Flowering Fern. The Filmy Ferns, the Hymenophyllums, and Trichomanes radicans, bear their spores without indusia proper. This, in the former family, is replaced by a cup-like projection, in which the spore capsules are sheltered, and, in the latter family, also a similar, but smaller, receptacle is produced, but the capsules are arranged on a spike, which projects considerably, and has given the popular name of the Bristle Fern. Finally, we must refer to the Polypodies, which have neither indusia or any pretence at a substitute, since the spore heaps are produced simply in unprotected round heaps on the frond backs; this is the characteristic of a very large genus, embracing very many and very varied specific forms. Our native members of the genus fall into two very distinct categories, P. vulgare having thick, fleshy, creepy rhizomes, large spore heaps, and much larger spores than usual, while these are both of a brilliant orange colour; the others, the Oak, Beech, and Limestone Polypodies, on the other hand, have their stringy rootstocks and tiny heaps of almost black spores. They are also quite deciduous, while P. vulgare is quite evergreen.

MR. F. WILLIAMS,
President of the East Anglian Horticultural Club.

Mr. F. Williams, whose portrait we have the pleasure of giving in this issue, is the president of the East Anglian Horticultural Club, and one of the leading

gardeners in the district of which the city of Norwich is the centre. For some years past he has occupied the position of head gardener at "The Cottage," Old Catton, Norwich, the residence of Louis Tillett, Esq., and here he has done such excellent work as affords ample proof of his cultural skill and administrative ability. He has done something more than this; he has gained the respect of the large body of horticulturists who pursue their avocations in this important centre of gardening, and of this we have evidence in the fact that he occupies a position that is the highest to which he could attain among those engaged in pursuits similar to his own. That it is an honour to preside over the East Anglian Horticultural Club there can be no question, for as we have previously stated, it is one of the most important of the horticultural asociations in the United Kingdom. It has an exceptionally large membership, and an influence that has no superior. As a proof of this it is only necessary to refer to the spirit with which the members have on several occasions entered into the competition for the valuable challenge cup that for some years past has been offered at the Royal Horticultural Society's autumn fruit show, as the premier award in the class for collections of fruit shown by gardeners' associations. The other day the members of the club paid a visit to the gardens under the charge of Mr. Williams, and derived much pleasure from the many objects of interest that came under their notice, and the high keeping evident on all sides.

Conference on Saxifrages.—The Rev. W. Wilks writes: "The President and Council of the Royal Horticultural Society have decided to hold a Conference on Saxifrages (not Sedums or Sempervivums) in the spring or early summer of 1915. Fuller particulars will be issued in due course, but notice is given thus early in order that those interested in this family of plants may have time to prepare material. The Council will be pleased to hear from anyone willing to contribute a paper at the conference, or to take part in any way. Notice 1915, not 1914."

Lupins at Hampton Court.—This season Mr. W. J. Marlow, the superintendent of the Hampton Court Gardens, has used with remarkable success the beautiful pink lupin Moerheimi in beautifying the flower garden between the spring and summer seasons. Grown in spacious beds, the flower spikes have attained a high degree of development and produce a rich effect.

The Strawberry Crop is somewhat later this season than for several years past, but, judging from the immense quantities of large, finely-coloured fruit that are being sent to the London and other markets, afford ample evidence that the yield in the earlier districts is abundant and the quality high. The greater proportion of the strawberries now being marketed are being sent from the strawberry-growing districts of South Hants, and fully justify the expectations of those engaged in the industry that the crop would be the best that has been obtained during the past six years. With fine, warm weather, the fruit is reaching the most distant markets in the best possible condition, and meeting with a brisk demand, which, it need hardly be said, ensures remunerative returns. Notwithstanding the excessive drought of 1911, and the cold, wet weather experienced in 1912, the Hampshire growers appear to have suffered but little from unfavourable climatic conditions of late years, for this season there is a considerable addition to the plantations in full bearing Those engaged in the strawberry industry in Hampshire have at length recognised the importance of co-operation in the disposal of the fruit, and have adopted what is known as a "clearance scheme," to which upwards of 200 growers belong. By means of this scheme the grower is informed day by day of the price obtained for his fruit, and advised as to the markets in which the demand is the most brisk.

London Daffodil Show of 1914.—We understand that the Royal Horticultural Society's Daffodil Show of 1914 will be held on April 21 and 22.

Rose Miss Flora Mitten.—With reference to the beautiful new climbing rose which, under the name of Miss Flora Mitten, received an Award of Merit at the meeting of the Royal Horticultural Society on May 14, and was illustrated in our issue of June 14, Miss Flora Mitten, of Hurstpierpoint, Hassocks, writes: "My attention has been called to an illustration in the current issue of THE GARDENERS' MAGAZINE of my father's rose, under the name of Miss Flora Mitten. The origin as given is incorrect. It was raised by my father about ten years ago with several others. Two out of the number were good, and after his death, were named by his family William Mitten No. 1 and 2 respectively, in remembrance. They were hybrids of Rosa rugosa and Rosa Brunoni (Rosa canina is ridiculous. The one illustrated is the one known to us as William Mitten No. 2. The alteration of the name has given considerable annoyance and is quite unwarranted. I may say that the No. 1 is equally good." Our statement with regard to the parentage of the rose was based on the information given by the exhibitor.

Flowers at the International Horse Show.—The ever-increasing popularity and attractiveness of flowers are shown in various ways, but especially in the extensive use of plants and flowers in connection with various exhibitions. At Olympia, Addison Road, London, it has been the custom to use flowering and foliage plants freely at the extremely popular horse show, and this year the custom is maintained under the direction of Mr. Fortescue. All round the boxes old-fashioned red roses are trained over trellis-work, and they are capital imitations of the real blooms. All around the arena long beds alternate with small ones, the former filled with soft yellow coleuses, Raspail Improved pelargoniums, marguerites, and pink hydrangeas, with rambling roses at the ends, and standards of golden euonymuses and Acer negundo variegata rising above the rest of the flowers. The smaller beds contain very fine blue hydrangeas. The floral promenade below the seats form a great attraction, with its palms, asparagus, ferns, acers, and various flowering plants. About 250 baskets of plumose nephrolepis being hung from points of vantage, and liliums, hydrangeas, dracænas, etc., cluster round the Royal Box. Some idea of the extent of the floral attractions at Olympia from June 19 to July 1 may be gathered from the statement that the plants used include 6,000 coleus, 12,000 pelargoniums, 1,000 Acer negundo variegata, 100 golden euonymus, 800 blue hydrangeas, 4,000 pink hydrangeas, 500 Lilium longiflorum, 5,000 marguerites, 2,000 rambling roses, 1,500 Asparagus Sprengeri, 350 bay trees and 500 palms of varying height. Four thousand tons of soil had to be brought to form the arena, and covered with 30 tons of tan, while for the beds of flowers a further 500 loads of soil were needed. In short, Olympia has been converted into a beautiful garden where horses and horsemanship are exhibited. It may be added that there are grass borders to the beds, and hidden lights are so arranged that they shine upon the flowers, and thus render them as attractive by night as by day.

Royal Botanic Society.—In the House of Commons the other day Mr. MacCallum Scott asked the President of the Board of Agriculture whether he was aware that the area occupied by the Royal Botanic Society in Regent's Park was nearly as large as that occupied by the Zoological Gardens; what area of the Botanic Society's premises was occupied by lawns, buildings, and scientific cultivation respectively; and whether any conditions were inserted in the lease as to the objects to which the site was to be devoted, and as to the granting of facilities of access to members of the public. In reply Mr. Runciman stated that the area occupied at the Royal Botanic Society, Regent's Park, is little more than half that used by the Zoological Gardens. He was not able to say what area of the Botanic Society's premises is occupied by lawns, buildings, and scientific cultivation respectively. The lessees are under a covenant which was quoted in an answer to a similar question on May 28 last. Mr. MacCallum Scott also asked the President of the Board of Agriculture whether he was aware that the programme of the Royal Botanic Society for the months of May and June contained four dog shows, followed by dinners, and two fêtes, but only two events that could be possibly described as of a botanic or scientific nature? and in reply Mr. Runciman stated that nothing in the programme of the society goes outside the engagement that have been entered into or is contrary to the covenants that have been made.

Forestry in England.—In the course of his presidential address at the annual meeting of the English Forestry Association, Lord Clinton said forestry would not become a really popular pursuit unless it was clearly shown that it could be made profitable. More timber was used per head of the population now than ever before, and there must be something wrong when a crop could be planted and reaped without any adequate return to the cultivator. With the English soil and climate we could grow timber as good as, or better than, any country in the world, but too frequently the price obtained for it was little more than the cost of production. The association had the work of organisation in hand, and were reviving an old industry in Sussex for the conversion of ash and chestnut poles into helves, etc., which, it was hoped, would result in considerable trade in that district. The association were also inquiring into the possibilities of new markets.

Manual Work in Rural Schools.—During recent years a material change has been effected in the views on teaching in our rural schools, and universal opinion judges it to be for the better. The several education authorities are constantly endeavouring to broaden the practical utility of manual work in rural schools, and to that end there will be a conference in the education tent at the Royal Agricultural Society's Show at Bristol at 2.30 on Saturday, July 5. Mr. W. Francis Rankine, Badshot Lea, Farnham, Surrey, will read the opening paper, entitled "Manual Work of Various Kinds in their Relation to Rural Schools." The conference has been promoted by the Education Committees of Gloucestershire and Somersetshire, and it is anticipated that it will be attended by many school teachers and representatives of education authorities.

ROYAL HORTICULTURAL SOCIETY'S EXHIBITION,

JUNE 17.

The exhibition on this occasion was hardly up to the standard of the past few shows, though there was plenty to be seen. No doubt Ascot week would account in some measure for this, also the fact that the York gala was being held the day after. In the great heat of the hall, however, those who did attend fully appreciated the extra room thus afforded.

HARDY PLANTS AND FLOWERS.

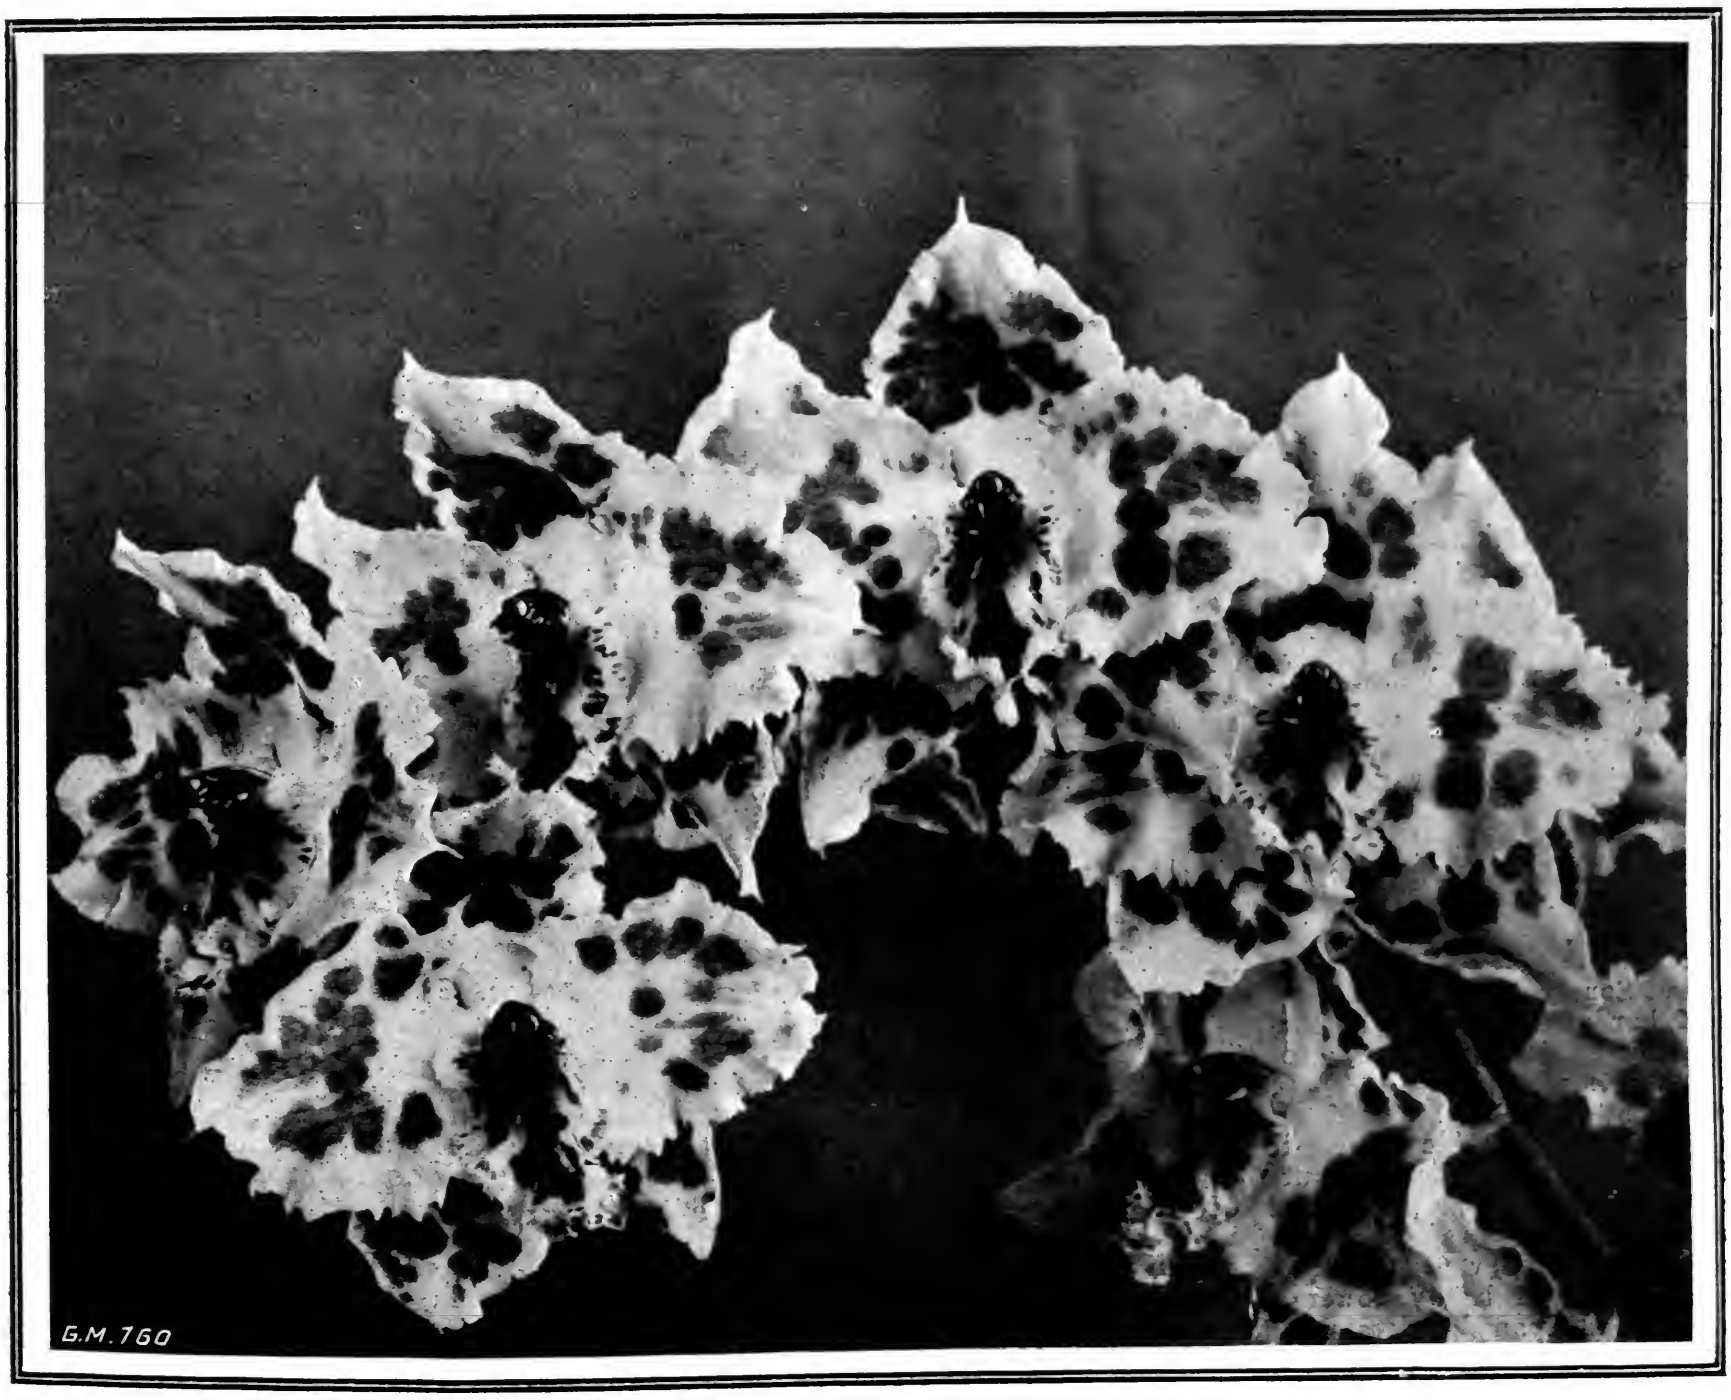
A welcome change was the exhibit of banks of English and Spanish irises, phloxes in variety, papavers, pæonies, pyrethrums, and a good colection of ixias.

From Mr. L. R. Russell, Richmond Nurseries, Richmond, came a bank of variegated foliage plants, such as Hedera arborea variegata, H. dentata variegata, very fine, and Dimorphanthus mandschuricus variegatus.

A table of delphiniums from Messrs. J. Piper and Sons, Bayswater, embraced a really good collection, but they suffered from the heat considerably.

cial mention is necessary for Papaver Perry's White, which was most conspicuous in the other varieties, while the Guildford Hardy Plant Company, Guildford, also displayed hardy plants most effectively. Here again, pæonies, dephiniums, and similar subjects were the leading features.

From Messrs. W. Fells and Co., Hitchin, Herts, came a well-grown collection of Primula Bulleyana, which gave a good idea of the effect such a breadth would produce in favourable surroundings. The Wargrave



ODONTOGLOSSUM CRISPUM THE BARONESS.

Flowers large, the colour white, tinted rose, and marked with purple-red blotches. A.M.. R.H.S., June 17. Baron Bruno Schröder.

Messrs. J. Cheal and Sons, Lim., Crawley, inasmuch as they had introduced a fine collection of ornamental foliage with their hardy flowers. Quercus nigra was beautifully coloured and clean. Kalmias were also much in evidence, while other notable subjects were Solanum crispum, Rosa rubrafolia, Buddleia globosa, and Rhododendron myrtifolium.

A fine table of pæonies and delphiniums came from Messrs. Kelway and Son, Langport, Somerset. Although the day was so trying for cut flowers, the pæonies stood it very well. The chief varieties were Jas. Kelway, Conference, Purple Cup, Artist, A. G. Vanderbilt, and Lady of the West.

Mr. Jas. Box, Lindfield Nurseries, Hayward's Heath, occupied a corner of the hall with hardy flowers. These were composed of huge columns of delphiniums in variety, Lupinus arborea Golden Spire, Linaria dalmatica, very fine, while clustered below were

Messrs. G. and A. Clark, Lim., Dover, also had a table of hardy flowers, in which were noted some fine patches of campanulas, irises, and papavers, while a plant of Verbena chamirdifolia was an object of interest with its crimson flowers and long straggling growth.

Mr. Profittlich, Twickenham, staged some well-developed astilbes with rose and pink tinted inflorescens, the most conspicuous varieties being Monte Rosa, America, Britannia, and Hollandia.

A bright and attractive display of hardy flowers was that staged by Mr. M. Prichard, Christchurch, Hants, a group of Lavatera Olbia being most conspicuous, while the delphinums were fine in size and colour.

Mr. Amos Perry, Hardy Plant Farm, Enfield, had a particularly bright exhibit of hardy flowers, which were arranged with much taste. Delphiniums were a great feature, as were also the campanulas. Spe-

Plant Farm were also well to the fore with a collection of hardy flowers arranged in a natural manner; again, the hardy primulas were a conspicuous feature. Salvia Grahami was also to be seen, as well as Linaria dalmatica speciosa.

Messrs. Reamsbottom and Co., Geashill, King's Co., Ireland, sent over a very bright and effective display of their St. Brigid anemones, which were undoubtedly very fine, and the colours well arranged. Messrs. Whitelegg and Page, Chislehurst, also staged hardy flowers in variety, the pæonies and delphiniums being the leading lines. They also exhibited some fine examples of their Newberry, while beyond an attractive rock garden was displayed.

English irises, as arranged by Messrs. Jas. Carter and Co., Raynes Park, S.W., formed a fine feature. They were arranged in fine bold masses, and were most effective, the most striking varieties being Mont Blanc,

Othello, Lorenzo, de Medices, Gladstone, Laura, and L'Adorable. Messrs. R. H. Bath, Lim., Wisbech, had a fine display of delphiniums and pæonies arranged on the floor of the hall. Some of the best were Princess Mathilda, L'Esperance, La Rosiere, Mont Blanc, Eismonda, and Victor Hugo. Messrs. Paul and Son, Cheshunt, also arranged a group of hardy flowers, which was formed chiefly with pæonies, backed with Verbascum Olympicum, while the front was rich with heucheras.

Mr. Fred Smith, Woodbridge, Suffolk, also arranged a group of hardy flowers, which were bright and attractive, his bold groups of Eremuri Elwesianus, gaillardias, campanulas, and heucheras were charming; while Messrs. T. S. Ware, Lim., Feltham, also displayed hardy flowers in great force. Here again the chief features were the pæonies, delphiniums, gaillardias, and heucheras.

The Wargrave Plant Farm, Lim., 10, The Arcade, Liverpool Street, E.C., were represented by a fine exhibit of gaillardias, papavers, irises, anchusas in variety, and pæonies, while the plants of Nepeta Mussini were in very fine colour. Mr. R. C. Notcutt, The Nurseries, Woodbridge, also staged hardy flowers in fine bold masses. A few of the chief features were Dictamnus fraxinella, erigerons, gaillardias, delphiniums, and Geum Mrs. Bradshaw.

Hardy flowers were well staged by Messrs. G. Bunyard and Co., Lim., Maidstone, the delphiniums being especially good. A few of the most prominent varieties were Lorenzo, Perry's Favourite, Mrs. Creighton, Cymbeline,' Queen Mary, and Nerissa. The pæonies were large and bright, and the irises of high merit.

In the annexe Messrs. Bees Lim., Liverpool, staged a collection of hardy flowers, which included some charming primulas, such as P. Beesiana, P. Orange Bees, P. capitata, and Bees' variety of Trollius patulus, a beautiful form with large rich yellow flowers, introduced by the firm from Thibet. There were also some lupins with new shades of colour.

Messrs. Brown, Peterborough, staged a miscellaneous display, chiefly hardy flowers, the exception being well-grown plants of Heliotrope Lord Roberts. A fine group of Lilium Szovitzianum at once arrested attention, as did also L. umbellatum. The gaillardias were also in fine variety; while Messrs. J. Peed and Son, West Norwood, arranged a bank of hardy flowers edged with sedums, saxifragas, and similar subjects, also a few nymphæas in a tray.

Mr. Henry Newman, 16 and 18, Woodford Road, Watford, had a nice table of Pink Challenger. The colour is attractive, but rather variable, being pink with slight chocolate marking at the base.

Messrs. Barr and Sons, Covent Garden, had an extensive exhibit of hardy flowers. The bright hues of the Spanish irises produced a striking effect, while the early-flowering gladioli could not be overlooked. The ixias, too, were well developed, while amongst other subjects were noted a large collection of irises.

Messrs. H. J. Jones, Lim., Lewisham, staged some remarkably well-grown plants of Campanula calycanthema, arranged with ferns and abutilons; the strain is a good one, exhibiting a wide range of colours. The hardy flower exhibit of Messrs. Wallace and Co., Colchester, was most interesting, the large group of Eremurus Warei being perhaps the chief feature, though one could not overlook the excellent collection of ixias, pæonies, liliums, and irises.

GREENHOUSE PLANTS.

Messrs. Jas. Veitch and Sons, Lim., Chelsea, occupied a table with a variety of plants. Cannas were quite a feature, some of the most striking were Duke Ernst, Gaekwar of Baroda, and Hesperitte. Primulas were arranged in groups, and included P. capitata and P. pulverulenta Mrs. R. V. Berkeley, while Rosa Moyesi was most striking with its charming single flowers. Pæonies and delphiniums were also staged in quantity.

Messrs. H. Cannell and Sons, Eynsford, Kent, presented a bright exhibit of cut zonal pelargoniums, while Mr. H. Burnett, Guernsey, had a bright exhibit of perpetual-flowering carnations, in which Marmion, Mrs. C. F. Raphael, Wodenothe, and Calypso were to be seen in fine form.

Messrs. H. J. Jones, Lim., Ryecroft, Lewisham, had a splendid group of zonal pelargoniums, arranged on the floor of the annexe. A few of the most striking were Mrs. T. F. Bunting, Scarlet Gem, Mab. Stirling, A. Lovett, Mrs. Tom White, A. Hemsley, and Charley Buller.

Messrs. H. B. May and Sons, Lim., Upper Edmonton, staged a delightful group of hardy ferns on the floor of the hall. The background was occupied chiefly with osmundas in variety, while large specimens of polystichums were grouped together naturally, the front being formed with a large variety of scolopendriums, the whole forming a pleasing group.

CARNATIONS.

The border carnation advent is evidently at hand, for Mr. Jas. Douglas, Edenside, Great Bookham, staged some splendid border varieties in vases and bamboo stands, the most conspicuous being Mrs. Elliott Douglas, yellow; Annie Laurie, pale pink; Fujiama, a glowing scarlet; Amy Robsart, white; and Elizabeth Shiffner, also some interesting vases of border pinks.

Mr. Charles Blick, The Warren Nurseries, Hayes, Kent, produced some fine vases of carnations of the border type, such as Scarlet Gem, Captain Scott, Madge Blick, and Shirmisher, while the new white variety King George attracted much attention.

Messrs. S. Low and Co., Bush Hill Park, filled a corner of the hall with carnations and roses. These were arranged in masses, and were consequently most effective. The carnations included groups of Malmaisons, with other sections; while the roses included fine examples of Rayon d'Or, Lady Hillingdon, Dean Hole, A. R. Goodwin, and Lady Pirrie.

ROSES.

Messrs. B. R. Cant and Sons, Colchester, occupied an entire table with an exhibit of roses, the background being formed with fine climbing and weeping varieties, all of which were in splendid condition, the best being Hiawatha, Delight, Excelsa, White Dorothy, and Dorothy Perkins, all being perfect specimens; while in the vases and stands were noted Rayon d'Or, Rose du Barri, Maharajah, Betty, A. R. Goodwin, and Lady Waterlow.

Mr. W. Easlea, Danecroft Nursery, Eastwood, Essex, had a small exhibit of roses, chiefly the newer kinds, for there were to be seen Excellence, M. S. Metizler, pure white, with the name abbreviated; Sunburst, in fine colour; Madame Ruau, a Pernetiana hybrid; Cherry Page, a bright rose, semi-double, that should make a grand garden rose.

Messrs. Hobbies, Lim., Dereham, Norfolk, exhibited some good stands of roses, the best being Pink Pearl, Eureka, and Lady Bird, a nice hybrid tea; the flowers were white, pale pink in the centre, with a yellow base to the petals.

From Mr. E. J. Hicks, Twyford, Berks, came a beautiful hybrid tea rose under the name of Mrs. George Norwood. The blooms are of large size and a deep rose-pink hue.

GLADIOLI.

The early-flowering gladioli classes were merely an apology rather than a show, for there were not more than three exhibitors. Messrs. B. Hoogstraten, Sassenheim, Holland, being placed first in class 1 with Queen of Whites, a tall-growing variety, white, with a suspicion of pink in the petals. Messrs. P. van Deursen, Sassenheim, was second with America, which was not up to its standard value.

For six varieties of early-flowering kinds Mr. R. Velthuys, Hillegom, appeared the only exhibitor, and he staged the following varieties: Colvillei rosea, Ne Plus Ultra, C. alba, C. rosea, and General Scott, but hardly up to Covent Garden form at the present time.

ORCHIDS.

The orchids were not numerous on this occasion; no doubt some of the exhibitors were going north, consequently the exhibits were fewer than usual, and the groups small. Mr. Sidney W. Flory, Twickenham, staged a small but attractive group, in which were noted some fine plants of Cattleya Mendelli, Lælio-cattleya C. G. Roebling, L.-c. Canhameana, and odontoglossums, all tastefully arranged with ferns and moss.

Messrs. Hassell and Co., Southgate, N., had a nice group, in which Brasso-cattleya Helen was conspicuous with its quaint colouring; B.-c. Phœbe also arrested attention with its bright apricot colour and crimson lip; while a number of well-flowered examples of Cattleya Mossiæ were to be seen, including a fine white variety.

From Baron Bruno Schröder, The Dell, Egham, came some well-grown plants of Odontoglossum crispum The Baroness, a fine bold variety, Cattleya gigas, Marga, C. gigas delicata, and a fine plant of C. Gaskelliana Fairy Queen.

Messrs. Charlesworth and Co., Haywards Heath, also contributed a group in which were noted Oncidioda Bella, a most distinct hybrid, with some well-flowered plants of Miltonias and odontiodas.

Mr. J. Gurney Fowler, Glebelands, South Woodford (gardener, Mr. J. Davis), sent a beautifully grown plant of Odontioda Cooksoniæ Fowler's var., which secured a Cultural Commendation. This, however, was awarded the F.C.C. last season. The same exhibitor also staged a lycaste assumed to be a natural hybrid. Sir T. Lawrence, Bart., Burford, Dorking (grower, Mr. J. White), exhibited with other plants Dendrobium Victoria Regina, with its remarkable colouring. Messrs. S. Low and Co., Bush Hill Park, N., contributed a small group, which included some well-flowered specimens of Cattleya Warneri, C. Charlesworthi, Brasso-cattleya Jessopi, also miltonias in fine condition, with some well-marked odontoglossums; while Mr. H. S. Goodson, Fairlawn, Putney, staged a group of odontoglossums, which contained some charming hybrids with well-blotched flowers.

FRUIT AND VEGETABLES.

The exhibits of vegetables were few in number, but the collection staged by Messrs. Jas. Veitch and Sons, Lim., Chelsea, was comprehensive and of a high order of merit, and formed a distinct and important feature. The arrangements, too, could hardly be excelled, the groups (one could hardly describe them as dishes) of Carrots Early Nantes and Parisian Forcing were models; and the same terms are just as applicable to the cauliflowers, beet, celery, spinach, cucumbers, peas, beans, marrows, etc., while tomatoes in variety, radishes, and lettuces were very fine.

Messrs. Dobbie and Co. Edinburgh, presented a collection of cabbages that certainly had not suffered from the drought, for they were as green and tender-looking as one could desire. Some of the most distinct in type were Winningstadt, Early Offenheim, Little Pixie, Early Harbinger, Wheeler's Imperial, Mein's No. 1, Early York, and McEwan's Early. From Mr. S. Mortimer, Rowledge, Farnham, came a nice box of cucumbers, named Continuity; they were straight, with a very short shoulder, and good in colour, while Mr. A. E. Course, Fairfield Road, Biggleswade, sent some very fine bundles of asparagus.

AWARDS.

Gold Medal to Messrs. Jas. Veitch and Sons, for collection of vegetables.

Silver-gilt Flora Medal to Messrs. B. R. Cant and Sons, Colchester, for roses.

Silver-gilt Banksian Medals to Mr. L. R. Russell, Richmond, for trees and shrubs; to Messrs. H. B. May and Sons, Lim., Upper Edmonton, for ferns.

Silver Flora Medals to Messrs. R. H. Bath, Lim., Wisbech, for pæonies, etc.; Mr. J. Box, Lindfield, for hardy plants; Messrs.

(Continued on page 466.)

FLOWER BORDERS IN THE KITCHEN GARDEN.

Year by year one finds the old custom of growing flowers in the kitchen garden extending, and it certainly is a custom worthy of every encouragement, because the flower borders entice the owners and their friends into that part of the garden where the gardener has to exercise his highest skill and forethought to secure ample and varied produce for the table all the year through. A gardener may be complimented upon the success of the rose beds, the summer bedding, the rock garden, or the conservatory, but it is usually left for his brother gardeners to congratulate him upon his crop of peas, beds of onions, breadths of Brussels sprouts, etc. For the reason that more interest will be taken in the crops of vegetables and small fruits, it is eminently desirable that, so far as circumstances permit, more flowers should be grown in the kitchen garden.

Such borders have a further value, for from them flowers may be cut for house decoration, to the very great relief of the flower garden proper, and the flower borders in the pleasure grounds.

On several occasions illustrations of flowers in the kitchen garden have appeared in these pages, but none has presented a more beautiful picture than that accompanying these notes. This represents a walk in the kitchen garden at St. Peter's Court, Broadstairs. The photograph was taken on May 26, and represents a walk about a hundred and fifty yards long, with borders on either side. A fine old walnut tree overshadows a part of the walk, and a large rose arch serves still further to break up the straightness of the line, and lend distance to the view. Espalier fruit trees separate the flowers from the vegetable crops.

The subjects used for edging are garden pinks, dianthuses, saxifrages, rock roses, thrift, arabis, etc., while the borders proper are gay with all kinds of plants, which grow vigorously in a chalky soil. Irises are a great success, and even varieties of I. sibirica grow and flower freely. Of Iris pallida and its varieties and hybrids there are splendid clumps, while day lilies, alstrœmerias, delphiniums, aquilegias, campanulas, geums, pyrethrums, lupins, and the stately eremuri all occur as large, handsome groups. Pains have been taken to select only those kinds of flowers which have proved first-rate in this soil and situation, and this selection, coupled with no mean cultural skill, have resulted in borders that are the pride of the owner, A. J. Richardson, Esq., and reflect the highest credit upon Mr. H. Ball, the gardener.

As already noticed, one border is bounded by espalier fruit trees; the other is backed by old apple and pear trees, which, in addition to beautiful blossoms in spring, and crops of fruit in autumn, also support climbing roses.

St. Peter's Court, Broadstairs, is a preparatory school for young gentlemen, conducted by Messrs. Richardson and Ridgeway, and is famous in this connection because the younger members of our Royal Family, Prince Henry and Prince George, receive instruction there. C.

FLOWER BORDERS IN THE KITCHEN GARDEN AT ST. PETER'S COURT, BROADSTAIRS.

A VIOLA BED.

Few flowers have ever attained such abounding popularity in so short a time as the viola or tufted pansy, for only a few years ago, comparatively, it was regarded by the average amateur as a rather indifferent pansy. Recently a northern nurseryman informed me that the viola was quite ousting the pansy—using the names in the popular sense—in the south, where he sold hundreds of the former to dozens of the latter, but that in the north the pansy was still holding its own. The climate of the north is better suited to the pansy, which suffers miserably in a moderately fine summer in the south, while the viola can stand a good deal of dry weather considering what a moisture-loving plant it is. Its rapidly-attained popularity is doubtless due to the improvement in the size and quality of the flower, and in the habit of growth of the plant, in which directions the violas of twenty years ago left a good deal to be desired.

Without detracting from the value of the viola for edgings and for surfacing beds and borders, it may be said that it is never so effective as when grown in a large,

well-prepared bed entirely given up to it. If plants are raised from cuttings early in the summer, so that they are nice compact tufts of dark green growth when planted out in October, they will flower a little in the autumn, and keep growing through the winter when the weather is open, producing the first fine blossoms by the middle of April in a normal season. Some recommend planting them in their flowering positions in the spring, which thus remain as brown fallow all through the winter instead of nicely planted beds of vigorous plants, but violas suffer a good deal in a dry spring in such circumstances, while the growth in any case is less vigorous than from autumn planting, and consequently the flowers smaller. It has been urged that there is danger of loss by frost in the open. This may happen sometimes in cold positions with some varieties, but I have not lost any from a cold, damp winter in Essex, not even in the winter of 1908-9, when we had two frosts of 30 and 27 deg. respectively, the latter as late as March. If we should have such a winter as February, 1895, the last really severe winter we had, then there might be loss, but such a winter is so rare that we may risk it.

Of all the combinations of colours in violas that I have seen nothing has, in my opinion, surpassed or even equalled that formed by the three varieties, Redbraes Yellow, Councillor Waters, claret, or crimson-purple; and Maggie Mott, bluish-lilac or lilac-mauve. The first-named is of splendid habit, perhaps as good as any variety; the second is very good, and the third rather slender in growth, but forming a mass of flowers. If a very bright contrast is wanted, the yellows will be put next to the dark, otherwise Maggie Mott should be put between them. There is only one drawback, which can be mentioned to that otherwise perfect viola, Redbraes Yellow, and that is, the fading flowers remain standing up straight instead of falling down and being hidden amongst the growth as is the way with most varieties. It is not a serious disadvantage, but the appearance of a bed is certainly improved if the dead blossoms are occasionally picked or cut off. It is also very short in the stalk for picking until the season becomes advanced. The other two are perfect in this respect.

Some like a white to go with the yellow, purple, and mauve, and for this purpose Snowflake can scarcely be improved upon for size of flowers and continuity of flowering, the same plants remaining in bloom with me last year from the middle of April to the middle of November, when the bed was cleared. It is, however, less compact in growth than the other three, though very sturdy. There is one disadvantage in the addition of a white viola, and that is, the effect of the others is killed by it, especially in the gathering dusk of the evening.

Everyone must have observed the deepened colour of yellow flowers when exposed to the setting sun, and perhaps it is scarcely less noticeable for a little while after the sun has set. This should be borne in mind when planting, and if there is any choice of positions plant the yellow one so that it faces the sky somewhere between north and west. During a wonderful series of clear evenings we had in May, 1909—the sunniest month on record up to that time—a large patch of Redbraes Yellow was a joy to look at in the coming of the evening twilight. Truly

> The world is so full of such beautiful things;
> We all ought to be as happy as kings.

ALGER PETTS.

AMONG THE ALPINE FLOWERS.

> "Now scythes are whetted and roses blow,
> Spring, carolling, said, 'It is time to go,'
> And though we called to her, 'Stay! O stay!'
> She smiled through a rainbow, and passed away."
>
> "In Veronica's Garden."

With the passing of the writer of the above lines—a real lover of flowers, whatever his failings as a Poet Laureate—the spring has sped its way, and we are into summer, with all its wealth of blossom, when shrubbery and border alike are seeking to dim the radiance of the alpine flowers and to eclipse their beauty in our eyes. Yet this is impossible to the earnest lover of these unassuming flowers, for they also have charms of the highest kind. There are among them many "gems of purest ray serene," which stand the closest inspection, and compared to which many popular flowers look garish, and lacking in their innate grace and charm. To the Queen of Flowers, the rose, we all bow in adoration, but the alpines of June also command our worship. They are full of grace and beauty still, and many are of striking effect as well, and hardly brook rivals among their sisters of the border or the parterre. Come with me and see.

Cytisus Andreanus prostratus.

This is a plant which has surely a future before it as a rock garden trailing shrub. What Cytisus kewensis is in the early season so Andre's prostrate broom should be in late May and June. When it comes more frequently before the alpinist in visiting other gardens, he will not be disposed to be without this grand shrub if he is possessed of sufficient space. When it reaches some size a mass of its gold and crimson or brown flowers trailing over some large rock will be a sight worth remembering, while for the smaller garden it may be clipped back annually immediately after flowering, and will be all the better for this Spartan treatment. Though only recognised by an award recently, it has been in cultivation for some time, and it is now several years since Mr. C. H. Curtis, of THE GARDENERS' MAGAZINE, drew my attention to it as a standard in an exhibit at a Temple Show. His usual acumen as regards good and new plants had not deserted him then, and now we shall acclaim C. Andreanus prostratus as a first-class rockery shrub.

Tanakea radicans.

A striking contrast to the wealth of colouring of M. Andre's broom is afforded by the white plumes of Tanakea radicans, raised a few inches above the leathery leaves. When it first opens one feels somewhat disappointed with the inflorescence of this native of Japan. The spikes and the individual flowers look insignificant, and one is inclined to have but a modified admiration for the rooting tanakea. But as the weeks go on it improves. The plumes become whiter and more feathery; they grow taller and look more graceful; and then we come to see that this ally of the saxifrages—for such it is—may be classed among the good alpines which increase in our favour.

It is hardy, and its liking for a cool, shady, and rather moist spot in the rock garden will commend it to many who have some difficulty in securing good things for such a place. It is easily increased by division when once established, and may be ranked among the many modest beauties which become more and more favourites as we become better able to appreciate their points of simple charm. To read a botanical description of Tanakea radicans is hopeless if we want to attain any idea of its appearance. It may be said briefly to resemble in flower a miniature white spiræa or astilbe some six inches high, or a little more, but with rather lanceolate, entire, leathery leaves. A peaty soil suits it best, and it is quite at home among the stones of the shaded part of the rock garden.

Dianthus sylvestris.

Not many people seem to grow Dianthus sylvestris, and this is, in all probability, because it is often a failure in gardens, and is written down as one of the "miffy" plants which should be avoided. It may be good fortune, rather than any skill in planting it, but here it is quite a success on a flat terrace on a dry part of the rock garden, and well mulched about with whinstone chips. With these about it, in a soil of sandy loam, light and well drained, this little pink has assumed some considerable proportions for a dianthus of its character. Its tuft of slender green grassy leaves is the picture of health, while there are raised some six inches above it, on slender yet sturdy stalks, several of the pretty solitary or twin rose-coloured flowers. There are choicer things among the pinks—for sylvestris cannot hope to vie with Dianthus alpinus or Dianthus neglectus, but we have surely room enough for more than two or three pinks, and this so-called wood pink, which, paradoxically, does not care for shade, may well have some consideration

Hyacinthus amethystinus.

Not yet over, but almost so, are the drooping flowers of the little bulbous plant called Hyacinthus amethystinus, whose colouring appears to have been truly derived from the bluest of the skies above, and which is so charming in nooks of the rock garden not too high up, but preferably near the level of the eye, so that the grace of the pendant flowers may be the better observed. It is a cheap and charming bulb for which room might well be found in rock gardens, where it would be a boon during the late May and early June seasons.

Other Flowers.

There are masses of saponarias of various shades. There are veronicas with sheets of blue; gypsophilas, either trailing over the stones or forming low carpets, dotted with white, prettily veined flowers, as in G. cerastioides; bright geraniums, erodiums, androsaces, drabas, aubrietas still, primulas such as farinosa, bulleyana, cockburniana, and others of the race. There are heucheras, gay and glowing helianthemums, thrifts, dwarf and tall geums, potentillas, saxifrages—in very truth a wealth of flowers commanding our admiration and compelling our praise.

S. ARNOTT.

Scutellarias.—Several of the warm-house scutellarias are valuable decorative plants, their flowers being bright and showy, and borne over a lengthened period. The best known is the Mexican Scutellaria mociniana, with terminal clusters of tubular-shaped flowers, scarlet, with a yellow mouth. Other showy species are S. costaricana, which bears a considerable resemblance to C. mociana, except that the flowers are borne in small axillary clusters as well as in the terminal one. In S. scarlatina the flowers, that are small, are very freely borne in short dense spikes. They are light scarlet in colour. In habit somewhat like the last is S. violacea, whose flowers, however, are of a pleasing shade of violet. All are readily propagated from cuttings, and of simple cultural requirements.—S. W.

LYCHNISES.

Among the members of the Rose Campion family there are several ornamental annual and perennial plants. Some are of great value for the herbaceous border like L. chalcedonica, with its dense corymbs of scarlet flowers, and L. viscaria, with rosy flowers, while others, like L. alpina and L. Lagascæ, are only at home in the rock garden. In colour the different species range from scarlet to pure white, with intermediate shades. Those of the Agrostemma section, to which L. coronaria belongs, are among the earliest of plants to grow, and are excellent either for the herbaceous border or for the wild garden and open shrubberies. In such positions they may be naturalised, and will come up freely, producing an effective display year after year. As nearly all the members of this family produce seeds freely they are readily increased by this means. There are about twenty species in cultivation, some of the best of which are the following.

L. alpina.

A pretty little alpine plant, more suitable for the select portion of the rock garden. It forms a tuft of dark green shining leaves and produces a stem some few inches high, bearing a head of closely-crowded pink flowers. There is a variety of it which is known as L. alpina lapponica, and has much paler pink flowers. It should be grown in very gritty soil that does not get too dry.

L. chalcedonica.

This is a well-known and valuable plant of great beauty which grows into great tufts, and reaches a height of three feet or more. Groups of this plant in the herbaceous borders, with its intense scarlet flowers, are very effective. Of it there are several desirable forms, some with white flowers, and others of intermediate shades of colour, while there are also double white and scarlet varieties. Known as the Jerusalem Cross, it is of very free habit, and a good stock may soon be obtained by dividing the stools in autumn or spring.

Lychnis, or Agrostemma coronaria.

With its rosy-crimson flowers and hoary leaves, L. coronaria is a handsome plant for the wild garden. It grows from two to three feet high, with freely-branched stems, and, once established, may be relied upon to come up in quantity every year. There are several varieties of it, of which oculata has white flowers with rose-coloured centres, and Walkeri has vivid blood-red flowers.

L. fulgens.

This handsome Siberian plant has been grown in gardens now for nearly a century. It reaches a height of about twelve inches, and produces large vemilion-coloured flowers in the early summer. As a border plant, and grown in groups, it is very decorative. Like many of the other members of this family it is very variable, and the strain known as L. Haageana are only varieties of it. In the latter we have mixed shades of colour ranging from crimson, rose, scarlet, and pink, to white.

L. Lagascæ.

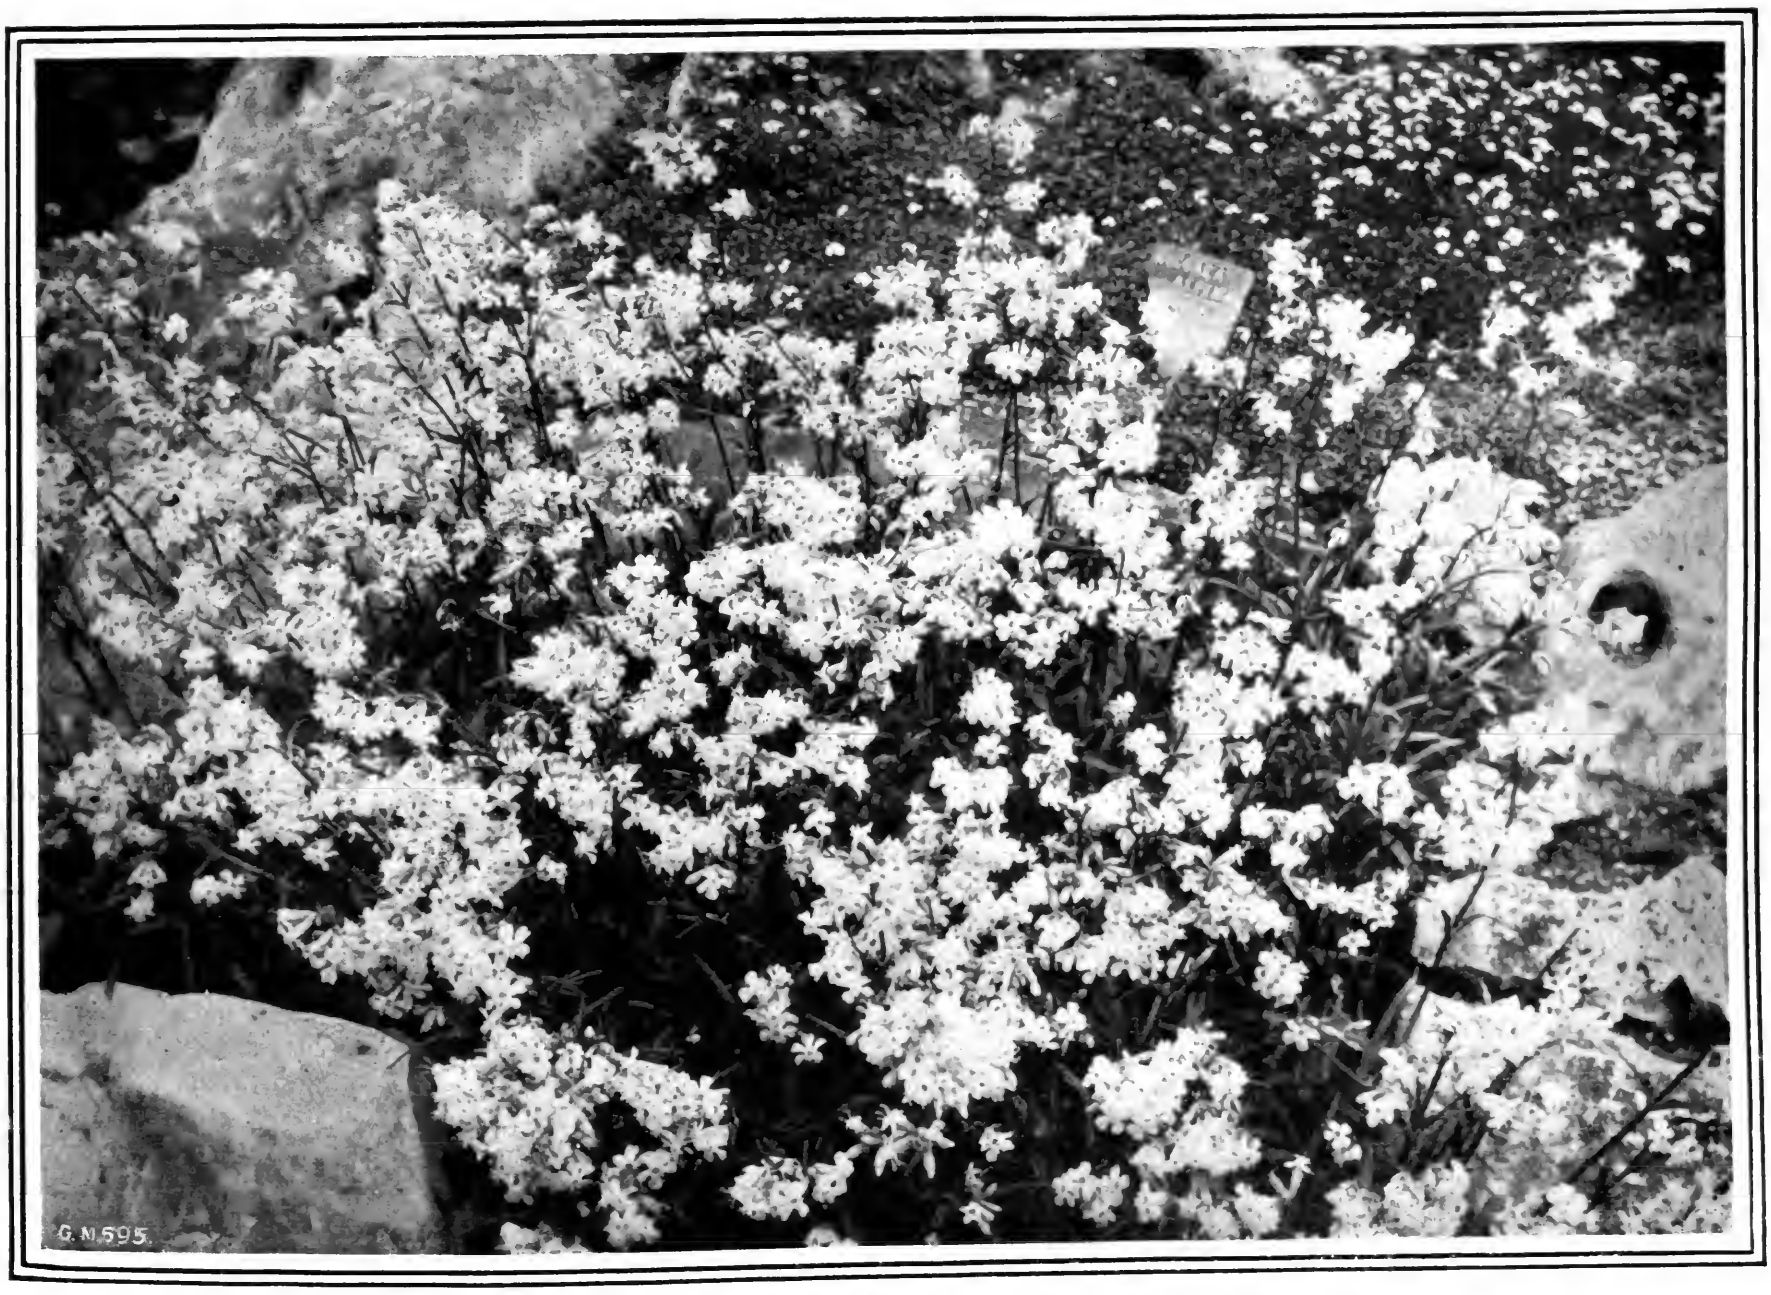
This is one of the most charming of rock plants, growing into a low tuft, covered with small rose-coloured flowers, having a white centre. It is a native of the Pyrenees, and flowers during the whole of the summer.

L. viscaria.

The German Catchfly is a dwarf-growing plant, forming tufts of long leaves from which are produced numerous stems bearing heads of rose-coloured flowers. For the rock garden or front of the herbaceous border there is no more useful plant, as it is such a vigorous grower and so free flowering. It produces itself freely from seeds in any suitable situation, self-sown seedlings spring up round about the old plants. L. v. var. alba, which is here illustrated, is a white-flowered variety of great beauty.

W. I.

Kew.



LYCHNIS VISCARIA ALBA IN THE ROCK GARDEN AT KEW.

MYOSOTIS DISSITIFLORA.

This beautiful early-flowering forget-me-not is one of the best of all for the flower garden, especially as a groundwork for spring bulbs. Both blue and white varieties of it have been raised, and most of them, as well as the species, may be raised from seed if provision is made for replacing the small percentage of rogues that will reveal themselves as soon as they begin to flower, or even before, and as this is so early in the year, often in February, replacing can be effected without damaging the appearance of a bed. Seeds should be sown early in the summer, the earlier in June the better, on a nursery bed of well-prepared soil. The seedlings may be thinned out sufficiently, and left to grow into good plants for moving in October, or they can be pricked out in rows in damp weather.

Owing to its compact habit of growth and profusion of bloom this myosotis makes a capital pot plant, and if potted up in the autumn it can be had in flower from Christmas onwards. Though it is of such great value for carpeting beds of bulbs, its most effective use is when massed together, either on the rock garden or in conjunction with yellow violas or dwarf golden wall-flowers.

A.

A PLEA FOR GREY-FOLIAGED PLANTS.

(Continued from page 434.)

Asperula suberosa is a lovely plant for a sunny rockery, its grey, woolly foliage and pink flowers making it a special favourite. I saw it was much admired at the Royal International Exhibition in 1912. It grows about six inches in height, and flowers from June to August. Alpine auriculas are useful and valuable plants for a "grey border," or the rock garden, in May or June. Bahia lanata is an ornamental herbaceous plant decidedly useful for naturalising; it has silvery foliage, and produces small but numerous yellow flowers in May and June, and grows about 18 inches high.

Carnations cannot possibly be left out of a "grey garden" arrangement, and should be planted like pinks, in large clumps of one variety, to obtain the best effect. There is an enormous choice of border varieties, but the few I here mention are good and of vigorous growth. White—Trojan, Vergilia, Duchess of Rothesay, Albion, and Mrs. Muir, the latter for its quantity of bloom and neat growth. Pink—Duchess of Fife, Lady Hermione (salmon-pink), Miss Willmott, Mrs. Nicholson, Queen of Scots, and Elizabeth Schiffner, a splendid self of rich deep pink and of very vigorous growth.

Cerastiums are well adapted for edging borders, carpeting walls, or any place in the rock garden, often thriving where other plants fail. C. alpinum is a great favourite of mine. It is a lovely plant for the rockery, the pure white flowers being charming in June and July. C. Biebersteini has both larger leaves and flowers, and lasts longer than C. alpinum. It is a grand plant for edging borders, growing over any stones, walls, mounds, or out of the wall, and is often used in bedding designs. The flowers are white, and last from May to August. C. tomentosum is the well-known "Snow in Summer." C. grandiflorum is a deciduous species, with large white flowers and hoary leaves. It grows nine inches high, and is in bloom from May to July. Convolvulus althæoides has shining silvery leaves on trailing stems, with fairly large pink flowers, which appear from June to September. C. incana is a prostrate species having silvery leaves. It is splendid for the rockery, its white flowers being highly attractive.

Erodium Sibthorpi, a rather scarce species of the "Heron's Bill," has silvery foliage and lilac flowers which last from June to September; six inches in height. E. guttatum is a good plant for a sunny spot in the rockery, growing only six inches in height, and having lovely silky-white foliage, and flowers veined beautifully with violet. E. olympicum was to be seen at the international show, and when better known will be largely grown. It is adapted for the rock garden, and produces pale pink flowers very freely

Eryngium giganteum is, I think, admissible to the grey garden; for a tall plant this "Ivory Thistle" gives a charming effect if planted in a sunny place, where it thrives well, growing in a very rigid fashion, and forming a bush. The stems are shining white, the leaves and flower bracts partaking more or less of the same glistening hue; it is seen at its best from July to September, and grows three to four feet in height. E. maritimum is a dwarfer kind, being the true Sea Holly; the leaves, stems, and flowers are of a greyish-white, and if grown in a large mass in front of E. giganteum makes it a handsome group. It is a British species growing about 18 inches in height.

Festuca glauca is an ornamental grass, and very useful for edging, as it grows in tufts, and is of a bluish-grey hue; six inches high. F. punctoria is a grand grass with effective foliage. Geranium argenteum, like almost all the Crane's Bills, is a beautiful rock or border plant, and delights in sunshine. It has silvery-grey foliage, and bears rose-coloured flowers from April to August. It was much admired at the International Exhibition. G. cinerium, and its white form album, are pretty silvery-leaved plants for the front of a sunny border. The type has rose-coloured flowers veined with purple.

Lavendula spica is the old-fashioned English lavender, which still keeps prime favourite owing to its well-known fragrance. There is a white form of L. spica which is quite as fragrant but not so much grown as the type. Lavender certainly does better in an open sunny position than in the shade, where it tends to grow very weakly and flowers very irregularly. Lavender is suitable nearly anywhere in the garden where the position is open. A bed I have in mind, which was very effective last July, was one of lavender, with Polyantha rose Phyllis growing out of the centre of the bed, the bright carmine-pink or the rose showing through the soft grey flowers of the lavender, and giving a charming effect. Another simple bed was a newly-planted one of lavender with Nigella Miss Jekyll. The cornflower blue of the Love-in-the-Mist on its fairly long stems was very pretty. Old Dutch lavender is a dwarf kind, barely reaching a foot in height, but it has pretty, blue flowers. L. atropurpurea is, as its name suggests, a rich purple-flowering variety, about nine inches high.

Lupinus argentea is a shrubby plant I saw at the Royal International Exhibition, but have not yet grown. Nepeta Mussini has short greyish leaves, but the plant is of a neat habit, and gives quantities of light blue flowers, which bees are fond of. N. violacea has light, glaucous foliage, with flowers of a violet colour from June to November. Both these Cat Mints are suitable plants for the top of a wall, rockery, or border.

Pinks are most useful for a grey border, rockery, or wall, as they retain their lovely foliage all the year through. They are easy to grow, thriving in any garden soil. The time when they need attention the most is just as they are showing the flower buds, and if the weather is then dry they should be given copious waterings till they are opening their blooms. Attention given thus will be well repaid by the better quality and quantity of bloom. Pinks are easily increased by pipings (growths three inches long, cut off below a joint), inserted in sandy soil in a cold frame or in the open border, making them very firm, and shading from strong sunshine until rooted. This should be done in early July, and by September all will be ready to be planted in their permanent quarters after well preparing the site. A good plan is to pot up some of the pinks, putting three plants into a seven-inch pot, and leaving them outside for a time, afterwards removing them to the greenhouse, where they will flower in the early months of the year. Afterwards, if planted out in the border, they will, if well watered, give another grand lot of flowers in the late summer. Mrs. Sinkins, Her Majesty, fimbriata alba, and Albino are all good white pinks, and very fragrant.

Ranunculus amplexicaulis is one of the most delightful alpines for the spring, having pretty bluey-grey foliage and numerous spikes of white flowers with conspicuous yellow stamens; it flowers from April to June, and grows about one foot in height. Salvia argentea, with its large silvery leaves, makes a handsome and showy plant for the border, and flowers the second year from seed. The leaves are nearly one foot long, the plant itself reaching the height of about three feet, and bearing large flowers, which are pinkish-white, in June and July.

Santolina chamæcyparissus, the Common Lavender Cotton, is a very old evergreen plant, which grows to the height of two feet, and has very pretty, small, silvery-grey leaves and yellow Tansy-like flowers. S. c. incana is quite a dainty little bush, which has the same pretty foliage, and is fine for the rock garden and borders, where it is the most effective if planted in fairly large clumps; grows one foot high, and flowers from July to September. Stachys lanata, a most useful plant for many purposes; it has soft, white, woolly leaves, commonly called Lambs' Ears, and has reddish-purple flowers on woolly stems in July and August.

Veronica incana is a beautiful and most useful plant; in fact, one of the best of this series. The pretty grey foliage, which it partly retains all the year, makes it most effective for bedding designs, and also for the rock garden or the border. It has stems about one foot long, and carries flowers of a lovely blue colour from the end of June to August. Veronica pectinata, and its form rosea, are more suitable for the rockery than elsewhere, owing to their creeping habit; both plants flower from May to July.

H. PRENTICE.

Hartpury House Gardens.

CLERODENDRON SPLENDENS.

This climbing species of clerodendron, which was introduced from Sierra Leone in 1839, has been before now noted in THE GARDENERS' MAGAZINE. It, however, at the present time forms such a fine feature of plant stoves, in which it is well grown as to merit a few words in its favour. The flowers are borne in large corymbose panicles, and are of a rich scarlet or scarlet-crimson colour. It is of much value as a rafter plant, for not being of a particularly vigorous habit of growth, is well adapted for training in this way. Another desirable feature is that a succession of its showy blossoms is maintained for a long time. Another species that is also very beautiful is Clerodendron Thomsonæ, more often met with as C. Balfouri. This latter is better known than C. splendens, and bears panicles of bright crimson flowers. The calyces are large and inflated, and pure white, thus contrasting markedly with the corolla. These two clerodendrons are certainly among the finest of stove climbers.

W.

GARDENS OF ROSES.

Poets generally give most praise to spring, but in the gardens where roses are cultivated for effect, surely the middle of summer is, as it should be, the fairest season? There is a lavish charm now that bulbous blossoms and full-blooming hawthorns, laburnums and lilacs could not quite produce, a luscious feast of colour and scent that no chill east winds may spoil. No longer

"The purple iris hangs his head,
On his lean stalk and so declines;
The spider spins his silver thread
Between the bells of columbines."

but the rambling roses are flinging tumultuous sprays hither and thither, fighting for precedence, the standards spread canopies on every hand, and the bushes annex more and more space. Soon we shall have reached the time when—

"From brazen sunflower's orb and fringe,
The burning burnish dulls and dies.
Sad Autumn sets a sullen tinge
Upon the scornful pæonies,"

but while the rose months are with us, let them be revelled in to the utmost.

The care of a garden of roses may be described as different, from first to last, to the care of exhibition specimens. It is a pity to cut trees nearly to the ground each year, since a huge generously-bearing bush is so noble an ornament; it is folly to disbud scientifically when the show is desired for weeks together. One secret of garden perfecting is not to allow a single bough to be hidden among its neighbours, nor one bud to open where its loveliness is semi-hidden. A little attention in the way of giving sticks, tying out the branches, and supporting individual flowers, by loops of green twine, to the wood of the tree, will ensure a magnificent display. This is especially advisable with the heavy-headed roses, such as Mildred Grant, J. B. Clark, and occasionally La France, which, after their cups become rain-filled, do not lift them again. Probably it is from espalier-trained roses, set in four-foot borders on either side of a grass path, then flanked beyond by gravel or paved walks, that the greatest beauty is gained; the trees can be seen from all aspects, and there is no overcrowding of foliage, while the blooms naturally jut out towards liberty, and unclose their petals deliberately, not hastened by any wind-shaking of their stems.

No rose-lover will need to be reminded that not a dead bloom should be permitted to remain until the petals drop, unless seed is being sought after. One object of this daily work of faded-flower removal will be he maintenance of sightly soil over the beds or borders. If carpet plants are not grown the hoe should be used so zealously that a caked surface is as undiscoverable as a weed.

A controversy will always be waged as to the benefit or harm derived from growing other plants with rose trees. Probably in cold, damp localities the practice is not good, but where heavy soil is combined with the scorching sun-heat, that quickly bakes it into a crust, where cold winds, possibly sea-gales, are followed or accompanied by that same scorching sunshine, experiments prove that all the roses whose roots are covered over by dwarf plants make far better foliage and give more and finer blooms than those which stand alone in their glory. The mossy saxifrage is an ideal plant for the purpose. The spring blossom is not over when the roses come in June, when it fades it can be rapidly clipped off by the shears, and then the green clusters regain the emerald excellence that they lost when red stems and snowy, or rosy-crimson, florescence eclipsed them. Aubrietias, arabises, and Alyssum saxatile compactum will be less costly than mossy saxifrages for general use.

Among standards and old-established bushes of hybrid perpetuals, and robust hybrid teas, Iceland poppies, though tall, do no harm, and lovely displays are gained by using the orange with white, the lemon with crimson, and the white with pink roses. Summer seed-scatterings will bring up Iceland poppies by the thousand, to provide carpets of mature value next year. The small Alpine poppies are useful among less tall or less hardy trees. Viola cornuta is a more suitable plant for most rose borders than the bedding viola, though the latter can be employed freely under standards and climbers. Seed is offered separately of V. cornuta, pale violet; alba, nearly white; Mauve Queen, reddish-violet; and the pinky-lilac Rose Queen.

The simplest wooden seats, made of old grey wood, look best in the rampant, semi-wild rose garden. A number should be kept to locate at the various positions from which the chef-d'œuvres of the rose cultivator can be best witnessed. M. H.

SAINTPAULIA IONANTHA.

This beautiful warm house plant is very finely grown by Mr. H. Prime, gardener to the Marquis of Salisbury, Hatfield House, Hatfield, who has exhibited groups on several occasions in London. The present illustration shows one pan, green painted, and with the drainage holes closed up, as used for house decoration, and filled with seven plants. Each plant is in a 48-sized pot, like the single specimen standing by the side of the pan. Those in the pan are not turned out of their pots, and no moss or ferns are needed to hide the pots owing to the freedom with which the plants grow and flower. Such pans are a mass of deep blue bloom, with a setting of neat green leaves.

SAINTPAULIA IONANTHA.

A beautiful blue-flowered plant, successfully grown and largely used for house decoration at Hatfield House.

The photograph from which the illustration was reproduced was taken on May 25, and is ample evidence of the value of Saintpaulia ionantha for house decoration when well grown. Mr. Prime has carefully selected his stock of this species, and has been careful to propagate only from the finest forms. The plants represented were raised from leaf-cuttings inserted last September.

GEUM COCCINEUM MRS. BRADSHAW.

As vigorous as the proverbial weed, with a brilliancy of colour that rivals the Oriental poppy, yet without their ephemeral character, Geum coccineum Mrs. Bradshaw is a plant of outstanding merit in the border during June.

Few border subjects have sprung into greater prominence in so short a time, and the number that merits such distinction is none too large. A striking feature of this fine subject is the ease with which it may be propagated, and by different methods of cultivation its season may be prolonged almost indefinitely. It comes true from seeds, and if these are sown in January and the seedlings grown in pots, using a rich, light soil, strong flowering plants may be had in July and August, to succeed those grown in the open border. Seeds sown in February, and the seedlings transplanted into boxes, and thence to a well-prepared position out of doors, will give plants that will flower during the autumn and right up to the period when frost occurs.

Not only is this geum a first-rate subject for massing, as it fills out well, and produces a thicket-like effect with its slender stems and large semi-double flowers, but it is also a splendid subject for indoor decoration, the colour lighting up well with dark-coloured decorations and dark wood panelling, and where a touch of colour is desirable to dispel the sense of heaviness associated with old-world furniture. Geum Mrs. Bradshaw appears to be really orange-scarlet in colour, although viewed in the border the effect is that of a crimson flower, this being most noticeable on dull days and in the evening, when the light is less glaring; the fire in the flowers is then subdued.

THOS. SMITH.

Coombe Court Gardens.

Mignonette.—This is appreciated at all times of the year for its delightful scent. For flowering in late autumn seeds may be sown now in 5in. pots. A suitable compost is one chiefly composed of loam and leaf-soil, with a sprinkling of finely-crushed lime rubble. The pots may be stood in a cold frame and shaded until the seedlings are through the soil.—E. HARRISS.

HARDY CLIMBING PLANTS.

Roses are good climbers. Carmine Pillar is a beautiful single climbing rose, with flowers of a true crimson-scarlet tint that entirely lacks the unpleasant magenta pre-

old ruined trees with a veil of ivory-white, starry blossoms. The new pink variety rubens furnishes a pretty contrast. Other good species are the yellow-flowered C. gra-

ever, without doubt, Solanum jasminoides, whose attractive qualities are widely recognised in the south-west, where it is largely grown by rich and poor alike.

Few flowering climbers useful for open-air gardening can surpass the honeysuckle It lends itself to wild gardening, and if allowed to ramble at will forms charming pictures. Rough cliff faces and ruined walls are rendered lovely and odorous by a veil of flowering honeysuckle. Tall firs may be seen with their columnar trunks swathed, sometimes to a height of thirty

NEW H.T. ROSE LADY PLYMOUTH.

Light yellow, with sulphur and cream-pink shading. Gold Medal, N.R.S., May 1. Messrs. Alex. Dickson and Sons, Newtownards. (See page 460.)

sent in Crimson Rambler. Reine Olga de Wurtemburg is another fine climber extremely rapid in growth, often making shoots twelve feet and more in length, and bearing large semi-double flowers of a rich crimson.

As regards the clematis family, the spring-flowering C. montana is one of the most ornamental of the whole race, admirable alike for clothing walls, fences and pergolas, and for garlanding evergreens or

veolens, a rapid grower, whose feathery seed-clusters are as decorative in the autumn as those of the well-known Traveller's Joy (C. vitalba) of our hedgerows, and C. balearica or calycina, which, in the south-west, produces its white, purple-spotted blooms as early as February, and quickly covers a large space, clambering over evergreens, and reaching the eaves of a house in a very short time. The best of the half-hardy flowering climbers is, how-

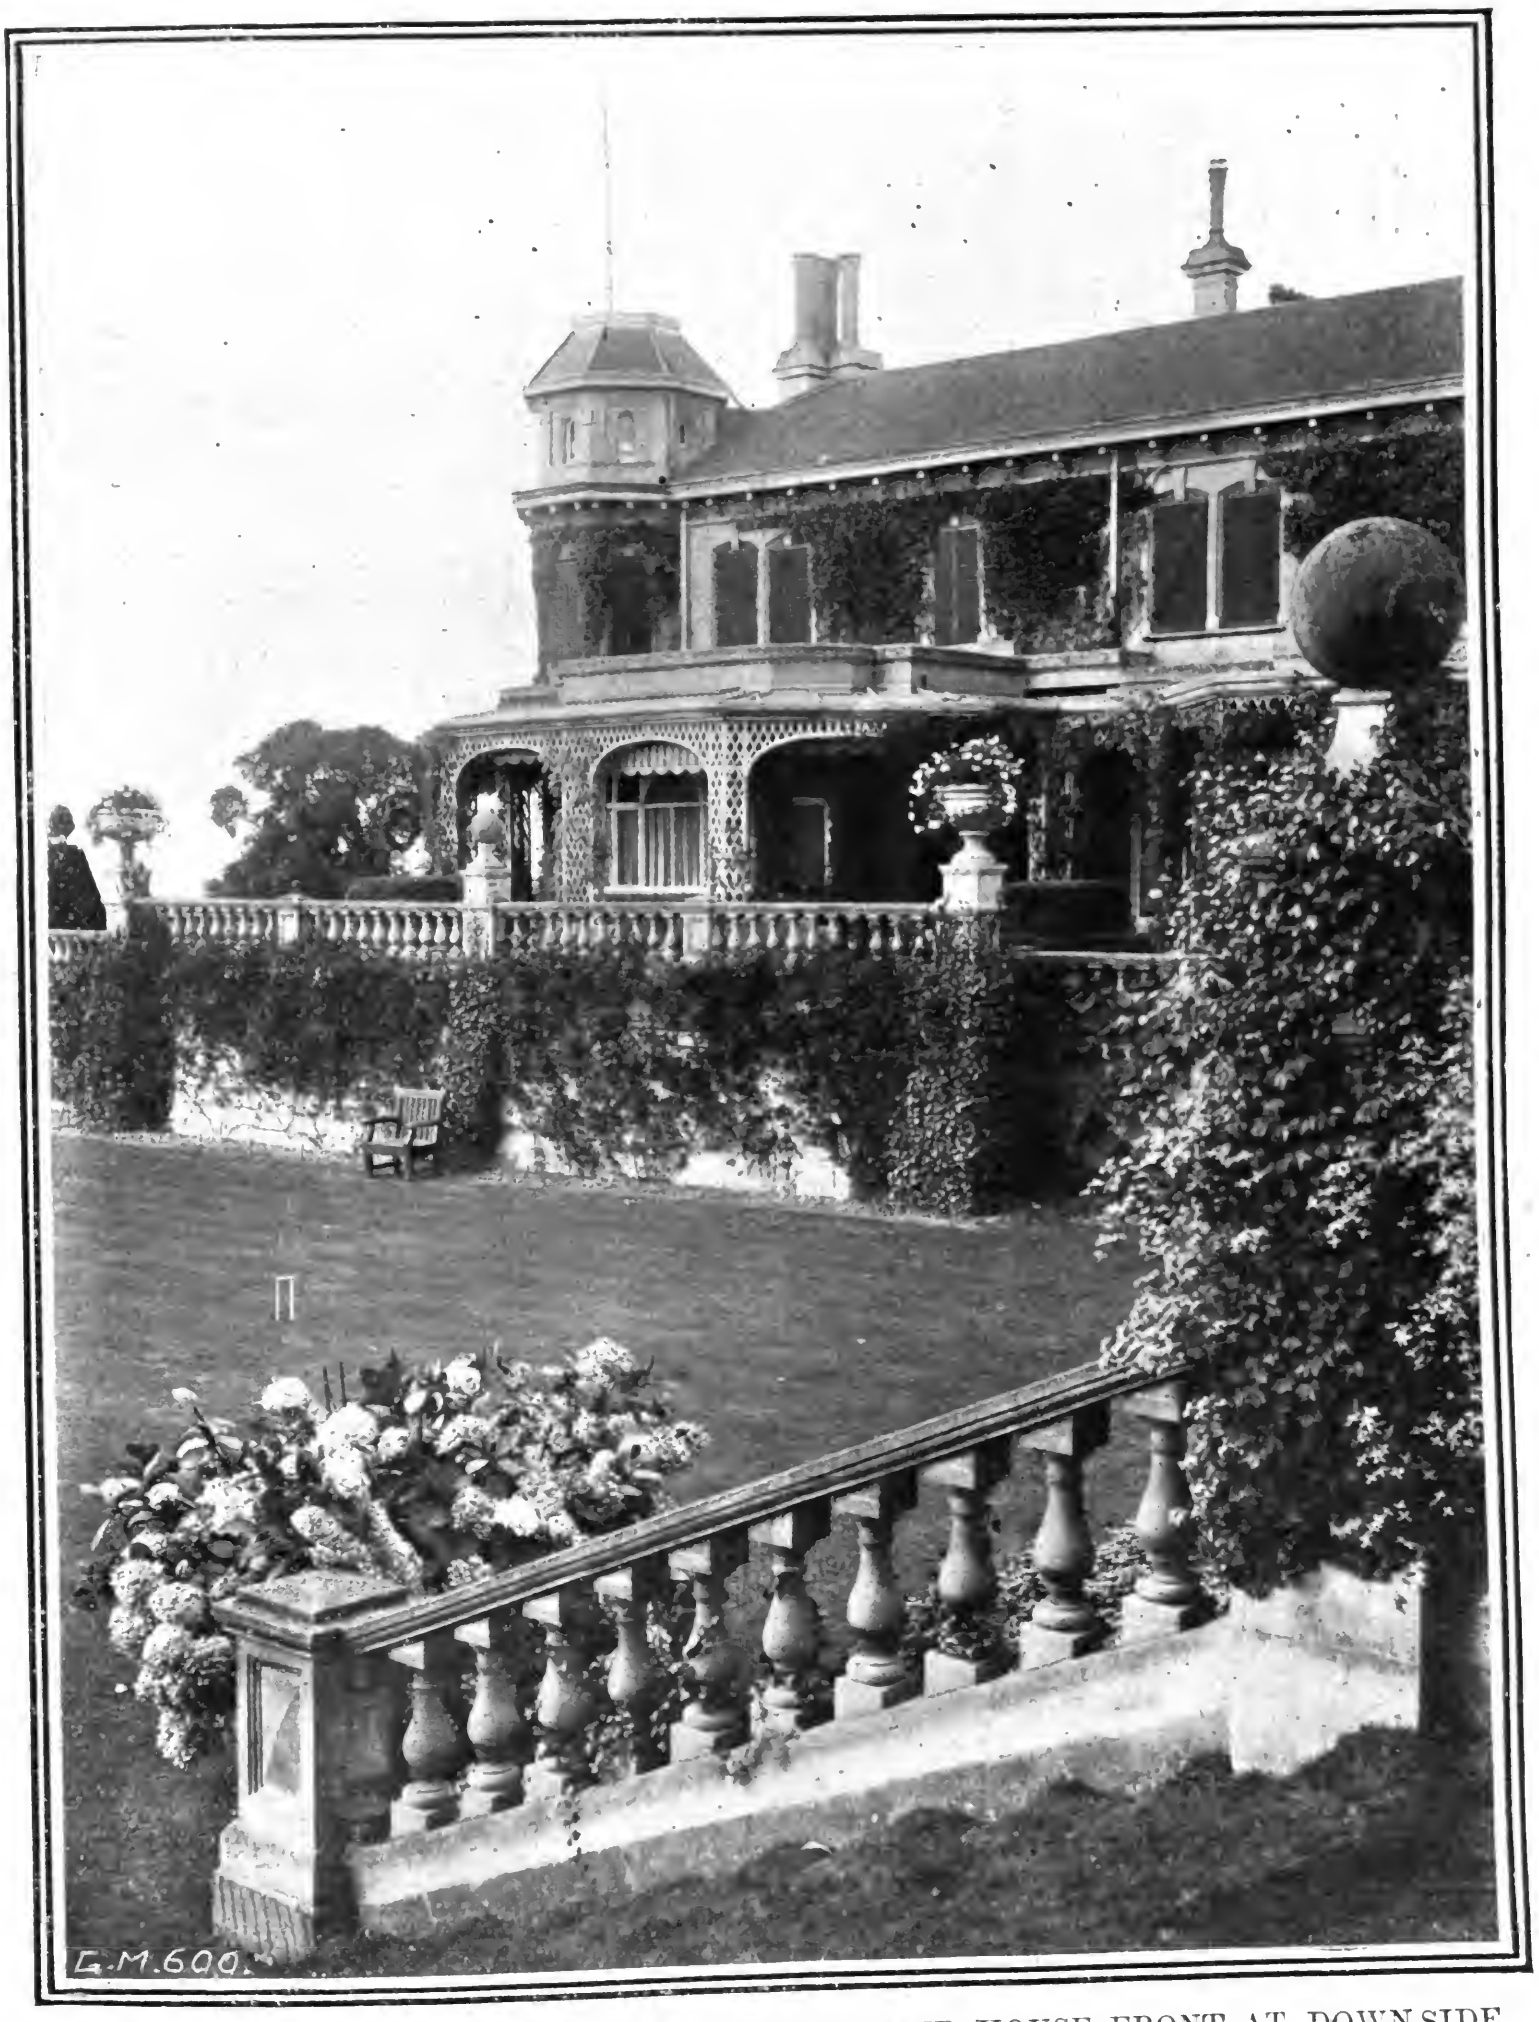
feet, with this climber. Clambering with other plants of like habit over arbours, pergolas, arches, and trellises, it is an object of graceful informality, and along the borders of winding wood walks, and over the top of straggling hedgerows it throws a mantle of delicate beauty.

The common jasmine is another invaluable climber much used for covering cottage porches, whence it distils the perfume of its countless snowy blossoms for the

enjoyment of every wayfarer; while in the winter its yellow-flowered relative, J. nudiflorum, lights the dim landscape with its golden blossoms, but never seen to such good effect as when associated with the crimson berries of Cotoneaster microphylla.

The passion flower, and its white variety Constance Elliot, are naturally popular, their flowering season being succeeded by an almost equally attractive one of fruit-bearing, when the orange globes hang like fairy lanterns amid the dark foliage. The wistaria, with its long lavender flower-fringe and delicious scent, is deservedly esteemed, and few climbers can excel it for covering a pergola. The large-flowered clematises are valuable for training over arches, and the seldom-seen scarlet clematis (C. coccinea) makes a pretty picture on a low wall. Bignonia (Tecoma) radicans is a most effective climber, with flowers of a bright orange-scarlet. Polygonum baldschuanicum is quite hardy and a plant of great decorative merit, making rapid growth, and being admirably adapted for covering rough trellis-work, which it clothes with abundant leafage that for many weeks is shrouded with a wealth of delicate, milk-white flower clusters. Akebia quinata is a perennial-flowering climber, bearing sweetly-scented flowers of maroon hue.

Actinidia chinensis, a recent introduction, is a hardy plant, with large, rounded, corrugated leaves, about six inches across, and yellow flowers. Another species (A. arguta) is a very handsome climber, covered in the summer with countless clusters of white flowers with black-tipped stamens. It is a rare climber, and is not mentioned in Nicholson's "Dictionary of Gardening." Menispermum canadense, called the Moonseed in its native land, is seldom met with, but is a very graceful climber, with long, slender, twining stems and delicately thin leaves. The flowers, which are white, are not particularly conspicuous, being generally hidden by the leaves, which also conceal the black, grape-like fruit, which ripens in September. Periploca græca can scarcely be termed showy, yet when profusely laden with bloom it is very pretty. It is a free-growing, deciduous climber with firm leaves four inches in length. The flowers are about an inch across and of a purplish-crimson colour. They are borne in clusters of about a dozen, and are often so numerous that the entire plant is a mass of blossoms.



CLIMBING PLANTS ON THE TERRACE WALLS AND HOUSE FRONT AT DOWNSIDE, LEATHERHEAD.

WYNDHAM FITZHERBERT.

Littonia modesta.—This South African member of the lily family is nearly related to the gloriosas, and, like them, it supports its slender climbing stems by means of tendrils at the ends of the leaves. The flowers are drooping, bell-shaped, and of a bright orange-yellow colour.—K.

CLEANLINESS IN GARDENS.

Some time ago our Editor kindly found space for some notes written by me, under the heading of "Necessity of Thought," and upon reflection it has occurred to me what a vast difference it makes with regard to results obtained by those engaged in gardening if they act under the influence of intelligent thought in dealing with the subjects under their care that are affected by insect, weed, or other pests. It is obvious to all of us, even to the most inexperienced, that immense advantages are derived from keeping garden crops, plants, and other similar subjects quite clean. It is equally evident that a considerable amount of mischief and loss arises from uncleanliness, and surprising how much seeming negligence and lack of enterprise is to be found in connection with these matters.

The reason for this unsatisfactory state of things should naturally be best known to those responsible for its existence; but in some cases it may be correctly attributed to a deficiency of requisite labour, or of other resources, in others to want of method in management. In most cases, however, there can be no question that precautions could be taken, or remedies be found, that would do much towards preventing, or at least mitigating, the evils that ensue from these unfavourable conditions.

Preventive Measures.

In taking measures in this direction, undoubtedly the best thing to do is to act upon the principle of "prevention being better than cure," and I will endeavour to refer to some means of carrying this into practice, by which injury may be lessened at but little cost.

From this standpoint we may first consider hardy fruits, which, taking them collectively, are most susceptible to attacks of noxious insects. What a common occurrence it is—to give a few instances—to observe plums with their leaves crumpled or curled up by aphis, or badly injured by caterpillars, gooseberries defoliated by like means, apples infested with woolly aphis, pear crops ruined by the midge, and those of the strawberry by slugs. Anyone at all conversant with the habits of these and similar creatures, would not, of course, pronounce a practitioner incapable, or charge him with neglect, because of his trees being slightly damaged by any of these things. To do so would be unreasonable; but it is a very different thing to find these pests left undisturbed to multiply and work irretrievable damage, as in some cases appears to be done. It is not my intention to now state remedies—the most efficient of them are well-known—for dealing with these pests. I wish rather to strongly urge the painstaking use of them during the trees' dormant season, and again as a destructive agent as early as possible after remedial measures are found to be necessary. Only by perseverance in this way can fruit trees be kept clean with a minimum of labour or other expense. Apart from attention being paid to the trees, the utility of keeping their surroundings clean should not be overlooked; prunings, leaves, old shreds, etc., should be cleared away and burned.

Still greater facilities for the serviceable use of these inexpensive accessories are to be found in the glass department, for here structures of all descriptions can, when empty, have the whole of their interior and exterior surfaces saturated with them, and they may also be forced into available crevices, or poured upon spar, plunging material, and suchlike surfaces with infinite benefit, especially where either mealy bug, spiders, cockroaches, crickets, woodlice, weevils, ants, slugs, etc., abound.

Importance of Quarantine.

Of other vital matters specially associated with this department there is that of guarding against the introduction of destructive vermin or fungoid diseases. It is a simple affair to unwittingly initiate serious trouble by this means, that even such disastrous evils as the Eucharis mite, gooseberry mildew, or the greatly to be dreaded phylloxera, the eradication of which, from some gardens, has given rise to much perplexity and expense, might unthinkingly in this way be imported. Therefore trees, plants, cuttings, etc., received from distrusted sources should upon arrival be thoroughly examined, and, if necessary, either cleansed, destroyed, or, at any rate for a time, isolated.

A gardener, well known and in the front rank, regularly adopts this precaution, with the result that mealy bug even is not to be found in the establishment—which is a large one—over which he has control. This reminds me of cases of mealy bug having gained the mastery to a degree that in one of them vines were uprooted, the borders cleared away, and the houses purified; and in another, creepers and other stove plants growing in borders were removed and burned. The taking of stringent measures of this description may appear to be extreme, nevertheless it is under some circumstances by far the most discreet step to take. Frequently affected subjects are preserved for no useful purpose, and become incumbrances and propagating grounds for vermin.

Fungoid diseases of some kinds are so active in development that disastrous consequences follow from very brief times of neglect, while others, though less active, are equally destructive if left unchecked, and for these reasons close watch should be kept for their appearance, and remedies be at hand for their suppression. Favourable atmospheric conditions readily promote their attacks, and I recollect a collection of fine plants of calanthes having to be burned from this cause. Again, how quickly attacks of mildew upon vines, for instance, originate in this way. Then attacks of finger-and-toe may be simply brought about by diseased roots, conveyed from the rubbish yard or manure heap, being dug in the land; and in a similar way these remarks apply to the potato disease. Quicklime dug in, and well mixed with the soil, is an excellent purifier of land contaminated by fungoid diseases, while gas-lime is an equally efficient destroyer of slugs.

Weeds.

Reference may be now made to weeds, which in a garden are not only in themselves evidence of uncleanliness, but they cause much mischief by harbouring other kinds. By far the best way of dealing with weeds that are found amongst crops is to destroy them by hoeing, or by otherwise uprooting them when they are young seedlings. This can be most thoroughly done during spells of sunny, dry, windy weather. By early suppression they do not impoverish the soil or crowd up cultivated crops. Walks are easily kept free from weeds by the employment of poisonous fluids. Under any condition weeds should not be permitted to seed, or their roots to ramify, as in the former case, such free seed-bearing kinds as groundsel, charlock, fat-hen, and in the latter such as couch grass, bearbind, or coltsfoot, cause endless trouble in eradicating them. Much trouble may likewise be caused from seeds, roots, etc., being conveyed, such as the seeds from hay in manure, seeds in mulching material, seeds and roots in refuse from the rubbish-yard, etc. By these and similar means the seeds of weeds may be unconsciously distributed wholesale. Many are the instances of this that have come under observation. For example, a farmer friend of mine made use of roadside trimmings as litter in a cattle-yard, carted the manure from the yard to a field, and was rewarded by a plentiful crop of thistles and docks; and in another case a gardener (myself) used mowings from lawns as a mulching in order to prevent the fruit of gooseberries from being soil splashed, and reaped a thick crop of daisies. With a view to avoid this unsatisfactory sort of thing, all refuse, such as stems of vegetables, prunings and leaves of trees or bushes, weeds, etc., should be subjected to a smothered fire before being made use of, so that seeds, roots of woods, spores of fungi, destructive insects, mites, eelworm, and slugs, etc., which it may contain, are exterminated.

THOS. COOMBER, V.M.H.

ROSE LADY PLYMOUTH.

Among the new roses which rose lovers will look for eagerly this season, the variety Lady Plymouth will certainly occupy a high place. Its debut has been of the most satisfactory character, for at the National Rose Society's Spring Show at Westminster on May 1 it secured a Gold Medal for its raisers, Messrs. Alex. Dickson and Sons, Newtownards, Ireland. It is a showy hybrid tea rose, delicately scented, and with large, shapely flowers of considerable substance. The colour is soft, light yellow, with sulphur tinting in the half-opened flowers, and a creamy pink shading in the fully expanded blooms. It has done so well under glass that great things may be expected of it from the open, and certainly it is a rose to be looked for and made a note of at the coming exhibitions.

CLERODENDRON TRICHOTOMUM.

This is the best known of the three or four species of clerodendron which may be grown out of doors in this country, and it is certainly a shrub that should be given a position in every garden where even small collections of trees and shrubs are formed in the south and west counties, for it is ornamental in foliage, flowers well during the latter part of the summer, and is conspicuous by reason of its richly-coloured foliage in autumn. A native of China and Japan, it forms a wide-spreading bush ten to fifteen feet high.

The leaves are heart-shaped and often eight inches long and five inches wide, with long, slender stalks. The fragrant flowers appear in flattened heads six inches or more across during August and September. They have reddish calyx lobes and white petals. After the fall of the petals the calyx remains and continues to develop in size and richness of colouring until the bluish or violet fruits are ripe. Towards the middle of September the leaves turn to a rich claret colour, which is retained until they fall about the end of October. C. trichotomum thrives in well-drained but moderately moist, loamy soil, and requires a fair amount of sun. Propagation is most easily effected by root cuttings. Sections of root, the thickness of a lead pencil, are cut about four inches long and inserted in pots or boxes of sandy soil in a warm greenhouse during early spring. As soon as young shoots and roots have formed, they are planted in nursery quarters until large enough for permanent planting.

Huge Stocks Held.
So confident are we in this Hose that we have put into stock unprecedented quantities.

Orders Railed Same Day.
No waiting unless special fittings have to be made.

Better than Armoured Hose.
Lasts longer; no rusty wire; no cutting up of lawns & paths.

Full Illustrated List and Samples free by return of post from—

WM. WOOD & SON, Ltd., Royal Horticulturists, **Wood Green, LONDON.**

Telephone: "Palmers Green, 377 & 378." Telegrams: "Fungheto-Wood, London." (Charged as two words.)

BENTLEY'S WEED DESTROYER

(POISON)

is the most powerful and has the largest sale of all Weed Destroyers manufactured.

Double Strength (1 to 50): 3 galls., **10/-**; 6 galls., **18/-**; 12 galls., **£1 13s.**; 20 galls. **£2 7s. 6d.**; 40 galls., **£4 10s.**

BENTLEY'S COMPOUND LIQUID QUASSIA EXTRACT (The Original!)

A cheap, safe, and infallible destroyer of Aphis in all its forms.

20 to 40 galls., **3/6** per gall.; 10 galls, **3/7** per gall.; 5 galls., **3/8** per gall.; 1 gall., **4/2**; ½ gall., **2/6**; 1 quart, **1/6**; 1 pint, **1/-**.

BENTLEY'S VITALIZER.

A complete Plant Food, suitable for all crops. Far ahead of the best so-called guanos.

In air-tight Casks: 1 ton, **£15 5s.**; 10 cwts., **£7 15s.**; 5 cwts., **£4**; 1 cwt., **17/-**; ½ cwt., **9/6**; 28 lbs., **5/6**.
In **Tins,** 2/- and **6d.** each.

BENTLEY'S CARNATION MANURE

The ideal diet for all varieties of the Carnation. Without unduly stimulating the plant, it develops this exquisite flower to perfection.

In air tight Casks: 5 cwts, **£4 7s. 6d.**; 1 cwt., **18/6**; ½ cwt., **10/-**; 28 lbs., **6/-**.
In **Tins,** 14 lbs., **4/-**; 7 lbs., **2/6** each.

Carriage paid on 5/- orders and upwards.

Complete Catalogue will be sent post free on application to the Sole Manufacturers,

JOSEPH BENTLEY, Lim.,
Chemical Works,
BARROW-ON-HUMBER, HULL.

EPPS'S SELECTED PEAT

For Choice Plants, Ferns, Rhododendrons, &c., &c.

SPECIAL ORCHID PEAT.

Loam, Leaf-mould, Sand, C.N. Fibre, Sphagnum, Charcoal, and all kinds of Garden Sundries.

Prices on application to

EPPS & CO., Ringwood, HANTS.

TENNIS COURT BORDER NETS, good colour, especially prepared, with strong line attached to net at top and bottom. Easy to erect or take away. Will not rot, can be left out in all weathers. 25yds. by 2yds., 6s. 6d.; by 3yds., 7s. 6d.; by 4yds., 9s. 6d. Any size made. Standards for same, 10ft. high, 1s. each. Garden Netting, 30 sq. yds. for 1s. Orders over 5s. carr. paid. List of Fancy Tents free. Write for Flag List. H. J. GASSON, Net Works, Rye. Est. 126 years.

ORCHIDS FOR AMATEURS.—A practical guide to the Cultivation of Cool and Warm-house Orchids, adapted for Small Mixed Greenhouses. The author is C. Alwyn Harrison, F.R.H.S., and the Publisher, 149, Aldersgate Street, London.

"A Storehouse of Practical Information in the most concise form . . . ."

THE ENCYCLOPÆDIA OF GARDENING

14th (Revised) Edition.

By T. W. SANDERS, F.L.S.

A Book of 466 pages, which shows at a glance How any Flower, Vegetable, Fruit, Plant, Tree, or Shrub can be grown with ease and success.

"A valuable book of reference in a handy form, conveying in a nutshell all that the Amateur Gardener needs to know about Plants and Flowers of every description."—

SPECIMEN PAGE.

tion, front of shrubberies. Plant, Nov. to Feb. Propagate by seeds sown ¼ in. deep outdoors in March, or in boxes of light soil in temp. 55° in Feb.; cuttings inserted in sandy soil under bell-glass in Oct.; layering in Oct. C. alnifolia suitable for forcing to flower in winter.

SPECIES CULTIVATED: C. alnifolia (Sweet Pepper Bush), white, Sept., 4 ft., Florida; alnifolia Michauxii, 4 ft.; alnifolia paniculata, 4 ft.; acuminata (White Alder), white, Sept., 10 ft.; arborea, white, Sept., 8 ft., Madeira; canescens, white, Aug., 8 ft., China.

Clianthus (Glory Pea; Parrot's-bill; Sturt's Desert Pea).—Ord. Leguminosæ Greenhouse climbing shrubs & herbaceous perennials. First introduced 1832.

CULTURE: Compost, two parts loam, one part leaf-mould & silver sand. Position, pots or beds in greenhouse. Pot or plant, March. Prune in April, shortening young shoots to within 2 in. of their base. Water freely March to Sept., moderately afterwards. Syringe foliage daily April to Aug. Temp., Oct. to March 45° to 50°; March to Oct. 55° to 65°. C. puniceus succeeds outdoors against warm walls in Devonshire. Propagate by seeds sown ¼ in. deep in well-drained pot of light soil in temp. 75° in March; cuttings of shoots inserted in sandy soil in temp. 75° to 85° in March or April.

SPECIES CULTIVATED: C. Dampieri, scarlet, April, 3 ft., Australia; puniceus magnificus, crimson, May, 6 ft., New Zealand.

Cliff Brake Fern.—See Pellæa.

Climbing Dahlia (Hidalgoa Wercklei).—See Hidalgoa.

Climbing Fern (Lygodium scandens).—See Lygodium.

Climbing Fumitory (Adlumia cirrhosa).—See Adlumia.

Climbing Groundsel (Senecio mikanoides).—See Senecio.

Climbing Hydrangea (Schizophragma hydrangeoides).—See Schizophragma.

Climbing Snake's-tongue Fern (Lygodium scandens).—See Lygodium.

Clintonia.—Ord. Liliaceæ. Hardy herbaceous perennials. First introduced 1788.

CULTURE: Soil, sandy peat. Position, moist shady border. Plant, Oct. or March. Propagate by division of roots in March or April.

SPECIES CULTIVATED: C. andrewsiana, rose, April, 2 ft., California; borealis, yellow, May, 1 ft., N. America; umbellata (Syn. Smilacina umbellata), white, May, 9 in., N. America; uniflora (Syn. Smilacina uniflora), white, July, 6 in., California.

Clitoria (Butterfly Pea). — Ord. Leguminosæ. Stove evergreen flowering climbers. First introduced 1739.

CULTURE: Compost, equal parts peat, leaf-mould, loam, & silver sand. Position, pots, tubs, or beds in light plant stove. Pot or plant, March. Water freely April to Sept., moderately afterwards. Temp., Oct. to March 55° to 65°; March to Oct. 70° to 80°. Propagate by seeds sown ¼ in. deep in light soil in temp. 75° in March; cuttings of side shoots inserted in sandy peat in temp. 80° at any time.

SPECIES CULTIVATED: C. ternatea, blue, July, 4 ft., E. Indies; ternatea alba, white, May; ternatea cærulea, blue, May; ternatea major, brown, Aug.

Clivia (Caffre Lily).—Ord. Amaryllidaceæ. Greenhouse evergreen flowering plants. Fleshy-rooted. Formerly known by the generic name of Imantophyllum. First introduced 1823.

CULTURE: Compost, two-thirds good loam, one-third decayed manure & sand. Position, sunny, close to glass in greenhouse. Pot, Feb. Water freely March to Sept. 65° to 75°. Propagate by seeds sown in light soil in temp. 75° in March; division of roots at potting time.

FRUIT TREES THAT FAIL.

Thousands of fruit trees are propagated in nurseries and distributed every year for the purpose of planting. It would be interesting to know what percentage of the trees which are sent out year by year flourish and come to maturity, and how many fail, but it is obvious that the proportion of the latter is by no means a small one, and a big item of the nurseryman's business is that of replacing the failures, not through any fault of his, or immediately after planting, but some years later, when the trees really ought to have arrived at a state of fruit bearing. If every tree sent out from nurseries during, say, the last twenty years, had thrived, this would probably have made a difference to the demand just now, so from the point of view of the nurseryman it may be rather a good thing that fruit trees fail, however disappointing this may be to the individual who buys and plants them.

If you want to get some idea, though it may only be a vague one, of the number of fruit trees that fail, and the reasons why, you want to journey, as I have done, through the orchard lands in the West Country, where standard apples and pears are grown on grass, and where an orchard is an essential part of practically every farmstead. You may wander along main roads, look over orchard hedges, and see trees, some planted only a few years, and others longer, that are certainly not dead, neither are they living, as we apply the term to fruit trees, but they are merely existing, and it does not require the eye of an expert to see that their fate must eventually be the wood pile. It is only fair to say that the majority of these trees are not under the care of gardeners, but farmers and small occupiers, and the fact also remains that the dismal failures represent so much money value, and that money actually thrown away, apart from the labour and the loss of valuable time.

The custom in the West is for the landlord to find the trees, while the tenant plants and looks after them, and when both parties do their share the orchards smile, but where one or the other fails in his duty you see decrepit orchards, composed of a few old trees that have defied the hand of Father Time, or young trees which, through the neglect of the tenant, have come to nothing. It is discouraging to a farmer who realises the value of his orchard, and takes a pride in it, when his landlord will not provide him with young trees, and it is equally disappointing in other cases for landlords to spend money on trees, and then see them go to rack and ruin because the tenant will not take the trouble to look after them. There are faults on both sides, but if fruit is to be grown successfully in orchards the orchard must be treated seriously as an essential part of the farm, and receive the same cultural care as that given to a root or corn crop.

And why do so many trees fail? There are several reasons, and the following are a few of them. As a matter of choice one would, of course, plant young trees on fresh soil, but it has to be remembered that many old orchards are conveniently situated close to the homestead, and it is highly essential that they should be kept up. That they can be is proved by the examples of many orchards made young again by replacing old trees with young ones, but it is obvious that young trees planted in old orchards are handicapped, and the reason why so many fail is because they are merely stuck in the ground, and left to look after themselves, instead of being given that bit of nursing treatment after planting which would help to establish and get them into growth. A cartload of fresh soil to plant the tree in, a mulching of manure, and cultivation round the stem are amongst the things that help the young tree in the old orchard, as well as the exercise of care in not planting the young specimen directly under the spreading branches of an old veteran.

Want of judgment and knowledge in the selection of varieties for orchard planting is another of the reasons why so many trees fail. There are many good-looking and good-quality apples that are absolutely unsuitable for orchard planting because they are not vigorous enough in constitution, and they fail to make the stems and branches and growth that are desirable in an orchard tree. Will it grow? is the question that a person ought to ask when advised to plant any variety of apple in his orchard, and his decision ought to be based on this more than anything. As a case in point, take Lane's Prince Albert, one of the best apples in cultivation, but unsuitable for a grass orchard, because it does not make growth enough, and fails to develop into a large tree. Dozens of people have planted Lane's in their orchards purely on the reputation of the apple as a garden or plantation variety, and have lived to see their trees ten years later, but not much bigger in the head then than when they were planted. Is it to be wondered at that thousands of apples of the type of Bramley's Seedling and Newton Wonder are being planted in orchards, considering that they are as good as anything can be in the way of varieties, the trees make fine specimens in a few years, and they will grow if any apple will?

The craze for cheapness is responsible for more failures, and trees with stems no thicker than your finger are planted in orchards because they do not cost much, but they are dear in the end when you count the percentage of the failures. I am no advocate of planting old trees that have spent many years in a nursery, and have been cut back time after time, but the young, vigorous tree with a straight stout stem and a well-balanced head is the cheapest even if it costs more at the outset, and the wise planter is the man who goes to the nursery and selects his own stocks.

The neglect in early pruning signs the death warrant of scores of young standard trees, and, after all the advice that has been given, many farmers plant their young trees just as they come from the nursery, and never think of pruning them. What happens? The next year fruit buds form along the main shoots, perhaps a few apples are obtained, and the farmer thinks he is getting on well, but it is at the expense of the growth and shape of the tree, and it is stunted, and fails, because it has begun wrong. The first business of the standard tree is to grow, and it should be cut back for that purpose. I am entering on no discussion as to whether the young tree is better cut back at planting time, or later, but I contend that if every orchard standard were left a year after planting, and then had its leading shoots cut back to one-third their original length, we should see less failures than we do, for the tree would begin to grow, and fruit bearing would naturally follow.

After all that has been written about the advantages of not allowing the turf to grow up to the stems of newly-planted trees for a few years, and the experiments that have proved the point beyond dispute, scores of planters are careless about it; they stick in their trees, and lay back the turves over their roots in defiance of everything and everybody, whereas if they would only bury the turf under the roots of the tree when planting, and keep the soil cultivated round the stems for a couple of feet from the latter by means of occasional hoeing, they would see for themselves the advantages of doing it, and fewer failures would have to be recorded. A good start is what the standard tree wants, and when once it is established it will look after itself.

Lastly, hundreds of orchard trees fail through sheer inexcusable neglect after they are planted, and for this reason alone I should not like to say how many pounds in hard cash have been absolutely thrown away in West Country orchards without anyone being one penny the better, except the nurseryman who supplied the trees, and he would rather see them grow and flourish. It is no good going to the expense of buying a good tree for an orchard unless one is prepared to stake it properly and protect it against stock. The staking and protection may cost more than the tree, but it is essential if stock has access to the orchard, and to stint this item is false economy. The trees also want attention afterwards in the way of tying and guarding, and when one sees, as I have, dozens of promising trees simply ruined through being damaged by horses and cattle, and all for the want of a little timely attention, one is justified in speaking strongly on the point. In fact, the trees that fail for one of the reasons explained above form an appreciable percentage of the yearly plantings in grass orchards, even in districts that Nature has adapted for apple culture, and the pity of it is that responsibility for the failures rests, perhaps, in the majority of cases, with the grower, either through his lack of judgment, or careless treatment of the young trees.

H.

SCENTED-LEAVED PELARGONIUMS.

Those of us who are growing old can recall many instances of plants that have, after a period of comparative neglect, rapidly become popular, and remained so for a long time. Signs are not wanting that the old-fashioned scented-leaved pelargoniums are once again coming to the fore, and collections of them have been freely shown of late. On May 14 one of the long tables at the Horticultural Hall was filled with a selection of these good old plants, some four or five of each kind being shown. Again, at the Chelsea Show, three fine groups were exhibited, one of them consisting of no fewer them 140 different kinds. They, as well as those at the hall, proved very attractive to the numerous visitors.

From trade sources I learn that there is a continually increasing demand for scented-leaved pelargoniums, so that everything points to their once again becoming popular. Being of easy propagation and culture, and with foliage attractive throughout the year, these pelargoniums have much to commend them, especially as the flowers of many are very pretty, and they can all be successfully grown in an ordinary greenhouse. A few examples of the old-fashioned fancy pelargoniums shown at Chelsea served to show that the members of this section have not quite dropped out of cultivation, though some of us thought they were quite lost.

W.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SOBRALIAS.—The different species and hybrids will be flowering now, and although they cannot be regarded as among the most serviceable of orchids, owing principally to their flowers being so short-lived, yet, where large specimen plants are grown for conservatory decorations, they are particularly useful. It is somewhat fortunate also that some of the finest varieties are those which last the longest in perfection. Sobralia xantholeuca and the pure white S. macrantha alba are two of the best. At this season of the year the plants are not only producing their flowers, but the young growths advance rapidly. In most cases specimens that have reached flowering strength rapidly fill their pots with roots, and they require a liberal supply of moisture. Where they are at all root-bound a weak application of liquid manure about once a fortnight will assist them. Where the atmosphere is at all dry, the foliage becomes infested with red-spider, but if kept well syringed, and occasionally sprayed with some safe insecticide, these pests may be effectually held in check.

REPOTTING AND DIVISION may take place when the plants have done flowering. The receptacle used should be large enough for two or three years' growth. The drainage must be free and ample. The potting compost should consist of fibrous loam, with charcoal, broken crocks, and sand added. The mixture should be made firm about the roots, and, if a layer of sphagnum moss is placed over the surface of the compost it will add to the appearance of the plants.

CATTLEYAS.—Many of the species and hybrids that have recently been in flower will require repotting. O. Skinneri, for instance, which has been flowering from growths developed last year, will have its roots in an active state, and while this is a species which should not be disturbed more frequently than is absolutely necessary, and repotting should be done while the roots are thus active. C. Mossiæ is not benefited by too frequent potting, and it is often more profitable to permit a plant to remain root-bound and resort to top-dressing, rather than run the risk of disturbance, which generally ends in breaking the plants into smaller pieces in the endeavour to rid them of old, leafless pseudo-bulbs. All freshly-potted plants must be carefully protected by shading them from strong light; they will also be benefited if sprayed overhead once or twice a day, and by keeping the atmosphere moist and close about the plants.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

GESNERAS FOR WINTER FLOWERING.—These should now be removed from their resting quarters, turned from the pots, and have the old soil carefully broken up, so that the strongest tubers may be selected for repotting. A compost such as is used for gloxinias will be found suitable; place them singly, crown uppermost, in large 60's, just covering with soil, and pressing moderately firm with the fingers. If the soil is in good condition, no water beyond an occasional syringing will be necessary until growth commences. An intermediate house, where moist conditions are maintained, will be suitable.

IXORAS.—Those propagated from cuttings in spring should be kept growing fast, be pinched occasionally to ensure bushiness, and transferred to larger pots before becoming pot-bound. Older plants now approaching the flowering stage may be gradually given cooler conditions. Before the flowers are open, it is well to give them a thorough cleaning with a fairly strong insecticide, care, of course, being taken to preserve the younger foliage and flower spikes from damage.

GARDENIAS.—Young plants will require the same kind of treatment, soil, and conditions as the ixoras, and, given careful attention, will provide a succession to the older plants, which will shortly be producing a quantity of flowers. As soon as the flower buds can be seen, all superfluous and weakly growths should be removed. Occasional feeding with soot water, diluted liquid manure or a top-dressing containing a little artificial manure, will be repaid by the production of much finer flowers. Gardenias are subject to attacks of scale and mealy bug, and it is necessary to pay attention to cleaning, particularly just before the flowering period.

EDGING PLANTS.—To maintain a finished appearance in the plant houses small edging plants, such as fittonias, Panicum variegatum, selaginellas in variety, etc., should be propagated at intervals, so that older stock may be dispensed with as soon as it begins to look untidy.—H. PRIME, Hatfield House Gardens.

FRUITS UNDER GLASS.

VINES.—The present is an anxious time for those in charge of an extensive range of vines, in order to keep every detail within bounds. The earliest grapes will be ripe, whilst others may possibly be causing some anxiety as to finish. As the grapes approach ripeness they will require cool treatment, liberal ventilation, and less moisture; but, with the whole of the summer before us, the floors, etc., must be damped when the weather is favourable to a free circulation of fresh air.

IN SUCCESSION HOUSES, which include different varieties, grapes will now be swelling freely, and the vines must have copious supplies of tepid liquid manure and other stimulants. As the days become more settled ventilation will become less difficult, and the maximum should be approached gradually by slight additions at short intervals as the temperature rises, while reduction must be followed gradually as the temperature falls. A steady artificial heat being nearly always necessary, the fires should be started early, so that the temperature may go down steadily to 70 degrees, and fall to 65 degrees in the morning. Examine the largest bunches for the last time after stoning is completed, as large-berried varieties, such as Gros Colmars, are very deceptive when finished. Do not pinch the laterals too closely, but the strongest will require pinching and regulating in order to maintain a free circulation of fresh air between the foliage and the glass.

MUSCATS.—These require similar treatment, but the temperature may range 5 degrees higher than is good for Black Hamburghs, although Gros Colmar enjoys the same high temperature. The latest Muscats will now be swelling freely; pay careful attention to the roots, and afford liberal feedings of warm diluted liquids and other stimulants, and by so doing keep the roots in a healthy and active condition. Meantime provide a brisk temperature with plenty of fresh air and atmospheric moisture, and the grapes will quickly respond to such treatment. Lady Downes and other late grapes require exactly the same management in regard to heat, fresh air, and moisture.

STRAWBERRIES.—It is always a relief to get the last batch of pot strawberries out of the houses, but no sooner is this done than preparations become necessary for next season's stock. Success depends upon having the plants in their fruiting pots as early possible in order to secure large, plump crowns for forcing, without which good results cannot be expected. Any of the usual methods for securing runners may be adopted with good results. Many successful growers layer direct into 5-inch pots; this method has the advantage of saving a considerable amount of labour in potting and watering, but unless great care is taken in watering the soil is in some danger of being soured. Whichever method is employed runners intended for very early forcing should be potted into 5-inch pots and the main lot into 6-inch pots by the middle of July.—F. JORDAN, Warter Priory Gardens.

THE FLOWER GARDEN.

EAST LOTHIAN AND BROMPTON STOCKS.—These are most desirable for late spring flowering, and well repay any attention bestowed upon them. In well-drained soils they will stand all but the severest winters with comparatively few losses, but in heavy, cold ground they are not so reliable in this respect, and the safest plan then is to pot them early in the autumn into five-inch pots, and protect them in frames from heavy rains and hard frosts until March, when they can be transferred to the open borders with safety. The Brompton stocks possess a hardier constitution than the East Lothians, and will sometimes stand the winter in the open where the latter fail. To have good plants either for potting or planting out in the autumn, the seeds should be sown now in the open in well-prepared soil, and the seedlings, when large enough, must be transplanted, allowing them ample room in which to develop into sturdy plants.

HARDY PRIMULAS.—Under this heading we must include polyanthuses, auriculas, and primroses, with the various primula species familiar in the rock and wild garden. Varied alike in form and character, they embrace some of the most delightful of spring flowering plants. Their propagation is brought about either from seeds or division. The former method is the one usually adopted, but as some kinds show such a diversity of forms when raised from seed, it becomes necessary, in order to retain a true stock, to adopt the latter method. The seeds of some primulas lie dormant in the soil for months before germinating, and for that reason it is always advisable to keep the pans containing the seed for a long period before turning them out; while, on the other hand, some come very quickly into growth. If not sown immediately after it has been harvested, primula seeds soon lose their vitality, especially when exposed to the air, hence the cause of some failures when sowing seeds out of packets; so the golden rule is to sow all kinds as early as possible. Shallow pans, well drained and filled with light sandy soil, are very suitable for this purpose; the pans containing the seed should be placed in a cold frame having a north aspect, and be kept in a moist condition.

PINKS. — The usual method of raising young plants of pinks from cuttings is very commendable, and preparations should now be made for inserting them. A cold frame containing light sandy soil is a most suitable place in which to put them, as here they can be kept close and shaded during bright weather until they have taken root. When taking the cuttings select the young growths and pull them off the old stem at the heel, cut away some of the lower leaves, and they are then ready for dibbling in.—T. B. FIELD, Wych Cross Place Gardens.

Ruellia formosa.—Several of the ruellias are very showy flowering plants, and, like many other acanthads, are of easy culture. This species forms a bushy specimen from eighteen inches to two feet in height, of a rather upright habit of growth. The flowers, which have a tube about 1½ inches long, and nearly the same across the expanded mouth, are of a bright scarlet colour. Under favourable conditions a succession of flowers is maintained during spring and early summer.—K.

YORK FLORAL FETE AND GALA.

York, the city of many attractions, is very proud this week because its great annual flower show, held on June 18, 19, and 20, in Botham Park, has been a very great success. A large portion of the great tent used for the Royal International Horticultural Exhibition at Chelsea in 1912, and at the Chelsea Show held in May of this year, was used at York in place of several large marquees, and its use met with general approval from exhibitors and from visitors. The airiness of the structure and the wider spaces for promenading were greatly appreciated, for, though the opening day was a hot one, an extended inspection of the vast number of exhibits was by no means an uncomfortable proceeding, notwithstanding the splendid attendance of stalwart men and beautiful women, beautifully dressed in the lightest and gayest of summer costumes.

We have never seen such a big array of trade exhibits at York as on this occasion, and, on the whole, the quality of these displays was good. We believe we have seen keener contests in many of the competitive classes than this year, and, in some respects, better material than was displayed this week; but roses have seldom been so extensively shown, and sweet peas were a fine feature. Orchids were good and plentiful, and the large specimen plants from Cheltenham were practically a necessity in this great tent. Hardy flowers were gloriously beautiful, though their arrangement might have been improved. The organisation of the show was excellent, and once again we acknowledge the courtesy extended by Mr. Arey, the secretary, Mr. T. G. Hodgson, and Mr. E. Bushell.

DECORATIVE GROUP CLASSES.

A keen interest always attaches to the competition in the principal group class, where a space of 300 square feet is allowed, and the premier award is £20, the whole amount offered in prizes being £70. This year there were five competitors, and first prize fell to Mr. J. Donoghue, gardener to T. Pickersgill, Esq., Bardon Hill, Weetwood, Leeds, who once more staged a beautiful exhibit. Tall and graceful palms, with Dorothy Perkins, Crimson Rambler, and Hiawatha roses formed a light background for tall, finely-grown crotons, perfectly coloured, set over a groundwork of moss, marantas, dwarf crotons, caladiums, bertolonias, and bromeliads. Here and there specimen cattleyas, miltonias, phalænopsis, and odontoglossums lent further colour and importance to the group. It was interesting to notice that Mr. Donoghue had almost entirely dispensed with the use of ferns in his groundwork and margin.

To Mr. W. A. Holmes, Chesterfield, was awarded the second prize; he had a fine lot of crotons, but his flowering plants were confined to a few roses and lilies in the background. Messrs. R. Simpson and Son, 30, Brook Street, Selby, were placed third for a rather heavy exhibit, in which tuberous begonias were the leading flowering subjects. Mr. Councillor T. M. Petch, Bridlington, came fourth; and Mr. F. H. Ward, Scarcroft Nursery, York, was awarded the fifth prize.

For a smaller group, 200 sq. feet of space allowed, Mr. W. A. Holmes, Chesterfield, secured the leading award with a pleasing arrangement of crotons, oncidiums, roses, liliums, and Statice Suworowi. Second prize fell to Mr. J. Donoghue, whose arrangement here was a trifle heavy; while third prize was taken by Messrs. R. Simpson and Son, Selby. On the whole we thought the two great group classes were scarcely up to the high-water mark of excellence achieved in some seasons, but this criticism must not be taken to suggest that the displays were poor.

HARDY FLOWER DISPLAYS.

The £15 first prize for a rock and water garden exhibit, arranged on a space 30ft. by 12ft., was won by Messrs. Jas. Backhouse and Sons, Lim., York, with a display consisting of bold rockwork, a background of bamboos, purple beech, and Acer negundo variegata, and a narrow lily-studded pool just behind a rocky foreground. There was a cool effect about this exhibit which was delightful. Among the rocks were colonies of Campanula Portenschlagiana, Primula Bulleyana, P. pulverulenta, Orchis foliosa, cistuses, edelweiss, thrift, saxifrages, dianthuses in variety, and Ramondia pyrenaica, with small ferns in a shady corner, and alpine conifers occupying points of vantage.

Messrs. W. Artindale and Sons, Sheffield, came second, and, though theirs was a good exhibit, the plants were a trifle crowded. Primula Bulleyana and P. sikkimensis, Iris Hermione, pæonies, and white thrift were among the most imposing subjects. The third award was made in favour of Mr. S. Pickering, Rosslyn Street, Clifton, York, and running water here added to the attractions of spiræas, astilbes, dianthuses, alpine phloxes, saxifrages, etc., backed by acers, bamboos, and hydrangeas, and a rustic bridge.

The classes for hardy flowers together formed one of the most pleasing and most brilliant sections of the great show. The chief class was for a display of hardy flowers arranged in a natural manner on a space of 300 sq. ft. There were three competitors for the prizes of £15, £10, and £5 respectively. First prize was awarded to Messrs. Harkness and Sons, Bedale, Yorks, who had a low, rather flat display, and, though it was brilliant in the extreme, and the flowers were excellent, the disposal of the flowers was too close and regular to be natural. However, we are, in these classes, getting steadily nearer to the ideal method of displaying hardy flowers. The Messrs. Harkness had a beautiful lot of Oriental poppies, Spanish

HARDY FLOWERS AT YORK FLORAL FETE AND GALA.

Messrs. Harkness and Sons' first prize collection on the left; Messrs. Gibson and Co.'s second prize collection on the right; and Messrs. G. Massey and Sons' third prize collection in the centre.

irises, liliums, Eremurus robustus, verbascums, pink and white lupins, pyrethrums, and early gladioli.

Messrs. W. Artindale and Sons, Sheffield, were awarded second position, and their design was a border separated from a front bed by a narrow path, the whole encircled by a hedge of cupressus. Pæonies, eremuri, Incarvillea Delavayi, irises, Geum Mrs. Bradshaw, Verbascum Caledonia, and Gillenia trifoliata were the principal flowers used. Third prize was awarded to Messrs. J. Backhouse and Sons, Lim., York, whose design was very similar to that of the Messrs. Artindale, except that the whole was raised above the general level, and the path was made of small flat stones.

CUT FLOWERS.

Very fine was the bank of hardy flowers made up by the three competitors in the class for a collection staged on a space 15ft. by 6ft. This was an open class, and Messrs. Harkness and Sons, Bedale, were placed first with a very beautiful collection, in which great sheaves of Verbascum Caledonia, V. Ivanhoe, Lupinus polyphyllus delicata, Papaver Mrs. Perry, P. Perry's Unique, Anchusa italica Dropmore, Iceland poppies, liliums, and delphiniums gave glorious pieces of colouring. Mesrs. Gibson and Co., Leeming Bar, came second with a very pleasing contribution, wherein poppies, pyrethrums, and gaillardias stood out prominently. Messrs. George Massey and Sons, Spalding, came third, and the great feature of their group consisted of superb flowers of Mons. Chas. Leveque, Canarie, and Duchess de Nemours pæonies, staged in some quantity.

The best two dozen bunches of hardy flowers came from Messrs. George Longster and Sons, Malton, Yorks; Nepeta violacea, Geum Mrs. Bradshaw, Spiræa Queen Alexandra, and Verbascum densifolium were especially good; this is the third year in succession Messrs. Longster and Sons have won this leading award. Messrs. Harkness and Sons second, and Mr. J. D. Hutchison, Crown Square, Kirby Moorside, third. For a dozen bunches, Mr. Wm. Hutchinson, Kirby Moorside, scored, with Mr. Arthur Sunley, Lumby Lane, South Milford, second.

Messrs. S. Bide and Sons, Farnham, were placed first for eighteen bunches of sweet peas, distinct, arranged on tiered tabling 12ft. by 3ft.; the leading varieties were Barbara, Mrs. Stewart, Champion, The Abbot, Thos. Stevenson, May Campbell, Queen of Norway, and Clara Curtis; Messrs. E. W. King and Co., Coggeshall, a very close second, and Miss Hemus, Upton-on-Severn, third.

GROUPS OF ROSES.

The premier award for a collection of pot roses was won by Mr. Wm. Todd, of York, whose group was admirably staged, and contained a good assortment of leading varieties such as Capt. Hayward, Hiawatha, Dorothy Perkins on arches, Lyon Rose, Mdme. Abel Chatenay, and a margin of neat polyantha varieties. Mr. W. Longstaffe came second with a group consisting chiefly of rambling roses and weeping standards, with a few tea and H.T. varieties and polyanthas in the front. Third prize fell to Mr. C. F. Poole, whose background plants were poorly flowered. The best group of twenty pots of roses came from Mr. W. Todd, who again staged a pleasing set, and well arranged his plants of Hiawatha, Dorothy Perkins, and Frau Karl Druschki, but his edging of palms and ferns was a trifle incongruous; Mr. W. Longstaffe came second, and Mr. Harry Pybus, Monckton Moor, third.

The best decorative table of roses, a space 6ft. by 4ft. allowed, was arranged by Messrs. W. and J. Brown, Stamford, who set up their flowers in tall stands, and showed beautiful flowers of Liberty, Irish Elegance, and the single pillar variety Mrs. Rosalie Wrinch, of silvery rose colouring. Second prize was awarded to Mr. George Prince, Longworth, Berks, whose vases of Juliet, General McArthur, and Mdme. Melanie Soupert were very fine. Mr. Henry Drew, Longworth, third.

CUT ROSES.

There were four contestants in the leading class for seventy-two cut roses, and the fight for first place was a close one. Messrs. D. Prior and Sons, Colchester, led, winning the £7 award with a fine clean lot of blooms, though some of them were a bit thin owing to the recent dry weather. Of Hardegg, Maman Cochet, Ethel Malcolm, Mrs. J. Laing, Bessie Brown, Marechal Niel, and Mrs. David McKee there were fine examples. Messrs. B. Cant and Sons, Colchester, came second, and their set was notable for the excellence of its light coloured flowers; Messrs. R. Harkness and Co., Hitchin, third; and Messrs. Frank Cant and Co., Colchester, fourth.

Messrs. J. Burrell and Co., Cambridge, annexed the premier award for four dozen roses, and they set up fine flowers of Lyon Rose, Comtesse de Nadaillac, Mrs. Herbert Hawksworth, Mdme. Jules Gravereaux, and Maréchal Niel; Messrs. D. Prior and Sons, second; Messrs. R. Harkness and Co., third; and Messrs. Frank Cant and Co., Colchester, fourth. Messrs. J. Burrell and Co. were to the front again in the class for two dozen blooms, and were followed by Mr. George Prince and Messrs. D. Prior and Sons. For eighteen blooms the awards fell in due order to Messrs. J. Burrell and Co., Messrs. D. Prior and Sons, and Messrs. W. and J. Brown.

ORCHIDS.

Messrs. Jas. Cypher and Sons, Cheltenham, won the leading prize for a display of orchids, and the arrangement was very light, bright, and elegant. At the sides, cattleyas, lælio-cattleyas, and brasso-cattleyas were massed with miltonias and sobralias, while high in the centre odontoglossums and thunias rose above graceful sprays of golden oncidiums, odontiodas, and Renanthera Imschootiana.

The best dozen orchids were those shown by Messrs. J. Cypher and Sons, Cheltenham, and among their finest specimens we noted Lælio-cattleya Aphrodite, with sixteen flowers; Miltonia vexillaria Cobbiana, Cattleya gigas, C. Gaskelliana, Epidendrum prismatocarpum, and Thunia Marshalliana. Second prize was won by Mr. J. Barker, gardener to W. P. Burkinshaw, Esq., West Hill, Hessle, with Cœlogyne pandurata, and Miltonia vexillaria Cobbiana in good form; Mr. Davidson, third. The Messrs. Cypher led for six orchids, and presented a fine Lælia tenebrosa and a good Oncidium Marshallianum in their set. Mr. Barker was again second, and his Lælio-cattleya Lady Miller, with twenty-two orange-salmon flowers, was very fine in this class; Mr. E. H. Davidson, Twyford, Berks, third.

Mr. Barker had the best specimen orchid, an example of Cattleya Mossiæ alba with seven beautiful blooms. The best three orchids came from Mr. E. H. Davidson, who staged Lælio-cattleya Canhamiana, Cattleya Mendeli Twyford Gem, and Odontoglossum Dora. In the amateurs' class for six orchids Mr. Barker had things all his own way, and his Miltonia Bleuana was a very pretty variety. Mrs. M. Furness, Monk Fryston, and W. Matheson, Esq., Horsforth, were also prize-winners in the orchid classes.

PLANTS.

In the plant classes Messrs. Jas. Cypher and Sons, Cheltenham, won the chief awards, scoring for a collection of stove and greenhouse plants with fine ixoras, anthuriums, bougainvilleas, statice, etc.; for a specimen flowering plant with a giant Clerodendron Balfouri; for three fine foliage plants with palms and a brilliant Croton Montefontainense, 6ft. high; for three stove and greenhouse plants, with Ixora Williamsi, Clerodendron Balfouri, and Franciscea eximea; and for six ornamental foliage plants, with fine palms and big crotons.

Messrs. John Waterer and Sons, Bagshot, won the first prize for a group of rhododendrons arranged on a space of 200 sq. ft. Theirs was a triangular arrangement, with a few standard red Japanese maples above the rhododendrons and an edging of veronicas and green moss. The rhododendrons were up to Bagshot form, notwithstanding the late date, and we noticed fine examples of Gomer Waterer, Lady Clancarty, Beauty of Bagshot, Mrs. Mendel, Lady Hillingdon, Lady Annette de Trafford, and Warrior.

Mr. J. Donoghue was awarded the first prize for a group of carnations; he showed malmaison varieties chiefly, and these were scarcely at their best, many of the flowers needing several more days in which to expand; Mr. W. Longstaffe, Garth Terrace, York, second.

Pelargoniums were fairly well shown, but the specimens were only shadows of the giants to be seen at York a score of years ago. So doth fashion change. Mr. Henry Pybus, Monkton Moor, led for a dozen zonal varieties with large, freely-flowered specimens, his Mrs. Newdigate and Mrs. Kelly being the best plants; Mr. J. W. Clarke, Clifton, York, came second with smaller plants that carried somewhat better flowers; Mr. J. Lumley, South Milford, third. For six specimens Mr. Pybus was again to the fore, Mr. Clarke and Mr. Lumley following in the order given.

Mr. J. Clarke beat Mr. Pybus for three specimen pelargoniums, and showed pretty plants of Beauty, Lady Sheffield, and Empress of India; Mr. Lumley third. Mr. J. W. Clarke scored for half a dozen double-flowered specimens, his varieties being R. D. Sayers, F. V. Raspail, Royal Star, Ernest Louth, King of Denmark, and Mdme. Thibaut; Mr. H. Pybus second; and Colonel Petre, Burton Lodge, York, third.

A curious class was one for a collection of plants and cut flowers, arranged for effect upon a table space of 12ft. by 6ft. Here Messrs. J. Cypher and Sons, scored with a light arrangement of orchids, crotons, liliums, ferns, and palms, all tastefully disposed; Mr. W. A. Holmes, West End Nurseries, Chesterfield, second with crotons, carnations, ixoras, etc.

Messrs. Blackmore and Langdon were to the front for a large group of begonias, and the splendid plants exhibited and the beautiful varieties staged commanded general attention and received unstinted admiration both for the quality and disposition of the flowers. In the other begonia classes Mr. Skill, gardener to S. Leetham, Esq., Elm Bank, York; and Mr. T. Winn, Garth Terrace, Burton Lane, York; and Mr. T. Douthwaite, gardener to Miss Barstow, Garrow Hill, York, were the leading prizewinners. Mrs. Ferrier, Fulford Croft, York, won first prize in the class for a group of begonias, with a good exhibit of double and single and frilled varieties; Captain E. Walker was placed second, and Mr. T. Winn was third.

There were five gloxinia groups, and first prize in this class fell to Mr. W. Walls, gardener to Mrs. Craven, Moorby, York, for very fine plants, well arranged with ferns, etc. Mr. F. Deane, gardener to Joseph Rowntree, Esq., Clifton Lodge, York, came second with a rather closely-packed group of well-grown plants; Mr. H. W. Clark, gardener to Captain Walker, York, third.

Calceolarias made a brave show, and the best group of these gorgeous plants was staged by Mr. G. Shill, Elm Bank Gardens; Captain Walker second, and Mr. J. Rowntree third.

There were four groups of show pelargoniums, and Mr. Keighley, gardener to H. E. Leitham, Esq., J.P., Sheriff of York, Aldersyde, York, won the leading honours with a bright display; second place fell to Messrs. W. J. Godfrey and Son, Exmouth; and third to Messrs. Seagrave and Co., Sheffield.

FRUIT.

Fruit was not a large display. The best collection of six dishes came from Mr. J. E. Hathaway, gardener to J. Brennard, Esq., Baldersby Park, Thirsk, who showed Muscat of Alexandria and Black Hamburgh grapes, Brown Turkey figs, Royal George peaches, Violette Hative nectarines, and Jordan's No. 2 melon; second prize was won by Mr. J. C. McPherson, gardener to Lord Londesborough, Market Weighton. The order of

merit was reversed in the class for four dishes of dessert fruit, the same competitors changing positions.

Mr. W. H. Cooke, gardener to Lord Belper, Kingston Hall, Derby, led for a dish of peaches with fine specimens of Hale's Early; Mr. G. E. Thomas, gardener to the Marquis of Ripon, Studley Royal, Ripon, second, with Royal George. For nectarines, Mr. C. Lawton, gardener to Colonel Harrison Broadley, M.P., Welton House, Welton, led with Lord Napier in grand style; Messrs. Thos. Rovers and Son, Sawbridgeworth, second.

Mr. W. H. Dodson, gardener to H. J. Hope Barton, Esq., Stapleton Park, Pontefract, had the best black grapes, winning with small but finely-berried clusters of Black Hamburgh; Mr. F. W. Johnson, Boston Spa, second. Mr. F. Larner, gardener to Chas. Thelluson, Esq., Bradsworth Hall, Doncaster, scored for white grapes with Chasselas Napoleon in good form; Mr. Thos. Grix, gardener to J. M. Dawson, Esq., Brook Hall, Tadcaster, second, with Buckland

A good rockwork exhibit came from Messrs. Kent and Brydon, Darlington. The arrangement of the stone, and disposal of suitable plants in the niches and pockets betokened skilful handling. The same firm showed ornamental trees and shrubs, and some good hydrangeas and other flowering subjects. Quite an attractive bit of rockwork was arranged by Messrs. S. Broadhead and Son, Wooldale Nurseries, Thongsbridge, Huddersfield. The stone was old weather-beaten limestone, and in between the strata were growing dianthuses, saxifrages, Gypsophila cerastioides, and a varied collection of suitable alpines and miniature shrubs.

Perpetual carnations were splendidly shown by Messrs. Young and Co., Hatherley, Cheltenham. Scarlet Glow, Mrs. Raphael, Empire Day, and Mikado were all good, and a large sheaf of Cecilia in the centre of the stand received general praise, its fine yellow flowers being so clean and fresh-looking. Mr. A. F. Dutton, Iver, Bucks, also showed perpetual carnations in good form, using the

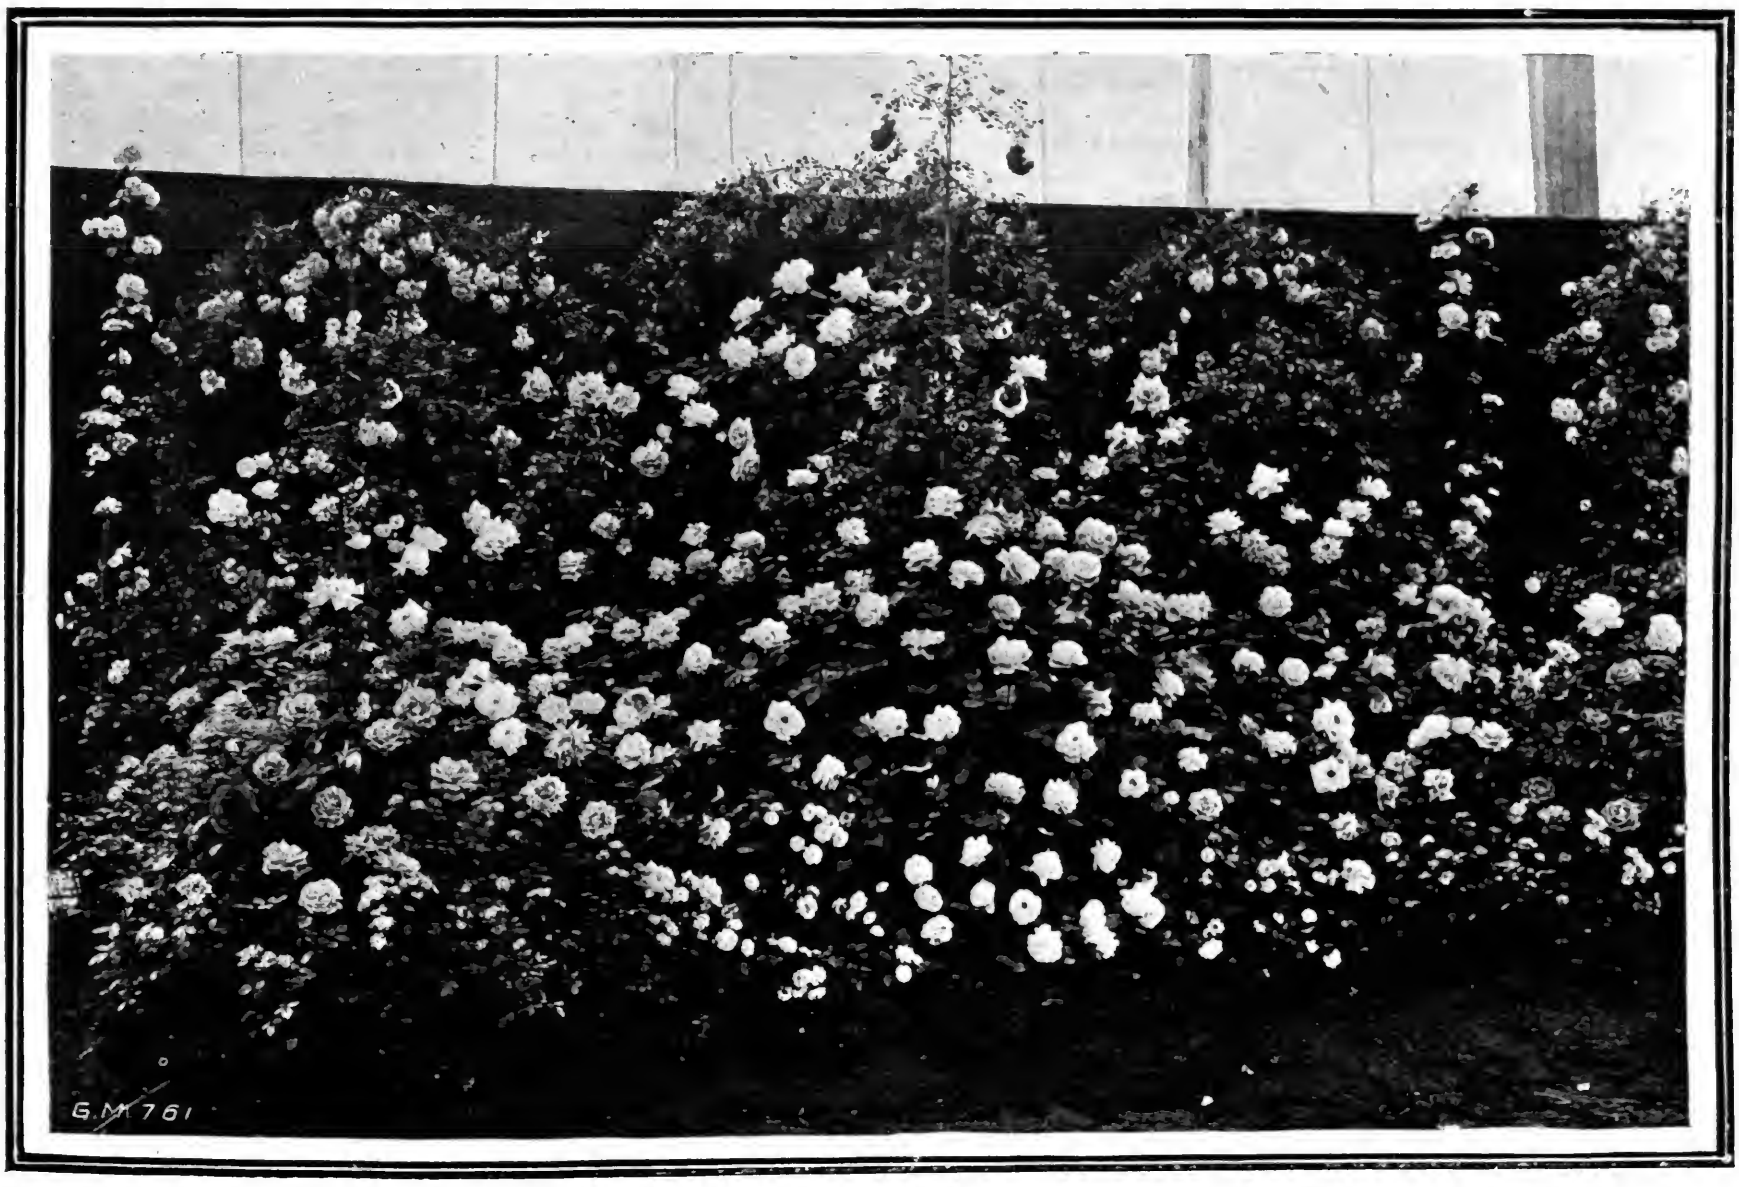
of horticulture, and on the pests and diseases that attack plants. Many of our readers were much interested in our exhibit, and we had the pleasure of welcoming many of our friends and supporters.

MEDAL AWARDS.

Special Large Gold.—To Messrs. Thos. Rivers and Son, Sawbridgeworth.

Large Gold.—To Messrs. Jas. Backhouse and Sons, Lim., York; Messrs. W. and J. Brown, Stamford; Messrs. Dobbie and Co., Edinburgh; Messrs. Kent and Brydon, Darlington; Mr. J. Wood, Boston Spa; Messrs. Mansell and Hatcher, Rawdon, Leeds; Messrs. E. Webb and Sons, Wordsley, Stourbridge; Messrs. Sutton and Sons, Reading.

Gold.—To Messrs. W. Artindale and Sons, Sheffield; Messrs. Batchelor and Sons, Harrogate; Messrs. R. H. Bath, Lim., Wisbech; Messrs. Charlesworth and Co., Haywards Heath; Messrs. Dicksons, Chester; Mr. A. F. Dutton, Iver, Bucks; Messrs. Gunn and Sons, Olton; Miss Hemus, Upton-on-Severn;



FIRST PRIZE GROUP OF POT ROSES.
Exhibited by Mr. Wm. Todd at the York Floral Fête and Gala.

Sweetwater. Mr. G. F. Brotherston, gardener to Francis Samuelson, Esq., Breckenbrough Hall, Thirsk, had the best dish of strawberries, winning with the popular Royal Sovereign; Messrs. Thos. Rivers and Sons scored for a dish of cherries with the black Early Rivers variety.

NON-COMPETITIVE.

Mr. John Wood, Boston Spa, York, erected another of his excellent model rockeries, the stone used being the fine old weathered Yorkshire limestone which we have commented upon on former occasions, and which enabled the exhibitor to produce the effect of an old-established and matured rockery. This exhibit was tiny in comparison with Mr. Wood's grand effort at Chelsea, but the clever arrangement was equally creditable, simply because the effect produced was that of a little corner of an actual projection in one of Nature's mountain gardens. The plants used were just sufficient to give the touch of life required to complete the picture, everything used being of the nature of rarities such as delight the connoisseur.

artistic baskets we have several times mentioned as receptacles for his flowers. Niagara, Beacon, and Mrs. A. F. Dutton were all good. Messrs. W. J. Godfrey and Son, Exmouth, put up some brilliant zonal pelargoniums, and also a small collection of choice fancy pelargoniums.

The collection of fruit trees in pots brought up by Messrs. T. Rivers and Son, Sawbridgeworth carried fine fruits. The Cardinal and Early Rivers nectarine and the May Duke cherries were splendidly coloured, and Lady Sudeley apples were finely finished fruit. This was a splendid exhibit. Rural table decorations exhibited by Robert Sydenham Limited, Tenby Street, Birmingham, were tastefully furnished with sweet peas. The flowers were good, and there was a lightness about the arrangement that pleased the eye.

Messrs. W. H. and L. Collingridge, 148-149, Aldersgate Street, E.C., occupied a stand on which The Gardeners' Magazine and "Amateur Gardening" were displayed, together with a range of books on various branches

Messrs. E. W. King and Co., Coggeshall; Messrs. J. Kelway and Sons, Langport; Mr. W. Lawrenson, Yarm-on-Tees; Messrs. J. Peed and Sons, West Norwood; Messrs. C. E. Simpson, Lim., York; Mr. W. J. Unwin, Histon, Cambs; Messrs. Young and Co., Hatherley; Messrs. Blackmore and Langdon, Twerton-on-Avon.

Silver-gilt. — To Messrs. Broadhead and Son, Huddersfield; Messrs. S. Bide and Son, Farnham; Messrs. W. J. Godfrey and Sons, Exmouth; Messrs. Sander and Sons, St. Albans; G. Yeld, Esq., M.A., Burton Lane, York.

Silver.—Messrs. Blackmore and Langdon, Twerton-on-Avon; Messrs. Jarman and Co., Chard; Messrs. Longster and Sons, Malton; Mr. W. A. Manda, St. Albans; Mr. G. W. Miller, Wisbech; Mr. G. Prince, Longworth; Robert Sydenham Limited, Birmingham; Messrs. Seagrave and Co., Sheffield; and Mr. W. R. Tranmer.

We shall make further reference to the non-competitive displays in our next issue.

BLETCHLEY AND FENNY STRATFORD HORTICULTURAL SOCIETY.

BLETCHLEY PARK, BUCKS.

Magnificent grounds, adjoining Bletchley Junction, L. and N.W. Rly.

FOURTH ANNUAL SHOW,

AUGUST 4th, 1913, BANK HOLIDAY.

The leading Show in the Midlands.
Special large Prizes for Roses, and for Table Decorations, etc., etc.

Schedules on application to Secretary,
THOS. BEST.
Bletchley, June 16th, 1913.

YORKSHIRE AGRICULTURAL SOCIETY.
GRAND HORTICULTURAL SHOW will be held in YORK, JULY 23, 24, and 25, 1913. Large Prizes are given for GROUPS OF PLANTS, HERBACEOUS FLOWERS, FRUIT, etc.
For Schedules apply PETER BLAIR, Trentham Gardens, Stoke-on-Trent.
Entries close July 5th.

LINCOLNSHIRE AGRICULTURAL SOCIETY. GREAT HORTICULTURAL SHOW will be held in LINCOLN, JULY 17th and 18th, 1913. Liberal Prizes are given for Groups of Plants, Roses, and Hardy Flowers.
For Schedules apply PETER BLAIR, Trentham Gardens, Stoke-on-Trent.
Entries close June 30th 1913.

BECKENHAM HORTICULTURAL SOCIETY.
GRAND SUMMER SHOW,
WEDNESDAY, JUNE 9, 1913.
Open Classes, Roses, etc.
Entries close June 28, 1913.
Schedules from Honorary Secretary, T. J. JACKSON, 5, Overbury Avenue.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

(Continued from page 452.)

Jas. Carter and Co., Raynes Park, for irises; Messrs. W. Cutbush and Son, Highgate, for hardy plants; Messrs. Kelway and Son, Langport, for pæonies; Messrs. Jas. Veitch and Sons, Lim., Chelsea, for pæonies, cannas, etc.; Messrs. Wallace and Co., Colchester, for hardy plants.

Silver Banksian Medals to Messrs. H. Burnett, Guernsey, for carnations; Mr. Jas. Douglas, Great Bookham, for carnations; Messrs. G. Jackman and Sons, Woking, for hardy plants; Messrs. H. J. Jones' Nurseries, Lewisham, for Canterbury bells; Messrs. Stuart Low and Co., for carnations; Messrs. Paul and Son, Cheshunt, for roses; Mr. A. Perry, Enfield, for hardy plants; Mr. M. Prichard, for hardy plants; Mr. G. Reuthe, Keston, for hardy plants; Messrs. T. S. Ware, Lim., Feltham, for hardy plants; Messrs. Whitelegg and Page, Chislehurst, for hardy plants; Mr. Goodson, Putney, for orchids; Mesrs. Hassell and Co., Southgate, for orchids; Mr. Flory, Twickenham, for orchids; Messrs. Charlesworth and Co., Hayward's Heath, for orchids; Messrs. S. Low and Co., for orchids.

Bronze Flora Medals to Messrs. Brown, Peterborough, for hardy plants; Mr. Smith, for hardy plants; Messrs. Bunyard and Co., Maidstone, for hardy plants.

Bronze Banksian Medals to Messrs. Dobbie and Co., Edinburgh, for vegetables; Mr. Chas. Blick, Hayes, for carnations; Messrs. W. Fells and Co., Hitchin, for hardy flowers; The Guildford Hardy Plant Company, for hardy flowers; Mr. F. Lilley, Guernsey; Messrs. Carter Page and Co., dahlias, etc.; Messrs. J. Peed and Son, for hardy flowers; Messrs. J. Cheal and Sons, for cut trees and shrubs; Messrs. Phillips and Taylor, Bracknell, for hardy flowers; Messrs. J. Piper and Co., for delphiniums; Mr. R. C. Notcutt, for hardy flowers.

Awards of Merit to Gladiolus Queen of the Whites, from Messrs. B. Hoogstraten, Sassenheim; Carnations Thomas à Beckett and Scarlet Gem, from Mr. Chas. Blick; to Trollius patulus Bees var., from Messrs. Bees, Lim.; to Sweet Pea Frilled Pink, from Messrs. Dobbie and Co.; to Statice Suworowi alba, from Mr. R. C. Notcutt; to Sweet Pea Edith Taylor, from Mr. T. Stevenson; to Philadelphus Norma, from Sir T. Lawrence; to Pæony Gismonda, from Messrs. R. H. Bath, Lim.; to Rose Paul's Lemon Pillar, from Mesrs. Paul and Son, Cheshunt; to Spiræa Sargentiana, from the Hon. V. Gibbs; to Saxifraga Counainia, from Messrs. Fells and Co.; to Astilbe Britannia, from Mr. Profittlich; to Rose Mrs. G. Norwood, from Mr. E. Hicks; to Blandfordia Cunninghami, from Mr. A. Worsley; to Cattleya Gaskelliana Fairy Queen, from Baron Bruno Schroeder; also to Odontoglossum crispum The Baroness, from the same exhibitor; to Oncidioda Bella, from Messrs. Charlesworth and Co.

SCIENTIFIC COMMITTEE.—June 3.

Present: E. A. Bowles, Esq., in the chair; Messrs. J. Fraser, W. E. Ledger, G. Wilson, J. T. Bennett-Poe, and F. J. Chittenden (hon. sec.).

VIOLET WITH LACINIATE LEAVES.—Mr. C. T. Druery sent a leaf of the sweet violet with the margins much cut, varying from the normal type in the way many species of Dianthus vary in their petals.

DAFFODILS FROM NEW ZEALAND.—Mr. A. E. Bowles showed flowers of King Alfred and Flamingo daffodils then in bloom, the plants having been raised from bulbs received from New Zealand.

LÆLIO-CATTLEYA × "FREAK."—Mr. G. Wilson showed a plant of Cattleya citrina × Lælia purpurata from the garden of C. J. Lucas, Esq., Warnham Court, Horsham. The flowers were intermediate in size and colour between the parents, and they are produced on a horizontal spike. A Certificate of Appreciation was recommended to Mr. C. J. Lucas.

PRIMULA CONSPERSA. — Messrs. J. Veitch and Sons, Lim., showed specimens of this species of primula from West Kansu, China, raised from seed collected by Mr. Purdom. It is a species of the farinosa section, flowering later than P. farinosa, and with taller stems and large flowers. The flowers are much the colour of P. farinosa.

CATTLEYA MOSSIÆ BUD SPORT.—Mr. E. H. Davidson sent a plant of C. Mossiæ Golden Ray having the petals marked with yellow like the labellum. It appears to be a case of irregular peloria, but differing from the usual form of peloria in having the labellum characters showing the petals, whereas in the usual form the petal characters show in the labellum.

United Horticultural Benefit and Provident Society.

The monthly committee meeting of the above society was held in the R.H.S. Hall on June 9, Mr. Chas. H. Curtis in the chair. Five new members were elected. Four members were allowed to withdraw double the amount of interest from their deposit accounts, viz., £6 1s., £4 12s. 4d., £3 2s. 2d., and £2 14s. 8d. respectively; and one member withdrew the sum of £20 from his deposit account. The sick pay for the month amounted to £43 7s. 4d. on the ordinary side, and £18 7s. 4d. on the State section, and maternity claims amounted to £18 10s. Mr. W. Collins (late secretary) was co-opted a member of the committee in the place of Mr. A. C. Hill. The secretary reported that balance-sheets and forms had been sent to principal nurserymen, park superintendents, and mutual improvement societies, with the object of bringing the "United" more to the notice of the young gardener. The committee also welcomed the suggestions put forward by two members, and these will be thoroughly discussed and reported upon in due course.

Mr. A. C. Hill, the secretary of the society, informs us that the following questions as to who is the employer for the purpose of the National Insurance Act have been submitted to the Commissioners, and the answers thereto are as given in the several paragraphs.

(9) A man who is carrying on business as a haulier is employed by a gentleman to do gardening work at the latter's private residence. The employment is regular, the man doing the work when he has spare time; he is paid 4d. per hour. The employer exercises practically no control over him, but is in a position to give orders if necessary. Decision:—That the employment of the applicant in garden work is under a contract of service within the meaning of the Act, and he is liable to be insured. (Question 78.)

(13) Applicant employs a gardener who does the work at his own convenience, and sends in a quarterly account for work done. The gardener also employs other men who sometimes take his place in performing the work. Decision:—That the employment of a gardener therein referred to is not

employment within the meaning of the Act. (Question 113.)

(191) A man who was employed to work in a private garden at a remuneration of 3s. per day. He was engaged from day to day for a period of nine days consecutively. Decision:—That employment by the applicant of a man to do work in his garden on the conditions set out in the application was employment of a casual nature, and, as it was not for the purpose of the applicant's trade or business, it was excepted under part 2 of the National Insurance Act, 1911. (Question 1168.)

(211) A gardener is employed at a private house to attend to a greenhouse, keep up the fires in the winter, etc., and to attend generally to the garden. The employer does not in practice exercise control over the work, but has the right to do so; the gardener receives 4s. per day, and is required to do the work in person. Decision:—That the man who is employed by the applicant to look after his greenhouse and do gardening work under the conditions set out in the application is employed under a contract of service within the meaning of the Act. (Question 968.)

East Anglian Horticultural Club.

At the June meeting of this club Mr. H. Goude, lecturer to the Norfolk County Council, gave a very interesting discourse upon "The Relation of Bee-keeping to Horticulture." He stated that bees were far more useful in the production of a fruit crop than was generally thought, and he was pleased to be able to state that latterly large fruit growers were beginning to see the importance of the matter, and were introducing bees into their orchards. He explained thoroughly the function of the bees, and the way they carried on their useful work of pollination, and how they helped to produce fruit upon trees that were self-sterile. Some remarks followed upon their work in the floral world, and also in the vegetable garden. This talk upon bee-keeping was much appreciated.

The animated discussion which followed proved that the subject had evoked much interest, and the lecturer was warmly thanked for his visit.

Many of the members contributed fine displays of flowers. Mr. John Brown, gardener to F. Glover, Esq., Norwich, staged some extra well-grown coleus. Mr. F. Wilby, gardener to F. A. Bainbridge, Esq., Hethersett, had fine outside-grown sweet peas of the newest kinds. Messrs. A. J. and C. Allen, Norwich, had bold bunches of some of the newer roses. Mr. W. Shoesmith, gardener to F. W. Harmer, Esq., and Mr. W. Mayoram, gardener to W. T. F. Jarrold, Esq., Thorpe, were each responsible for a nice exhibit of strawberries. The competitive classes also were keenly contested.

On the day following the officers and committee accepted an invitation to spend the afternoon in the garden of Louis Tillett, Esq., The Cottage, Old Catton. This garden has a reputation for being well kept, and for containing subjects of great interest. Mr. F. Williams, who is in charge here, is president of the club this year, and he conducted the party round. Congratulations he received in large measure, but most perhaps for the beautiful group of the North American cypripedium, which was a treat.

OBITUARY.

MR. C. E. PILLING.

Horticulturists in Norfolk have received a severe shock by the sudden death of the above-named gentleman, who for some time has been secretary of the Norfolk and Norwich Horticultural Society. He took office when the society was not in a very flourishing condition, but by dint of hard work and enthusiasm he lifted it up considerably. Only 48 years of age, Mr. Pilling died at a tennis party on the 9th inst. in the County Rectory Garden, near his home at Wymondham. Many horticulturists paid their last respects to him at the graveside.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

BRITISH GENTIANS.—S. G. F., Purley: If you will be good enough to tell me whether there are any British species of gentian I shall be very much obliged.—Hooker lists and describes five species of gentian as British. These are: Gentiana campestris, pale lilac; G. Amarella, very like G. campestris, but with calyx less deeply divided; and G. nivalis, a low-growing, blue-flowered species. These three are annual kinds. The perennials are G. Pneumonanthe, bright blue, from 1ft. to 2ft. high; and G. verna, a well-known species of lowly growth and with bright blue flowers. The latter ascends to 2,400ft., and is found in Westmoreland, Durham, York, Mayo, Clare, and Galway. It is also found in most alpine districts in Europe, excluding Turkey, and in Northern and Western Asia.

PROPAGATION OF FIGS BY CUTTINGS AND LAYERS.—Mr. Alfred Booth writes, from Bradford: On February 22 last you kindly inserted a query of mine concerning the best method of layering a little bush fig. It was in a cold house, and I ran seventeen of the slender branches through four-inch pots, at the same time putting the remaining eleven branches in slight bottom heat as cuttings. In both cases the results are good, and I have now twenty-eight sturdy plants potted into six-inch and seven-inch pots. However, the result of this and some previous experiments leads me to say that, as the fig is such a free-rooting subject, the method of propagation by cuttings (given a little bottom heat) is less trouble and more expeditious than that of layering. I may add that it is about sixty years ago since I commenced as an amateur to experiment with the Brown Turkey fig, and now, at seventy-five years of age, I am still an enthusiast in these matters, and find great pleasure and profit from the regular perusal of THE GARDENERS' MAGAZINE.

PACKING GRAPES.—F. P. D., Shrewsbury: Kindly tell me the best method of packing grapes to travel by rail. The chief difficulty experienced so far is that of preserving the "bloom" on the berries.—It is practically impossible to send grapes by rail for any distance, and at the same time entirely preserve the bloom on the berries. If special arrangements could be made to ensure safety, then the bunches could be sent on show-boards, the boards being well padded with cotton wool covered with tissue paper. A few ties will keep the bunches in position, and cotton wool wrapped in tissue paper will serve to relieve the weight of the shoulders of large bunches. The stand must be screwed down in a box. Another method is to use cotton wool or fine wood wool for padding the sides of a box, wrap the bunches in soft paper, as cut, and at once place them in the box, stalk upwards. Cover with paper and add sufficient cotton wool or wood wool to keep the whole firm when the lid is put on. Where the railway people are used to handling fruit, and the distance to be covered is not great, the method of packing the grapes in baby baskets, on paper-covered cotton wool, is a good one. The baby basket is then placed in a wicker "flat" or hamper, and fastened down.

TREE TOMATO. — D. G., Chepstow: Would the tree tomato grow and fruit out of doors in this district, or would culture under glass be necessary?—The tree tomato (Cyphomandra betacea) would not be a success out of doors, and is hardly likely to survive the winter without protection even in a sheltered place. It is a quick-growing, small tree, and if grown in standard form it is useful for sub-tropical bedding, its glossy green leaves being quite effective, while its orange-coloured, egg-shaped fruits are a great attraction. They would have to be specially grown in a warm house for this purpose, and hardened off, as in the case of other subjects

used for summer bedding. The fruits are quite good to eat when ripe, and the flavour closely resembles that of the tomato. It may be raised from seeds or cuttings, and treated like other shrubby, warmth-loving members of the solanum family.

AUCUBA AND LAUREL.—S. E. T., Stamford: I have always understood that the laurel and the aucuba were very closely related, if not members of the same family; but was told a few days ago that they belong to quite different natural orders. Will you kindly tell me whether I am correctly informed?—It is a quite common occurrence to find people who believe the laurel and aucuba are very close relatives, and this belief is shared by many gardeners who have not studied botany. The aucuba belongs to the order Cornaceæ, and is therefore closely allied to the dogwood. The laurel is, correctly, not a laurel at all, the tree laurel being the common bay (Laurus nobilis); while the shrub known as the common laurel belongs to the cherry family, and is named Prunus Lauro-cerasus, or Cerasus Lauro-cerasus. The bay belongs to the order Laurineæ, and the laurel to the order Rosaceæ.

ROLLED ROSE LEAVES.—C. H. M., Ross: I enclose some leaves taken from a rose trained upon the south side of our house. The leaves are rolled up in a curious fashion, and in most cases, when unrolled, are found to contain a greeny-grey maggot. Please tell us how to deal with the little pest that is doing so much damage in this way, for I find the leaves die before long, once they curl or roll up.—The rolling of the rose leaves is caused by the leaf-rolling sawfly (Blennocampa pusilla), a pest that has done a great deal of damage in some districts during recent years. The flies appear in May or June, and eggs are laid upon the leaves; the larvæ feed and cause the leaves to curl or roll up, and form comfortable hiding places from which they are not easily dislodged. When full fed the larvæ enter the soil, form cocoons, and remain there until about February, when pupation takes place. Hand-picking is the best method of dealing with an attack, and the leaves removed must be at once burned to destroy the larvæ it contains. Spraying with nicotine solution renders the foliage distasteful, and will kill the larvæ it reaches.

NAMES OF PLANTS.

S. E. J., Torquay.—Catalpa bignonioides.

C. B. W., Wisbech.—1, Linnæa borealis; 2, Saxifraga androsacea.

P. N., Watford.—1, Sophora virginica; 2, Dicentra formosa; 3, Clematis integrifolia.

T. R. C., Botley.—1, Dianthus neglectus; 2, D. deltoides; 3, Periploca græca; 4, Silene nutans; 5, Convolvulus mauritanicus.

M. B. F., Dorchester.—1, probably Cortusa pubens; send further specimens if possible; 2, Tamarix gallica; 3, Cassiope tetragona.

W. J. M., Kildare.—We did our best to determine the name of the plant, but failed to get the specimen identified. If you could send us more and better material we may be more successful.

NOTICE.

READERS experiencing difficulty in obtaining "THE GARDENERS' MAGAZINE" at any bookstall or newsagent should write to the

PUBLISHING MANAGER,
148-9, Aldersgate Street,
London, E.C.,

who will give the matter immediate attention.

MARKETS.

COVENT GARDEN.

Flowers.

Business continues to be brisk. Irises are very good, and both carnations and roses are abundant.

THE GARDENERS' MAGAZINE

NOTE OF THE WEEK.

Fruit Bottling.

Although the preservation of various kinds of fruit by the process commonly known as bottling is by no means new, it had, until within a comparatively recent period, been so long in abeyance in private houses, that when the revival came few indeed were those who had a practical acquaintance with the details essential to success. When some twenty-five years ago a movement was set on foot for the purpose of encouraging the extension and improvement of fruit culture and the introduction of improved methods of utilising fruits, it was generally believed that the drying of fruit under artificial conditions would become an important factor in the extension of the period in which the several kinds would be available for the table. The hopes that were entertained unfortunately failed in realisation. Many experiments were made, and it was found that while dried fruits of fairly good quality could be obtained, the drying process was really not adapted to the conditions that obtain in this country. In the course of the experiments at Chiswick and elsewhere it was soon proved to demonstration that a large proportion of the fruits grown in British gardens are quite unfit for drying, and that the others were far from satisfactory both for commercial purposes and home use. Not even the plums, of which much was expected, gave good results; they lost much in weight, and their shrivelled appearance placed them at a great disadvantage in comparison with imported fruit that had been ripened and dried naturally in a more sunny clime than that of the British Isles. The drying process having, so far as this country is concerned, having failed, attention was once more given to the bottling of fruit for the purpose of extending the period in which it may he had in use, and this has proved an unqualified success. There have been failures, and in many cases where failure has been averted the results have not been satisfactory. These have been due to an imperfect acquaintance with the details, or a want of appreciation of the necessity of every detail being carefully carried out. By the process of bottling, fruits which naturally have a season extending over a few weeks only may be had in excellent condition throughout the year; and the details are so simple as to admit of the work being entered on by any intelligent person with the full assurance of success. There are a few points to which special attention should be directed, and foremost among them is the fruit best suited for bottling. Strawberries, which are plentiful, and now coming to the table in splendid condition, may be bottled, but thus dealt with they lose so much in appearance and flavour as to be but poor apologies for the fresh fruits. Moreover, they shrink so much in course of sterilisation that when complete the fruits contained in three bottles are required to fill one, and these have to be again heated to ensure the proper capping of the bottle. Gooseberries, black and red currants, raspberries and loganberries, and Morello cherries and plums are all of much value. Gooseberries are now in prime condition for bottling, as they should be nearly or quite their full size without the slightest indication of their becoming soft. We are usually told by writers that these fruits should be bottled when of the size used for tarts, but this is vague, because of the continuous increase in size until the ripening stage is reached. Black and red currants should be bottled when ripe, but before they are ripe enough to have become soft. Raspberries and loganberries are of exceptional excellence, and to have them at their best the fruits must be selected and handled with great care. They should be sufficiently advanced towards maturity to be red and to have their characteristic flavour partly developed, but be quite firm. It is essential they be put into small baskets when gathered, and be bottled immediately. They will then retain their characteristic shape and colour, and be rich in flavour, instead, as often happens, be shapeless masses and indifferently flavoured. Cherries and plums are the most satisfactory if bottled when approaching ripeness, but not so mature that there is the slightest risk of injury to the skin. Experimentally we have bottled plums when green, and at various stages of maturity, but the best results have been obtained with fruits that had taken on their usual red, purple, or yellow colour, yielded slightly to pressure, but without the skin having become so tender that there was a risk of breaking it when the fruit was handled. In all cases the fruit selected for bottling should be the best of their respective kinds in the garden and market. The process will not, as some bottlers appear to assume, convert that which is second-rate into fruit of the highest class. In the case of plums some consideration should be given to varieties, for there is a considerable difference in their suitability for the purpose under consideration. Those which can have the strongest recommendation are perhaps the Czar, Greengage, Monarch, and Victoria, and those who have supplies of these varieties should take full advantage of them. The last-named is the most generally useful of the plums, and we find it the most highly appreciated when on the table. Plain water is the most frequently advised for filling the bottles, and excellent results may be obtained with its use, but syrup has much to recommend it, and we advise those of our readers who have not used other than plain water to substitute it for the latter in a few dozen bottles. When the

MR. J. DAVIS.

fruits, especially of gooseberries, have become charged with water there is some difficulty in sweetening them properly, and in all cases it is necessary to heat them up in some way, and thereby subject them to further cooking. On the other hand, with syrup the sweetening is uniform and agreeable, and when used as a separate sweet it is simply necessary to turn them out of the bottle into the dish, and thus the risk of breaking the fruits is avoided. The syrup is made by adding half a pound of cane sugar to each quart of water and boiling for 30 or 40 minutes at a temperature of 212 degrees. For Morello cherries, gooseberries, and some of the rather sour plums, the sugar used may be increased to three-quarters of a pound. There is no occasion to refer otherwise than briefly to the apparatus necessary, for, contrary to the opinion so generally held, it need not be elaborate or costly. If one can afford such a luxury as a steriliser fitted with thermometer, etc., it may be purchased and used, but the sterilisation can be effected equally well in the large iron pot which is found in most households. Where bottles have to be purchased, those with glass tops and screw rings should be selected, because of the greater facility with which the bottles can be made air-tight when sterilisation is complete. They are not, however, essential to success, as any wide-mouthed bottles of convenient size may be used. In the case of the latter it is simply necessary to fill the bottles high up in the neck previous to sterilisation, and when this is complete, place them on one side until the contents are quite cold, and then pour sufficient melted mutton suet into them to form a layer about three-quarters of an inch in thickness. In all cases the bottles should be closely packed with fruit and filled to nearly the top of the neck with water or syrup, great pressure being avoided in the filling process. The temperature of the water in the steriliser has to be carefully regulated, a point with which some few private bottlers are not acquainted, judging from the cracked fruit that may be seen. The water or syrup when put into the bottles will be cold—that is to say, of a temperature between 60 and 65 degrees. It is then slowly raised to a temperature of 155 or 160 degrees, so slowly indeed that about 45 minutes are required to bring it to the temperature mentioned. Subsequently the water is maintained at the same temperature for another three-quarters of an hour, when the process is complete, and the bottles taken out and screwed down, or in the case of those without caps be put on one side to cool. A steady temperature is necessary, for when the heating of the water is hastened during the earlier stage a large proportion of the fruits will have their skins cracked and be rendered more or less unsightly.

Mr. J. Davis, who has occupied the position of head gardener at The Glebelands, South Woodford, the residence of J. Gurney Fowler, Esq., is generally recognised as one of the most successful practical horticulturists of his day, and the high reputation he enjoys is well deserved. Best known in horticultural circles as an orchid grower of a high degree of eminence, Mr. Davis has obtained distinction as a cultivator of fruit and vegetables, and as a proof thereof it may be mentioned that he has for some considerable period been a member of the Fruit and Vegetable Committee of the Royal Horticultural Society. It will be of interest to recall the fact that, at an early age, Mr. Davis commenced his gardening career at Stanlake Park, Twyford, where he remained three years, and laid the foundation of his remarkable knowledge of gardening generally. After a year profitably spent in the gardens of Hurst Lodge, Twyford, Mr. Davis went to Haines Hill, the residence of F. C. Garth, Esq., also in the Twyford district, and here he remained seven years, four years as general foreman. After an engagement as garden foreman at Billingbear Park, Wokingham, Mr. Davis entered on his present position as head gardener at The Glebelands. Orchids were grown in some of the gardens in which Mr. Davis received his training, but not extensively, and at The Glebelands the collection of these fascinating flowers was not large. Now, as the result of the interest taken in them by Mr. J. Gurney Fowler, who at the present time is the chairman of the Royal Horticultural Society's Orchid Committee, and the skill of his gardener, the collection is extensive, and remarkable for the number of the fine hybrids and varietal forms it coutains, and also for the robust health of the plants. Mr. Davis also excels as a cultivator of selaginellas, and those who were fortunate in seeing the fine specimens that were shown in association with orchids from The Glebelands gardens at the Royal International Horticultural Exhibition at Chelsea last year will not readily forget them.

Field-Marshal Lord Grenfell, the President of the Royal Horticultural Society, received, on the 20th inst., the Honorary Freedom of the Gardeners' Company, which had been conferred upon him in recognition of his association during the past twelve years with the work of the Royal Horticultural Society. Following the meeting the members were entertained at lunch by the Master, Mr. G. R. Blades, and, in acknowledging the toast of his health, Lord Grenfell said that he had been a gardener nearly all his life, and wherever he had been quartered he had done his best to make a garden somewhere in the vicinity. He had done so in Canada, and also in Malta, where he thought he was the first to produce roses. It had been supposed to be impossible to grow English roses in Malta, but he had imported a large number and grown them successfully. He had no garden in India, but he had one in Egypt, where he spent twelve years, and he started a horticultural society there. He thought that by the time he left that country there had been a great improvement in the culture of flowers there. It was very difficult to grow flowers in Egypt owing to the rise of the Nile.

The Henry Cannell Fund.—With very great regret we have to announce that Mr. Henry Cannell, V.M.H., of Swanley, has, in his old age, fallen on evil times, and is greatly in need of financial assistance; and, having regard to the services he has rendered in the course of his long and strenuous life, we earnestly hope that this assistance will be forthcoming. A short time since we received information of the straitened circumstances in which Mr. and Mrs. Cannell are, and in making the necessary enquiries, we found the case so sad as to justify our making an appeal for funds to alleviate the unfortunate position in which they are in. When on the point of making the appeal we received from Sir Harry Veitch a circular letter calling attention to the case and appealing for funds, and this appeal has our warmest support. Mr. Cannell is now over 80 years of age, as also is Mrs. Cannell, whose health has been so indifferent as to necessitate her having to keep her bed during the past three years. They have had to leave the Swanley nurseries, and in consequence of their straitened circumstances, they applied for and have obtained the old age pension, which is all that they have to depend upon. We need not now refer to the work of Mr. Cannell in the introduction of many fine begonias, cannas, chrysanthemums, dahlias, fuchsias, pelargoniums, and other flowers for beautifying the garden and greenhouse, but we would mention that he had the misfortune to lose two of his sons who were associated with him in the business at a time when his age rendered their help doubly valuable. Sir Harry Veitch states that he will be pleased to receive any contributions to the fund, and that he will use them to the best possible advantage for both husband and wife. Upon the latter point there can be no doubt, and we trust a generous response will be made to the appeal. Contributions should be addressed to Sir H. J. Veitch, Royal Exotic Nursery, Chelsea, S.W.

Flowering of Agaves at Leicester.—One of the most interesting of the many features of the Abbey Park, Leicester, at the present time, is formed by the flowering of three of the fine specimens of Agave americana, which have long had their home in this fine open space. The specimens are between sixty and seventy years old, and splendidly developed and the flowering of three simultaneously is a matter of considerable interest.

National Sweet Pea Society.—This society's annual outings are invariably a success, and members are being notified of an outing to Messrs. John K. King and Sons, Coggeshall, on July 18, and to the society's trials at the Burbage Experiment Station on July 25; for the moment these dates are only approximate, but members wishing to join one or both of the parties will be sent particulars if they notify the hon. secretary of their intention, on or before July 7. The committee is issuing Question Sheets, and these will be the means of stimulating interest in the society's name flower, and gathering information for the general good. We also notice that the committee is offering a silver medal for the best photograph of sweet peas sent in by a member on or before September 1, and this offer is made for the purpose of securing a wider range of illustrations for the "Annual" of 1914. The society's London Exhibition will be held at the Royal Horticultural Hall, Westminster, on Thursday, July 17.

The Finchley Horticultural Society, which has reached its fifty-fourth year, will, as usual, offer for competition at its annual exhibition, which will be held on July 10, a number of challenge shields and silver cups, and Lord and Lady Ronaldshay have kindly promised to distribute them.

The Gardeners' Company.—In the course of the proceedings at the meeting held by the Worshipful Company of Gardeners, on the 20th inst., Mr. G. Rowland Blades, the outgoing Master, said that it had been a pleasure to him during his year of office to establish a common hall fund, which would provide a permanent home for the company. As an additional proof of his great regard for the Guild, and the interests of gardening, he was proposing to offer a substantial sum to the President of the Board of Agriculture as an endowment for the cause of technical education in gardening on certain conditions, the chief of which would be that the name of the Gardeners' Company should be for ever associated with his gift. The inducement for this proposed action of his was his appreciation of the honour of the Mastership.

and his gratitude for the kindness and loyal support he had received from all the Wardens, Assistants, and Commonalty of that dear old Guild. He also referred in eulogistic terms to the splendid work that had been done by Mr. E. A. Ebblewhite, the clerk, which had enabled the company to attain its present prosperity.

Sweet Pea Conference at Carlisle.—In connection with its provincial show, to be held at Carlisle on August 13 and 14, in conjunction with the Carlisle Horticultural Association, the National Sweet Pea Society will hold a conference, in the Market Buildings, at 7 p.m. on the first day of the show. Mr. F. J. Harrison, of Ulverston, will preside, and Mr. Alex. Malcolm, of Duns, will read a paper on "The Cross-fertilisation of Sweet Peas."

A Gardener's Lost Will.—Seven years ago Mr. William Chester, for some time head gardener to the Duke of Devonshire, at Chatsworth, died at the age of eighty, leaving estate exceeding £5,000. As no will was found, relatives in Australia successfully claimed the money. It was generally understood, however, that Mr. Chester intended to provide for his housekeeper. Last week Mr. Jennings, the present head gardener at Chatsworth, was hunting a rat in his office; his clerk was placing a trap in a recess over the doorway when he slipped, and in endeavouring to break his fall brought down a part of the ceiling, and also a document that proved to be the duly-attested will of the late Mr. Chester, leaving all his property to his housekeeper.

Destruction of the Alpine Pink in Lakeland.—We understand there is considerable indignation in the Lake district because of the removal, by collectors, of many rare plants, especially alpine pinks. Large masses of the latter have been removed from Hobgarton Cragg. We have no information as to the species that has been removed in quantity; it may be a dianthus, or, possibly, Lychnis alpinus, which is sometimes known as the alpine pink.

Flower Culture at Preston.—As mentioned in a recent issue of THE GARDENERS' MAGAZINE, special efforts are being made at Preston to stimulate greater interest in window gardening, and in the cultivation of flowers in front gardens of cottages and villas. A comprehensive competitive scheme, with liberal prizes, has been prepared and published, and strenuous endeavour has been made to place those interested in possession of information that will enable them to make a satisfactory beginning. Mr. W. N. Wood, the secretary of the Preston Horticultural Society, has been especially active in the educational side of the movement. He has just completed his series of lectures and demonstrations, which were commenced on May 20, and have proved highly successful. During a period of about three weeks Mr. Wood gave demonstrations at thirty-one schools and sixteen open-air stations, the attendance at the meetings varying from 100 to 500 persons, many of whom brought plants on which they were desirous of obtaining information. The interest aroused in the town is great, and it is anticipated that an immense improvement will be seen both in flower and window gardens this summer.

ROSE MRS. GEORGE NORWOOD.

A large and finely formed, bright rose-pink, sweetly-scented hybrid tea variety. A.M., R.H.S., June 17. Mr. Elisha Hicks, Hurst, Twyford. (See page 473.)

THE SITKA, OR MENZIES' SPRUCE.

Amongst the several exotic trees which are being tried under forest conditions in this country the Sitka spruce, or, giving it its correct name, Picea sitchensis, is likely to prove one of the most important, for it appears to be better adapted than any other tree yet tried for reclaiming wet and cold ground at a considerable altitude, while it is also spoken highly of in some quarters for planting in exposed positions about the coast.

Until recently the common spruce (Picea excelsa) was usually chosen for planting wet ground, but where this and the Sitka spruce have been planted side by side the latter has quickly taken the lead. When planted on wet ground, either at a low elevation or at a considerable altitude, young plants of P. excelsa commence to grow early in spring, and the young shoots are often crippled by frost. The Sitka spruce, on the other hand, starts into growth rather later, and is less liable to injury. It sometimes happens that trees which grow rapidly during their earlier years mature early, and are outgrown later by a kindred species which was slower in its early days; but there does not appear to be any fear of this happening with the Sitka spruce, for in various parts of the country there are ornamental specimens approaching one hundred feet in height, with a considerable girth, but which, from the date of introduction, 1831, cannot have reached maturity yet.

As an instance of its rapid growth when planted under favourable conditions annual growths of from four to five feet in length have been measured both in Scotland and in the South-west of England. On the other hand, trees planted on the "raised turf," or "Belgian system," on bog land at elevations varying between 800 and 1,400 feet in Scotland, have formed shoots twelve to fifteen inches long in a single season, and that the second year after planting.

So far as the timber is concerned, that from native-grown trees is superior to the wood of P. excelsa, and there does not appear to be any reason to doubt its quality when grown in this country. Any that has been seen so far has been cut from trees grown for ornamental purposes, and it was, therefore, rough and knotty, a condition which will not apply when proper forestry methods are adopted throughout their growth.

Whether planted near the sea coast or inland, it stands wind well, and in the south-west counties it is said to be superior to either Pinus insignis or Cupressus macrocarpa for exposed situations, although these two trees are looked upon as exceptionally good subjects for providing shelter for tender subjects.

The Sitka spruce is a native of the Pacific Coast region of North America, occupying a comparatively narrow belt from Northern Alaska to California. In many parts it is found in swampy ground about the banks and mouths of rivers, and extends to the tide mark along the coast. For the latter reason it is sometimes given the name of Tideland Spruce. Under favourable conditions it attains a height of 200 feet, with a trunk diameter of fifteen or sixteen feet. The best stands are said to occur in rich, moist soil in Oregon, Washington, and in some parts of British Columbia and South Alaska. The wood is light, strong, straight-grained, and brownish in colour, and the colour is more especially developed in the heart wood. It is used for all kinds of building purposes, cooperage, and paper pulp, forming one of the many important commercial timbers of Western North America.

The best plantations in the British Isles, and probably in Europe, are to be found at Durris, near Aberdeen. There are two plantations, covering about 83 acres. They stand at altitudes varying from 700 to 800 feet, and were planted on wet, boggy land, drains being opened at about eight or nine yards apart at planting time to let off some of the superfluous water. Originally, common spruce, Douglas fir, and Scots pine were mixed with the Sitka spruce, but the majority have been suppressed by the latter, and the plantations are now almost pure. The planting was accomplished in 1878, and the trees are now from thirty-five to forty feet high. No thinning has been done other than that naturally accomplished by the suppression of the weaker plants, therefore the plantations are dense enough to kill the lower branches, and so clean the trunks. Unfortunately, very few plantations were made for many years after those at Durris were formed, and the majority of those which are now to be found are less than ten years old.

One factor working against the general planting of Sitka spruce is its price, for it is still much dearer than ordinary spruce, although it appears to be becoming cheaper. Large quantities of young plants are offered by Continental nurserymen, but many people complain about the numerous deaths which occur amongst such plants, probably due, to some extent, to heating during transit. As a rule, if plants are obtained from such sources it is advisable to procure either one-year or two-year-olds, and line them out in the nursery previous to transferring them to permanent quarters, but many people prefer, and wisely so, to pay a little more for plants grown in this country, or to obtain seeds and raise their own.

There is one disease which attacks the Sitka spruce in common with the common spruce, that being the Spruce aphis, Chermes (or Adelges) abietis, which punctures the young leaves, and causes them to develop into a cone-like gall, often called a pineapple gall. Nursery stock and isolated trees may be cleaned by spraying once every fourteen days during April and May with a paraffin solution, but it is almost impossible to do anything to infested trees in a plantation, because of the labour involved in thoroughly spraying them.

W. DALLIMORE.

PRIMULA PULVERULENTA.

May I further commend Primula pulverulenta as a splendid subject for the waterside and for deep beds and herbaceous borders? Plants of this deep red primula are quite hardy throughout England, and from seed sown one season one obtains plants which make a magnificent display the next. The growth is much the same as that of P. japonica, but it is lighter in formation, and, in my opinion, much better adapted for garden decoration. Our plants were, at the middle of May, in their beauty, and continued to make a pleasing picture for some time. A fine variety is the blush white form shown under the name of Mrs. Berkeley. This makes a splendid contrast to the red colouring of the type. Whether Mrs. Berkeley is practically identical with some seedlings we have just flowered, my memory hardly justifies me in saying. With us these pale forms are of a soft salmon-pink shade, very dainty, and of decided merit. At any rate, Primula pulverulenta, or varieties raised from it, may be commended to all amateur gardeners. P. H.

ALLAMANDAS.

These are usually grown in a stove temperature in this country, but they do fairly well in an intermediate house in the summer time when grown in pots, which enables the cultivator to move them from place to place as occasion requires. Where allamandas are planted out in borders in a stove it is desirable to keep the soil around their roots rather dry throughout the winter months.

Experienced cultivators have no difficulty in growing very fine specimens, the flowers of which possess such soft shades of yellow and look so charming during many months of the year. On the other hand, growers who have not had much experience do not thoroughly know what the treatment should be, and often produce too much unripe wood on their plants. The branches of plants growing in borders should have the maximum amount of light throughout the growing season; any shading that may be advisable being of a temporary character. Plants in large pots can be moved to any required position.

Weakly shoots should at the winter pruning be cut out altogether, and others judiciously shortened. The soil must have a good watering and the branches frequent syringings to induce early growth of young shoots. These, in due course, require to be trained wide enough apart under the roof-glass to admit of light reaching all the main leaves. When the new shoots are about two inches long, those plants that need it may be repotted and others in borders top-dressed. Good fibrous loam should form the principal ingredient in the compost, a small quantity of leaf-soil and some old mortar rubble being also useful. Slowly-dried cow-dung may be added after passing it through a half-inch mesh sieve. Pot firmly, water carefully, and keep the leaves and rods quite free from mealy bug and other insect pests.

If it be wished to have these plants on balloon-shaped wires for any special purpose, the branches must be trained in position some time before the plants are actually required to be removed. Cuttings are easily rooted during the summer months if inserted in small pots filled with a very sandy compost, and plunged in a bottom-heat of about 75 degrees, keeping the plunging material in a moist condition.

G. B.

GLOXINIAS GROWN COOL.

The remarks on the culture of gloxinias by your correspondent "G. B." in THE GARDENERS' MAGAZINE of June 14, is entirely in accord with my own experience. There is no doubt that gloxinias are often kept too warm, the result being floppy leaves and weak flower stems. Added to this, plants grown in a considerable amount of heat are far more liable to be affected by insect pests than those under cooler conditions.

My first experience in growing plants cool was brought about by a demand for them late in the summer. Having a quantity of one-year-old tubers, I treated them much the same as begonias, that is to say, they were laid in shallow boxes of sandy soil in a warm part of the greenhouse in order to start them into growth. Then they were potted into 3½-inch pots, and as soon as spring frosts were over they were placed in a cold frame. Plenty of light and air were given, though for a short time the frame was shut up rather early in the afternoon in order to husband the supply of sun-heat. When the roots had taken possession of the new soil this was discontinued.

This mode of treatment proved to be such a success that I have always followed it since. Gloxinias like a liberal amount of leaf-mould in the compost.

S. W.

NEW PLANTS AND FLOWERS.

SWEET PEAS.

Dobbie's Frilled Pink.—An attractive, palest pink variety of large size; nearly every flower has a double standard, and the frilling or waving is particularly pronounced. A.M., R.H.S., June 17. Messrs. Dobbie and Co., Edinburgh.

Edith Taylor.—A beautiful variety of fine form, with just a trace of frilling in its broad standard. The colour is very bright cerise-rose, most effective in the garden. A.M., R.H.S., June 17. Mr. T. Stevenson, gardener to E. G. Mocatta, Esq., Woburn Place, Addlestone.

ONCIDIODA BELLA.

An interesting and beautiful bigeneric hybrid derived from Cochlioda Noezliana and Oncidium Marshallianum. It has a modified oncidium growth, and a spike that suggests the possibilities of branching when the plant becomes stronger. The flowers are of oncidium shape, and about 1½ inch across. The sepals and petals are light and bright orange with orange-yellow bars on the former, and similarly coloured margins to the latter. The lip has a spreading golden-yellow central lobe, and an orange base and side lobes. A.M., R.H.S., June 17. Messrs. Charlesworth and Co., Haywards Heath.

ODONTOGLOSSUM CRISPUM THE BARONESS.

A splendid odontoglossum with flowers of very large size and excellent form. The spike carried thirteen blooms, and their colour is white, tinted with rose; large blotches of rich purplish-red are on the sepals, and the marks on the petals are of deeper red. The lip has a light golden crest and base, and bright red-brown spots. A.M., R.H.S., June 17. Baron Bruno Schröder (gardener, Mr. Shill), The Dell, Egham. (Illustrated in THE GARDENERS' MAGAZINE of June 21, p. 451.)

CATTLEYA GASKELLIANA FAIRY QUEEN.

A delightful white variety; sepals and petals being of the purest white, while the lip is creamy-white with yellow throat and a pale pink mark on the centre of the white apex. A.M., R.H.S., June 17. Baron Bruno Schröder, The Dell, Egham.

STATICE SUWOROWI ALBA.

One of the most beautiful of the new plants at the recent meeting of the R.H.S. It is a strong counterpart of the popular old S. Suworowi in all but colour. The tiny flowers clustering on long, spiky branches are of purest white. This bids fair to be a popular market plant; it is certain to be a greenhouse favourite. A.M., R.H.S., June 17. Mr. R. C. Notcutt, Woodbridge.

SPIRÆA SARGENTIANA.

A new Chinese shrubby species with very twiggy growth. As shown, it is about 3½ft. high. The white, green-centred flowers have a creamy appearance in the mass, and they are borne in terminal corymbs on the slender young side growths. A.M., R.H.S., June 17. Hon. Vicary Gibbs (gardener, Mr. E. Beckett, V.M.H.), Aldenham House, Elstree.

ASTILBE BRITANNIA.

A graceful and pretty hybrid astilbe, about 3ft. high. The colour is a lovely shade of rose-pink, and the individual blooms are of good size for an astilbe. A.M., R.H.S., June 17. Mr. Profittlich, Twickenham.

BLANDFORDIA CUNNINGHAMI.

An uncommon plant, and one rarely seen in flower. It has wiry, grassy foliage, and an erect spike rising about 2ft. high, and bearing, in this case, eleven flowers and buds at the apex. The flowers are pendulous, tubular, about 3 inches long, and of a deep yellow colour with reddish-brown base. A.M., R.H.S., June 17. A. Worsley, Esq., Isleworth.

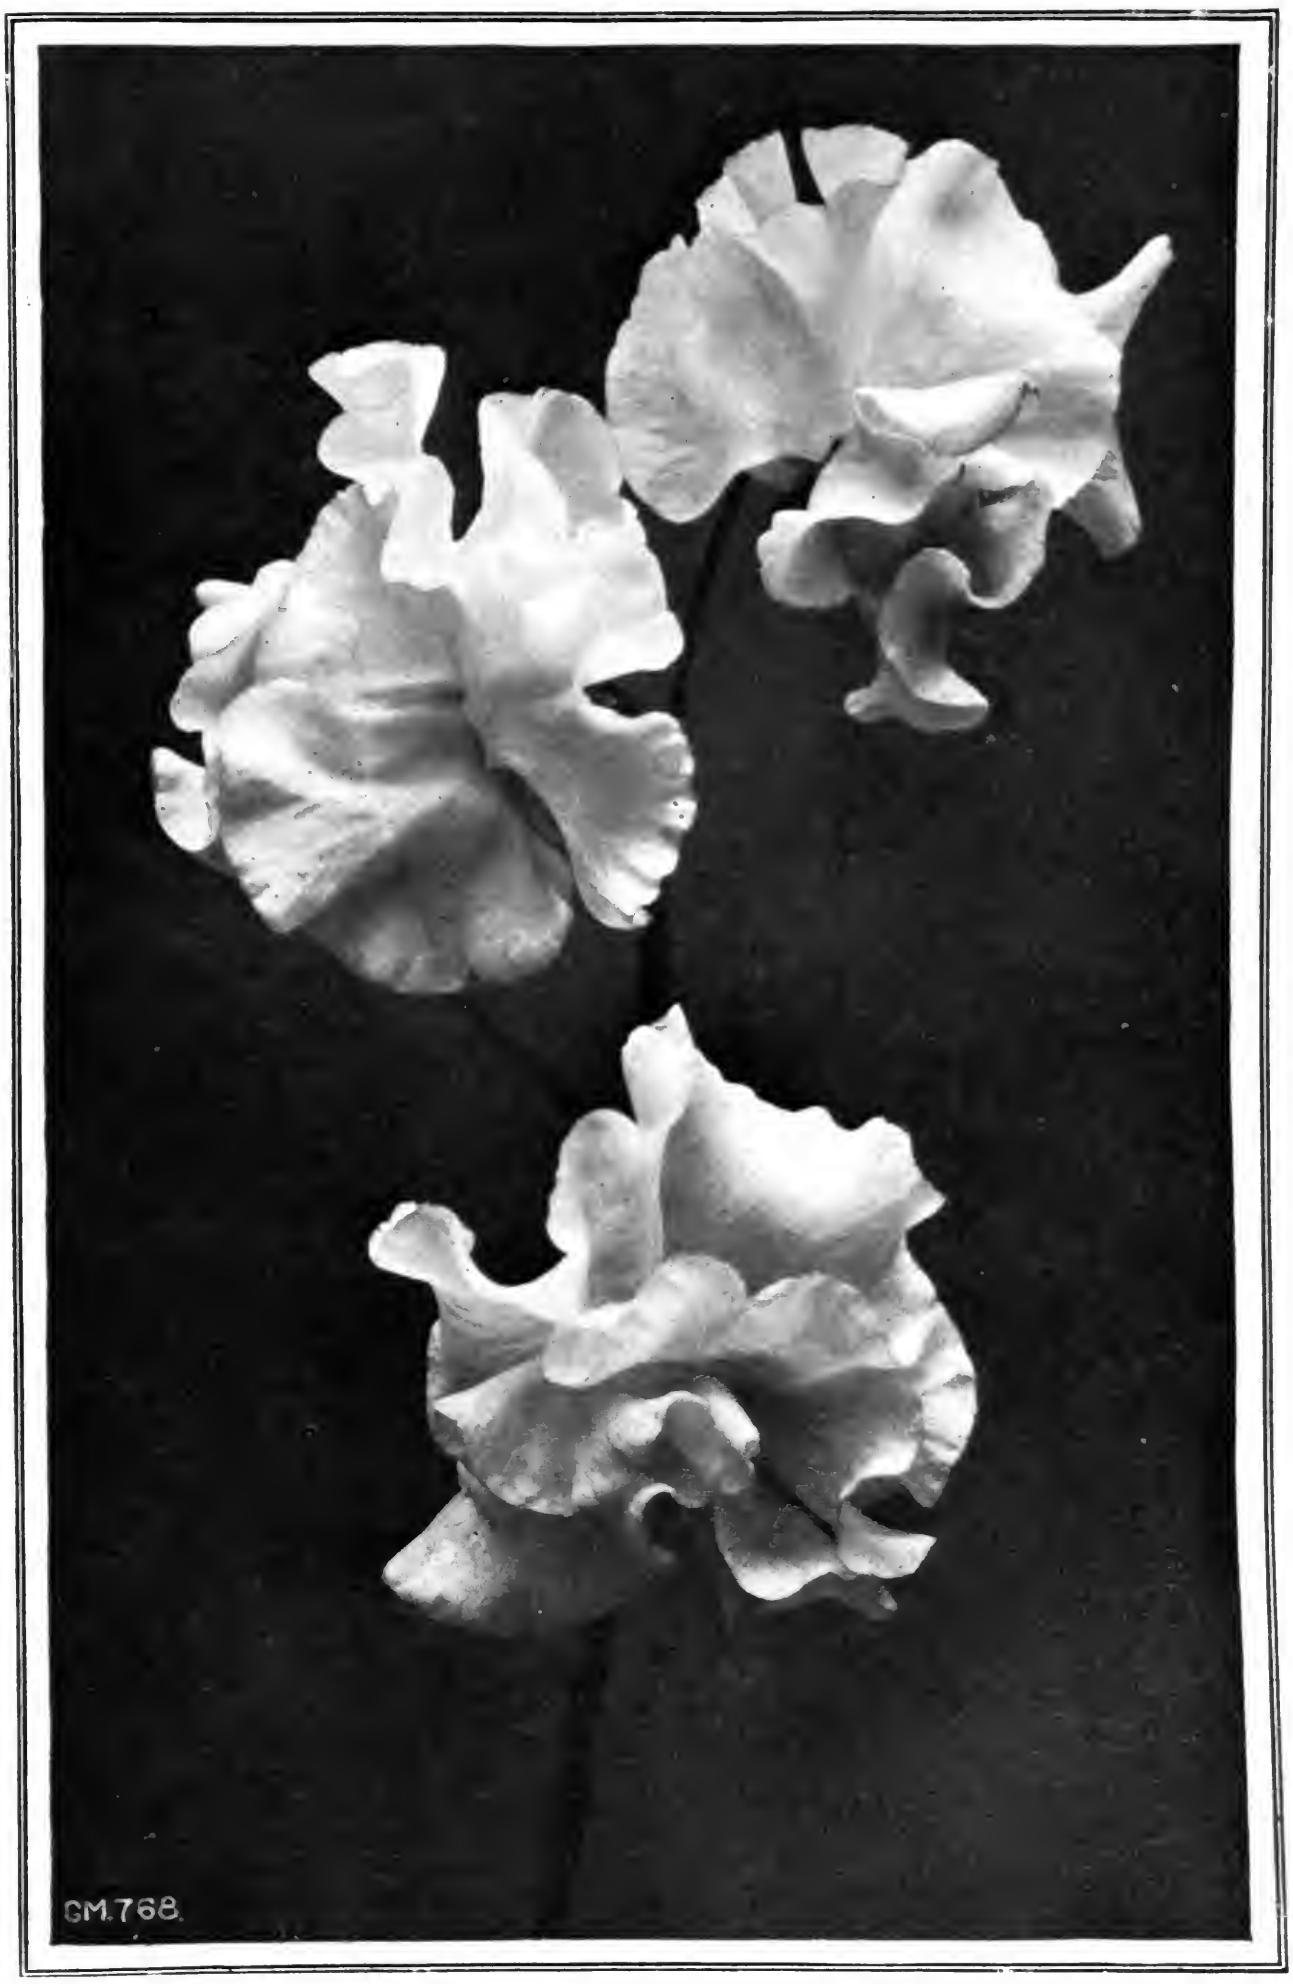
ROSES.

Mrs. George Norwood.—A lovely hybrid tea rose of excellent form, fine growth, and sweet fragrance. It is broad-petalled, and of a lovely deep rose-pink shade. This has the sturdiness and a great deal of the form of Frau Karl Druschki, which rose, with Mdme. Gabriel Luizet, were its parents. A.M., R.H.S., June 17. Mr. Elisha J. Hicks, Hurst, Twyford, Berks.

Paul's Lemon Pillar. — This beautiful cream-coloured or lemon-tinted rose is a very distinct new variety derived from Marechal Niel, and, probably, Frau Karl Druschki. It has a vigorous climbing habit, and produces its large, shapely flowers all along the rods. In shape and fragrance Paul's Lemon Pillar is very much like Marechal Niel, therefore, as a climbing rose, the variety seems certain of a fine future. A.M., R.H.S., June 17. Messrs. Paul and Son, Cheshunt.

TROLLIUS PATULUS BEES' VAR.

A beautiful hardy plant collected by Forrest at an altitude of 12,000ft. on the



SWEET PEA DOBBIE'S FRILLED.

A pale pink variety, very much frilled, and with double standards to the flowers. A.M., R.H.S., June 17. Messrs. Dobbie and Co., Edinburgh.

Kari Pass, by the Yanktse-Kohong divide in South-east Thibet. About a foot high when in flower, it is of tufted habit, and has small trifoliate leaves, deep green with pale green dots at the bases of the main and marginal divisions. The erect stems carry from one to three rich golden-yellow—buttercup yellow—flowers, and these are from 2 to 2½ inches across, and have a central cluster of golden stamens. A very attractive and useful plant for the moist spots at the foot of the rock garden, or in some other boggy place. A.M., R.H.S., June 17. Messrs. Bees Lim., Liverpool.

SAXIFRAGA BRUNONIANA.

An interesting and curious little species with rosettes of small linear-oblong, hairy-margined leaves. The lax corymbs of yellow flowers rise rather less than six inches high, but are not very attractive. The clustering leaves and the numerous crimson runners, each with its plantlet, make the attraction in this plant. A.M., R.H.S., June 17. Mr. W. Fells, Hitchin.

PHILADELPHUS NORMA.

A very fine single-flowered variety in which the white flowers are about two inches across, of finely-rounded form, and borne quite freely along the arching growths, usually in threes at the ends of the little branchlets. A.M., R.H.S., June 17. Sir Trevor Lawrence, Bart. (gardener, Mr. Bain), Burford Lodge, Dorking.

CARNATIONS.

Scarlet Gem.—Of extremely good form, and with the flattest, smoothest petals any florist could wish for. This border variety has a good calyx, and its colour is rich coral-red. A.M., R.H.S., June 17. Mr. Chas. Blick, Hayes, Kent.

Thomas à Beckett.—A yellow-ground fancy variety, with rosy-pink edging and splashes. Of large size, and with a first-rate calyx. A.M., R.H.S., June 17. Mr. Chas. Blick, Hayes.

PÆONY GISMONDA.

A large and very double herbaceous variety of light rose-pink colouring, and pale guard petals. A.M., R.H.S., June 17. Messrs. R. H. Bath, Lim., Wisbech.

GLADIOLUS QUEEN OF THE WHITES.

A tall-growing, pure white variety, with well-expanded flowers of good size and shape. A crimson blotch at the base of the tube does not detract from the purity of the flowers, as it is viewed when growing. A.M., R.H.S., June 17. Mr. B. Hoog-Straten, Sassenheim, Holland.

WHAT IS A SPRING FLOWER?

At a recent meeting of the Bournemouth Gardeners' Association, which was devoted to "Questions and Discussions," amongst various others was the question, "What is a spring flower?" (not necessarily hardy). The opinion was expressed by some that any flower that bloomed in the spring under artificial conditions should come under that definition. On the other hand, it was contended that such flowers as carnations, zonal pelargoniums, etc., which, although perpetual-flowering in the spring, yet bloomed practically all the year round, should not be allowed. Also that such annuals as stocks, clarkias, schizanthus, etc., when grown in pots for that purpose, should undoubtedly be included. No answer that was considered satisfactory was forthcoming, and the question being an important one in view of the wording of classes in some show schedules, it was suggested that I write you on the matter. Indeed, the question is one that might well be discussed in the columns of THE GARDENERS' MAGAZINE. It would, at least, be useful to have the opinions of readers who are interested in the question.

C. NIPPARD,
Secretary, Bournemouth Gardeners' Association.

SMALL CHILDREN IN THE GARDEN.

Some regard them as a trial, and others in the same way as birds—a nuisance at times, but the garden is a dull place without them. We know some grown-ups who are like crusty old bachelors in their attitude towards children in the garden—they must not go on the lawn because of treading down the edges, they must not set a foot on the dug ground because of making the gravel paths dirty, they must not touch a flower or a fruit, nor have a square yard to do what they like with; while there are others who are so indulgent that the children may do almost anything their wayward fancies suggest without being even remonstrated with. Both these extremes, it need hardly be said, are utterly wrong, and, though there may be some incorrigible specimens of the genus boy, I am convinced—and my conviction is based on experience—that there is another method totally different from either, and able, with the exercise of wisdom and patience, to go a long way towards solving the problem. If it were more generally adopted, possibly we should not see so many advertisements for, or by, gardeners giving the impression that a family, even a small one, was a hindrance to a gardener in his profession.

Early Training.

The first and most essential part of the method recommended consists in early training, and this may, and should, begin while the child is only a few months old. Some will smile; but, as every wise mother or experienced nurse knows, a child may begin to acquire disciplined ways before many months old, and the treatment of flowers may be amongst these. The first and most important thing is to accustom children to seeing and handling flowers. Let the flowers be always in the room with them, and before very long their beauty will begin to grow upon them, and then they will get to love them. When this stage is reached, and it is a perfectly natural one, a great step has been taken, for children will not, as a rule, knowingly injure things they love.

I knew a little girl in her second year who used to kiss all the sweet-smelling flowers, whether in apparent imitation of her elders, or through delight in their fragrance, I cannot say, but at least it showed affection for them, and she very rarely damaged any, though pretty mischievous in some ways. If a little boy brings you with delight a beautiful spike of gladiolus with only the first flower open, it is not a case for scolding, unless it has been repeated several times, but rather a good opportunity for explaining to him that he has destroyed the beautiful flowers as they were coming into the full enjoyment of life. Some children have the bump of destruction strongly developed, but then some children often have latent possibilities of an appreciation of form and colour, as well as affection and sympathy, and if any, or all, of these can be called out, they may act as a powerful brake upon the destructive tendencies.

When a certain section of a Bank Holiday crowd gets out into the country and proceeds to destroy wild flowers, trample down corn, mutilate young trees, and the like, it is really rather a case for pity than punishment, however indignant we may feel, for we may be pretty certain that these misguided people have never had a chance of becoming familiar with the beauties of the plant world, and so have no liking, or even reverence, for them, which will restrain them from such wantonness. The normal children, who have been brought up as suggested above, will not, when grown up, destroy flowers or plants for destruction's sake. When children are big enough for games of various kinds, and generally rampageous romping, then, of course, accidents will happen, probably frequently, especially if the garden is not a large one. But that is another matter, these notes only dealing with small children.

Help with the Work.

Another important point in the management of small children in the garden is to encourage them to try and help with the work. Children of three will not really be of much help, or only exceptionally, and the necessary teaching and explanation as to what they are to do will be a hindrance at first. But the time will have been well spent, for it will be the beginning of their training in being useful later, and it will give them an interest in seeing some results of their little attempts at work, and an interest in taking care of what they have helped to produce. Children generally like to be useful, and a normally healthy child usually likes to be busy; and, in common with children of a larger growth, their interest in the garden, as in anything else, will be in proportion to the time they have given and the effort they have made to add a little to its beauty or usefulness. A man who will take trouble with this process of instruction which the child will regard as playing with its father, for it cannot be expected to do anything much alone for the first five years of its life, will be amply rewarded later on by a great deal of willing help and service, good for both father and child. One need have no fear of making a boy effeminate or unfit for the sterner work of life because he has been led to acquire a love for flowers. As the late Dean Hole says in one of his books: "Why should a boy be less brave or strong if taught to appreciate the beautiful things about his daily path? Or why should youth ride more timidly to hounds because it has a flower in its coat? There is a time for all things . . . . a time to develop the intellectual as well as the physical powers."

The Fruit Problem.

It may be said that it is not flowers that present the difficulty in the garden so much as the fruit. Doubtless the latter is the greater problem, and where the garden is not large enough to produce such an abundance that even a couple of boys can make no impression upon it, one must remember one's own boyhood, and make up one's mind to some sacrifice. One can, however, do a good deal even in this direction by early training. A little girl of two gnawed the rosy cheeks of some Adam's Pearmains which hung temptingly within her reach, and came and told her father what she had done. As with the gladiolus referred to above, explanation was the only course, pointing out what beautiful fruit she had spoiled, and when the winter came a particularly fine specimen was produced for her to eat, and memory called in to identify it with a certain fruit which looked so inviting on a certain branch in the summer and autumn, the child was old enough to put things together sufficiently to see that it was a pity to touch growing fruit. And there is a higher appeal than this, namely, to the child's unselfishness, the effectiveness of which will vary according to the disposition it has inherited. Children may be made very selfish by being considered and indulged too much, and there is not the least doubt that unselfishness may be encouraged and developed by wise example and early training.

ALGER PETTS.

FRAGRANT FLOWERS AND FOLIAGE.

Many plants are grown for their scent rather than for the beauty of their flowers, though in some instances the two attributes are combined, as in the rose, carnation, lily, and others. As a rule, this is not so, for often we find the most simple forms, such as the lavender, mignonette, wood laurel, and the like, whose individual flowers are quite insignificant, exhaling the most delicate perfumes. To obtain the real charm of such things, they should be either grown in large quantities by themselves, or intermixed with others of like character. For example, lavender does not present a pleasing appearance in a formal garden associated with pelargoniums and the like; but planted by itself, growing over a low wall, or in a semi-wild state, on a dry, sandy bank, it is most charming. Even when not in bloom its grey foliage is cheerful. The rosemary, grown in the same way, or sheltered by a belt of shrubs, has a charm all its own, particularly where it blooms early. I was much struck with this when visiting Hartpury in February. Plants growing in sheltered positions were then in full flower, which was unusually early, even for so warm a place.

The common Daphne (Spurge laurel) is another plant that should be grown in a semi-wild state on a dry, sandy bank, where it will expand its small green flowers very early in the year, scattering their perfume for a considerable distance around. This plant makes but few roots, therefore resents transplanting when it has attained any size. For this reason those who are desirous of having good clumps should plant rather close together when in a small state. Azara microphylla also produces small, insignificant flowers, but their vanilla-like perfume is very refreshing. This shrub is much hardier than many suppose, though in low-lying places it is sometimes cut down in severe winters, but, as a rule, if planted in a sheltered place, will grow away most luxuriantly.

There are many plants like the myrtle, Aloysia citriodora, sweet-scented geraniums, and bergamot (Monardia), that are grown more for their foliage than flowers, though the latter is a showy herbaceous plant. Among deciduous shrubs we have such kinds as lilacs, syringas, Azalea pontica, and others. These, as a rule, should not be planted in quantities in close proximity to the mansion, especially some of the philadelphus, as their scent is too powerful; but when grown in groups along the woodland walks, the perfume to many is most refreshing.

As already mentioned, but little effect is produced by many of the sweet-scented flowers, but if we plant mignonette amongst stocks, either in beds or borders, they harmonise, and at the same time are very effective, especially when the stocks are of distinct colours. It is not, however, in every establishment that space can be afforded to grow plants in pots of these things specially for bedding, space being too limited, as both take up much room. Mignonette planted by itself does not make much of a show, but if a patch be sown on a border near the mansion it is always appreciated.

Heliotropes in themselves do not make a bright display, but standards of the white kinds on a groundwork of the deep heliotrope colours are most effective, and the scent of this is very agreeable wherever they are planted. There are also many sweet-scented flowers that are more suited to the herbaceous border than for bedding, their habit of growth being too loose for the latter.

Turning to plants for the production of cut flowers, those that have long stems find most favour, as they can be used for so many purposes, the rose, carnation, lily, and others. At one time there was a great demand for gardenias, but these of late years have lost favour, as they require so much heat to grow them to perfection, but they are still largely grown in some places, and where they are well grown it is astonishing the quantity of flowers they produce. The neat, bright, glossy foliage that surrounds the flowers give them added value for buttonholes, bouquets, and the like. Eucharis flowers were at one time in great demand, large houses being devoted to their production, but of late they have lost favour, especially since it has been possible to retard bulbs of lilies and other plants. Where lily of the valley used to be grown by the hundred it is now produced by the million; the same may be said of other things. It is not so much now a case of forcing such things into bloom as retarding them to produce flowers at any given period of the year.

Carnations have now become very popular, more especially the perpetual kinds, as these bloom so freely during the winter. At one time carnations flowers in January were great rarities; now they are as common as the tulip and hyacinth. There has also been quite a revolution in the production of roses since the hybrid teas came so much to the fore; thousands of these are now to be had at very low prices even at midwinter, the production of them having become quite an industry. If we turn to the sweet-scented violets, we shall find that these also are grown in very large quantities. There has been great strides made, both in the mode of production and in the varieties grown. Fifty years or so ago there was only the small kinds, such as Devoniensis, and now there are dozens of varieties. Marie Louise seemed to be the starting-point, and it is still largely grown, though other varieties, especially those with long stems, find most favour, as they can be used for such a variety of purposes.

H. C. P.

PHILADELPHUS NORMA.

This is a very large-flowered pure white variety. A.M., R.H.S., June 17. Sir Trevor Lawrence, Bart. (gardener, Mr. Bain), Burford Lodge, Dorking. (See page 474.)

NOTES FROM SCOTLAND.

Flowering Trees and Shrubs.

Owing to the lateness of the season in more northern parts of the kingdom, it was thought the May-flower—Crætagus oxacanthra—would this year allow its name month to pass away unrelieved by the perfume and attractiveness of the customary wreaths of blossom. Though so very common, there are but few flowering trees that have such a charm for town dwellers as this, its name alone being a prominent factor in this respect. In the Glasgow pleasure resorts, but more particularly in Queen's Park, and its splendid adjunct, Camphill, the thorns were at their best on June 4. Fine old specimens of the white, as well as many of the older scarlet and pink forms, were pictures of loveliness, to which admiring crowds of visitors daily gave their attention. Younger plants of the more newly-introduced varieties are there, too, in numbers, and likewise meet with most favourable criticism. These, perhaps, are still more beautiful than older specimens, owing to a greater preponderance of foliage, which tends to display the rich inflorescence to greater advantage than when closely-packed masses of flowers are not in this way relieved.

The rowan tree, lilac, laburnum, the various kinds of viburnum, and many other species are now at, or are approaching, their best. The "bonnie broom," though but a humble plant, is really one of the best among the many at this season, and as seen growing in odd places, as upon a sun-burnt bank or by an outcrop of rock, which may bring its lovely yellow blossoms to the correct point of vision, it never fails to elicit the warmest admiration from all parties and classes of persons.

Rhododendrons and Azaleas.

In the first-named park, upon the northern slope of the hill, and the spacious terrace overlooking the city, the rhododendron beds are still making a grand show. Some of the earlier varieties are about past their best, but many of the better hybrid varieties have yet to open, and should provide a display of much interest throughout the month. Upon the lower slope bordering the bowling-green a large mass of that grand, though old, variety, Broughtoni, has been for ten days or more as near perfection as one could ever expect to see it. In the same enclosure large beds of the Ghent or mollis azaleas, planted in colour sections, are now at their best. Moreover, both these and rhododendrons are making excellent growths, which in such comparatively young plants augurs well for another year.

Darwin and Cottage Tulips.

Upon the terrace referred to these were planted in groups among rhododendrons, which as yet, being small, they overtopped by about six inches, thus showing their varied and in many instances most gorgeous colours in a most effective manner. Among the many, the old Gesneriana is still very conspicuous, having stems quite 30in. in length, and rich, deep-coloured flowers that are always appreciated. Other striking sorts are Fairy Queen, Clara Butt, Black Chief, Mrs. Moon, Picotee, Fawn, Caledonia, Inglescome Yellow, Lucifer, and Prince of Orange, among many others scarcely less meritorious. Spring bedding, which is largely practised here, has been of high quality this year; and although bulbous plants, with the exception of the large-growing scillas, are now past, carpeting plants and beds of wallflowers still make a good display.

Rouken Glen.

This splendid estate, on which are situated two mansions, was purchased a few years ago by Lord Rowallan (then Mr. Cameron Corbett), and presented by him to the Corporation of Glasgow in trust for the use of the citizens for all time, is now looking its best. The famous Glen, which takes its course right through the central portion of the estate, having wide areas of park lands on either side, is one of the most charming touches of natural scenery it has ever been my privilege to behold. Giant trees, tangled undergrowth, flowering plants and ferns, rocky defiles—a waterfall and parting stream drifting therefrom—together with well-kept and easily-graded walks, make this indeed a pleasant place. The walks and drives that intersect the more level portions of the estate have, for the most part, been long formed, and are judiciously planted with trees of many varieties, both as park specimens and in avenues.

Hitherto access to this resort on Sunday has not been of the best; for, although an excellent service of tramcars pass and repass the gates, these at times, but more especially in the evenings, were quite inadequate to the demand made upon them. On Sunday, June 1, the Caledonian Railway instituted a service of excursion trains —ten in all—from the Central Station, Glasgow, to Whitecraigs Station, for the convenience of travellers wishing to visit Rouken Glen. The venture appeared to work well, and large numbers took advantage of the facility thus presented. I am not quite certain, but I believe this to have been the first occasion on which a Sunday excursion train was ever run in Scotland. The service is to be continued throughout the season.

A mild protest against such desecration of the Sabbath was made for a few days previous, mostly by way of paper correspondence, but of little avail. Could the objectors have seen the happy thousands revelling in the bright sunlight and light, refreshing breezes of an almost perfect afternoon, they might possibly have been led to change their views. The project thus inaugurated by the premier railway company is almost certain to be followed by others; and, whether right or wrong in its conception, will assuredly go a considerable way towards relieving the extreme dreariness of a Scottish Sunday in the larger centres of population, and would be the means of affording facilities to thousands, whose lives thereby would be brightened in beholding the glories of Nature.

JAMES DAY.

Rondeletia strigosa.—This is a near relative of the bouvardias, and, like them, it forms an exceedingly pretty little flowering shrub. It is of a freely-branched habit, furnished with shining green leaves, while the flowers, borne in compact clusters, are bright crimson, with a yellow centre.—K.

FLORISTS' AZALEAS.

I do not know whether the azaleas of the indica type are as popular with the florists and their customers as they were a few years back. Perhaps they are not, especially as pot plants are not so much in demand nowadays, owing to the greater love for cut flowers.

Be this as it may, there are still large numbers grown, and, with due attention to the selection and effective display of the most attractive varieties, the florists can do much to keep this sterling race of shrubby subjects well to the front.

Many buyers hesitate over azaleas because of the difficulty in keeping them in health after they have them, a state of affairs partly due to the method of their importation. Readers know that these azaleas are largely sent over from Belgium and Holland as lifted plants, and potted after arrival. They carry new season's foliage, and also their complement of flower buds.

One notes with favour the use of tiny azaleas in blossom. This is a good thing, and the bright-hued varieties, in small pots, can be easily dropped into receptacles for decorating the tables or the boudoir. Pyramidal azaleas are pleasing, but their price is somewhat against them, though for effect they are better than flat-crowned plants.

Then again the manner of showing azaleas has a great deal to do with their sale. Attraction tells. Brilliant reds, arranged with a massing of cherry-red and ruby cyclamen, would be very desirable for St. Valentine and birthday gifts. Whites, of course, will have the preference for Easter sales, but some of the prettiest shades of pink and white should always be on view. It is possible, too, that well-grown specimens of free-growing and lighter-habited azaleas could be brought more into commerce by enterprising traders. Finely-flowered specimens of A. ledifolium leucanthum are always appealing to the eye, and should be popular for early flowering. The newer A. sublanceolatum, which was given an Award of Merit a season or two ago, is valuable for decoration late in the season, and the large rosy-red blossoms are most attractive.

I wish to especially commend the decorative azaleas, which the Japanese so freely use in the creation of their brilliant colour effects in landscape gardens. These azaleas do especially well in pots, and for brilliancy and floriferousness they are unsurpassed. Grown under cool conditions they are a veritable glory during March and April. A grouping of one variety in a conservatory, or in the centre of a florist's window, is sufficiently glowing to hold the onlooker's attention.

Among the finest forms for decorative effect are Hinodegiri, a brilliant profuse red, with a neat, pleasing habit. Benigiri, also a bright, telling red, compact in growth, and smothered with blossom in spring. Kirishima, very near to Hinodegiri, gives a wonderfully brilliant glow of rosy-red colouring. I like it even better than Hinodegiri, and it is quite as free as that variety, and the flowers are a trifle larger, and more enchanting in hue. Yavegiri is glorious, a semi-double salmon-red, of undisputed beauty. It is a good grower, and a few well-flowered plants make an ideal picture of azalea beauty. In closing, may I commend the white-flowered Hakatashiro? As a white this is superb, the colour being very pure, and the shape of the blossoms reminds one forcibly of a trumpet lily.

P. C.

POT PLANTS FOR THE GARDEN.

From early seed sowings it is easy to obtain fine specimen plants for pot cultivation in the summer garden, and not only is immense interest to be gained thus, but the whole appearance of the pleasure grounds will be vastly improved. The wild, or natural garden, or the vicinity of a semi-wild water garden, should not be artificially decorated in this manner, but the lawns and broad walks on large estates, the tiled paths, verandah edges, step sides, and corners of small floral parterres, more or less formal as they are sure to be, are not injured in character by rows of pot plants.

A new idea that added much to the attractiveness of a moderate-sized villa garden last year was the sinking of pot subjects in gravel, wherever space could be spared; a wide walk was avenued by stately delphiniums, between each two a foliage plant appearing, such as Kochia tricophylla, the giant Eragrostis maxima, the Abyssinian grass that reaches a height of three feet; Lavatera arborea variegata, the mallow with cream and grey-green leaves; and Zea gracillima variegata, Z. japonica variegata, and Z. japonica gigantea quadricolor. A less broad path was made into a walk offering perfume and beauty by the row of sunk pots of sweet peas, while another, in shade, gained in value as a lounging spot by reason of the lines of different tobacco plants. By keeping the pot surfaces an inch below that of the paths the plants gain the benefit of receiving more water than rain conveys to their neighbours in beds and borders, or, if drought arrives, filling the pots to the rim twice a week will safeguard the roots that are hidden from fierce sunheat by the protecting gravel.

In addition to the plants mentioned there are hundreds of others that can be sown, for either sinking or standing in the ornamental environs of our dwellings. Sunflowers of tall annual species succeed if given manure in the compost; hollyhocks require large pots, but when grown in them, and from the best seed, the colours, separately even, are extraordinarily beautiful, embracing apricot, blush, peach, deep mauve, salmon, and purple, as well as all the familiar pinks and crimsons. Chimney campanulas may be shown all the summer in the open, and housed during winter, to either blossom under glass or be serviceable another year out of doors, while the popular Canterbury bell yields almost denser colour masses, so numerous are its blooms. It is worth noting that this plant, like many others, attains maturity sooner under pot culture than if transplanted in the seedling stage into boxes, and then given more root room in soil.

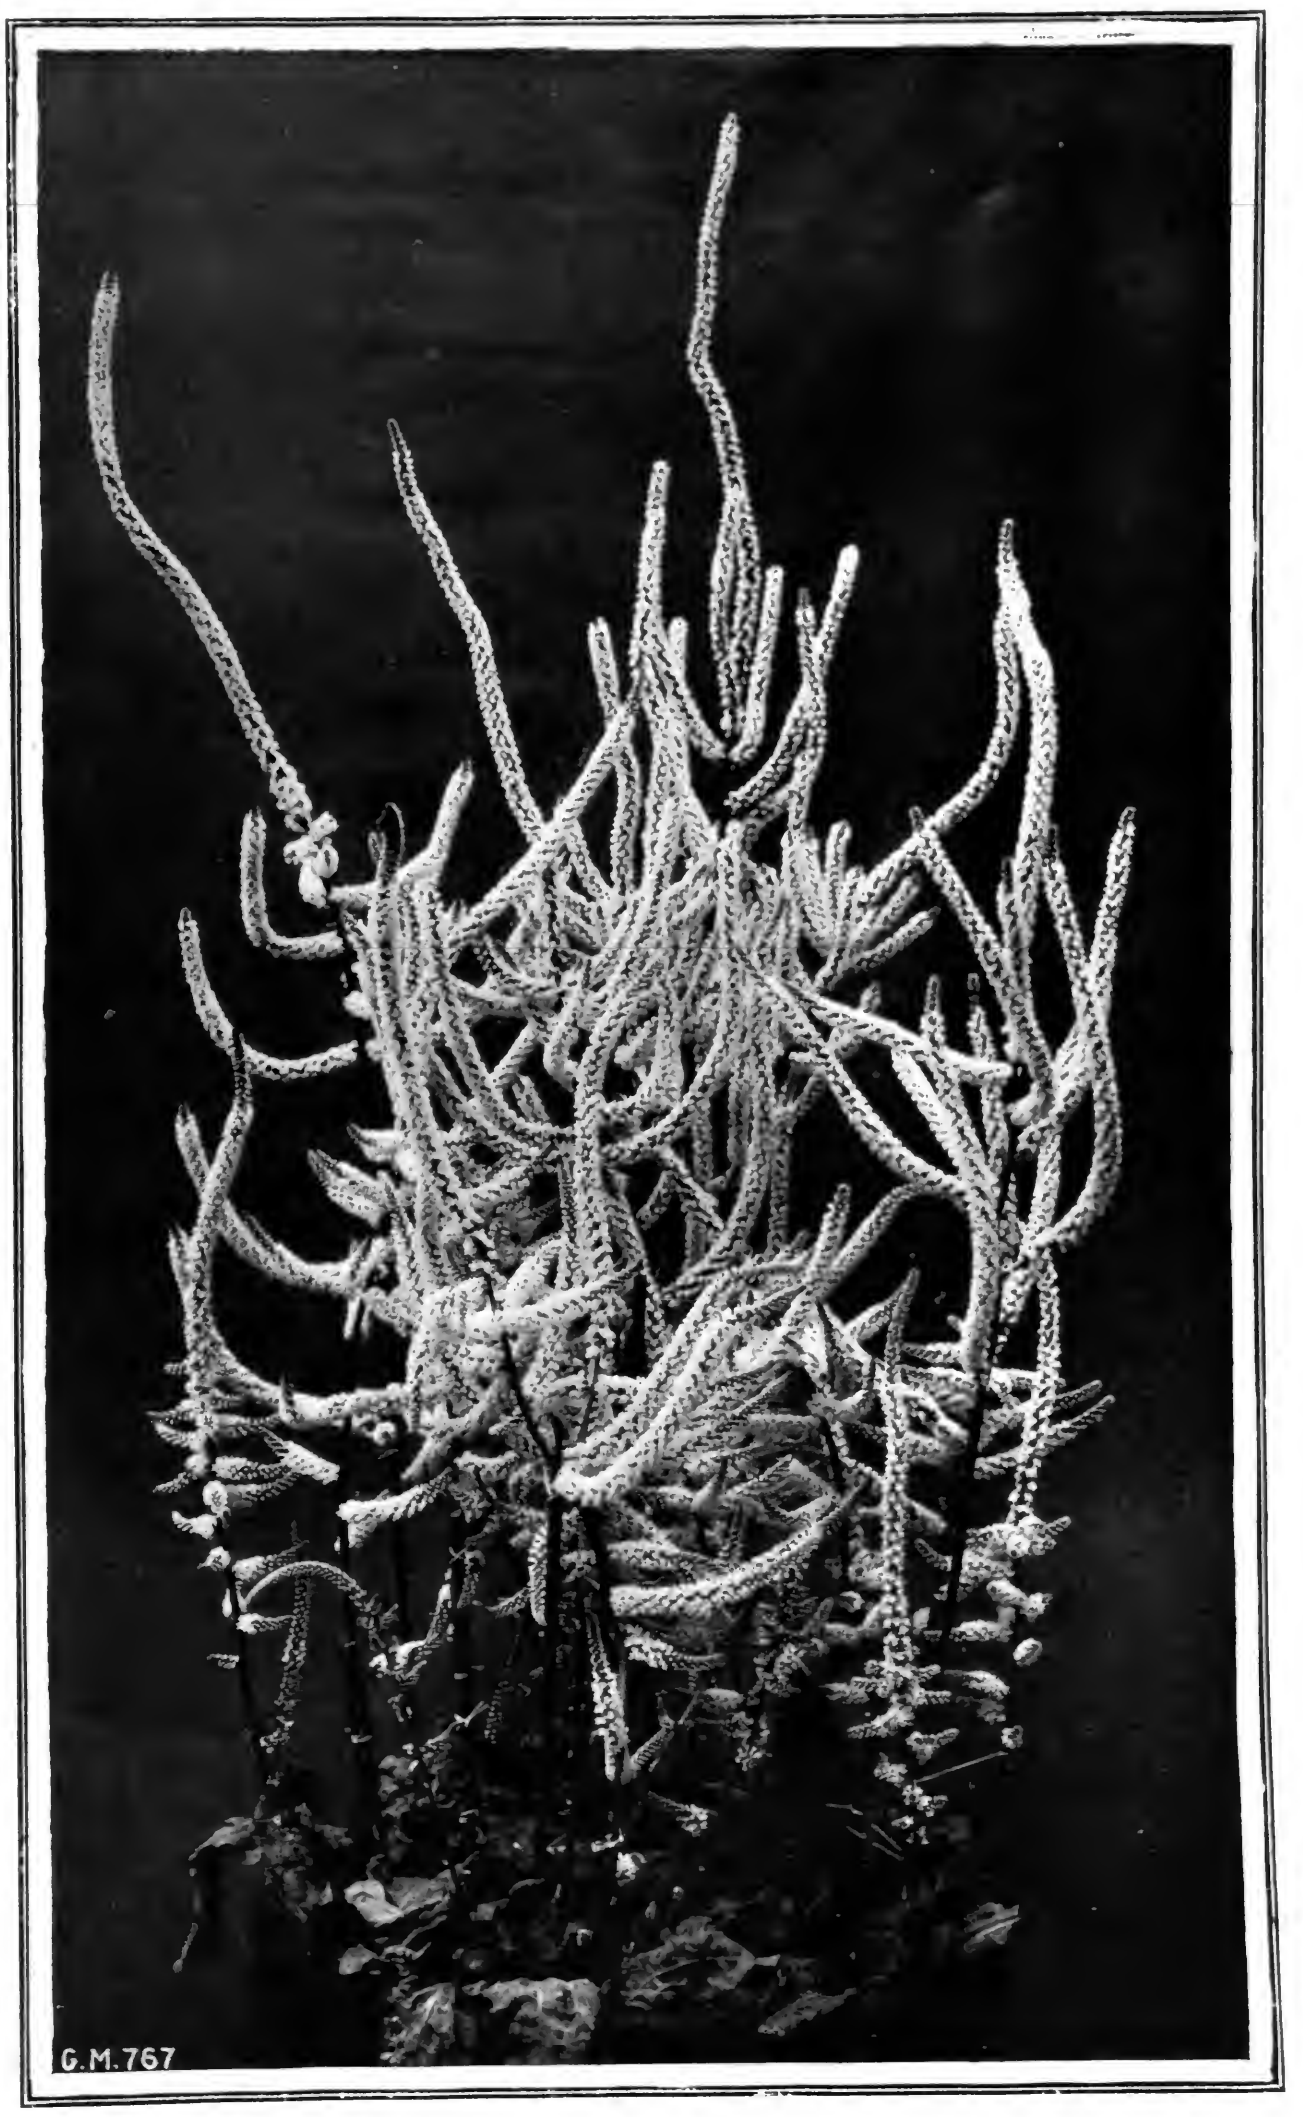
Perhaps it is among half-hardy subjects that the best pot plants are found. The fine Ricinus panormitanus, with its colossal leaves and six-feet stems of blue, is not sufficiently known; R. sanguineus is a self magenta-purple; R. Cambodgensis has stems nearly black, and all these give a tropical air to an English garden. For a rapid-growing hardy foliage plant Rheum officinale should be chosen. Many of the giant annual poppies, if sown in the pots and reduced to one, two, or three, as the size may demand, would form surprisingly handsome ornaments, and be able to bear any amount of heat. Papaver somniferum Marion is soft heliotrope, three feet in height.

A further use for pot plants, sunk or standing, is to encircle shrubs that have become bare at the lower stem, or trees that have grown unsightly for any reason. Then owners of small gardens, who naturally desire to locate beauty in every spot, may outline greenhouse walls, against which borders are seldom permitted. Admirable fuchsias can be raised from seed early, and grown on under glass, to adorn shady sides; or shadowed nooks anywhere, by ferneries, rockeries, glades, arbours, or walls, may be charmingly embellished by lines or groups of white and coloured foxgloves. The biennial Mulleins, Verbascum olympicum, and V. phlomoides, with their grand silvery leaves and yellow spikes, can also be recommended for shade.

Groups of different pot plants can often be found room for in the centre spaces of gravel formed by the junction of walks; if the pots are sunk the effect will be that of a round or square bed as soon as the leaves have spread over the gravel. The best method is to lay the surface gravel very loosely to hide the soil in the pots. To prevent a group of plants in pots from danger of being blown over is easy. A strip of green-painted wire netting should be fastened round them, and a couple of short stakes driven into the path and wired to this will effectually secure the whole.

Tubs are, of course, as useful as pots, and more pleasing to the eye if painted brown, grey, or a really dull green, with which no leaf colour is likely to clash.

M. H.



STATICE SUWOROWI ALBA.

An elegant plant with branching spikes of small, pure white flowers. A.M., R.H.S., June 17. Mr. R. C. Notcutt, Woodbridge. (See page 473.)

PERPETUAL-FLOWERING CARNATIONS.

The most forward of the perpetual carnations are now established in their flowering pots, but there are still a number yet to receive their final potting. Young plants that are growing in 48's should be moved on into 24's as soon as they are well rooted through. For this potting a compost consisting of two parts good fibrous loam, one part flaky leaf-soil, and sufficient silver sand and crushed charcoal to keep the soil sweet and open, is recommended. If the loam is rather retentive, the addition of some broken mortar rubble would be an advantage, while a 5in. potful of carnation manure may be added to each bushel of the compost.

See that the pots are quite clean and well crocked. Pot firmly, but do not place the plants too deeply in the new pots, as deep potting is liable to cause stem rot. It is important to see that the plants are moist at the roots before being potted, and it will then be unnecessary to give any water for several days after potting; in fact, it is preferable to allow the soil to become moderately dry again before giving water, but when water is supplied always allow sufficient to moisten the whole of the soil.

Newly-potted plants become established more quickly if kept fairly close in a frame for a few days, but later on air must be admitted freely. It is desirable to shade the plants lightly with thin tiffany during the hottest part of the day, and also to spray them over several times daily in bright weather. Stake and tie the growths as they need support, using green stakes and raffia, and taking care not to draw the ties too tightly. The patent wire supports have much to commend them, and when once affixed they save a good deal of subsequent labour, and the blooms are certainly more easily cut if these supports are used.

Stopping requires careful attention, and most of the stock will now be ready for the second stopping. At the least four pairs of leaves should be left on each shoot, and it is better to perform the work early in the morning, as the growths then snap off readily. As a general rule, it is not advisable to stop perpetual carnations much later than the end of June if one wishes to commence cutting early in October, although varieties like Enchantress, Dorothy Gordon, May Day, Rosette, Winsor, Beacon, and White Wonder may be stopped up to the middle of July.

Established plants succeed better stood on ashes in the open than in a cold frame, as the air can then circulate more freely around them, and it is always advisable to allow them as much room as can possibly be spared. It is necessary, however, to be able to protect them with frame-lights in case of heavy rains, and for this purpose a wooden framework should be erected over them.

A sharp look-out must be kept for insect pests, and upon the first signs of them preventive measures must be taken. Green-fly is easily eradicated by the use of quassia extract. Red spider is destroyed by the use of nicotine soap insecticide, or a more simple remedy is to spray with salt and water, one ounce of salt to a gallon of water, repeating the operation at intervals of two days until the pest is entirely annihilated. I have found "Anti-Rust" effective in destroying the rust disease, but when the attack is not a bad one it is preferable to cut off the affected leaves and burn them.

Keep the pots free from weeds, and pick off any decayed foliage that may appear. Applications of weak soot water are beneficial to established plants, and it can also be advantageously sprayed on the foliage. Endeavour to have the plants housed by the end of August, as they are best under glass after that date. J. GARDNER.

ROSE PAUL'S LEMON PILLAR.

A robust, large-flowered pillar rose, with fragrant cream or lemon-tinted flowers. A.M., R.H.S., June 17. (See page 473.)

Asparagus.—From the present time the cutting of asparagus heads should cease generally in the South, and in warm, dry districts, otherwise the strength of the plants will be unduly taxed, and the next crop be poor in consequence. Beds which have not been top-dressed should receive an application of agricultural salt, nitrate of soda, guano, or soot, or, failing those, of farmyard liquid manure. The artificials should not exceed at one dressing 2oz. per square yard. In the absence of heavy rain it will be necessary to give a thorough watering. The plants from the April sowing will require to be thinned to a distance of not less than six inches apart. The beds of one-year-old plants, and those formed this year, should be given a mulching, as an insufficiency of moisture at the roots will seriously affect the growth.—W. MESSENGER.

IVER NURSERIES.

Enjoying all the advantages of pure country air, untainted by smoke of factory chimney or railway engines, the site of the Iver Nurseries is ideal, and particularly well chosen for Mr. A. F. Dutton's speciality, the carnation.

Mr. Dutton was among the first in this country to venture largely upon the cult of the modern perpetual-flowering carnation, and he has for a number of years occupied a prominent position among our leading exhibitors of this popular flower. Iver Nurseries to-day may justly claim to be one of the most extensive perts and largest growers of this increasingly and up-to-date establishments among the considerable number that are devoted mainly to carnation culture.

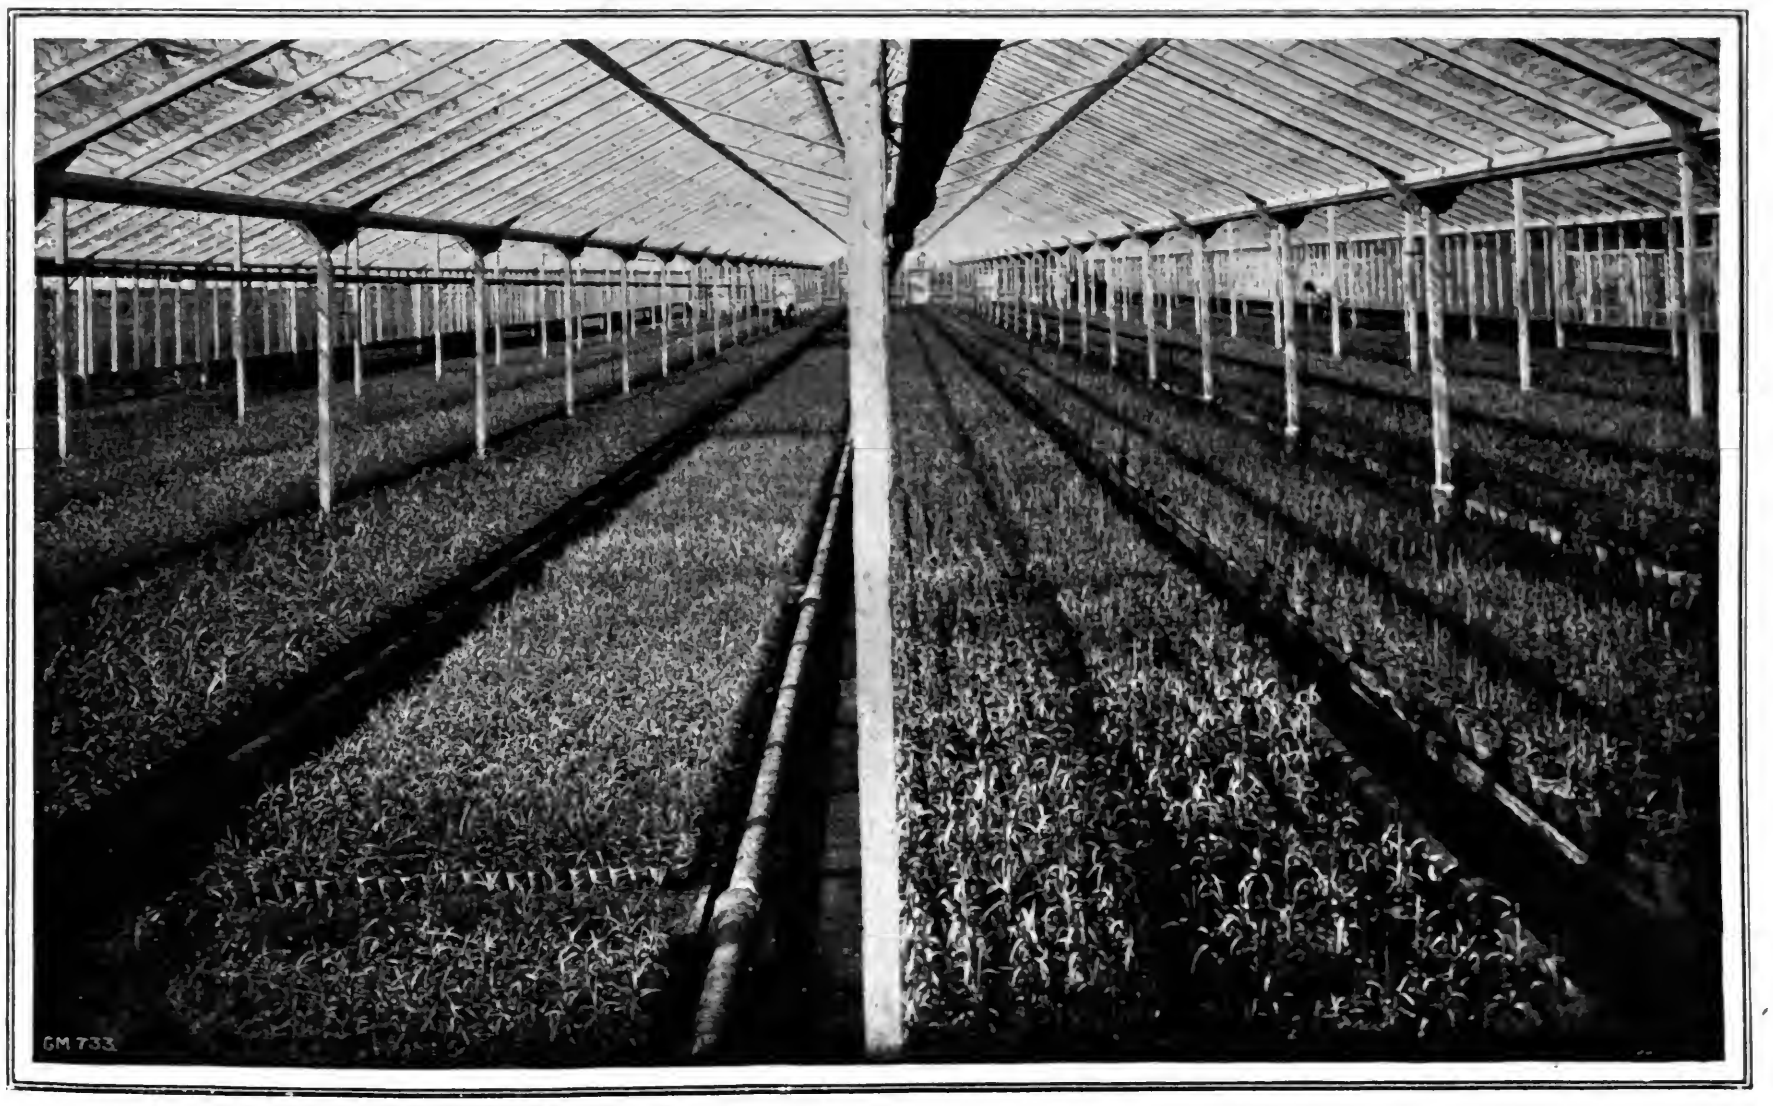
The excellent range of broad, lofty houses, built upon modern lines, covers no less an area than 146,000 square feet. The general arrangement of the houses is after the American plan, there being two or three spans to the roof of each house, the eaves of which are about ten feet from the ground. The atmosphere of these lofty, wide houses is more buoyant than is the case in the narrow, low-roofed houses that were formerly built, and a suitable temperature can, as a consequence, be maintained with far less expenditure of fire-heat. The heating installation is modern and efficient. A row of pipes runs round the the houses overhead, close under the roof, as well as a row near the ground. Powerful boilers are worked in pairs, anthracite coal being the fuel used. Mr. Dutton has recently installed an ingenious device known as Haden's Electric Turbo, by means of which the hot water is driven from the boiler through the pipes in a large block of houses at such a speed that it returns to the boiler before it has lost two degrees of heat. Thus, the return pipes stand at practically the same temperature as the flow, and a genial temperature is maintained with far less consumption of fuel than is possible without the aid of this clever instrument, and there is no risk of the objectionable and injurious results accruing from an overheated pipe. Electric power is necessary for driving the Turbo, and it may here be mentioned that Mr. Dutton has his own electric plant for the production of both power and light.

Capital packing sheds, and a beautifully cool underground shed for cut flowers have been built, and a competent staff is constantly busy packing both plants and cut blooms.

Now, as to the plants. First, in the propagating house, a span-roofed structure, 180ft. in length, were many thousands of cuttings, rooted or rooting in successive batches, shallow pans being used, in which the cuttings appeared to root without fail. Then there is a big new three-spanned house, 200ft. long, filled entirely with young plants in 60's. The accompanying illustration will convey some idea of the vast number of plants this house contains. I never remember seeing so many thousands under one roof, and a sturdier, healthier lot of plants no one could wish for. Next in importance come the big batches of plants in 48's, for sale as ready to flower, and, indeed, all were well budded, and some actually in bloom at the time of my visit. The houses filled with the main stock for production of flowers for exhibition and market, presented an imposing display. Growing in beds, the plants show the vigour and robustness that denote liberal treatment without coddling, and a thorough understanding of all the details of culture. As to coddling, indeed, Mr. Dutton's system is the reverse. He has adopted with distinct success almost open-air treatment, one of the ranges of houses being built with movable roofs, and the plants are kept uncovered until they are just about coming into flower.

Of varieties it may be said that the collection at Iver lacks none of the best. Certain varieties that have proved themselves exceptionally serviceable are grown in very large numbers, and when a new one is found to excel others of its colour, the superseded have to retire. May Day is a strong favourite with Mr. Dutton, it and Scarlet Glow being grown in thousands. The variety Mrs. A. F. Dutton was in fine form. Its clear rose flowers are of a lively and pleasing colour, and the plant is of fine constitution. Our illustration fairly represents an average bloom of this variety, showing it to be a shapely, well-built flower. I may whisper that carnation-lovers may expect ere long to see other novelties emanating from Iver.

Mr. Dutton grows border carnations on a large scale, and his collection is kept well up to date. He also devotes one house to malmaisons, growing all varieties of merit. From end to end of the establishment there is evidence of business-like control, a keen perception of that which is most serviceable, and abundant proof, endorsed by conversation with Mr. Dutton, that he is as keenly interested in the charm and merits of the flowers he grows as in the successful conduct of his business. Although carnations are the speciality, they are not the only feature of the nurseries. In the open several acres of hardy perennials are grown for cutting, and latterly bulb-growing has been taken up. Altogether my visit to Iver Nurseries proved most enjoyable, and I came away well pleased with all I had seen. VISITOR.



A HOUSE OF YOUNG TREE CARNATIONS AT IVER NURSERIES.
The house is 200ft. by 75ft., and contains about 130,000 plants.

LUPINS.

The great improvements which have taken place during the last few years among the perennial lupins have placed this sterling race of decorative plants upon a high level. Lupins are of immense value for massing, and are capable of really splendid effects when the colours are carefully selected.

In the past Lupinus polyphyllus has been one of the greatest favourites of the country cottage gardens, especially the older varieties, such as the deep blue, the blue and white, and the pure white. The easy growth of these plants, their longevity, and their effective display when in blossom made these general favourites in the past, and when one adds to these values the wonderful fragrance of the bean-field, there will assuredly be no hesitation in using the lupins very extensively in private gardens.

Two of the most beautiful colourings yet seen among the polyphyllus section are the pinks, of which the variety roseus is the type, and the ruby-purple shades give a fine vinous touch of warm colouring which is splendid in bright sunlight. The value of these two-colour groups for massing is certainly high.

Then the sterling race of hybrids raised by crossing L. polyphyllus with L. arboreus has rendered many new shades of colouring

possible. It would be difficult to exactly denote all the varieties which owe their origin to these crosses, but most of the newer sorts belong to this intermediate type. From Langport come the favourite yellow Somerset, practically a herbaceous form of great utility; Belle of Huish, a bronzy-yellow, with a very profuse, bushy habit; Coronation, a splendid golden-yellow of intermediate type; Canary, a soft clear yellow, with goodly spikes, and a typical tree lupin habit; Rod of Ivory, white, with creamy upper lobes to the blossoms, and tall, well-held spikes; Columbine, pale blue, with creamy-yellow lobes, and a good herbaceous habit; Langport King, a fine variety with colourings of blue, bronzy-carmine, and white; and Phyllis Kelway, a sterling creamy-yellow, are but a few out of many forms, and their value is enhanced because they are more continuous flowering than the older forms.

Like delphiniums and many other decorative perennials, the lupins are greatly assisted by the removal of the flower spikes directly the blossoms have faded. This aids the production of new growths and blossoms, and thereby adds considerably to the usefulness of the plant.

Seeds sown early in the season, and potted on when large enough, will often produce a good display, but from an outdoor sowing later in spring one cannot expect good flowering plants until the following season. Lupins revel in a strong soil. In heavy clay soil they grow luxuriantly and make grand bushes. They are successful in light soils, but are not so lasting. As subjects for town gardens they are invaluable, though, of course, one associates them with the open beauty of the countryside.

Then just a word concerning the Tree Lupins (L. arboreus), in its white and yellow forms. These are easily raised from seeds, and make splendid specimen bushes for the crowns of banks, or for isolating in the grass. Given plenty of space, they form splendid symmetrical bushes, which in due time are completely covered with odorous spikes of blossom. They are also valuable for large borders, and make splendid low hedges to separate one portion of the garden from another, the exceptionally free growth being of the greatest value to "break up" a summer landscape.

Lupins are freely used in the wild garden. Where grouped in large numbers they are splendidly effective, especially if there is sufficient sunshine to light up the colours of the blossoms. Where large numbers of seedlings are grown, it is always a wise policy to make selections of the best, and reserve them for future garden adornment and as parents. P. S. HAYWARD.

CARNATION MRS. A. F. DUTTON.

A beautiful perpetual-flowering variety with bright rose-pink flowers, raised by Mr. A. F. Dutton. (See page 479.)

ROSE NOTES.

Seldom have we had such a season for insect foes as the present has proved so far. The excessive hot weather, accompanied by north-east winds, was very trying to the roses during the early days of June, and they seemed quite unable to get away from their foes, the only remedy being a constant use of the syringe late in the afternoon. Too many do not sufficiently bear in mind the incongruity of syringing during a bright mid-day sun, and I am convinced that much of the burning and shrivelling of the tender foliage is brought about by this. A free use of water only is a great help early in the evenings of hot and dry days, and refreshes the foliage more than many imagine. I have found it especially useful upon hot and dry walls, having a decided tendency to check the attack and spread of red spider, a persistent little foe that put in an earlier appearance than usual this season. Altogether, I do not remember a season when the constant use of the syringe was in greater request, and it will be well to keep up its use.

If the present arid weather continues we should not neglect to use the hoe freely, and then apply some mulch. Many kinds of mulch may be used, but the one finding most favour with me is Wakeley's hop manure. This has a clean and pleasing appearance, feeding the roots, and keeping all much cooler than in the case of many other mulches. It is all very well to use crude natural manures, but unless these are somewhat covered with soil, it is more or less unpleasant to get among the plants, especially during damp weather, when of the roses are at their best.

As I write (June 14) we have a good show of flowers among the earlier hybrid perpetuals, and teas, and their hybrids, with the earlier of the wichuraianas and climbing polyanthas. But I fancy we have a greater number of malformed and abortive flowers than usual, a few of the worst varieties being Madame I. Periere, Mrs. Paul, Souv. de la Malmaison, and the earliest of the darker hybrid perpetuals, which were doubtless caught by the succession of early morning frosts experienced here in East Sussex.

The necessity for careful hand-picking of rose grubs and caterpillars seems lasting much longer than usual, but we must not cease in this work so long as the enemy is in evidence, for nothing can so completely destroy the best and most promising flower-buds than the ravages of these insects. One of the worst things in this neighbourhood is the overwhelming attack of aphides upon the climbers in sheltered positions, causing much labour in the way of washing, more so than for many seasons past. Various cheap and effective washes have been given from time to time, and I have made a good one by dissolving a penny packet of Hudson's soap in 20 gallons of water, this being all the more effective if first of all dissolved in a gallon or so of boiling water. I have found this quite harmless to the foliage, but deadly to insects, and all the more so when applied with considerable force, while we could scarcely have anything cheaper or more easily obtained.

Do not neglect to earth up dwarf stocks intended for budding during next month, when I hope to be able to offer a few practical hints once more. If the stocks have a little of the surrounding soil drawn up to them, the bark will be softer, and lift much freer, which is a great point towards a satisfactory "take."

The present is a critical time in the cultivation of plants for winter blooming. Unless we secure good wood from now onwards we cannot obtain a satisfactory crop of flowers in the forcing house. I am induced to note this because so many are apt to neglect their pot roses after their chief beauty is past and large quantities of blossom are available from the open. But we must remember than any neglect now means poorer wood to start upon for next winter's forcing. Where necessary, I prefer to pot now, while the growths are partly ripe. All will admit that, given sufficient room, it is better to have the roots well established before forcing begins. Further, the soil will not be so exhausted, and one can feed to great advantage by the aid of mulchings and liquid manure as the forced growth progresses. Syringe freely and keep the plants growing for at least another two months. This is more than ever necessary in the case of climbers and weeping standards in pots, as it is long, well matured rods of maiden growth that are so essential here. ROSARIAN.

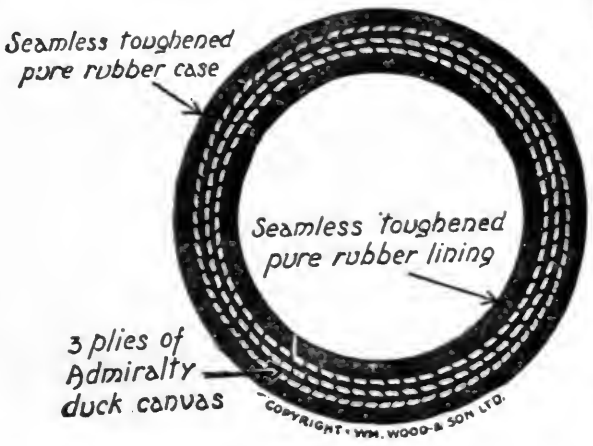
GARDEN HOSE. "RHINOHIDE" BRAND.

This Hose is built to our special specification, from the purest materials, without the admixture of any make-weigh's whatever; colouring matter is even excluded, preserving the natural light grey colour. The inner lining is SEAMLESS, of the purest toughened rubber procurable, thoroughly frictioned to and covered with three plies of ADMIRALTY STANDARD Quality Duck Canvas, the whole encased in the outer cover of purest toughened rubber. The ends of each length are rubber sealed, uniting the inside lining and outside cover, preventing any moisture or grit working into the plies. With absolute confidence **we claim this to be**

The Best Hose in the World

and back it with **10 Years' Guarantee.**



Seamless toughened pure rubber case

SILVER-LEAF DISEASE.

One of the most distressing features which have marked the last decade for all fruit growers, amateur and professional alike, has been the terrible progress "silver leaf" disease has made all over the country.

Ten to fifteen years ago, now and again one came across Victoria plum trees which were afflicted by the disease, the cause of which was then unknown, but now it is no exaggeration to say that hundreds of acres are affected, while the ravages have extended to many other varieties of plums and also some apples.

The most striking effect, which was the first indication that the tree was suffering from a disease, was the curious white, colourless appearance of the leaves on the affected bough or branch; hence, of course, its name, "silver leaf disease." The most careful microscopic search of the affected leaves failed to discover any fungus or anything to account for the condition.

By and by, however, it was observed that when a branch of a tree died as the result of the disease, some time after small fruiting bodies of a fungus made their way through the bark in large numbers. Considerable controversy has raged as to whether this fungus is really the cause of the disease known as silver leaf, but it may be considered that it has been conclusively proved that it is so.

Certain experiments have been made, healthy trees being inoculated with minute portions of the fungus fruits, and the diseased condition of the leaves has followed within a very short period. When, however, the portions of fungus were rubbed on to the uninjured bark, no such effect was observed, and the tree was quite healthy.

It will be seen from this that the fungus is a wound parasite, being unable to obtain an entrance into the tissue of the trees except by means of some wound either accidentally caused or by the process of pruning. As soon as a spore of the fungus has lodged upon such a wound, germination quickly takes place, and the mycelium grows through the vessels of the wood. It is this choking by the mycelia of the vessels which carry food, etc., to and from the leaves that causes their peculiar appearance.

The mycelium grows through the vessels till the affected part—bough, branch, or even the tree itself—is killed, and it is only then, and not till then, that fruiting bodies are formed, which push through the bark, and so distribute their spores widecast and affect other trees. Two facts will naturally follow from this: firstly, the great importance of removing at once all dead and dying wood from trees affected with the disease, and burning them up out of the way; and, secondly, that all wounds, however caused, should be protected in some way to prevent the spores germinating upon the surface and finding an entrance thereby.

For this purpose something should be used which will last a year or two till the wound should have healed itself over, and, of course, should not be of such a nature as to injure the tree. Stockholm tar seems very good for this purpose; also red or white lead paint, preferably mixed without turpentine, as it is just possible that the latter may be injurious to the trees. Whatever is used, it should be applied as soon as possible after the wound has been made, and all cuts from an inch in diameter upwards should be protected. With regard to curative measures, once a tree is attacked we know very little at present what to do to affect a cure.

Occasionally, when the attack is discovered at a very early stage, the removal of the affected bough sufficiently far back into the healthy wood will put a stop to it, but such cases are very seldom met with. One now and again meets with a case of a tree being affected, and then for all the silvery appearance to disappear from the leaves after a time without anything being done, but such cases are even more rare. The fact that the mycelium remains internally during the life of the host led to the suggestion that toxic substances should be injected in such a manner as to be carried up or down, as the case may be, in the sap.

The method which was ordinarily used consisted of boring two or three holes of about 1in. diameter into the tree and filling these with finely divided crystals of sulphate of iron, which had been previously well damped, closing the hole with a stopping of Portland cement. Varying results have been reported, some who tried the method reporting cures and others quite the opposite.

One improvement might be suggested in the method: that is, by replacing the cement plug by a piece of tin fastened to the tree by tacks, by this means ensuring that the hole is quite full of the sulphate and that it therefore comes into contact with the sap, both in ascending by the wood and descending by the inner bark. A further development of the idea is to sow sulphate of iron round the tree, and prick it in amongst the roots to try and get it taken up by them; but this seems scarcely as feasible as the former method. It is quite necessary, however, that some remedy should be discovered very shortly to combat this destructive disease, otherwise the orchards in many places will be swept entirely away.

F. W. Hammond.

ALPINE PLANTS FROM SEEDS

One of the most fascinating pursuits is found in raising rock and alpine plants from seeds; and wherever these charming subjects are grown to any extent, no other method can rival this in providing healthy and vigorous specimens. It is generally accepted as sound policy that seeds of alpine plants give the highest percentage of germination when sown as soon as ripe, and this is probably most noticeable in genera like Primula, Gentiana, and Anemone; and, although numerous kinds germinate quite freely when sown at the usual time in spring, the prudent cultivator will sow seeds as soon as ripe, for then the vitality is greatest.

It is, of course, with home-grown seeds that one gets the best results, and, in seelcting these, choose only the best types. For example, Dianthus neglectus and Ramondia pyrenaica often give weak colours in the flowers, and such should not be perpetuated when it can be avoided. Another instance occurs in Saxifraga longifolia, which, with insect agency, readily fertilises with S. cotyledon and similar kinds; and, while the resulting seedlings have a certain beauty and interest of their own, they are not comparable with the true plant. For this reason, a good flowering specimen of S. longifolia should always be carefully hand-fertilised, and the flower-spike enclosed in some fine gauze material to exclude insects.

In certain quarters it is frequently held out as a bait to the uninitiated that from seeds there is always the chance of raising something in advance of the type—a fact none can dispute: but an improved variety is more generally the result of careful selection and systematic crossing; while the novelties that originate haphazard or by accident are exceedingly rare, and do not fall to the lot of many.

Alpine seeds are best sown in well-drained pots or pans, using a compost of loam and peat in equal parts, with a quantity of sharp grit or crushed chalk to keep it open. Large numbers of rock and alpine plants show a decided preference for chalky soil. In their young stages this substance maintains the soil in a sweet condition; while in the open, with chalk in the soil, they are more reliable perennials. The seed-pans must be carefully drained, and filled to within half an inch of the top with the compost advised, first passing it through a half-inch sieve. The seeds must be sown thinly, and covered lightly, or not at all, acording to their size. The pans should not be watered overhead, but stood carefully in a tank or other vessel of water. Once the water rises to the surface, remove the pans and place them in a shaded frame, glassing each pot separately, in order to conserve moisture, and so hasten germination. When the seedlings appear, slightly tilt the cover glasses to admit air, and gradually increase the amount until the glasses can be dispensed with.

When the seedlings are large enough to handle, transplant into pots or boxes, using a compost as already advised, but slightly rougher. During the hottest period of the year alpine seedlings make most rapid progress when the pans or boxes are stood upon a cool ash base, and some light shade is afforded, while those that are transplanted into thumb-pots should be plunged to the rim in coal-ashes or cocoanut-fibre refuse. Numbers of these free-growing rock plants may eventually be placed out in nursery beds. This ensures much larger plants; and, if these can be planted permanently by the middle of September, there will be few losses during the winter.

Choice and rare alpines are most readily established when planted in their permanent positions towards the end of March. Some attention will be necessary the first season, in the matter of watering; but, if the soil is specially prepared before planting, and the plants are made thoroughly firm, the problem of supplying adequate moisture to establish them successfully, will not be laborious work.

Among rock and alpine subjects I have raised from seeds in the manner indicated are the following: Æthionema coridifolium and Æ. grandiflorum, Alyssum montanum, A. alpestre, A. saxatile and its var. citrinum; Androsace carnea, A. Haggeri, A. sarmentosa, A. villosa, and A. primuloides; Anemone pulsatilla, Antirrhinum glutinosum, Arenaria balearica, A. grandiflora, and A. montana; Campanula cenisia, C. pulla, C. pumila, C. valdensis, and C. Vidali; Dianthus alpinus, D. deltoidea, D. graniticus, D. neglectus, and D. sub-acaulis; Edraianthus dalmaticus and E. graminifolius; Erinus alpinus and varieties; Geranium argenteum, Gypsophila muralis, G. repens, and G. cerastioides; Hypericum fragilis, H. coris, H. repens, and H. reptans; Iberis gibraltarica and I. jucunda; Leontopodium alpinum, Lithospermum graminifolium, Onosma albo-roseum and O. stellulatum; Papaver alpinum, primulas of many kinds; Ramondia pyrenaica, Saponaria ocymoides, Saxifraga Burseriana, S. longifolia, and many others; sedums of many kinds; Silene alpestris, S. armeria, and S. Shaftæ; varieties of Thymus serphyllum; Tunica saxifraga, Veronica incana, V. prostrata, and V. rupestris.

Thomas Smith.

Coombe Court Gardens.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

IMPORTED ORCHIDS.—Such species of cattleyas as C. Dowiana, C. D. aurea, and C. Warscewiczi (gigas) are imported in quantities at this season of the year. The species usually arrive in good condition, that is to say, the plants reach us with a minimum loss of leaves, and the pseudo-bulbs in a normally plump condition. Some of the plants, especially those of C. Warscewiczi, may even retain their flower sheaths, and may produce flowers later in the season, although it is desirable that they should not be permitted to bloom until they have become re-established, or at least, made a season's growth under cultivation. It is desirable to retain the leaves on the plants as long as possible. With this end in view, the fact should not be overlooked that the plants have been packed in cases for some weeks in transit, and thus in darkness. To expose them directly they are received to the full effects of our midsummer light is liable to have an ill effect; and this will be made apparent by a rapid change of colour, which generally ends in the loss of some of the foliage thus effected. Care therefore is necessary to protect the plants for a few weeks from strong light, even if they are placed in their receptacles and permanently potted.

POTTING.—My experience has been that shallow pans are the most serviceable for the culture of C. aurea, C. Warscewiczi in its varied forms, and the natural hybrid C. Hardyana. These should be well drained and the compost used should be of a lasting nature. The compost should be pressed moderately firm. Suitable wires should then be affixed so that after the plants have become used to the light they may be suspended in a position within reasonable distance of the roof glass.

INSECT PESTS.—Before potting it is most desirable to cut away all dead and decaying matter about the base, and to thoroughly examine for insect pests which may be hidden beneath the decaying bracts. The worst fear from imported cattleyas is the cattleya fly. Previous attacks on the plants may be detected by small perforations and the disfigurement of bulbs. Where these are observed it is advisable that the plants should be isolated and grown well away from the general stock. Later indications of the appearance of the cattleya fly may be seen in the thick, knotty appearance of the base of the new growth when an inch or so in length. If such growths are cut off and examined, the grubs of the fly will be found in different stages of development. Where the young growths of cattleyas are affected with this pest it is desirable that they should be cut clean off the plant and burnt. Although it may be disappointing to lose what have apparently been good growths, the consolation remains that there are usually plenty of dormant buds on imported plants, and later growths are not generally infested by the cattleya fly.

WATERING.—Imported plants should not be very liberally watered, as by carefully spraying the plants overhead in warm weather they will retain their normal plump condition until such time as the new roots become established in the potting compost.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

HUMEA ELEGANS. — This beautiful greenhouse plant is now developing its inflorescence, and, as it requires plenty of head room, it may be removed to the conservatory, where, apart from its distinct character, the scent of its leaves and flowers is always appreciated. The pots are now full of roots, and during periods of bright sunshine they must be examined frequently for the purpose of ascertaining whether they require water, for if they suffer from drought they will be seriously injured. The flowering season may be somewhat delayed, if desired, by placing the plants on the north side of a high wall, and plunging the pots in ashes. Shift on young plants that have been raised this season as their requirements demand, but do not overpot them, or apply moisture to the roots too freely. Keep them moving steadily in a cool house, and shade them from bright sunshine.

CHRYSANTHEMUMS.—The final potting of these must be accomplished with the least possible delay, so that the plants may be arranged in their permanent summer quarters. A position must be chosen which is exposed to the sun during the greater part of the day, but if somewhat sheltered from rough winds it will be an advantage. The large-flowering kinds must be securely tied to wires that are supported to stout posts. Recently-potted plants must be carefully watered till the roots are pushing freely in the new soil, and manures must be withheld till they are well rooted. Give the plants a vigorous syringing morning and evening, and damp the immediate surroundings with the aid of the garden hose occasionally, to help keep the atmosphere cool during very hot weather. Spray the plants overhead occasionally with an insecticide to keep them free from aphis. The decorative kinds should have their pots half plunged in ashes, if time will permit.

LILIUMS SPECIOSUM AND AURATUM.—If these are not already supported with stakes they should receive support at once. The pots being now full of roots, stimulants may be given liberally. A top-dressing of some rich soil will also be beneficial. Guard against attacks of aphis by spraying with insecticide.

SHADING. — The blinds must be kept drawn during the greater part of the day in hot weather. This remark may also be applied to all houses containing flowering plants. The plants must be watered several times daily if necessary, and, where practicable, the flowers and stages should be sprinkled with water occasionally to keep the atmosphere cool.—E. HARRISS, Lockinge Park Gardens.

HARDY FRUITS.

APPLES.—The prospect at the present time of a good all-round crop is excellent; indeed, not for many years have I seen a heavier set of fruit, both on orchard and bush-grown trees. The latter will need to be thinned now that the fruits are large enough to enable the cultivator to see which are the most likely to attain full size and high finish. Thinning the clusters is a matter of great importance, and should be commenced early by removing the undersized and deformed ones first with a pair of grape scissors. Then thin the remainder so as to leave the crop as evenly distributed as possible. The quantity to leave on each bush should be regulated by the size of the variety and the strength of the growth. On no account should the trees be overcropped, especially on light land, as this would be entirely at the expense of next year's yield. Do not on any account allow the roots to suffer from an insufficiency of moisture, and feed liberally with liquid manure if the trees are in need of such assistance. This will enable the fruits to attain a good size and ensure the formation of strong fruit buds by the end of the season. These remarks apply also to all kinds of fruit trees bearing good crops. Destroy caterpillars as they make their appearance on the leaves. A few light syringings with a nicotine insecticide followed with clear water will do much to rid the trees of the pests.

PEARS.—The crop of these is very light, so that very little thinning will be necessary. The trees of most varieties produced a profusion of flowers, and looked very promising till we had 10 degrees of frost that seemed to change matters, and since both flowers and tiny formed fruits dropped wholesale. Morello cherries are very satisfactory, and most kinds of soft fruits. Keep the leaders of all young trees that have not filled their allotted space neatly secured to the required position, and on shallow borders a few good soakings of water will prove very helpful in many cases where the growths are not over strong. Keep the foliage free from red spider, also slug-worm, if such put in an appearance; a few syringings with nicotine insecticide will destroy most kinds of insects if applied according to directions given on the tins.

FIGS.—Attend to the young growths of trees trained on walls; lay in the leaders and other shoots required for next year's fruiting. Any superfluous growth should be removed, so that there is no overcrowding of the wood. A firm rooting medium and ample extension of the branches is the best for the production of plenty of figs. Large trees will benefit greatly from a few good soakings of liquid manure and a mulching of decomposed cow manure. Keep late-planted trees well supplied with moisture to assist them to make a free, healthy growth.—H. MARKHAM, Wrotham Park Gardens.

THE KITCHEN GARDEN.

TOMATOES.—Plants grown in the open, whether trained against walls or fences, or fastened to stakes, should be made secure against winds. All lateral growths should be removed at an early stage. They must not suffer from an insufficiency of water at the roots, otherwise the flowers will not set satisfactorily. When a good set is obtained, place a mulch of decayed manure about the plants, and supply them with liquid manure alternately with clean water.

SCARLET RUNNER AND CLIMBING FRENCH BEANS. — The rows of plants should receive their stakes before the vine has made much growth. Some short, twiggy growths introduced between the tall stakes will form a support to the young bines, and from those they will transfer themselves to the stakes. If the land be of light texture lay a thick mulch of manure along the sides of the rows. An abundant supply of water is required during dry weather, dryness at the roots being one cause of the failure of runner beans to set their flowers. A good spraying of the foliage during the evening after hot days is most beneficial.

CARROTS.—A good sowing of the Scarlet Model type should now be made. These will provide a useful stock of young carrots for autumn use, or they may be lifted and pitted for the winter. A position previously occupied by early potatoes is well adapted for the purpose; the land should be forked over and levelled. Apply a good dressing of soot, which should be well raked in. The soil must be in a moist condition when sowing occurs, and unless a good water supply is at command it is advisable to wait for rain.

SAVOY CABBAGE. — A good batch of plants should be transplanted during showery weather. The land should be moderately rich, and occupy an open position. If varieties grown are dwarf ones, allow a space of eighteen inches between the rows and twelve inches from plant to plant in the row; for the Drumhead varieties, a distance of two feet between the rows, and 1½ feet between the plants is a suitable distance at which to plant. Water liberally until the plants are well established.

BROAD BEANS. — When most of the flowers are set, pinch out the tips of the stems to protect the plants from being laid by strong winds; stakes should be driven in 9ft. apart on either side of the rows, fastening string to them.—W. MESSENGER, Woolverstone Park Gardens, Ipswich.

ROYAL SHOW

BRISTOL,
July 1st to 5th, 1913.

£11,000 in Prizes.

Horses, Cattle, Sheep, Pigs, Poultry, Produce, Implements, Jumping, Riding and Driving, Four-in-Hand Teams, Horse-Shoeing and Butter-Making Competitions, Agricultural Education and Forestry Exhibitions, Flower Show, Dog Show.

OVERSEAS SECTION.

Military and Naval Displays,

Bands of H.M. 19th (Queen Alexandra's Own Royal) Hussars and 1st Batt. Gloucestershire Regiment.

Prices of Admission: Tuesday, July 1st, 5/-; Wednesday and Thursday, July 2nd and 3rd, 2/6—after 5 p.m., 1/-; Friday and Saturday, July 4th and 5th, 1/-. Season Ticket, 10/6.

THOMAS McROW, Secretary.

THE GREAT ROSE SHOW OF THE YEAR

Will be held by the

National Rose Society

in the

ROYAL BOTANIC GARDENS, Regent's Park, N.W.,

on

FRIDAY, JULY 4.

The two Champion Challenge Trophies will be competed for, also numerous other Cups and Pieces of Plate, and Money Prizes to the value of over £400.

NEW SEEDLING ROSES IN A SEPARATE TENT.

BANDS OF THE ROYAL HORSE GUARDS (THE BLUES) AND SCOTS GUARDS.

Luncheons, Teas, and other Light Refreshments.

ADMISSION:

Noon to 3 p.m., **5s.**; 3 to 5 p.m., **2s. 6d.**; 5 to 7 p.m., **1s.**

E. MAWLEY,
Hon. Secretary, Rosebank, Berkhamsted.

THE POPULARITY AND PROSPERITY OF THE

BIRMINGHAM FLOWER SHOW

INCREASE EACH YEAR!!

£600 CASH PRIZES. 8 SILVER CUPS.

Gold, Silver-Gilt, Silver, and Bronze Medals.

FRIDAY and SATURDAY, July 18 and 19, 1913.

WILLIAM G. CARRADINE, F.R.H.S.,
Secretary, Birmingham.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY.

GRAND QUARTER CENTURY FLOWER SHOW.

SOPHIA GARDENS, CARDIFF,
WEDNESDAY and THURSDAY, JULY 23 and 24.

Specially good Prizes in every section, amounting in money and plate to nearly £500. Tents lighted by electricity. Popular Prices.

Schedules from the Secretary, Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

MALVERN ROSE AND SWEET PEA SHOW.

THURSDAY, JULY 10th, 1913.

Open Classes in Roses and Sweet Peas.
Nearly £100 in Prizes.
Entries close July 7th.

For Schedules and Entry Forms apply to A. D. MELVIN, Secretary, The Poplars, Malvern Link.

NORTH LONSDALE ROSE SOCIETY, ULVERSTON.

THIRTIETH ANNUAL EXHIBITION, FRIDAY, JULY 18th.

Numerous Open Classes for Roses, Sweet Peas, Violas, and Herbaceous Flowers.

Entries close July 12th. Schedules from F. J. HARRISON, County Square, Ulverston.

LEICESTER.—ABBEY PARK FLOWER SHOW, 5th and 6th August next. Open Class, Group of Plants, £20, £15, £10, £6. Liberal prizes for Collections of Fruit, Displays of Roses; Silver Cup, Gold and Silver Medals for non-competitive exhibits. Schedules from JOSEPH BURTON, Supt.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

York Floral Fete and Gala.

Owing to the great pressure on the space in our issue of the 21st inst. we were compelled to leave over our notes on the floral designs and a portion of the non-competitive exhibits. These we have now the pleasure of giving.

FLORAL DESIGNS.

Mr. F. H. Ward, York, staged the best bouquet of roses, and also the best basket of roses. Messrs. W. J. Godfrey and Son, Exmouth, were easily first for a basket of carnations, and they associated a white with a heliotrope variety. In the hand-basket class Mr. F. H. Ward scored with blush carnations, very prettily arranged.

Mrs. Jefferson, Acaster Malbis, York, was placed first for a group of flowers suitable for a table decoration, and she used pink and cream-pink sweet peas, with pink and pale blue schizanthuses; Mr. J. Morrod, Clarence Street, York, came second with a charming arrangement of white and pale lavender sweet peas.

NON-COMPETITIVE EXHIBITS.

The delphiniums from Messrs. J. Kelway and Son, Langport, were noble spikes of first-class varieties, James William Kelway being one of the largest-flowered and richest dark blues. This firm's pæonies were also very fine, and made a brave, bright display of rich colour. A group of rambling roses, hydrangeas, carnations, etc., was arranged in front of the main entrance by Messrs. J. Backhouse and Son, Lim., York. The groundwork was well filled in with newer varieties of the dwarf polyantha roses, with zonal pelargoniums, liliums, and ferns to give pleasing variety to the group.

From Messrs. Sutton and Sons, Readiog, came a very attractive display of choice vegetables with stands of melons and tomatoes, all tastefully set off with vases of sweet peas, antirrhinums, poppies, and other flowers that may be raised from seeds. Prominent on the stand put up by Messrs. Jarman and Co., Chard, was a collection of cut zonal pelargoniums, embracing a fine assortment of both single and double varieties. Mr. Wm. Lawrenson, Yarm-on-Tees, came out strong with pyrethrums, and also perpetual-flowering carnations.

Messrs. E. Webb and Sons, Wordsley, Stourbridge, occupied a big space at the entrance end of the tent, arranging upon the ground mounds of gloxinias, begonias, petunias, spiræas, etc., with a small collection of cut sweet peas and a central stand of vegetables, melons, etc. A unique exhibit of radishes was staged by Messrs. J. Kelway and Son, Langport, there being something like seventy dishes. Some of the varieties were very uncommon and of exceptional form and colour, particularly Golden Globe, Triumph, Olive Black Japan, and Violet Giant.

On Messrs. Sander and Son's (St. Albans) stand of orchids there were Lælio-cattleya Canhamiana and several hybrid forms, such as L.-c. Kathleen, and L.-c. Cora, together with choice cypripediums and odontoglossums, and in the centre of the group rose the tall spikes of Peristeria elata, a plant of quite distinct character, and considerable interest.

A large group of choice ferns, arranged by Messrs. E. J. Batchelor and Sons, Harrogate, was restful and pleasing to the eye, and contained many choice things. The finely-crested Nephrolepis Batchelori was very well shown, and such things as davallias, platyceriums, and adiantums were well used. A group of caladiums from Messrs. J. Peed and Sons, Norwood, reminded us of past days, when these were in the height of popularity as exhibition subjects, and they also demonstrated that caladiums are still capable of producing a refined, but striking, effect that even to-day should not be ignored. Messrs. Peed also showed gloxinias, and some well-grown streptocarpus.

Sweet peas were rather largely shown, several of the leading specialists putting in an appearance. Messrs. E. W. King and Co., Coggeshall, occupied an end position on one of the tables, arranging their flowers in the form of a double-sided bank with tall columnar stands at intervals along the centre. Queen Mary, Anglian Fairy, and Rosabelle were three distinct and good varieties shown. Another very fine exhibit was that from Mr. W. J. Unwin, Histon, Cambridge, who had splendid vases of Clara Curtis, Nettie Jenkins, Scarlet Emperor, Cyril Unwin, and Edith Taylor among his extensive collection of up-to-date varieties.

Messrs. Dobbie and Co., Edinburgh, made a feature of sweet peas, their flowers being really fine, and of rich colours. Ruby Palmer was very bright, and Mrs. McIlwick represented one of the now popular metallic mauve and terra-cotta shaded varieties. Antirrhinums of a splendid strain were another fine feature in Messrs. Dobbie's exhibit, the glowing colours and long spikes of Dobbie's Scarlet, Crimson King, and Moonlight being highly effective. Collarette dahlias and violas were also shown by this firm.

Messrs. S. Bide and Sons, Lim., Alma Nurseries, Farnham, put up sweet peas of the most useful and popular sorts in small vases. Thomas Stevenson, Mrs. Hugh Dickson, Loyalty, and Dorothy being a few of the most distinct. Miss Hemus, Upton-on-Severn, showed big masses of sweet peas, such as Paradise Comet, Orange Paradise, and Lavender Paradise, as well as some delightful Iceland poppies, and her rich dark blue petunia, which is of striking colour and very free flowering.

Mr. G. Yeld, M.A., 2, Burton Lane, York, showed a set of his hybrid irises, including several remarkably pretty things. Mars, with soft brown standards and rich maroon-purple falls, was pleasing; Sunshine, a clear yellow, and the large bold flowers of Lord of June were among the best. Hemerocallis Tangerine, another product of Mr. Yeld's, was particularly bright. "Glorious pæonies!" was the descriptive exclamation we heard just as we approached Messrs. R. H. Bath's splendid exhibit of these noble flowers. The adjective was distinctly appropriate, for the noble blooms were fine in size and form, as well as rich in colour. Her Grace, a delicate china pink; Francois Ortegal, glowing crimson; and Marie Lemoine, cream colour, were three beauties.

Messrs. Blackmore and Langdon, Twerton Hill Nurseries, Bath, made a splendid show of delphiniums. Statuaire Rude was conspicuous among the mauve shades, whilst the white Moerheimi and the Cambridge blue Capri contrasted well with such dark varieties as Walter T. Ware, Robert Cox, and King of Delphiniums.

Messrs. Mansell and Hatcher, Lim., Rawdon, Leeds, put up a group of orchids that was imposing in general effect, and of sustained merit when submitted to closer investigation. Sprays of odontoglossum overhung a big central mound of cattleyas and other large-flowered orchids, and on either side were similar mounds, the intervening spaces and the foreground being furnished with Vanda teres, Odontoglossum Williamsonianum, Miltonias, Cypripedium niveum, Lycaste aromaticum, and other lovely things, all nicely arranged on a foundation of fresh green moss. Orchids were beautifully shown by Messrs. Charlesworth and Co., Haywards Heath. Miltonia vexillaria, well flowered, several good Odontoglossum crispums, and Lælio-cattleyas in variety were the outstanding

features, but some of the smaller things, such as Epidendrum vitellinum, Odontioda Lutetia, and Masdevallia Courtauldiana were also well shown.

A stand of violas, numbering somewhere about a hundred varieties, was set up by Messrs. W. Artindale and Son, Nether Green, Sheffield, most of the best-known bedders and exhibition varieties being represented. Pyrethrums were a telling feature of Mr. G. W. Miller's exhibit from the Clarkson Nurseries, Wisbech, but his pæonies, delphiniums, and other border flowers were bright and effective.

A bright display of herbaceous flowers came from Messrs. G. Longster and Sons, Derwent Nurseries, Malton, including Kniphofia Tucki, Hemerocallis Sovereign, Papaver Mrs. Perry, and a few pyrethrums, pæonies, etc. Messrs. Dicksons, Lim., Chester, had a mass of pæonies, with big bunches of delphiniums in the background, and a group of Astilbe Arendsi Ceres as a centrepiece. Messrs. Gunn and Sons, Olton, Warwick, arranged a group of phloxes on the ground, using their best and brightest varieties in big, showy masses.

Messrs. W. and J. Brown, Stamford, put up a beautiful group of cut roses, the table being occupied by exhibition blooms in boxes, with tall stands of decorative varieties at intervals. Towering to a good height at the back of the stand were fine bunches of Lilium Szovitzianum.

Richmond.

In the fine Old Deer Park, at Richmond, the local horticultural society held its exhibition on June 25. The show was a good one, though we have seen some better at Richmond. Roses were fine, and hardy flowers were very well shown; fruit was a short display, but vegetables were very good for the season.

GROUPS AND PLANTS.

Premier award for a group was won by Mr. H. Burford, gardener to Sir Max Waechter, Terrace House, Richmond, who staged a very elegant combination, in which Campanula Moerheimi, Lilium speciosum, Malmaison carnations, clarkias, and a few well-grown crotons were lightly disposed over a pleasing groundwork of maidenhair ferns and Gypsophila elegans. Mr. H. Hicks, gardener to C. M. Bartlett, Esq., Uplands, East Sheen, came second with a rather heavy arrangement of caladiums, coleuses, gloxinias, crassulas, etc.

The plant classes were fairly well filled. Mr. Burford scored for palms with very good kentias and cocoses; Mr. H. Lawrence, gardener to Mrs. Vaughan Arbuckle, Stawell House, Richmond, had the six best foliage plants, including a good Anthurium crystallinum; Mr. A. Allum, gardener to Lionel Warde, Esq., Petersham House, Petersham, was a capital first for six caladiums, with grand specimens, and in a good competition; Mr. H. Lawrence was to the front for six ferns, his Asplenium nidus being his best specimen.

Mr. E. Skelton, Townsend Terrace, Richmond, showed the best hardy ferns; Mr. Allum led for coleuses, with large, well-coloured pyramidal specimens, in a close contest; Mr. Lawrence was an easy first for aspidistras, winning with four grand plants among five competitors; Mr. Lawrence had the finest six fuchsias, but Mr. Hicks ran him very closely. For half a dozen orchids, Mr. F. Cresswell led with Odontoglossum Dora, O. eximium, O. Williamsianum, O. MacNabianum, Odontioda Wilsoni, and Lælio-cattleya Canhamiana; Mr. H. S. Chandler, Quencote, Ashford, second.

Mr. W. J. Hill, gardener to G. Aitkens, Esq., Manaton, East Sheen, had the best single and the best double begonias, and also the finest nine streptocarpuses, these being particularly well flowered. Mr. W. Chant, gardener to E. R. W. Bennett, Esq., Darly Lodge, Sunbury, beat Mr. Hill for gloxinias.

Mr. F. Cresswell, gardener to Dr. Miguel Lacroye, Brynder, Roehampton, scored for a small group; his arrangement was a rather solid one, and the grace of his numerous odontoglossums and odontiodas was spoiled by the rigidity with which the spikes were erectly staked; Mr. F. Tarrant, gardener to C. W. W. Burge, Esq., Sunnybank, Teddington, second, and Mr. F. W. Taylor, gardener to T. J. Messom, Esq., The Hut, Strawberry Hill, third.

ROSES AND HARDY FLOWERS.

The Gunnersbury Park Challenge Cup for the best forty-eight roses, distinct, three blooms of each, secured a good contest among three competitors. Messrs. Harkness and Co., Hitchin, won the cup with a fine clean lot of flowers, and especially good were their blooms of Mrs. Shean, Gustave Piganeau, Mrs. D. McKee, Mrs. J. Laing, Mdme. Jules Gravereaux, Avoca, Mrs. T. Roosevelt, Mabel Drew, Frau Karl Druschki, Bessie Brown, Mildred Grant, and Jennie Bigatois. Messrs. B. R. Cant and Sons, Colchester, came second with smaller fresh flowers; and Messrs. D. Prior and Son, Colchester, were third.

Five contestants came forward in the class for two dozen treble blooms of roses, and first prize was awarded to Mesrs. W. and J. Brown, Peterborough, for a good set that contained Mdme. C. Soupert, W. R. Smith, Frau Karl Druschki, Mdme. Jules Gravereaux, Dean Hole, and Mrs. M. Sinton. Messrs. G. and W. H. Burch, Peterborough, were placed second, and Messrs. Harkness and Co., third. Mesrs. G. and W. H. Burch came first for twelve trebles, and they had fine blooms of St. Helena and Dean Hole; Mr. J. Pigg, Royston, Herts, second, and Messrs. W. Crisp and Sons, Colchester, third; four entries.

First place for twelve tea roses, one variety, was occupied by Messrs. W. and J. Brown, Peterborough, with Mdme. Jules Gravereaux in fine form; this same variety, gained second place for Messrs. G. and W. H. Burch, and third for Messrs. D. Prior and Sons; the two unplaced boxes contained Mrs. Foley Hobbs. The best twelve H.P. or H.T. roses were bright blooms of Lyon Rose, from Messrs. G. and W. H. Burch; there were seven competitors, and Messrs. Harkness and Co. came second with Mrs. John Laing, and Messrs. D. Prior and Son third with Bessie Brown.

The Rev. L. E. Chalmers Hunt, William Rectory, Letchworth, led in the amateurs' class for a dozen roses; and the Rev. J. H. Pemberton, Havering-atte-Bower, came second. The same competitors occupied similar positions in the class for two dozen blooms, but there seemed little to choose between the two sets.

Mr. G. Baldwin, Greenford Green, had a grand nine bunches of sweet peas, and worthily won the first prize with Marks Tey, Mrs. Cuthbertson, Dorothy, Thos. Stevenson, Sunproof Crimson, Melba, Hercules, Lavender George Herbert, and Lady Knox. Mr. Allum scored for two dozen bunches of herbaceous flowers with a fine lot, in which campanulas, delphiniums, and liliums were very fine; Messrs. G. Massey and Sons, Spalding, second; and Mr. Thos. Smith, gardener to the Marquis of Ripon, Coombe Court, Kingston Hill, third.

Mrs. A. R. Bide, Farnham, led for three stands of flowers suitable for a dinner table, with a pleasing association of pink clarkias and Mdme. Abel Chatenay roses; Mrs. Robinson, second; and Miss Bashford, Barrow Hedges Farm, third, with Lady Hillingdon roses. Miss Martin, North Road, Richmond, and Mrs. A. Robinson, Norhyrst, Carshalton, were the leading prize-winners in other classes for floral arrangements.

FRUIT AND VEGETABLES.

In the fruit classes Mr. W. Lintott, gardener to Sir W. Greenwell, Morden Park, Caterham, had matters pretty much his own way. He was first for six dishes of dessert fruit, with Black Hamburgh and Foster's Seedling grapes, Brown Turkey figs, Early Rivers nectarine, Royal Sovereign strawberries, and Premier melon. Both for black grapes and for white grapes Mr. Lintott was first prize-winner. Mr. F. W. Taylor and Mr. G. Baldwin, gardener to A. W. Perkin, Esq., Greenford Green, Harrow, second and third respectively. Mr. Allum led for a dish of strawberries; and Mr. E. Montague, gardener to Colonel Biddulph, Grey Court, Ham, scored for nectarines with good fruits of Cardinal.

Vegetables were numerous and good. Mr. G. J. Broome, gardener to Miss Langworthy, Grays House, Holyport, Berks, led for Messrs. Webb and Sons' prizes for six kinds, and also won the first of Messrs. Sutton and Sons' prizes for six kinds, with very fine carrots and onions. Mr. Broome continued his successes by winning Messrs. J. Veitch and Sons' first prize. The Richmond allotment holders brought out some splendid produce, their carrots, beet, turnips, cauliflowers, and peas being in first-rate condition.

NON-COMPETITIVE.

The traders supported the committee ably on this occasion. The chief displays were of Japanese maples and bamboos from Messrs. Fromow and Sons, Chiswick; pot roses in great variety; and hydrangeas from Messrs. Jas. Veitch and Sons, Chelsea; ivies, greenhouse plants, fuchsias, especially good, from Mr. L. R. Russell, Richmond; palms, blue hydrangeas, and pink spiræas from Mr. Wm. Thompson, Sheen Nurseries, Richmond; hardy flowers in great variety, including a selection of alpine plants, from Messrs. T. S. Ware, Lim., Feltham; roses, finely set up, and hardy flowers from Messrs. G. Jackman and Son, Woking; roses in abundance and finely coloured from Messrs. W. and J. Brown, Peterborough.

Manchester Orchid Society.

At the recent meeting the members of committee present were: Messrs. Z. A. Ward (in the chair), H. Thorp, J. Evans, D. McLeod, Dr. Hartley, J. Bamber, C. Parker, G. Weatherby, A. J. Keeling, W. Shackleton, A. G. Ellwood, J. Lupton, J. Cypher, and H. Arthur (secretary). The display was good, and numerous novelties were exhibited.

R. Ashworth, Esq., Newchurch (gardener, Mr. Gilden), was awarded a Large Silver-gilt Medal for a fine group, comprising Odontoglossums Vuylstekei Ashlands var. (A.M.), Vertumis (A.M.), Jasper, Fascinator, Leeana, Ardentissimum, crispum xanthotes, Odontioda Charlesworthi, Miltonias vexillaria Cobbiana, Kaiser A. Victoria, Chelseaensis, and Bleuana grandiflora; Cattleyas Mossiæ delicata, Robert de Wavrin, Lælio-cattleyas Aphrodite, Fascinator, and G. S. Ball; Cypripediums bellatum, Queen of Spain, R. Ashworth, Godefroyæ, Kaiser Wilhelm, niveum Ashlands var., callosum Sanderæ, grande atratum, and others.

A. Warburton, Esq., Haslingden (gardener, Mr. Dalgleish), staged a nice group, for which a Large Silver Medal was awarded. Among the odontoglossums were O. crispum Grairelanum, Luce-Mariæ, Capartianum, A. J. Balfour, Mortebeekense, and Virgin Queen; Miltonias vexillaria, including the Vine House var.; Cattleyas Schroderæ Vine House var., Lælia purpurata, and a fine plant of Cypripedium Rothschildianum, carrying five fully-expanded flowers on one stem, a Cultural Certificate with Bronze Medal being awarded to Mr. Dalgleish.

O. O. Wrigley, Esq., Bury (gardener, Mr. Rogers), exhibited in fine condition Phalænopsis Rimestadiana, Odontoglossum crispums (white and blotched), and fine examples of Cypripedium niveum.

Z. A. Ward, Esq., Northenden (gardener, Mr. Weatherby), staged a seedling with 7 flowers, and O. crispum xanthotes, for which a Cultural Certificate and Bronze Medal were awarded to Mr. Weatherby.

Colonel J. Rutherford, M.P., Blackburn (gardener, Mr. Lupton), staged Cattleya Mossiæ Beardwood var., and a fine variety of Miltonia vexillaria.

Messrs. Armstrong and Brown, Tunbridge Wells, had a group for which a Large Silver-gilt Medal was awarded. Amongst the host of good things must be specially mentioned Cœlogyne pandurata, Orchidhurst var., with 14 flowers on one spike (F.C.C.), Cymbidium Lowianum concolor; cattleyas in variety, in-

cluding Mossiæ alba, Lælio-cattleya Martinetti, Orchidhurst var., Brasso-cattleya Veitchi splendens, Lælia purpurata, Orchidhurst var.; a nice collection of odontiodas, containing several new hybrids; miltonias of the vexillaria type, Masdevallia Harryana, and others.

Messrs. Cypher and Sons, Cheltenham, were awarded a Silver Medal for a group, containing Lælio-cattleya Aphrodite, Canhamiana, Fascinator, Brasso-cattleya Triune, Mossiæ Digbyana, Cattleya Mossiæ, Skinneri Temple's var., Miltonia vexillaria, Bleuana nobilior Odontoglossum eximeum, Lambeauianum, Thunia Veitchi, Oncidium pulchellum.

The Liverpool Orchid and Nursery Company were awarded a Silver Medal for a group of unnamed Lælio-cattleyas, amongst which were several good varieties; well-grown plants of Canhamiana and Dominiana, with Miltonia vexillaria and a few cypripediums, including bellatulum album and Godefroyæ Sunset, made a nice display.

Messrs. A. J. Keeling and Sons, Bradford, staged a good mixed group, for which a Silver Medal was awarded, the miltonias of the vexillaria section being very fine; a Cultural Certificate was voted for one specimen.

Messrs. Stuart Low and Co., Enfield, staged Cattleyas Mossiæ, Reineckiana grandis, Pintadeau, and Mrs. E. Ashworth; Lælio-cattleyas Canhamiana, Duchess, and Eudora superba.

Messrs. Charlesworth and Co. staged Odontoglossums splendens, Marietta, and eximeum.

A First Class Certificate was awarded to Cœlogyne pandurata Orchidhurst var., a fine variety, with large flowers, from Messrs. Armstrong and Brown. An Award of Merit was made to Odontioda Vuylstekei Ashlands var., and O. Vertumis, both shown by R. Ashworth, Esq.

A NEW ROT OF POTATO TUBERS.

A new disease of potatoes, which was notified from Ireland last year, has now been described in detail by Dr. G. H. Pethybridge.* It was first observed in 1909 in the plots of the temporary experiment station, established by the Irish Department of Agriculture, at Clifden, Co. Galway. Since then it has been kept under observation, and has also been received from other parts of Ireland. Referring to this new disease, the "Kew Bulletin" states that the rotting is found to be due to a fungus closely allied to Phytophthora infestans, but differing in certain essential particulars. The fungus is named P. erythroseptica, and for the disease the name "Pink Rot" is suggested, owing to the cut surfaces of affected tubers quickly turning pink when exposed to the air.

The facilities afforded by the Clifden station give Dr. Pethybridge exceptional opportunities for studying potato diseases, and in the opening part of his paper he briefly but critically reviews the principal forms of tuber-destruction caused by vegetable organisms. The potato tuber is a structure on which, when once it has been injured, a most varied micro-flora and fauna readily develop, hence the diagnosis of the cause of decay is exceptionally difficult.

Pink Rot commences when the potatoes are still in the ground, and has been found in some varieties as early as July. In most cases the attack begins at the "heel" end of the tuber, and proceeds rather quickly towards the distal or "rose" end. Diseased tubers remain firm, but if pressed exude a quantity of juice, and finally become completely rotten. They do not, however, develop cavities, as in the case of Black Stalk Rot, caused by Bacillus melanogenes. If the tubers are exposed to the air, the subsequent stages resemble those of a "dry" rot; but if covered, the moisture which is exuded does not dry up, so that in the field or store the rot would be regarded as of the "wet" type. A characteristic series of colour-changes takes place when affected tubers are cut open and exposed to the air. The pink colour begins to show after a few minutes, and within half an hour the whole of the diseased portion becomes a deep salmon-pink. With an exposure of several hours the cut surface gradually darkens, and becomes purplish-brown or nearly black. As pointed out above a number of other fungi develop on such decaying tubers, and pustules of various kinds, including those of Fusarium, break through the skin. The latter are merely secondary, the organism causing the initial injury being entirely internal.

Examined with the microscope diseased tissues show an abundance of rather wide, much-branched, intercellular hyphae. No haustoria were observed, and no reproductive organs of any sort could be discovered.

With suitable precautions the fungus was isolated without difficulty, it being found to grow more easily on artificial media than its ally P. infestans. A full account of the culture media and methods is given, and also of the experiments which prove the pathogenic character of the fungus. Reproductive organs were produced abundantly in artificial cultures, though strong predilections for certain substrata were shown. Growth on various media derived from oats was specially vigorous, and an abundant crop of sexual organs follows, from which oospores develop. An acid medium appears to be unfavourable for the production of antheridia and oogonia. Conidia were produced when pieces of culture were transplanted to sterilised peat-bog water or even rain-water; these structures are apparently only developed under water and very rarely, if ever, on aerial mycelium.

The method of development of the apparently sexually produced oospores is remarkable and unique amongst fungi. The oogonium incept enters the antheridium at or near its base, grows up through it and out at the top, expanding there to form the oogonium proper in which the oospore develops. Cytological details are not yet available. At the end of Dr. Pethybridge's paper other species of the same genus are shown to behave in a similar manner, and some systematic alterations based on this discovery are proposed.

Phytophthora erythroseptica is prevalent in the West of Ireland, and the losses caused by it are considerable, in some cases heavier than those due to P. infestans. They are greatest in crops grown continuously on the same land (infection taking place from the soil) and can be avoided by proper rotation.

* On the Rotting of Potato Tubers by a New Species of Phytophthora having a Method of Sexual Reproduction hitherto undescribed. Sci. Proc. Roy. Dubl. Soc., vol. xiii., No. 35, March, 1913.

GARDENERS' ROYAL BENEVOLENT INSTITUTION.

The festival dinner of this institution, held at the Hotel Metropole on June 25, under the chairmanship of Leopold de Rothschild, Esq., was an unqualified success. The attendance of 220 ladies and gentlemen constituted a record. The Whitehall Rooms were beautifully decorated with orchids, carnations, and roses, and the function was an altogether brilliant one. We shall refer to the gathering in more detail in our next issue, but now have only time and space to state that the sum total subscribed to the funds of the institution amounted to a little over £3,000, including 100 guineas from the chairman, £100 from Messrs. N. N. Rothschild and Sons, £100 from Messrs. Sutton and Sons, £250 from the Duke of Bedford, £100 from Messrs. J. Veitch and Sons, and £50 each from Messrs. N. N. Sherwood, Mr. Edward Sherwood, and Mr. Wm. Sherwood; £50 from Sir Jeremiah Colman, £165 collected by Mr. Jas Hudson, £62 by Mr. Wallace, £75 by Mr. H. G. Alexander, and £271 from Covent Garden friends. In addition to the chairman, the chief speakers were Sir Harry J. Veitch, Colonel Mark Lockwood, M.P., Hon. W. T. Mackenzie, and N. N. Sherwood, Esq. The capital musical arrangements were under the direction of Mr. Herbert Schartau.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of the GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in the GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

EARLY ENGLISH WRITERS ON GARDENING.—P. R., Coventry: There seems to be a general impression that Wm. Tusser, who wrote "A Hundreth Good Pointes of Husbandrie," published in 1577, was the first of English authors on gardening matters, and I find some difficulty in discovering anyone who wrote upon this subject at an earlier date. Do you know of any?—Felton, who wrote concerning English Authors on Gardening, in 1830, refers to "Alfred, an Englishman, surnamed the Philosopher, much respected at Rome. He died 1270, and left four books on the Meteors of Aristotle; also one on Vegetables, and five on the Consolations of Boethius." He further refers to Daniel, a Dominican friar, who left a manuscript treating upon herbaria, trees and fruits, and who appears to have flourished about 1379. Richard Arnold had a chapter on "The Crafte of graffynge, and plantyne, and alterynge of fruyts, as well in colours as in taste"; this was printed in 1502.

COMMON SODA IN THE GARDEN.—W. D., Horeham: Would you kindly inform me if a quantity of discoloured washing soda could be put to any good use in the garden or orchard, or for farm crops?—Washing soda (carbonate of soda) is of little use in the garden as a fertiliser. In a very dilute form it may be serviceable on light lands because, as in the case of salt and nitrate of soda, it has the power of retaining moisture. In many cottages the soap suds are carefully preserved after washing day, and, diluted, are used in the garden, with no small success. In a dry state soda is capable of doing considerable damage to crops, and in the neighbourhood of alkali works leaves become covered with a fine deposit and soon drop, and trees do not last long under such conditions. Dr. Bourcart, in a recent publication, points out that "carbonate of soda acts like carbonate of potash; when it is a case of neutralising the acidity of certain marshy lands carbonate of soda may play the part of lime, and the nitric ferments, which cannot act except in slightly alkaline media, may thereby modify the flora of the field. In such conditions carbonate of soda, in small dose, may exert a favourable influence on vegetation." We do not know the cause of the discolouration of your soda, and you do not state the quantity; but we suggest it is of more value for cleansing purposes, or, in a powdered state, for killing weeds on paths, than as a fertiliser in the garden.

FAILURE OF OUTSIDE PAINT WORK.—A.M., Guildford: As an old subscriber to your valuable paper, can you or any of your numerous correspondents help me with their advice on the following? A short time ago I had an orchid house painted white inside and out, with the result that, although the inside paint-work, in spite of the heat and water, is as hard as possible, the greater part of the outside paint-work peels off in strips as though you were stripping a wall-paper, and leaves the wood as clean as when it came from the plane. If any of your readers who have an orchid house have found the same difficulty, perhaps they can suggest a satisfactory remedy.—It is probable that the woodwork was damp when the paint

was put on outside, and damp wood is a frequent cause of trouble to painters. However, we shall be very glad to receive suggestions for cause and remedy from any of our readers.

SPARTIUM JUNCEUM.—F. E., Bournemouth: I send you some growths and flowers of a shrub that is new to me, but can hardly be uncommon, as I found it growing upon a dry, gravelly bank near a railway. It was perfectly at home, and of good size, and I should like to know what it is, whether it is easily obtainable at a reasonable price, and how it is propagated. I may say that I have lived in the extreme north of England all my life, and that may be one reason why I have never seen this shrub before.—The plant is Spartium junceum, a shrub that is quite hardy in the south, and produces its golden, fragrant flowers in profusion. It is not particular as to soil, but rather prefers a sandy, stony, or gravelly soil, and it must have a position where it obtains all the sunshine available. Plants can be obtained at reasonable rates from any of the nurserymen who advertise in our columns. Propagation is from seeds.

EMPLOYMENT IN PUBLIC PARKS AND GARDENS.—B., Rotherfield: For employment in the London parts, apply, enclosing particulars of experience, age, etc., to the Chief Officer, Parks and Open Spaces, London County Council, Spring Gardens, London, W.C.; for Hyde Park, apply to Mr. J. Gardiner, Park Superintendent, Hyde Park, London, W.; for Regent's Park, to Mr. A. D. Webster, Superintendent, Regent's Park, London, N.W.; for the Brighton Parks, to Mr. G. Ward, The Lodge, Preston Park, Brighton.

COLOUR ASSOCIATION IN FLORAL ARRANGEMENTS.—H. H., Sussex: I shall be glad if you will kindly tell me what colours associate best in the cases of flowers used for table decorations, etc.—White will associate well with any other colour, but rather hard effects are produced by white and very brilliant blue, or vivid scarlet. Yellow and pink, pink and pale blue or lavender, blue with a pale and a deep pink, yellow and brown, orange and brown, crimson and scarlet, crimson and bronzy-purple, cream and blue, cream and pink, salmon and carmine, deep crimson and rose, orange and yellow, and scarlet and maroon are a few combinations of colours that look well, but a great deal depends upon the kinds of flowers associated, and their disposition. Beautiful table decorations may be produced by the use of two or three shades of the same colour, and some consideration of this point, with a little practice, will enable you to create many different and excellent effects. Then, also, the same flowers look quite distinct when used with different greenery, and this alone is a point well worth studying, because sometimes one has plenty of a certain kind of suitable flowers that may be popular with the ladies of the house, and if these can be arranged in different ways and with distinct greenery, or perhaps a few other flowers, the use of that particular flower does not become monotonous. Watch Nature's combinations of colours in field and hedgerow and woodland, and also in the same plant and flower, and you will find plenty of object-lessons.

STATICE AURICULÆFOLIA. — C. M., Colne: This is not hardy everywhere; indeed, some authorities list it as only half-hardy, but it is given in the Kew Hand List of Herbaceous Plants, so we may assume that it is fairly hardy at Kew.

GALLS ON AZALEA LEAVES.—W. R., Berks.: I send a few azalea branches, bearing leaves upon which are a number of galls. Kindly tell me whether these galls are caused by a fungus or insects, and how to get rid of the trouble. — The galls are caused by a fungus named Exobasidium rhododendri. The fungus spreads by means of spores, and not by means of permanent mycelium in the plant tissues, therefore the affected leaves should be at once removed and burned, and a careful watch must be kept upon the bushes so that leaves may be cut off as soon as signs of the fungus appear. Next season a close watch must be maintained, and affected leaves removed at the first sign of the disease. In this way the disease may be exterminated, or at least kept severely in check.

NAMES OF PLANTS.

E. B. E., Bath.—Phœnix canariensis.

K. G. C., Southgate.—1, Cornus alba sibirica variegata.

S. M. M., Hayes.—1, Salix babylonica annulis; 2, probably Pyrus nivalis.

R. O., Edgbaston.—1, Veronica buxifolia; 2, Campanula Portenschlagiana; 3, Centaurea candidissima.

W. J. C., Taunton.—1, Odontoglossum Lambeauianum; 2, a poor Cattleya Mossiæ; 3, Iris sibirica; 4, Asparagus verticillatus.

C. M., Colne.—Campanula rapunculoides; 2, Nepeta Musseni; 3, Lachyrus grandiflorus; 4, Scabiosa alpina; 5, Gnaphalium lanatum.

P. A., Woking.—1, Helichrysum microglossum; 2, Cistus laurifolius; 3, Ginkgo biloba; 4, Cornus Spathi; 5, Linaria cymbalaria; 6, Anchusa italica Dropmore.

D. B., Old Colwyn.—1, Poterium sanguisorba; 2, Silene inflata; 3, Anthyllis Vulneraria; 4, Linum catharticum; 5, Hemerocallis flava; 6, Epilobium montanum.

W. P., Wilts.—1, Tradescantia virginica; 2, Mertensia dahurica; 3, a form of Thalictrum aquilegifolium; 4, Veronica gentianoides; 5, Campanula Portenschlagiana.

P. B., Rugby.—1, probably a Plectranthus, send when in flower; 2, Libonia floribunda; 3, Pelargonium quercifolium; 4, Nephrolepis exaltata todeaoides; 5, Cypripedium barbatum; 6, C. Harrisianum.

The Gloriosa Pink.—The pinks are universal favourites, and this comparatively new one has undoubtedly come to stay. It is of that dwarf tufted habit of growth, common to the good old white pink of cottage gardens, and totally different from many present-day kinds, which show a leaning towards the carnation. The flowers of Gloriosa are large and full, prettily fringed, and in colour a delightful shade of lilac rose. They have also a delicious perfume, and are borne over a lengthened period.—W.

TRADE NOTES.

PÆONIES FROM LANGPORT.

Attractive in colour and rich in perfume are the splendidly-developed herbaceous pæonies that, through the courtesy of Messrs. Kelway and Sons, we have now upon our table. The name of the Langport firm has so long been closely associated with these glorious flowers that it is hardly necessary to say that they were among the first to give attention to the improvement of pæonies, and have attained to a high position both as raisers and cultivators. Especially deserving of mention among the single varieties that have been submitted to us are Queen Alexandra, white, with golden anthers; British Empire, purple-rose, with pink and yellow centre; Dorothy Daniels, blush; Signorette, rose, suffused crimson, with pink centre; Muriel Law, rose-pink, with white centre; Miss Ida Chamberlain, rich pink, with golden anthers; and Prince George, rich rose-crimson. The double varieties include Lord Paunceforte, pink, shading to white; Mrs. Philip Belben, bright pink; Limosel, rich rose; and Sophia Miller, all of which are of high merit.

MESSRS. SUTTON AND SONS' EMPLOYEES' OUTING.

The excursion which is annually so generously provided for their employees by Messrs. Sutton and Sons, Reading, took place on Friday, June 20, when Bournemouth was visited. Two special trains conveyed the employees, their wives, etc., the party numbering nearly 1,000 together with the members of the firm. The s.s. "Monarch" had been chartered to make four trips from the pier to and from Swanage, and these were heavily patronised. The Corporation tramways, too, were largely requisitioned, the journeys to Christchurch and Poole being particularly popular. The beautiful gardens were duly appreciated, while the sands were, of course, greatly enjoyed by the younger people. The firm, as usual, not only bore the cost of the trains and steamer, but provided each employee with a sum of money to defray the day's expenses.

FRUIT CROPS IN GERMANY.

His Majesty's Consuls in Germany, in reporting on the condition of the fruit crops in that country, state that the prospects for the current year are most unfavourable. Cold weather with frosts and snow which set in about the middle of April did great damage to almost every kind of fruit, and in all quarters severe losses were suffered by what had promised to be an exceptionally plentiful crop. Most harm appears to have been done to the crops in Baden, Wurtemberg, Hesse, and Saxony.

Red, white, and black currants promise small to medium crops, and gooseberries and strawberries a medium crop; most of the raspberry blossom stems were frozen, but it is hoped that fresh shoots may yet make the crop a medium one. Large cherries may be a good crop, but it is feared that the cold days at the beginning of May did further damage; in many districts sweet cherries have been for the most part destroyed, whilst sour cherries are expected to have suffered more than the larger kinds. Peaches and apricots suffered most severely, and a complete failure of these crops is reported. Apples and pears were not much damaged, and good crops are expected. Early Zwetschen plums promise a scanty crop, but a slightly better crop of later kinds is hoped for. Mirabelles are expected to be a good crop on the whole; in the interior of Lorraine they are promising well, but in the left Moselle valley the crops were frozen.

As regards individual districts, the lowlands in Wurtemberg, where the chief fruit-growing districts are to be found, suffered much damage from frosts; but on higher ground trees were more backward and prospects are still fairly good. Apricots, peaches, and early cherries are practically a failure, but later cherries are fair in some places. Plums are a small crop in some districts, but Zwetschen promise an average crop. Early pears and apples are almost a failure, but an average crop of late sorts is expected. Raspberries, red currants, and gooseberries promise fairly well on high land; on low lands they are a failure.

The fruit crop in Rhenish Hesse, except for apples, is almost a total failure. Apricots, peaches, and sweet cherries have been entirely destroyed; plums, mirabelles, and sour cherries have suffered less; about half the average crop of Zwetschen and pears was hoped for, but the setting fruit is now beginning to drop from the trees.

In Baden peaches and apricots were frozen, sweet cherries, early Zwetschen, and early plums suffered severely, sour cherries and late Zwetschen were not so much affected. It is hoped that from the abundance of cherry blossom a moderate crop may yet result. A devastating hailstorm was experienced on May 28, in the neighbourhood of Heidelberg, especially in the Gaiberg district, which is famous for its cherries, and the whole crop has now been ruined.—Journal of the Board of Agriculture.

THE GARDENERS' MAGAZINE

NOTE OF THE WEEK.

Deep Cultivation and Dry Weather.

Although the considerable deficiency in the rainfall during the past month does not appear to have seriously affected the more important of the garden crops, except on light soils, it has necessitated the general use of the garden hose and watering-can, and brought into special prominence the immense value of deep and otherwise thorough cultivation. In all seasons, whatever may be the character of the weather, the results obtained from a deeply-stirred and well broken-up soil are such as to afford an ample return for the additional labour involved; but in a summer such as that of last year fairly good crops are obtained from shallow working. This summer, as in so many others that one could call to mind, some crops are more or less variable, due, in some instances, to the soil being so thin and light as to fail to retain within range of the roots any considerable proportion of the moisture that falls upon the surface, or to enable the plants to draw to any considerable extent upon the subsoil for the supplies of water so essential to healthy growth. Where, on the other hand, crops growing in soils of a substantial character are seen to be less vigorous than usual, and giving a poor yield, it may be assumed that the importance of tillage, carried out in accordance with the more advanced views that obtain has not been appreciated or that the cultivators have not had a sufficiency of manure at their command. Except in the case of small areas of land, such, for example, as gardens of quite small dimensions, it is not practicable to materially reduce the porosity of the soil, but available supplies of such material as decayed vegetable refuse, leaf-mould from the woods, well-decayed manure, and other organic matter, should be utilised for the purpose of increasing the humus in the soil, and consequent thereon improving its powers of retaining water. In the case of gardens having a large area, those in charge have practically to rely on purely cultural methods in their endeavours to assist both ornamental plants and useful crops to pass through periods of drought without serious injury. Thorough cultivation, combined with judicious manuring, is, perhaps, of even greater importance in the management of ordinary and strong loams than in the case of those which are light in texture because of the possibility of modifying the moisture they contain in the most diverse seasons. In dealing with soils such as these, they may, at the annual digging or trenching, be so prepared that the plants will have a deep root run, and in periods of drought be able to draw upon the water contained in the subsoil. Then, in the course of the season of growth, the surface may, by frequent use of the hoe, be maintained in a sufficiently loose state to prevent any appreciable loss of soil moisture by evaporation from the surface. In soil preparation it should be constantly borne in mind that the particles of which it consists are enveloped in their films of water, and that when there is a continuity of these, the water will pass horizontally or upwards or downwards through the soil. If this fact is fully recognised and constantly kept in mind, it will not be difficult to understand the necessity for care in carrying out the operations of digging, or the results obtained from perfect or faulty methods of procedure. Moisture derived from the rains falling on the surface of the ground envelops the minute particles in the form of a thin film, and as the quantity increases it passes downwards by means of the continuous films until the whole of the particles are covered. Should the water be in excess of what is necessary for this purpose, the pressure from above causes the films to increase in thickness until they form drops of water in the open spaces and pass away into the drains. Should, on the other hand, there be a drying of the films of the particles forming the upper layers of the soil, the loss resulting therefrom will be replaced by the moisture drawn from the lower layers, provided there is a continuity in the water films. This latter is a point of great practical importance because if the soil is consolidated throughout its depth, there will be a continuous rise of water from the subsoil to the surface, where it will be evaporated, until the loss from the upper layers is replenished by rains or artificial watering, or, as in the case of long droughts, the subsoil supply is exhausted. Should, on the other hand, the soil be trenched or dug over in a rough manner and thrown loosely into the bottom of the trench, there will be some loss of continuity, and the water will not rise freely by capillary attraction. As the result of this faulty method, the plants will be deprived of some part of the subsoil water, and suffer accordingly should the weather be dry for any considerable period. The proper course in both digging and trenching is to well break up the soil, except on the top, where it will be exposed to atmospheric influences, so that it may become well consolidated before the time of sowing or planting. When this is done there will be

MR. WILLIAM HALES, A.L.S.

a continuity of water film between the subsoil and the layer above where the greater proportion of the roots are found. If the soil remains in a consolidated state on the surface evaporation will take place at a rapid rate, and not only will much moisture be lost, but the surface will, early in the season, have its temperature so greatly reduced as to impose a check on the growth of young and tender plants. To obviate this, the soil should be hoed to a depth of about two inches at sufficiently frequent intervals to maintain the surface in a loose state. We are sometimes told by the advocates of summer hoeing that a layer of loose soil is equal to a mulch of manure, but such views are hardly supported by experimental research. A good mulch has a slight advantage, but the soil mulch is so highly beneficial that there should be very little cessation in the use of the hoe in weather such as that which we have experienced. The season in which soil is dug or trenched has some bearing upon its water-content, although seldom referred to. It may therefore be mentioned that soils which are prepared in the autumn, and, in accordance with usage, left rough on the surface, and absorb a much greater quantity of moisture than that which is allowed to remain in a consolidated state until the spring.

Mr. William Hales, A.L.S., who has charge of the famous old Physic Garden, at Chelsea, is an old Kewite who, like many another, had to put in a deal of "spade work," before arriving at an important position. Born at Leamington, he commenced work about 1886 at Strathearn House, a local establishment long noted for good cultivation. Later on he was employed in a local market nursery where several tons of grapes, besides other indoor fruits, and quantities of flowers were produced. A period here was followed by eighteen months in a private garden at Edgbaston, which was preparatory to entering the Birmingham Botanical Gardens, where Mr. W. B. Lathom was then the superintendent. At Birmingham Mr. Hales became keenly interested in botany, and studied this science at the Midland Institute, meanwhile adding greatly to his knowledge of plants, and his experience as a cultivator. He stayed four and a-half years at Birmingham, and during his stay regularly attended the meetings of the Birmingham Gardeners' Association, winning one second and three first prizes for essays. From Birmingham to Kew followed as a natural course of events, where he soon became a sub-foreman, and did so well that in 1899 he was recommended for the post he now occupies. The old Chelsea Physic Garden had been sadly neglected and the prospect was not encouraging, but, believing that the garden could be made a useful educational establishment, he put all his energy and skill into the work of reformation, and with such good effect that a competent authority recently wrote: "The garden is now the most educational of its kind within the Metropolis." Mr. Hales has been elected an Associate of the Linnean Society, he has a seat on the R.H.S. Scientific Committee, and the closeness with which he studies the subject of the education of gardeners was evidenced in the paper he read before the Conference on the occasion of the International Horticultural Exhibition of 1912. Mr. Hales has accomplished a great work at Chelsea, a work that we hope he may long be spared to continue.

National Rose Society's Exhibition.—We shall give in our next issue a full report, with illustrations of new roses, etc., of the National Rose Society's Exhibition, held in the gardens of the Royal Botanic Society, Regent's Park, July 4.

Presentation of Carnations to the Queen.—On Coronation Day the Past Master (Mr. G. Rowland Blades) and the Clerk (Mr. E. A. Ebblewhite) of the Worshipful Company of Gardeners attended at Buckingham Palace and presented to the Queen a beautiful bouquet of carnations. The bouquet was composed of the flowers of the pure white variety known as King George, and the lovely pink Queen Mary, which were first submitted to public notice two years since.

To Save the Crystal Palace.—"The Times" has opened a Crystal Palace Fund, at the request of the Lord Mayor of London, for the purpose of raising the £90,000 needed for the completion of the purchase of the Crystal Palace and grounds for the benefit of the public. A "Private Citizen," who desires to remain anonymous, has offered to contribute 10s. for every £1 donated on or before July 31, and his offer stands good to the total of £30,000, which means that the public must give £60,000, and then the needed sum will be completed automatically. The appeal has met with a splendid response. On the first and second days the donations amounted to £10,018 4s. We commend the public-spirited action of our contemporary to our readers, and hope that the £90,000 will soon be raised.

Croydon Gardeners' Association.—This enterprising association does not arrange for a recess in the summer, in accordance with the practice that so generally obtains, but instead of holding meetings at that season visits are made to noteworthy gardens within a convenient distance of Croydon. A few evenings since about seventy members of the association visited the gardens of Wood Hall, Dulwich, the residence of J. C. Eno, Esq., and had a very enjoyable time. The gardens, which are under the charge of Mr. R. B. Leech, are remarkable for their diversity and high keeping, and the visitors, whether interested in herbaceous plants, rock gardening, fruit and vegetable culture, or trees and shrubs, found plenty to interest them, and saw the various ornamental plants and useful crops at their best.

Insect Enemies of the Pear.—At the meeting of the North of England Horticultural Society, recently held in the Leeds Law Institute, Professor F. V. Theobald gave an instructure lecture on the more destructive insect enemies of the pear. Having briefly described the habits of the more noteworthy of the insect pests that prey upon the foliage and fruits of pear trees, he stated that only eleven are sufficiently injurious to be termed pests, and by far the worst is the pear midge, after which the pear leaf blister mite, and the pear and cherry slugworm rank as most serious. The first-named he characterised as one of the chief drawbacks to the production of good crops of pears. It cannot be checked by spraying; all one can do is to try and lessen it by persistent hand-picking of deformed fruits. The midge may be reduced by keeping poultry in the garden and orchard at the time the maggots fall, and dressings of kainit and vaporite have both proved successful, spread under the trees when the larvæ fall to the ground. Hand-picking was described as useless unless other cultivators in the neighbourhood follow the same plan; the midges that lay the eggs being able to travel a considerable distance. The blister mite could, Professor Theobald stated, be controlled by spraying in winter with lime, sulphur, soda, salt wash, and in spring with paraffin jelly. The slug-worm also, he said, could be easily controlled by spraying with arsenate of lead. Several minor pests, it was stated, would yield to tobacco wash or other treatment, and he especially mentioned the pear or leaf-curling midge (Cecidomyia pyri) as an insect which had recently increased considerably, and needed to be checked at once by spreading vaporite round the trees at the time the larvæ are falling.

Birmingham Horticultural Society.—This society has made such rapid advances within the past two or three years that its annual exhibition, which will be held on July 18 and 19, has the promise of being one of the most important of the provincial gatherings of the season. Silver challenge cups to the value of 130 guineas are offered in seven classes. Four are of the value of £21 each, and one of these is for a rock and water garden, one for a collection of roses, one for a collection of sweet peas, and one for the best exhibit in certain of the trade classes. The cash prizes are on a liberal scale, and as the schedule is comprehensive in character, the total amount is large. The Royal Horticultural Society will send a deputation for the purpose of awarding that society's medals to the more noteworthy exhibits. The secretary (Mr. W. G. Carradine), 84, Hamstead Road, Handsworth, Birmingham, will readily give full information on the various competitions.

The Chiefs from Southern Nigeria, who arrived in London a short time since for the purpose of giving evidence before the Colonial Office Committee on Land Tenure in Africa, paid a visit the other day to Messrs. Sutton and Sons' seed establishment at Reading. The members of the party were conducted through the various departments in the extensive premises, and expressed themselves as greatly interested in what they saw. At the close of the inspection they were entertained at lunch in the Abbey Hall, at which Mr. Arthur W. Sutton, V.M.H., presided, Mr. Leonard Sutton being also present. Subsequent to this function a visit was paid to the firm's trial grounds in the London Road.

Plant and Animal Life.—In the course of a lecture on plant life given before the Nottingham branch of the International Society of Philology, Science, and Art, Professor Leon directed attention to the fact that, while plant life and animal life appeared to differ very materially from each other, they are found on investigation to be in remarkable agreement, both in structure and development. The plant body, like that of the animal, is built up of a number of different tissues, each of which has its function to perform in the economy of the whole organism. The body of a plant, like that of an animal, is ultimately composed of innumerable minute cells, which in the plant are each enclosed within a cell wall. The living cells are extraordinarily uniform throughout the whole plant world, and is closely akin to those of animals. Plants go through the same stages of life and growth as animals, they are born, have their youth, arrive at maturity, reproduce their kind by a species of sexual arrangement, attain old age

arrive at senility, die, and decay. As in animals, so in plants, there is a great diversity in the length of the duration of their lives, from the ephemeral creature whose period of existence can be measured by hours to the one who flourishes, hale and strong, for long periods. Speaking generally, however, the duration of life amongst plants may be divided into three classes—annuals, biennials, and perennials. The life processes and reactions are not nearly so obvious among plants as they are in animals, but many of them are strikingly similar in the two classes. The greatest fundamental difference between them is in their methods of obtaining nutriment.

Vacant Lectureships at Aberdeen.—At a meeting of the Central Studies and Staff and Forestry Committees of the Aberdeen and North of Scotland College of Agriculture it was decided to advertise for a lecturer in horticulture at a commencing salary of £150 per annum, rising by yearly increments to £300. It was also agreed to advertise for a lecturer in forestry in succession to Mr. William Dawson, who has been appointed Reader in Forestry at Cambridge University. The commencing salary offered for the latter post will be £350 per annum.

National Botanic Garden at the Cape.—There is a movement on foot for the founding of a National Botanic Garden for South Africa, at the Cape. The Kirstenbosch estate, which is Government property, is suggested as a suitable site. It is further urged by those who are moving in the matter that such a garden should come under the control of the Agricultural Department, rather than be attached to the South African College. There are, of course, others who urge that the directing body should be a scientific botanical staff. The difficulties do not seem beyond solution, and there can be no doubt but what such a garden would be of immense scientific and economic value to South Africa.

The Sweet Pea Trials that are being carried out at the University College Gardens, Reading, under the direction of an advisory committee, of which Sir Randolf Baker, Bart., is the president, and Mr. W. P. Wright the hon. secretary, will be inspected on Thursday next, July 10. The Advisory Committee will meet from 12 noon to 3 p.m., with an interval for lunch, and the Awards Sub-Committee will sit from 3 to 5 p.m. Guests will be admitted at 2 p.m. to the sections of the trials already dealt with by the Advisory Committee. The members of the last-named body will, with the guests, visit Messrs. Sutton and Sons' trials of sweet peas at Southcote, Reading, leaving the University College, at 3 p.m.

Viola Trials at Wisley.—The Royal Horticultural Society's Floral Committee visited the Wisley Gardens a short time since for the purpose of inspecting the viola trials which have been carried out during the past two years. As the result of the inspection the committee recommended that Awards of Merit should be made to fourteen varieties, and that twenty-four varieties should be commended for having stood well through two seasons. These awards and commendations have been confirmed by the Council of the society. The varieties receiving Awards of Merit were Royal Scot (Grieve), Agnes Kay (Kay), Sulphurea (Grieve), Purity (Forbes), Redbraes Bronze (Grieve), Bertha (Gold), Blue Duchess (Dobbie), Alexandra (Grieve), Admiral of the Blues (J. P. Robertson), Redbraes White (Grieve), Redbraes Yellow (Grieve), Virgin White (Todd), Bridal Morn and Fred Williams (Forbes). Plants of the last-named variety were sent to Wisley by Mr. John Forbes, those of Bridal Morn by Mr. Charles Turner, and those of all the other varieties were sent by Messrs. Dobbie and Co. The commended varieties were: Kitty Bell, Pencaitland, Archie Grant, Walter Welsh, Maggie Mott, Snowflake, Grievei, Mrs. Chichester, William Robb, Primrose, Arabella, Max Kolb, Ivanhoe, Countess of Kintore, James Pilling, Kingcup, Molly Pope, Virgin White, Bullion, Rotherfield Belle, Kate Blythe, Cornuta, Dawn, and Palmer's White.

Commons and Footpaths.—It is gratifying to have unquestionable evidence that the Commons and Footpaths Preservation Society are not less active in their endeavour to prevent the stopping of public footpaths and the enclosure of commons than at any previous period. At the recent annual meeting of the society Lord Eversley, the president, stated that during the past two years they had been concerned in 1,200 cases, as compared with 1,000 during the two previous years. In every part of the country the lords of the manor were continually taking small tracts of commons, and footpaths were being blocked up. During the period the society had opposed sixty Bills in Parliament, forty with regard to commons, and twenty in respect of footpaths. While these Bills asked for something like 760 acres of common, they did not succeed in getting more than a single acre, and not a single substantial footpath had been blocked. About 250 complaints of encroachments by lords of the manor had been dealt with by the society, and in almost every case they had been able to prevent the enclosure. The society had been approached by landowners to arbitrate between them and the public with regard to footpaths. Altogether they had had some 800 complaints regarding footpaths. They had advised legal proceedings in certain cases, with success on the part of the public, while, in some cases, where they had advised local authorities that they had not a good case, the local authorities had rushed into litigation and lost their cases.

Roses at Swanscombe.—Just now the cemetery at Swanscombe is aglow with roses, and well deserving a visit from those who are specially interested in these fragrant flowers. A correspondent informs us that there must be upwards of 2,000 rose plants, and that both old and new varieties of merit are represented. Many of the bushes are, he states, so large that they carry upwards of one hundred finely-developed blooms. Mr. W. Etherington, the able superintendent, may be heartily congratulated on the success he has achieved in the furtherance of rose culture in the Swanscombe district.

Trials of Irises at Wisley.—The attention of growers of irises is called to the fact that the Council of the Royal Horticultural Society have decided to hold a trial of "Bearded Flag and German Irises" at the Society's gardens at Wisley. Those wishing for their plants to be tried should send two of each in July.

AN EFFECTIVE ARRANGEMENT OF JAPANESE IRIS
In the gold medal water garden exhibited by Messrs. R. Wallace and Co. at the Holland House Show.

VARIATION AND ENVIRONMENT.

In the innumerable essays and theories which have been promulgated with regard to the underlying causes of variation, especially in plants, the predominant idea appears to be that change of environment is the great predisposing cause. That plants do assume different habits in response thereto is beyond all doubt; a lowland plant transferred to highland conditions of extra exposure must, if it survive, show the result in contracted foliage and other differences, and, probably, in the course of a few generations its seminal offspring may inherit these induced peculiarities.

There are, however, many forms of variation which differ markedly from this class, and, inasmuch as a unique branch of study in this direction exists in the shape of the innumerable natural sports of our native ferns, I think it is much to be regretted that, so far, the scientific varietal specialist has practically left this field of investigation entirely to the amateur. The writer, indeed, has never found its value recognised, or even alluded to, in the works on the subject which he has come across. Attention is largely concentrated on cultivated plants, in connection with which, of course, purely natural wild sports, and the conditions under which they have originated, are left out of the question, although it is precisely these which should be studied most.

I have stated above that, so far as ferns are concerned, the field of study is a unique one, and I say so very advisedly. No other class of wild plants has been subjected now for more than half a century to close investigation by varietal experts all over the country, and the results of research retained, not merely as herbarium specimens, but in a large majority of cases, as living plants. Some of these experts, moreover, have kept persistent and clear records of their discoveries as well, so that almost exhaustive lists are extant with descriptions and localities demonstrating the really marvellous capacity of plants to assume, in many cases, very diverse forms, departing widely from the normal ones, and, as a rule, so efficiently endowed with the power of reproduction on the same abnormal lines as to entitle them to specific rank, but for their usually sporadic and solitary nature.

In Mr. E. J. Lowe's "British Ferns," 1891, no less than 1,360 different wild finds are recorded and described, and although these doubtless embrace a number of very similar forms, the fact that even these have been found in widely separated localities establishes their value as independent "sports." To return now to the question of environment, or change of environment, as underlying the departure from the normal type, it is quite impossible for the experienced fern hunter to accept this view. The vast majority are found growing under precisely the same conditions as the innumerable normals among which they appear. One has, indeed, often to dig them up and disentangle their roots and fronds from those of their normal companions of the same species. How, in such cases, is it possible to impute the often great structural and constitutional variations to difference of environment, or any change therein? Hill sides, in quite unfrequented districts, far removed from any cultural influences, i.e., under absolutely wild and unsophisticated conditions of growth, have afforded hundreds of these discoveries, and here the environment must have been the same for ages. Yet on one and the same hillside very different forms may crop up, dwarf and congested, robust and lax, and so on, and these, when extracted and brought under culture, will not only retain their peculiarities permanently, but, as we have said, will, as a rule, yield true offspring from their spores.

All but a very few of our native species have "sported" freely, and in many directions, and in all the literature dealing with them it has so far been quite impossible to even suggest a reason for the wide departures from the normal structural types which distinguish these "finds" from their immediate neighbours. Furthermore it has happened repeatedly, and this brings us to another phase of these inscrutable phenomena, that spores taken from these purely wild plants, even from the wild fronds as found, have produced, together with the parental type, very different varieties in addition, and in several well-recorded cases repeated sowings have yielded, roughly, equal percentages of several distinct types. A decomposite tri-pinnate Polystichum (P. angulare decompositum Pearsoni), for instance, yields from its spores a percentage of densely quadripinnate plumose forms a percentage of the true parental form, and a small percentage of a most remarkable depauperate grandidens, with all the subdivisions reduced to short spikes. As the parent presents no iota of irregularity, we are confronted here with the curious fact that three different kinds of spores are produced.

In a wild Dorsetshire find of P. aculeatum (pulcherrimum) repeated sowings demonstrate that here also three different variations are inherent in its spores, since, in addition to the parental form, it produces, in one direction, reversions almost to the normal, and, in the other, about 20 per cent. of marvellously attenuate forms with almost hair-like subdivisions, endowed with the peculiar capacity of becoming longer and longer as they approach the extremity of the pinnæ, though the pinnæ of the parent taper off gradually in the normal way. The result is that sub-divisions normally of one-third of an inch attain a length of nearly three inches in the offspring, which they produce from some of the spores. Here again, since these diversely-endowed spores are, as in the previous case, all sown together, and are produced on one and the same frond, it is clear that environment or change of environment can be no factor, especially since the distinct varietal character is evidenced by the first primary frond the prothallus produces.

A very beautiful percristate form of Pteris aquilina when sown gives invariably a brood of the true parental form and another of a dense grandiceps type, practically consisting of stalked crests. This latter bears no spores, and is always raised by sowing its parent again. This fern is, in a great many collections, in various parts of the country, but the varied environment this involves makes no difference, the same two kinds of crops, always without linking forms, are sure to result from a sowing of spores from any of the various sources. These three cases of what may be termed a segregated definite varietal capacity in the spores of one and the same plant, are, of course, different to those in which spores from erratic and unsymmetrical "sports" yield varied progeny. They are in themselves more or less inconstant, and it only appears reasonable that spores produced on erratic parts of the frond should be so affected as to yield erratic progeny, as some ferns do to a remarkable extent.

In the three cases cited, however, the fronds are perfect and present no traces of the divergence which arises in the progeny of the spores they bear.

How "sports" arise, therefore, we cannot pretend to explain, but in the case of science, something is always gained by the elimination of unfounded theories, and to those who have carefully studied the phenomena presented by our native fern sports, it is, at any rate, perfectly clear that variation does occur quite independently of environment or change of environment, and that on a very large and very striking scale.

Chas. T. Druery, V.M.H., F.L.S.

THE OLEANDER.

This showy flowering shrub, which forms such a prominent feature along the Mediterranean district, and in other warm portions of the globe, is an old plant in gardens, having, according to the "Dictionary of Gardening," been introduced as long ago as 1596. It used to be more popular in gardens than it is now, perhaps, to a certain extent, owing to the fact that many fail to induce it to bloom in a satisfactory manner. The conditions under which it occurs in its South European home will give the key to its successful culture here, for it is essentially a sun-lover, and, at the same time, needs a plentiful supply of water at the roots. If grown in a shaded greenhouse the foliage will be of a healthy dark green tint, but flowers will be sought for in vain.

Of course, the protection of a greenhouse is necessary for the oleander during the winter, but, as far as my experience extends, the best way to induce it to flower is, as soon as it can be safely turned out of doors, to stand it in a sheltered sunny spot, taking care that it does not suffer from want of water at the roots. The flower spikes are terminal, and sometimes, after being very promising, they will not open properly. This is liable to happen if the plants become too dry at the roots, or if there is a long spell of wet, cold weather.

Sometimes young growths are pushed out immediately below the flower spikes, and if these shoots are allowed to grow unchecked they may starve the flower buds. On this account they are better removed.

In the cultivation of the oleander it must be borne in mind that it is naturally of a loose, willow-like habit of growth, hence it is useless to continue stopping it in order to form a dense bush. At the same time, a certain amount of stopping when young is necessary. When the pots are full of roots it is an advantage to give an occasional stimulant.

There are many varieties of Oleander (Nerium Oleander), most of them having been raised in continental nurseries. The type has single pink flowers, but one of the finest is splendens, with blossoms of a bright rose-pink, and semi-double in character. Of the white varieties, Madonna grandiflora is one of the best. There is a variety which has leaves freely marked with gold. So showy is it that a good example will vie with some of the crotons.

S. W.

Campanula pyramidalis.—The plants which are intended for flowering in the conservatory or greenhouse should either have their pots plunged in ashes or be secured to wires to prevent damage by strong winds. The former method is the best, as it also helps to keep the roots cool and moist. They must now be liberally treated in the matter of watering and feeding with stimulants, or they will lose some of their lower leaves, which very much spoils their appearance when in bloom. Shift on young seedlings, and stand the pots on a cool ash bed in a cold frame.—E. Harriss.

PENTSTEMONS:

ATTRACTIVE AND INTERESTING SPECIES.

Apart from the florist's varieties, chiefly derived from P. Hartwegi, P. Cobæa, and P. gentianoides, this large and beautiful genus contains many useful and attractive species, which are of great value in the garden. It is essentially a North American genus, the Rocky Mountains and the north-west of the continent being the home of many species, while others are found as far south as Mexico. There have probably been fifty species in cultivation in this country at various times, but as some are short-lived they are often lost to cultivation for a time until reintroduced by means of seeds from their native habitats.

In addition to the great range of colour found in the family, including nearly all shades of rich purple and violet, scarlet and rose, to white, the time of flowering of the various kinds extends from May to October. In masses they are exceedingly effective, while for the rock garden the choice kinds, like P. heterophyllus, P. glaber, P. Menziesi, and its varieties are most charming.

The cultivation of pentstemons, as a whole, presents no difficulties, as most of them are easy to manage, only a few having the unfortunate habit of failing to accommodate themselves to circumstances. Their main requirements are a deep and rich, but well-drained soil. With liberal treatment they will produce most effective and pleasing results, with an abundance of flower.

During our damp and foggy winters plants in the open are tried severely, and they often get cut back badly, especially where the soil is at all close and retentive. But usually they will break away freely in the spring. It is as well, however, to always keep a reserve stock of the more tender kinds in pots in a cold frame. Seeds of most species may be obtained readily, and they will germinate freely if fresh. With many of the species, like P. glaber and its allies, seeds produce the best results. They may also be increased by means of cuttings in July, when half-ripened shoots should be selected, and inserted in sandy soil under a hand-glass. They root readily, and good plants may be had if they are potted up and kept in a frame for the winter.

P. azureus is a dwarf plant from California, with pretty blue flowers on stems nearly a foot high. It is most suitable for the rock garden.

P. barbatus.—No garden is complete without this species, which is one of the most elegant of perennials. It is one of the taller-growing kinds, with stems from 2ft. to 3ft. high or more, bearing a profusion of rich scarlet flowers. One of the easiest of all to manage, it is easily increased by division or by seeds. There are many seedling forms of this plant, with flowers of various shades of rose, carmine, and scarlet.

P. cæruleus.—When obtained true this is a beautiful plant hailing from the Rocky Mountains of Colorado. Sub-shrubby in habit, it grows about 1ft. high, with narrow glaucous leaves and flowers of a fine blue colour. The only way to increase this species is to select a few plants and cut off all flowers, thereby inducing it to produce young shoots which may be taken off and inserted as cuttings.

P. Cobæa.—A native of Texas, this beautiful large-flowered kind is somewhat tender, and must be kept in a frame for the winter. In height, from 1ft. to 2ft., the flowers vary in colour from pale purple to white.

P. confertus.—A useful plant for the rock garden, having a dwarf spreading habit, and producing its lilac-coloured flowers in May and June. The variety cæruleo-purpureus is a good form, with bluish-purple flowers.

P. Eatoni.—Reaching a height of 3ft., this

PENTSTEMON PUBESCENS.

A hardy species with soft purplish-blue flowers and lilac lip. Exhibited by the Wargrave Hardy Plant Farm at a recent R.H.S. meeting.

handsome plant has glaucous leaves and stem, while in contrast the flowers are of a rich carmine-scarlet, produced very freely in branching panicles. It is a native of North-western America, and requires to be frequently raised from seeds.

P. gentianoides.—A sturdy growing plant, with variable coloured flowers of violet shades, and a native of Mexico. It is one of the least hardy of the family.

P. glaber.—A beautiful dwarf and free-flowering plant, rarely a foot in height. It is one of the most useful for the alpine house in pots, or for the rock garden. It comes into flower in May and continues throughout June. The flowers, varying in colour from purple-violet to blue or rose, are produced in dense thyrsoid heads. P. glaber var. roseus is a lovely form, with rose-coloured flowers.

P. Hartwegi.—The chief and most important factor in producing the valuable race of florist's penstemons, P. Hartwegi itself is a first-class border plant. It is a native of Mexico, grows about 2ft. high, and bears large scarlet flowers. Two of the most distinct varieties are albus, with creamy-white flowers, rather longer in the tube than the type; and roseus with pretty rose-coloured flowers.

P. heterophyllus.—One of the most charming plants in the genus, this is of free branching habit, growing about 1ft. high, with narrow leaves and rosy-purple flowers of a very pleasing shade. It is shrubby in habit, very compact, and makes an ideal plant for a sunny corner in the rock garden. In very sheltered, well-drained positions, it will come well through the winter, but young plants are readily raised from seeds, while cuttings strike freely in July and August.

P. humilis is a low-growing plant from the Rocky Mountains, only a few inches high, with pretty blue flowers, which turn to a rosy-purple with age. It is one of the hardiest, and should be planted in gritty soil and in a sunny, well-sheltered position.

P. Menziesi.—Shrubby, or sub-shrubby, in habit, this species and its numerous forms are amongst the most attractive of plants in May and June. The type has flowers of a rosy colour, produced in great profusion. Newberryi has flowers of a rosy-pink, while the variety Scouleri bears large, rich, blue-purple flowers in such profusion as to hide the whole plant; most effective for borders. Considered by some as a form of this species, P. Douglasi, with exceedingly large rose-coloured flowers, out of all proportion to the plant, is a very interesting kind.

P. pubescens is an old garden plant, growing about a foot and a-half high. It is of branching habit, with purplish-blue flowers, having a pale-coloured lip. For the border it is very useful, and one of the hardiest members of the genus. The illustration on the previous page represents a specimen recently exhibited by the Wargrave Hardy Plant Farm. There are several forms of this in cultivation, one, latifolius, with broader leaves and purplish-white flowers; and pygmæus, a diminutive form only a few inches high.

The above represent but a small proporton of the desirable members of this genus.

W. IRVING.

Clerodendron fallax.—If grown cool, this clerodendron forms a noble feature in the greenhouse during the summer, the large, upright panicles of flowers being, under such conditions, very richly coloured, while they also retain their beauty for a considerable time.—W. T.

Tibouchina heteromalla.—That popular greenhouse plant so well known as Lasiandra or Pleroma macrantha, is now placed in the genus Tibouchina, the specific name being changed to semi-decandra. Though an older plant, T. heteromalla is much less grown than the other, and, truth to tell, it is less showy. Blooming, however, as it does at this season, it forms a striking feature in the warm greenhouse. The flowers, borne in panicles, are violet-purple in colour, and about two inches across.—K.

OUTDOOR PEACHES AND NECTARINES.

It is useless to attempt to grow peaches and nectarines out of doors unless assiduous attention is given to their requirements, and this is most urgently necessary throughout their growing and fruiting seasons, to which these notes will chiefly refer.

Insect Enemies.

During the time the trees are in blossom, and in some situations for several weeks subsequently, they require protection from frost. It is indiscreet to run risks by slackness of attention to this, for it is easy to be caught napping, and be deceived by the weather, and in this way have a crop of fruit either much impaired or wholly destroyed. At the commencement of leaf growth, a close watch must be kept for aphis, and upon its first appearance the trees should be properly sprayed with one of the several well-known efficient insecticides, but in reality the best method to adopt, and that which is practised here, is to spray the trees in this way at intervals, commencing immediately before the blossoms expand, and without waiting for discovered attacks. Only by this means can the trees be kept perfectly clear of aphis, and their cultivators, in this respect, relieved from anxiety. On the other hand, if this pest becomes so well established as to be protected by curled leaves before attempts are made to dislodge it, there is much difficulty in clearing the trees, and the young shoots are more or less permanently crippled, the crop of fruit receives injury, and the prospects of that of the following season reduced.

Of insect pests red spider, next to aphis, is usually the most troublesome to peaches, especially in dry seasons upon trees planted upon light or porous soils. This pest will, however, be powerless to cause injury if the roots are properly supplied with moisture, and their branches have unremitted attention paid to them with the garden engine or syringe.

Blister and Mildew.

At the commencement of leaf growth the fungoid disease known as blister also frequently makes attacks, and this is certainly likely to happen in exposed bleak positions, if the weather is cold, and thus congenial to its development. Under such conditions, the attacks are likely to be severe, and cause many of the leaves to become fleshy and distorted, and quite unfit to fulfil their functions. Our trees are protected from spring frosts by canvas blinds, which are considered to lessen the evil, though they do not wholly prevent it. To pick and burn the affected leaves is essential, and as a remedy, solutions of carbonate of copper or of "Medela," used in the form of a spray immediately before the blossoms expand, and again subsequently, if needful, are found to be beneficial. As in the case with mildew some varieties are more susceptible than are others to this disease. Sulphide of potassium applied as a spray, at the rate of half an ounce to a gallon of soft water as soon as attacks appear, is a certain cure for mildew.

Disbudding.

The disbudding of shoots is a most important detail of management, necessitating skilful manipulation, and particularly in the case of young trees. It should be commenced as soon as the shoots can be manipulated by finger and thumb, followed up gradually, and completed before the shoots become woody at their base. Any superfluous growths found after this stage is reached should be carefully removed by a knife. By adopting this practice the circulation of sap is not injuriously checked nor consequently their root action. When operating in this way, the chief objects to be kept in view are the retention of sufficient of the most promising and best-placed shoots, both for the formation of properly balanced trees and for furnishing them, over their whole surface, with good fruit-bearing wood; though this, it should be remembered, cannot be obtained unless the shoots are allowed enough space for their leaves to be well exposed to the sun. Apart from affording the advantages referred to, disbudding is beneficial in improving the quality of the fruit. After the disbudding is completed the sap will be more concentrated and cause the remaining shoots to make increased progress, and thus render necessary close attention to tying and training, and to stopping their lateral growths.

Thinning Fruit.

In favourable seasons the thinning of fruit, owing to the trees usually, under these conditions, setting more than they can bring to perfection, becomes a necessity, some varieties, Bellgarde peach for example, setting more freely than do others. This operation should be commenced as soon as it can be discerned which fruits are taking a decided lead, be followed up gradually, and finished when the fruit commences to stone. The largest and best placed—in preference, those placed on the front of the strongest branches—should be reserved for the crop, the weight of which should be governed by the vigour, general constitution and the treatment the trees receive with respect to stimulants. In an ordinary way, when fruit of the finest quality is required, one peach to each square foot or one nectarine to each square of nine inches of the tree's surface, is sufficient. It is not, however, possible to closely follow a strict rule in this matter. Nevertheless, it must not be forgotten that over-cropping is a mistake that sometimes has disastrous effects upon the trees and their future productiveness. In order to obtain the highest degree of flavour and colour of the fruits, they should as soon as their stoning period is over and the second swelling is about to commence, be exposed to the sun and air. When they begin to ripen they must be protected from birds, and during the gathering season be carefully attended to in this respect, at least once daily, so that the dropping of the fruit is, as far as possible, prevented.

Manurial Assistance.

Properly diluted liquid manures from the farmyard answer well in assisting the trees to bring their crop up to perfection. Bone-meal and kindred artificial compounds, of which there are several valuable ones in the market, are also most suitable fertilisers. Assistance of this description is most profitably given during the early stages of the fruits' development. In dry seasons, upon light soils particularly, mulchings of stable litter are beneficial, and waterings, either with clear water or manurial liquids, as required, should at all seasons receive timely and intelligent attention. I write intelligent in this instance, because I have known a given quantity of water to be poured upon borders for the benefit of the trees, and a great portion of it to run off the surface into drains, the operator appearing to think he had achieved his object.

THOS. COOMBER.

The Hendre Gardens.

THE OLD ENGLISH GARDEN IN BATTERSEA PARK.

For a long period Battersea Park has occupied a leading position among the open spaces under the control of the London County Council, and it is evident that those who are responsible for its management at the present time fully appreciate the importance of increasing its attractions and interest as opportunities offer. The latest addition to the amenities of the park is an old English garden, wherein visitors may enjoy hardy and other flowers under much the same conditions as those which obtained in the days of their forefathers. It was a happy idea to provide so distinct a feature, and those with whom it originated have the satisfaction of knowing that what has been done has met with the hearty approval of the residents of Battersea. This much may be assumed, for we have heard nothing but praise of the garden, and when we were there the other morning it was so crowded that the photographer found it anything but an easy task to use his camera without showing in the resulting picture paths so crowded with visitors as to render obscure many of the objects in the beds and borders.

This new garden has been formed on the west side of the park, and in the enclosure known as the Botanic Garden, an area of which a portion has been devoted to supplying the botanical classes in the Metropolitan schools with specimens for practical study. The enclosure is within a very short distance of the western entrance, and within a few yards of the southern side of the river drive. The enclosure has an area of about two acres, and is surrounded by trees and shrubs, the former being perhaps a trifle too tall, but the belt of arborescent and ligneous vegetation, effectively screens the garden from those who are not within its boundaries, and adds much to its enjoyment.

The garden has for its centre a pool of water, with fountain, and this has around it at intervals specimens, in pots, of hydrangeas, apaganthus, and other suitable plants. At either end are large beds chiefly planted with dwarf roses, and at the present time gay with annuals, the dwarfer candytufts being the most prominent. Flanking the water pool, and its accompanying beds, are borders about twelve feet in width, and intersected in the middle by a cross walk. These borders are chiefly filled with hardy perennials, comprising delphiniums, erigerons, pæonies, Michaelmas daisies, herbaceous phloxes, and other of the finer subjects. There are also excellent groups of certain of the biennials, such, for example, as Canterbury bells and sweet williams. Tender plants are not largely grown, but those which have been given a position in the garden have been selected with much judgment. Especially noteworthy among the tender subjects are the breadths of finely-flowered verbenas.

On the western side is a pergola which extends the whole length, and terminates at either end with a small temple fitted with seats. On the three other sides there is a flat arch of wood at each of the entrances. The pergola and arches are made of square oak, and remarkable, not less for elegance of design than for durability of material, and when clothed with roses and other plants of scandent habit they will add much to the attractions of the garden. Mr. Rogers, the able superintendent of Battersea, may be heartily congratulated on the success he has achieved in the creation of this new and interesting feature.

OLD ENGLISH GARDEN, BATTERSEA PARK.
Central view looking west, with the pergola.

GARDENERS AND THEIR HOLIDAYS.

It would seem that in these days, when every trade or profession takes an annual holiday, the gardener alone is in a general way excepted. In some instances employers are more generous in this respect than in others, as they not only grant their gardeners leave of absence, as it were, but, knowing the circumstances in which they are placed, they render them substantial monetary aid. There are, however, some who entirely object to their gardeners having a holiday at all, and others who tell their gardeners they cannot make it an annual affair. Now the gardener is placed in peculiar circumstances, and those who have had the control of a large establishment know full well that the duties in such places are very exacting, and one is glad at times to get away from the place for a little relaxation, as it were, from the excessive toil. Not only has the gardener to look after those under his charge, he has in many instances accounts to keep, and much clerical work in addition. No wonder then that we see so many poor fellows go wrong. How many, I wonder, have taken this into consideration; but when we look into the matter we find that almost daily there is some one of the craft falling out of the ranks through nervous breakdown, or going out of his mind. Now were there a system whereby the gardener could take a holiday and visit a friend in a different part of the country, he would no doubt go back to his labours much refreshed both in body and mind. It is not always well to be a drudge; both brain and limb need some rest.

If gardeners who are able to take a holiday would visit some gardens where things are well grown, they would be astonished.

H. C. Prinsep.

AMONG THE ALPINE FLOWERS.

"Golden butterflies gleam in the sun,
Laugh at the flowers, and kiss each one;
And great bees come, with their sleepy tune,
To sip their honey and circle round;
And the flowers are lulled by that drowsy sound,
And fall asleep in the heart of the noon."

Philip Bourke Marston.

Such is a part of the picture the poet draws of the garden in the high tide of summer, and as we look upon our flowers in the mid-day of the bright hours we seem to enter into the spirit of his words. In the full sunlight many of the flowers appear drowsy amid all their brightness, and look "asleep in the heart of the noon." Yet the alpines are inexpressibly beautiful, even though the shrinking, more modest beauties of the earlier months have gone to their rest. Instead of the more unassuming flowers, which consort so well with the softer charms of the spring months, we have the more opulent charms of their later sisters. Helianthemums open with the morning in all their glory, and, should the weather be bright, fall asleep on many days by the time the sun reaches the meridian; glowing or delicately-coloured pinks open their lovely eyes to the wooing of the sun of July; campanulas give their lovely cups or bells of blue or white; cranesbills and heronsbills in plenty brighten the rock garden; veronicas afford us their welcome flowers of blue or white; soapworts are in sheets of bright colour; a few silver saxifrages yet send up their lovely plumes; gay poppies flaunt in the winds, and a host of other flowers proclaim their enjoyment of the time with all its wealth of beauty. From among them we must select a few for notice.

Spiræa decumbens.

As a rock or wall garden shrub of trailing habit few can surpass Spiræa decumbens in combined beauty and grace, and a handsome plant, seen the other day, brought out this fact in a most striking way. Planted in an almost perpendicular retaining wall, it was about three feet through, and was exquisite, with its mass of small and beautiful leaves, and the many, many flowers so closely, yet gracefully, arranged in their sprays. The colour of these is a soft white, which harmonises well with the delicate greenery of the foliage. One finds this an easy plant on rockwork also, and, as it will thrive in loam, leaf-soil, or peat and sand, it can well be accommodated with other flowers of the rock garden. It is raised from cuttings, and will thrive in almost any position. We have grown it best in a south-east exposure, but other plants of equal beauty have been seen in other aspects in different gardens.

Dianthus alpinus.

Except for a certain hardness of colouring, Dianthus alpinus is one of the finest of a most delightful class of rock plants, the alpine pinks. It is not a success everywhere, and we find gardens in which it has been attempted year after year with but little success. In others, again, it thrives admirably, and covers its pleasing leaves with its magnificent deep rose flowers, which are often so closely set together that not a vestige of the foliage can be seen when one looks on the plant from above. In some places our arch-enemies, the slugs, destroy the small plants, but where they are kept in check, the plants generally increase in size and in beauty. D. alpinus is evidently one of those which have a penchant for lime, though this is not essential, and it is a pleasure to see it in such a soil, flowering well, and even sowing itself and colonising the places round about by its healthy, vigorous, self-sown progeny. Where it is happy it is the freest, perhaps, of alpine pinks, but for my part, I have a preference for another gem in point of colour. This is Dianthus neglectus, of which I may speak again.

The Snowdon Thyme.

Most of us "know a bank where the wild thyme blows," and many of us grow this fragrant plant in our gardens in some form or other. For a while the so-called "crimson" variety of Thymus serpyllum was written largely in the list of coveted plants, and its white sister variety found, and still finds, favour with many. Here there is a very beautiful variety, which came to me as having been collected on the Welsh Snowdon. At present it is very beautiful, though not a large plant, with its soft pink flowers close set on the foliage they hide so prettily at its flowering season, but which is too neat to be concealed for ever from view.

Helichrysum rupestre.

Just a note of warning regarding this "everlasting" rock plant. It is too rank for many places, and is not good enough for any but very large collections. Its height depends on the soil, but it ought always to be in very poor material. A dry, limy moraine, or a bank of rubble, poor soil, and limestone will suit it, and there it will pass among many other plants, though it is impossible to admire it greatly. It has silvery, woolly foliage, and in poor soil heads of "everlasting" yellow flowers on stems some nine inches high.

S. Arnott.

ERANTHEMUM TUBERCULATUM.

Some well-flowered examples of this pretty and distinct species of eranthemum were recently noted in flower in the intermediate portion of the T range at Kew. It differs markedly from the more commonly-grown species of eranthemum, such as E. pulchellum, whose flowers are collected in a terminal cone-like head, and also from those which are of upright growth and sparely branched. Eranthemum tuberculatum forms quite a freely-branched, compact little bush, whose slender branches are curiously warted, hence the specific name of tuberculatum.

The leaves are small and ovate in shape. The flowers, which are scattered over the shoots, instead of being collected in one head or cluster, are pure white, about one and a-half inches across, and somewhat suggestive of the flowers of Bouvardia Humboldti corymbiflora. The small warts on the stems are very suggestive of scale insects, and as these pests are very fond of this eranthemum, they are often very numerous before their presence is suspected.

A native of New Caledonia, Eranthemum tuberculatum has been long grown in gardens, but, as a rule, to a very limited extent. Where decorative flowering plants have to be provided all the year round it is decidedly worthy of attention. Cuttings root very readily, even if good-sized shoots are taken, provided they are put in a close propagating case with a gentle bottom heat. As with most eranthemums, this species is more satisfactory when treated as an intermediate house plant than in the stove.

K.

BORDER CARNATIONS IN APRIL.

It is not easy to grow winter-flowering carnations satisfactorily unless they are grown in a house by themselves, and, to some eyes, one bloom of a border carnation is worth many of the other kind, even when the latter are at their best. My gardener (Mr. G. Cousins), therefore suggested this spring that he should try what he could do with some border plants, potting them up in February, and growing them under glass, at first in a vinery, and later in a cool greenhouse. I have been much pleased with the result, for the foliage of the plants kept clean, the flowers came of good colour, and sufficient size, while the calyces burst very little, if at all, more than is the case with the plants flowering in July.

The plants (a little more than 200) were from layers taken in the usual way last August, and were placed in their flowering pots (two or three plants in 32-sized pots), at, and soon after, the middle of February. Top air was given them always in each house, and the temperature was generally 55 to 60 degrees during the daytime. Sir Walter flowered by the end of March, and we had flowers throughout April. On May 5 there were forty blooms in the house, and not all the plants had then flowered.

No top-dressing was given; the soil was that used for the July flowers. Tantalus was particularly good, better than he was with us last July. Ronnie Buchanan, Pasquin, Linkman, and Burgomaster also threw plenty of good blooms; Father O'Flynn was of fair size, but burst more than others; Grand Dame did very well; Mrs Walter Herriott fairly well; Sir Galahad well; Duchess of Wellington well, except that the colour was not as "blue" as it should be; Mrs. Griffith Jones was excellent in colour, but the blooms varied in quality; Cyclops did well.

The experiment seems to me one that lovers of border carnations may well try, for many beautiful blooms can be had in this way at a very small expenditure of space and labour. Now that carnation time is almost with us, this little record may be of service to lovers of the flower.

Winchester College. J. A. Fort.

HIBBERTIA DENTATA.

As a climbing plant for the greenhouse this scarcely has its merits sufficiently recognised, as from a foliage point of view it is very ornamental all the year round. It makes headway by twining its flexible shoots around any support, the bark of the said shoots being when young bright red, a colour with which the young leaves are also deeply suffused. The mature leaves are more of a bronzy green, but in colour there is a certain variation, according to the amount of exposure the plant gets. The flowers, borne from autumn to spring, are rich golden-yellow, about three inches in diameter, and rather suggestive of some of the hypericums. Cuttings strike root very readily, while seeds are sometimes ripened from which young plants can be easily raised.

W.

BUDDING ROSES.

The months of July and August are undoubtedly the most suitable for the work of budding roses; and, although information is frequently given on the subject, it is such an important detail in the culture and increase of our national flower as to call for a few notes at this seasonable time.

I do not propose to treat upon the actual method of budding, but to give a few hints that may be of service and a reminder to those about to bud their various rose stocks. None of these should be cut or unduly disturbed in any way previous to budding, as this upsets the flow of sap for several days. Therefore any cutting back that may seem necessary for the easier manipulation should be done a fortnight or so previously. For the same reason I would not disturb or cut any wood away after the bud has been inserted.

It will be well to draw especial attention to the great advantage of more careful selection when taking the buds than is usually given. Not only should we take buds from a perfectly healthy and typical plant of each variety, but they should be taken from the best shoots. I am convinced there is more in this method of selecting buds than many apparently think. The rosebud and stock should be in a perfect condition for the operation, otherwise I would prefer waiting until such occurs, which will not be long if we devote a little thought and work towards that end. The quicker the flow of sap that occurs at a suitable time the greater the chance of success.

Oftentimes I meet with cases where the bud has not been tied in firmly enough. It should be as firm as possible, without constriction, and due care taken to ease the tie a little after the bud is set, and as the stock swells through its natural growth. Any lengthy exposure that will dry up the sap left upon the inner bark of the rosebud, or that between the lifted bark and the exposed wood of the stock, must be most carefully avoided. A dry and dull day is an ideal time for budding, and I have been struck with the higher percentage of failures when working through a drizzly wet day, the water not conducing to so good a result as when sap-moisture alone is present.

To have to force the bark up in the case of stocks, or to find any difficulty in removing the small portion of rose wood from below the eye or bud to be worked, is plain proof things are not in an ideal condition for the operation. Water the stocks well, and let the buds remain upon the shoot in water for a time under such circumstances.

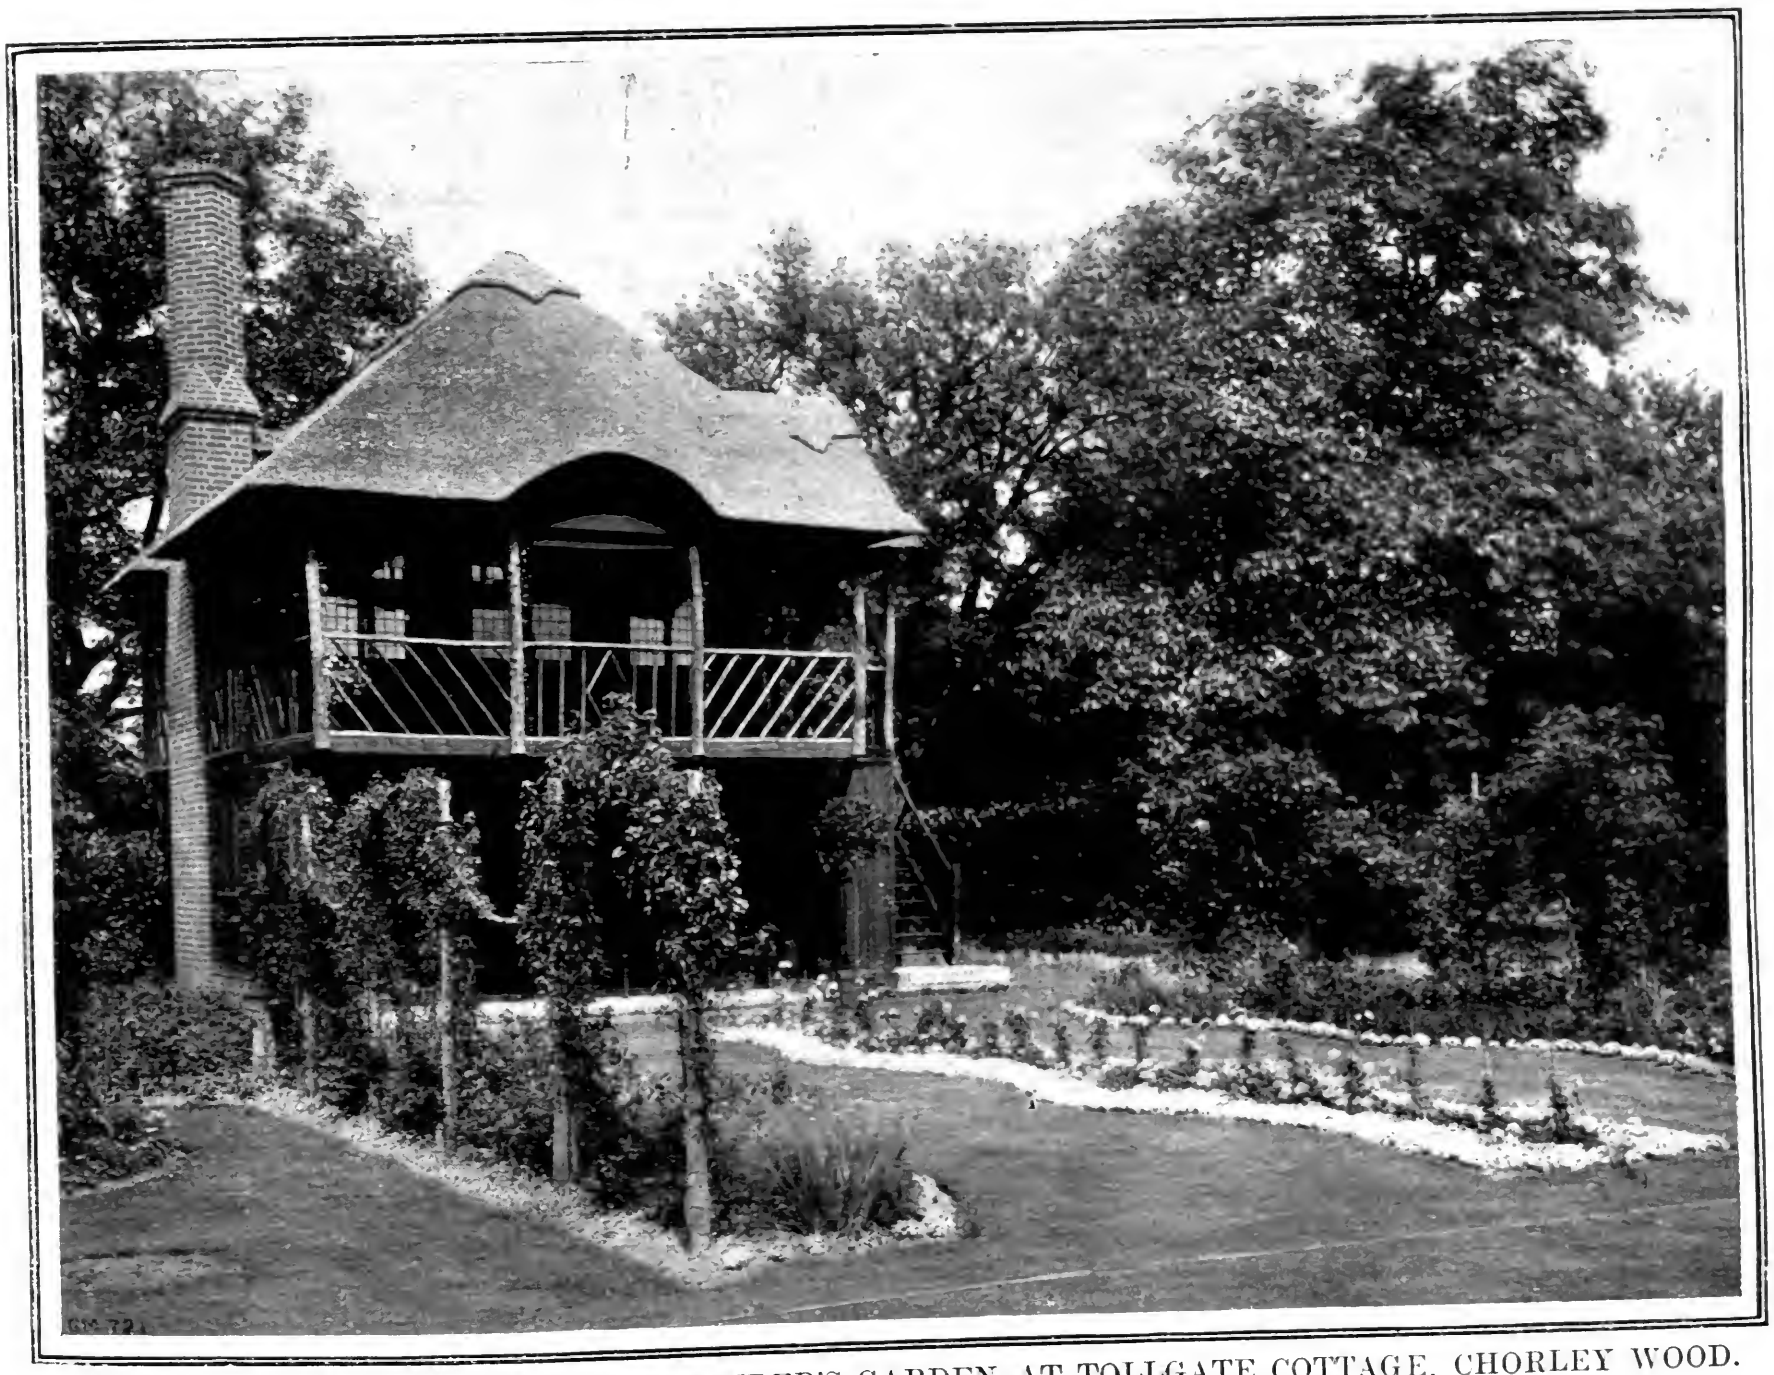
It is almost useless, too, to put in any rose bud that does not carry a sound and prominent seat, or heel, after the small portion of wood has been removed from it, as it is most vital that this seat should rest firmly upon the exposed wood of the stock. Make the lengthwise cut before lifting the bark of the stock, as near to the crown of roots in the case of dwarfs, and as close as possible to the main stem of standards, so that you can slip the bud down well, and thus avoid space that may eventually develop a number of suckers from the stocks. Cut through the bark only, never into the wood.

If the dwarf stocks were planted rather shallow, and some soil drawn up around them, as suggested in former notes, the bark will be found in a softer and more tractable condition for lifting than if the whole of the stems had been left exposed.

ROSARIAN.

TEA HOUSES IN THE GARDEN.

One of the great revivals of recent years is the love of open-air life, and particularly of a desire to live as much as possible in the garden. This revival has led to the construction of garden houses of a very different character to the old-fashioned summer house, and the aim has been to secure shelter from wind and rain, and a little shade from occasional hot sunshine, without shutting out light and air and excluding the beauty of the garden. In very many instances such houses are not far from the home, and placed in a position commanding special views of the garden or of the surrounding country. In such houses it is a common practice to have breakfast, lunch, and tea from late spring until the "chilly autumn hours" arrive—in short, the idea is to live as much as possible out of doors.



TEA HOUSE IN SIR GEORGE ALEXANDER'S GARDEN AT TOLLGATE COTTAGE, CHORLEY WOOD.

Garden houses of this character are varied in design and size, and when far from the dwelling they are usually more substantially built than when close at home. Numerous examples of useful and beautiful garden houses—and, happily, usefulness and beauty may be combined readily—have been illustrated in these pages; and in the present issue Sir George Alexander's tea-house at Tollgate Cottage, Chorley Wood, is depicted. This is a two-storied design, the lower portion wide open, the upper with a broad balcony and arrangements for providing just as much or as little shelter as the occasion warrants. Set among trees at the head of the rose garden, this tea-house is in keeping with its surroundings, and a distinct ornament to the garden, as well as a desirable place in which to have tea.

SUMMER COLOUR IN THE GARDEN.

There should be a blaze of glorious eye-satisfying rich hues in the garden from June to November, varied by those masses of white and grey, bronze and silver-green, that can be supplied partly by foliage, and are necessary to rest the eye and give value to the brightness. Probably colour is more wasted in English than in continental pleasure-grounds, and more in private pleasaunces than in public parks. There is no reason why the smallest strip garden behind a villa, or the humblest roadside plot before a cottage, should not be planted with a view to colour. Certain it is that only when professional and amateur gardeners are awake to the necessity of caring for plants and flowers primarily as colour producers that the whole effect of their labours are most noticed, for the finest isolated specimen plants do not give the pleasure that can be reaped from a full collection of less perfectly developed ones. This is no plea for overcrowding, since flowers will not show their finest hues unless well cultivated, but it may serve as a suggestion that a few bouquets of exhibition blooms are less worth working for than a garden display that will be the talk of a neighbourhood.

As though adorned to help all men equally the least costly flowers, on the whole are most appreciated, at least among outdoor growers. The pelargonium is generally employed, and cannot be called expensive, yet a more vivid red still can be gained by sowing field-like spaces of the Tulip poppy, a hardy annual, eighteen inches high, that springs up and flowers within two months. Then what a magnificent, slightly deeper scarlet, comes from serried ranks of the double Opium poppy. The zonal pelargonium, by the by, is one of our most wasted plants. Dotted over a bed among other colours, it loses all its distinctive worth, but congregated closely for a bank covering, both on sides and summit, it will create a summer feature that will live long in memory. The deep rose-pink pelargonium, the common gold calceolaria, whose hue exactly rivals gorse, are two other beauties for similar employment.

In an old-fashioned garden last year, where long paved walks led between wide borders, two of the latter, opposite each other, were filled entirely with orange and with lemon African marigolds respectively. Under the azure sky of July and August, hovered over from dawn to dark by myriad bees and butterflies, these displays of a noble foreign flower gave delight that no mingled carpet-bedders, no variety of pale fuchsias and marguerites, could have conferred. For as far as the eye could reach down the walk were the side masses of orange and of lemon, the great buds nodding, the huge double balls clustering, the elegant foliage spreading, the whole a luxuriance of tropical splendour.

Dahlias and hollyhocks are flowers from the lavish planting of which generous colour effects can be gained, especially as the best dahlias now throw many more blooms, and higher above the plants, than did the older kinds; yet the herbaceous phlox stands, perhaps, supreme as an example of the floriferous hardy subject of an infinite choice of tints. Phlox clumps will blossom grandly the same year if not planted before June, so long as plenty of old manure is put where the pots can soon strike down to it, and if water is copiously given when rain does not supply enough. Phloxes of deep shades are far preferable to those in which a second hue appears. Etna is a perfect dazzling coral-red, Flambeau, a distinct orange-scarlet, Lady of the Lake, a charming salmon-pink. It must not be imagined, however, that only the warm colours are entitled to high praise for garden splendour; the phlox Iris, of blue-violet, like violet China asters or ten-week stocks, will make an extraordinary show under a sunny sky, one that violas can repeat on a lower level. The pale and deep blue asters and stocks, too, only require to be present in sufficient quantity to be remarkable.

An illustration of a plant capable of attracting attention by the rarity of its hue is Gilia coronopifolia, a genuine cerise flower, produced in branching spikes. Calliopsis nigra speciosa, terra cotta-crimson, is exceptionally rich-looking; the brown calceolaria has its merits; so also has Antirrhinum carmineum, a magenta-carmine, and a variety named Ruby, an original shade of old rose that comes true from seed.

The pelargonium experiments made last year went to prove that, when pelargoniums are desired more for bloom than foliage, they should be planted so closely that stem and foliage growth is checked, as in pot culture, the yield of the trusses being then doubled. Nasturtiums remain the chief colour bedders for the cottage garden, though equally suited to the adornment of beds on a wide-spreading lawn, and the miniature, or liliput, strain gives an even finer spread of brilliance than do the older Tom Thumb varieties. M. H.

SEASONABLE NOTES ON CHRYSANTHEMUMS.

Owing to the introduction of the beautiful early-flowering varieties during the past ten years, the season of chrysanthemums has been considerably prolonged. The beauty of the flowers, their usefulness, both in the open borders and the supply of cut flowers for indoor decoration, combined with their dwarf, compact habit, have commended them to cultivators, and they are now highly popular. There was not much diversity of colour in the older border varieties; some of the best of them flowered very late in the season, others were very tall, and one often saw them tied up like so many sheaves of corn in the beds.

In these days less staking is needed, but it is done in a very neat manner, so as not to spoil the character of the variety dealt with.

Timely Staking.

This is most desirable; if growths are allowed to fall apart, or topple over to one side, and so remain for a week, or even a couple of days, much difficulty will be experienced in getting them back to their original position; in fact, this can seldom be done.

After flower buds form the stems quickly harden, so that it is not necessary to have the stakes used higher, when fixed in the ground, than the topmost main leaves. About nine inches of flower stem and main stem will appear above the top of the stakes, and while sufficient support will be given there will not be any unsightly display of sticks.

Watering and Feeding.

So far this season there has not been any long spell of very hot weather. When such a time comes, and the plants are growing in a poor soil, they become stunted, and flower prematurely. The first crown buds develop in an ill manner, the florets are too short, the colours poor, and the flowering season all too brief.

There are other reasons why some batches of border plants are, in like manner, unsatisfactory, but there should not be any deficiency of water. Neither should liquid manure be very sparingly used. With the aid of surface mulching, watering, and judicious feeding, the plants will make a satisfactory growth, and produce an abundance of highly-developed flowers. Surface driblets of liquid manure are of but little use, and, as a rule, once every week the soil should be thoroughly soaked.

Earwigs.

Just at the time when the first crown buds develop the young earwigs are becoming very numerous, and infest the plants. They are more troublesome where the soil is allowed to become dry on the surface immediately round the stems. Less damage is done when the soil is maintained in a moist condition, as the pests cannot then find a comfortable lodgment. Hollow bean stalks, pots with moss in them, old pieces of boards placed together on the ground, and similar old-fashioned means of trapping may be carried out. I have, however, found that earwigs lodge a good deal in the crown blooms, which they eat, usually leaving the younger flowers untouched. By closely examining these early blooms morning and evening many earwigs will be found, and can then be destroyed. It is also a good plan to place a few dahlia blooms that are beginning to fade between the stems, about six inches from the ground. The earwigs lodge in the blooms, and may be shaken out and destroyed.

Feeding and Top-dressing.

Plants that are grown for exhibition must be assisted with rich top-dressings and other food as soon as the pots are well filled with roots. However good the compost may be, it is not in great bulk in each pot, and when the roots are plentiful they soon exhaust the nutriment in it. Suitable stimulants in weak doses should be given in due time, as a week or ten days' delay in their application will result in a certain loss to the cultivator.

Many growers give soot-water first. This is a good stimulant when the soot is not too fresh, but if it is fresh, and the liquid beyond a medium strength, the roots will be destroyed, and many leaves on the lower part of the stem will suffer. I prefer to give supplies of very weak liquid manure for a week or so, applying them alternately with clear water, before using any soot-water. It being necessary to water the plants at least twice each day in fine weather at this season, few days will pass without some stimulant being given. Later on, of course, the strongest-growing varieties will need stimulants every time water is given.

Some artificial fertilisers, either in dry or liquid state, must be applied directly the plants are becoming potbound. These concentrated manures must be applied according to the directions given with them, using rather less where other home-made manures are also applied.

Geo. Garner.

PYRETHRUMS.

The Compositæ order is generally recognised in gardens for its beauty or utility, and nowhere are these qualities more charmingly combined than in the garden forms of pyrethrum. As a market flower, the sale of pyrethrums each season attains enormous proportions, and they appeal first to the grower and then the public, and are of special value in garden decoration. Pyrethrums are easy to cultivate in any well-tilled soil, but prefer one of medium texture to those that are inclined to be heavy and therefore wet; the latter, however, if drained and well broken up, incorporating some half-rotted manure in the process, will generally give good results, while light soils should be solidified by heavier material and well-rotted manure.

Pyrethrums are best planted in spring, but where it is necessary to lift and divide the crowns this may safely be undertaken after the flowers fade, choosing, if possible, showery weather for the work; on a small scale, artificial watering may be practised with success. Pyrethrums develop an enormous quantity of fine fibrous roots, and, as a general rule, they resent disturbance, and while only a moderate display can be looked for the first season after planting, in the second and subsequent years the display is prodigal in the extreme. As decorative subjects in the garden they exhibit the highest lasting qualities, whether as cut flowers or allowed to fade naturally on the plants. The colours are bright and pure, and exhibit considerable variety.

Pyrethrums have either single or double flowers; in the latter case the blooms are mainly self-coloured, while in the singles the ray florets are usually very distinct from the normal yellow of the disc.

A dozen good double sorts include: Queen Mary, with bright satin, rose-pink flowers; Mont Blanc, pure white, early; Lord Rosebery, bright crimson scarlet; Captain Nares, purple-crimson; Empress Queen, blush-pink, extra good form; Pericles, yellow, outer petals tinted peach; Delicatissima, rosy-lilac, centre orange; Le Dante, combination of rose and orange; Paul Journer, blush, deepening to rose; Regale, large, bright reddish-crimson; Uzziet, striking combination of orange-bronze; and La Belle Blonde, large and beautiful white.

Singles.—Agnes Mary Kelway, bright rose-pink; Albert Victor, crimson-scarlet; Carmen Sylva, blush-pink; Clemence, crimson; Elsie Gertrude, pale flesh; Esmeralda, cherry-red and white; Jubilee, scarlet-crimson; Mrs. W. Kelway, flesh-pink; Pink Pearl, extra good pink; Princess Marie, white; Vivid, bright amaranth; and Warrior, carmine-purple.

Coombe Court Gardens.

ANCHUSAS AT KEW.

Prominent among the many features of interest in the Royal Gardens, Kew, at the present time is that formed by the glorious masses of the Dropmore variety of the Italian Alkanet (Anchusa italica), which are proving veritable surprises to not a few of the many visitors. This fine form, which some years since originated in the gardens of Dropmore, long famous for its coniferous trees, is one of the finest of all the hardy perennials bearing blue flowers, and should therefore be given prominent positions in the mixed border, if the space will not admit of it being grown in bold masses, as at Kew, on the lawn or by the waterside. Given a favourable position and a deeply-cultivated soil, the plants will attain a height ranging from 4ft. to 6ft., and produce side branches so freely as to form huge pyramids, densely furnished with flowers of the most brilliant blue.

For several years past the cultivation of this distinct and beautiful alkanet has been steadily increasing at Kew, and this year it is so freely represented as to add immensely to the attractions of the gardens. It is grown both in large beds, and in bold, irregular masses on the banks of the lake that flanks the southern side of the Syon Vista. There is no occasion to institute comparisons between the two methods of arrangement. Both are good; and, while the formal beds are the best for breadths of lawn, the irregular groups are most in keeping with the conditions that obtain on the margin of a lake that is free from formality. We illustrate herewith the exceptionally fine bed on the lawn, not far distant from the northern end of the T-range. The bed has, perhaps, a larger area than would be advisable in the majority of private gardens, but the modification of the size would be a very simple matter, and it may well be regarded as a model of what such a bed should be. The plants are about 4ft. in height, and remarkable for their uniformity, and the profusion of the large, brilliant blue flowers.

Those of our readers who are specially interested in hardy flowers should, if they have the opportunity of doing so, visit Kew during the next few days. Readers who are desirous of obtaining the fullest information on the cultural requirements of this handsome anchusa will do well to turn to the highly interesting article on its culture from the pen of Mr. Wyndham Fitzherbert, which appears in our issue of April 20, 1912.

A GLORIOUS BED OF ANCHUSA ITALICA DROPMORE VARIETY, AT KEW.

Blandfordia Cunninghami.—It was pleasing to see a good specimen of this Australian liliaceous plant at the Horticultural Hall on June 17, when an Award of Merit was given it. These Blandfordias are much rarer in gardens than was at one time the case; still, they are well worth attention, their drooping bell-shaped flowers of a waxy texture being so beautiful Though the specimen shown was in general features, characteristic of B. Cunninghami, the exterior of the flowers was less richly coloured than I have before seen them.—W.

HOLLAND HOUSE FLOWER SHOW.

The Royal Horticultural Society's summer show at Holland House on Tuesday, Wednesday, and Thursday, July 1, 2, and 3, was a great success horticulturally, as the range of subjects was extremely wide, cultivation of the highest order was evident on every hand, and the standard of arrangement was higher than usual. The Rev. W. Wilks, Mr. S. T. Wright, Mr. H. B. May, Mr. Reader, and Mr. Gaskell deserve a word of praise for the smartness with which the tents were cleared, judging commenced, and the whole place tidied up ready for the visitors.

The weather was overclouded in the early morning of the opening day, but the rain kept off, and the light breeze was appreciated alike by visitors and exhibitors.

ORCHIDS.

Messrs. Charlesworth and Co., Haywards Heath, put up a glorious group of orchids, quite one of their best efforts. The central mass of Lælio-cattleya Canhamiana and L.-c. Fascinator was noble, while at each end the grace and colouring of the odontoglossums whole arrangement was light, and every plant stood clear of its neighbour. Disa grandiflora, Cattleya Mossiæ Wagneri, Odontoglossum Williamsianum, Miltonia vexillaria Queen Alexandra—a lovely thing, and the pretty Odontioda Lambeauianum, with golden markings in the bright red. Mr. S. W. Flory, Twickenham, presented a rather flattish arangement of Cattleya Mossiæ, miltonias, odontoglossums, and a few pans of the dainty golden-veined Ancectochilus. Another small group, chiefly of odontoglossums and odiontiodas, was from

LÆLIO-CATTLEYA GOTTAIANA THE PRESIDENT.

A handsome form of this fine hybrid; the colouring rose-mauve and ruby-purple. Exhibited by Messrs. Charlesworth and Co. at the Holland House Show.

Orchids were good, roses were present in great force, formal and rock gardens were again a great feature, and evidenced a large expenditure of skill and money. Greenhouse plants were also well displayed, and carnations were very fine. Sweet peas were grand, indeed remarkably so for the season. Vegetables were splendid, though not overabundant, and fruits were represented by pot trees, superb pineapples, and tempting strawberries.

Out of doors the newer Chinese trees and shrubs, and formal gardens, added to the size and interest of the show. One tent was filled with horticultural sundries, and there were seats, tents, and other garden accessories in the open, but the way in which some of these exhibits were arranged and decorated reminded one of a local fair ground rather than the summer show of a dignified Royal society.

and odontiodas were very noticeable. A few outstanding plants were Lælio-cattleya Gottaiana The President, rosy-mauve and ruby-purple; Dendrobium Dearei, Odontoglossum Episcasta, O. President Poincaré (very fine), Grammatophyllum Ellisi, with big spikes of green and brown flowers; a finely-branched spike of Odontioda Cooksoniæ, O. Brewi (O. Charlesworthi and Odontoglossum Harryana), with deep red-brown flowers; the handsome Miltonia Charlesworthi, Cattleya Mossiæ Olympia, and the fine old Peristeria alata.

Messrs. Mansell and Hatcher, Rawdon, Leeds, put up a famous group, and fine plants of Cattleya gigas filled up the centre, flanked by recessed groups of Phalænopsis Rimestadiana over Renanthera Imschootiana. At the ends L.-c. Canhamiana, L.-c. Aphrodite, and Cattleya Mendeli were piled up lightly with ferns and white odontoglossums to form splendid corner mounds. The

Mr. Harry Dixon, Spencer Park Nursery, Wandsworth Common.

Messrs. Stuart Low and Co., Enfield, had a fairly large exhibit of orchids, and their central feature was a high stand of Renanthera Imschootiana and Phalænopsis Rimestadiana, the crimson and white colouring combining well. Stanhopea tigrina and Acineta densa, with their drooping spikes, were also very interesting in this display. Cattleyas and lælio-cattleyas were very much in evidence, and there were good masses of Cypripedium callosum Sanderæ, Dendrobium Dalhouseanum, Epidendrum vitellinum majus, and Oncidium crispum. Cirrhopetalum robustum, with its green and yellow flowers, was a quaint species on view.

A large and particularly charming group of orchids from Messrs. Sander and Sons, St. Albans, commanded attention by reason of its superb central feature, composed of

fine plants of Phalænopsis Rimestadiana carrying about thirty glorious spikes of white flowers, hanging over a group of Miltonia vexillaria, in which M. v. Chelseaensis, M. v. Invincible, and M. Sanderæ were notably fine things. This combination of phalænopsis and miltonias was greatly admired, and very much commented upon. Cattleya gigas Sanderiana, grouped in mounds at either end, were grand, and in the recesses were almost innumerable odontiodas, oncidiums, cypripediums, Dendrobium Dearei, Acineta chrysantha, and a number of beautiful hybrid odontoglossums. An altogether fine display. Mr. Edward V. Low, Vale Bridge, Haywards Heath, had a charming group of orchids squeezed between hardy flowers and carnations. Cattleya Mendeli Lambeauianum was his leading feature, and this is white, with pink-tipped lip. Nanodes Medusæ and Oncidium macranthum were good in this contribution.

The finest private contribution of orchids was set up by Mr. J. Collier, gardener to Sir Jeremiah Colman, Bart., Gatton Park, Reigate. This was a large and elegant, as well as a very bright and interesting exhibit, the plants being pleasingly arranged over ferns, asparagus, and moss. In the centre a number of Lælio-cattleya Phœbe lent their bright orange-gold colouring, blending with the purple of L.-c. Canhamiana and the white of Phalænopsis Rimestadiana. To right and left elegant spikes of Odontioda Bradshawiæ, Oncidium Papilio, and Odontoglossum Lady Roxburgh rose above Cattleya Mossiæ, C. Mendeli, miltonias, Lissochilus speciosus, Masdevallia Harryana, Cypripedium superbiens, C. callosum Sanderæ, and many other rare and beautiful kinds. Surrounded by some fine specimens of the useful Polypodium Mandaianum Mr. W. A. Manda, St. Albans, showed a few plants of Cattleya Mossiæ and C. gigas.

CARNATIONS.

Border carnations that appealed to the fanciers were shown in good form by Mr. Jas. Douglas, Great Bookham, who had several dozen vases of fine flowers; first-rate varieties were Renown, Mrs. Robert Gordon, a lovely pink shade; Hercules, crimson; Mr. Robert Morton, salmon; Greyhound, heliotrope; Mrs. Henwood, white; ; and Bookham White, the latter a superb variety. Mr. C. Engelmann, Saffron Walden, displayed perpetual carnations, grandly setting up tall stands containing scores of blooms of Carola, Sunstar, Harlequin, Lady Northcliff, Pioneer, Enchantress, May Day, and Triumph, with lower vases underneath of Mikado, Winsor, Lucy, Mrs. C. W. Ward, Carola, and My Rose.

A very beautiful and artistically-arranged group of perpetual carnations came from Mr. Bertie E. Bell, Guernsey, who put up fine flowers in baskets and vases of varying size, and disposed them skilfully. His leading varieties were Carola, Winsor, Rose Doré, Beacon, very bright; White Enchantress, Mrs. C. W. Ward, splendid; Britannia, Coronation, and Dorothy Gordon. Some fine flowers came from Mr. H. Burnett, Guernsey, but he had not such a large display as usual, presenting grand vases of Marmion, Mrs. C. F. Raphael, Calypso, Rosette, White Wonder, Baroness de Brienen, and the yellow and pink Mandarin.

Under a canopy of muslin and smilax Mr. G. Hillman, gardener to W. M. Gott, Esq., Trevython, Par Station, Cornwall, staged a large collection of Malmaison carnations; the flowers were of fair quality, and looked well disposed in vases over maidenhair ferns. Leading varieties were Princess of Wales, Mrs. Trelawney, Calypso, Maggie Hodgson, Old Blush, Princess Juliana, King Oscar, and Duchess of Westminster. An imposing exhibit of carnations from Messrs. Stuart Low and Co., Enfield, was composed of raised vases of Malmaison and perpetual varieties, Old Blush and Princess of Wales being especially well shown, together with Lady Coventry and Cerise Seedling.

A large corner exhibit in the great tent was arranged by Messrs. Wm. Cutbush and Son, Highgate. Roses were included, chiefly weeping standards and pillars. The whole was prettily arranged, and most informally. There were grouplets of Maggie Hodgson, Monk, Lady Coventry, Baldwin, and Princess of Wales carnations, and vases of such beautiful varieties as Mrs. C. W. Ward, Marmion, May Day, and White Enchantress, as well as of such fine pinks as Coronation, The King, and Princess Christian, all very free flowering and attractive varieties. Mr. Johnson, gardener to Lord Burnham, Hall Barn, Beaconsfield, was represented by a large group of Princess of Wales carnation, a popular Malmaison variety. The plants were in pots, and carried a goodly number of flowers; there were fifty or sixty plants staged.

Carnations and phloxes came from Messrs. W. Wells and Co., Merstham, and of the former they had excellent blooms of R. F. Felton, Bonfire (vivid scarlet), Mrs. C. W. Ward, Cecilia Improved, Scarlet Glow, and Dorothy Gordon.

ROSE MURIEL DICKSON.

An effective hybrid tea, the colour rich carmine. A.M., R.H.S., July 1. Messrs. Hugh Dickson, Lim., Belfast.

ROSES.

From Messrs. W. Paul and Son, Lim., Waltham Cross, came a grand display. Magnificent specimens of climbers and extra tall weepers made a charming effect, while low on the ground baskets were grouped, and formed a bed of delightful colouring, perhaps a trifle too flat. Some of the best were Bianca, Betty, Ophelia, very fine; Beauté de Lyon, a grand colour; Joseph Hill, Juliet, Triumph, and Pharisaer. Messrs. G. Jackman and Son, Woking, occupied a position on the stage, which they made the most of. Utilising decorative varieties in the background, which were in fine condition, as were also tall stands of Lady Ashtown, Le Progres, Hugh Dickson, and Madame Ravary, while the front was exceedingly bright with exhibition and decorative forms.

Messrs. F. Cant and Co., Braiswick Nurseries, Colchester, staged an extensive exhibit, the front being attractive by means of a large collection of polyantha varieties arranged in vases. The decorative sorts were bright and well arranged. Mention should be made of Commandant Jules Gravereaux, Irish Beauty, Ecarlate, Dawn, Rouge Angevine, and Rayon d'Or. Messrs. G. Bunyard and Co., Lim., Maidstone, staged some nice boxes of roses, backed with vases of decorative varieties. In the former were fine boxes of Hugh Dickson, Rayon d'Or, Dean Hole, and Frau K. Druschki.

Mr. Walter Easlea, Danecroft Nursery, Earlwood, also staged some effective roses, in which were noted Cherry Page, a promising decorative variety; Rayon d'Or, Mrs. Herbert Stevens, Yvonne Barbier, a white polyantha, Sunburst, and Chateau de Clos Vougeot. Messrs. Morse Bros., Deben Nursery, Woodbridge, staged some very nice roses arranged in bamboo stands and vases. The most conspicuous were Rayon d'Or, Leslie Holland, Juliet, General McArthur, Sunburst, and Lady Pirrie, while Messrs. H. Cannell and Sons, Swanley, also contributed a display of ramblers, and single blooms arranged on a moss bed.

Mr. John Mattock, New Headington, displayed roses in tall bamboo stands, with baskets and vases in front; in the former were Aglaia, Lady Curzon, Helene, and Crimson Damask in fine form, while Irish Elegance, Marquis de Sinety, and Lyon were also quite prominent. Messrs. W. and J. Brown, Peterborough, staged an effective display, which was built up with pillars, arches, mounds, and the orthodox boxes in front, the general effect being excellent, Lyon and Irish Elegance being happy in combination, while Avoca, Dorothy Page Roberts, Lady Ashtown, Joseph Hill, and Lady Pirrie were in fine condition.

Mr. G. Prince, Longworth Nurseries, Faringdon, occupied his space to the best advantage. The arches were, perhaps, a little crowded, but the general effect was capital. Perhaps the most conspicuous were Madame Jean Dupuy, Irene Walls, Rayon d'Or, Irish Glory, Juliet, and Avoca. Messrs. G. Bunting and Son, Buntingford, Herts, also had a considerable display, in which the decorative varieties occuped first place, while Mr. R. C. Notcutt, Woodbridge, arranged some fine flowers in bamboo stands and vases, especially good were Leslie Holland, Joseph Lowe, Juliet, and Lyon.

From Messrs. Stuart Low and Co., Bush Hill Park, N., came an effective exhibit, built up with pillars, baskets, and mounds. Here fine examples of Rayon d'Or, Liberty, Lyon, very fine; Leslie Holland, Molly Sharman Crawford, and Lady Ashtown were to be seen, the arrangement being most effective.

The Rev. Chalmers Hunt also exhibited some well-grown roses in the orthodox boxes and also in vases. A charming display was that from Mr. Charles Turner, Royal Nurseries, Slough. The group was composed of huge ramblers, in a cut state, with some splendid weepers, while the front was formed with baskets and vases filled with all sections of the rose. Tall cocos and kentia palms were used effectively, and contributed to this handsome display.

Messrs. B. R. Cant and Sons, Colchester, had an effective display of cut roses arranged in bamboo stands. The background was occupied with decorative varieties, which included the singles Lady Curzon, Mrs. A. Kingsmill, Blush Rambler, and American Pillar. The most striking of the specimen flowers were Edward Mawley, J. B. Clark, Theodore Roosevelt, Betty, Warrior, Joan, very fine; Killarney, Lyon, and Mrs. A. Tate. Messrs. Paul and Sons, Cheshunt, occupied a corner of the large tent with a fine exhibit of roses in pots, which included climbers in fine condition, also tall weeping kinds, which were in the pink of condition, the most conspicuous being Rubin, Excelsa, Shower of Gold, and Paul Transon, while fine examples of Lyon, Sunburst, G. C. Waud, Mary Countess of Ilchester, and Madame Ravary were also noted.

Messrs. Hobbies, Lim., Dereham, had a central position, which they occupied with an effective design, but the feature of the display was undoubtedly the fine standard weepers. These were lightly arranged, and displayed each plant well. Baskets made a fine groundwork, while the front was composed of posts and chains on which were arranged decorative varieties in vases, with trails of smilax.

SWEET PEAS.

Messrs. Sutton and Sons, Reading, produced a huge display, arranged in splendid style, the tall columns at the back showing up well against a white background. These were looped together with arches of smilax, while vases and shields were effectively arranged, nearly all the leading sorts being represented, while the size of the blooms left nothing to be desired. Mr. James Box, Lindfield Nurseries, Haywards Heath, presented a splendid exhibit arranged in rather low mounds, but they were all directly under the eye. The peas themselves were remarkable for size and brilliancy of colouring, while the stems left nothing to be desired. The most striking varieties were President, Maud Holmes, R. F. Felton, Elfrida Pearson, Jas. Box, Edith Taylor, and Orange Perfection.

Sir Randolf Baker, Ranstone House, Blandford (gardener, Mr. A. E. Usher), had a splendid exhibit staged in vases, with huge columns to break up the outline, the result being a fine achievement, the blending of colours being especially pleasing. Clara Curtis, Hercules, Anglian Pink, Princess Victoria, Barbara, May Campbell, Tennant Spencer, King Manoel, Dobbie's Cream, and Edrom Beauty were most conspicuous. Mr. J. D. Webster, Chichester, also had a nice exhibit of sweet peas, which were fine in colour, and nicely arranged with Asparagus plumosus, but the same remarks could not apply to the front, which was somewhat crowded. The Rev. L. C. Chalmers Hunt, William Rectory, Letchworth, also staged a considerable collection of sweet peas.

Messrs. Dobbie and Co., Edinburgh, arranged a magnificent display of flowers of high quality. Columns and vases were the order of the day. These were mounted with Asparagus Sprengeri, trails of smilax, and other suitable material. The peas that struck the visitor most were New Marquis, Rosabelle, Elfrida Pearson, Thomas Stevenson, dazzling in colour; Melba, Dobbie's Scarlet, Edrom Beauty, Syeira Lee, Inspector, Lady Miller, and John Ingman, again a remarkable colour. Messrs. G. Stark and Son, Great Ryburgh, arranged a light display of well-developed flowers with good substance. The most striking were Mrs. Pitt, Burgundy, a remarkable colour, but slightly weather-worn; Maggie Stark, Hercules, Premier, The Abbot, and Double Cream.

Messrs. E. W. King and Co., Coggeshall, staged some fine examples of their seedlings on the table arranged by them. Anglian Lavender, Anglian Cream, Anglian Orange, Anglian White, very fine; Anglian Royalty, killed by the dark velvet background; and Anglian Pink. Messrs. S. Bide and Sons, Lim., Farnham, contributed a bright bank of fine flowers, though somewhat crowded. Particularly fine were the varieties Edward Prince of Wales, Premier, Clara Curtis, Mrs. W. J. Unwin, Edith Taylor, May Campbell, and Dorothy.

Messrs. J. King and Sons, Coggeshall, occupied one of the "right over" exhibits, which means, in common parlance, that one side can be viewed, but to see the other one had to go outside the tent to the next entrance. The firm, however, had risen to the occasion, and staged some very fine examples of Moneymaker, Hercules, Lady Miller, Maud Holmes, King's Scarlet, Prince George, Thos. Stevenson, Eric Harvey, and Mrs. W. J. Unwin.

ROCK AND FORMAL GARDENS.

A garden that attracted a very great deal of attention, and deservedly so, was the one designed and planted by Messrs. J. Carter and Co., Raynes Park. Within a rough stone terracing, with its cupressus hedge, there was a formal water garden, with a high rough stone wall at the back of it, supporting a terrace and portico beyond. The water garden terrace was the great feature because water lilies bloomed in this pool, and a glorious lot of Iris Kæmpferi were planted all around, and were in full bloom. On the wall dwarf antirrhinums bloomed gaily. Behind the columns of the portico evergreen and deciduous trees formed a fine backing for splendid pillar roses and a border daringly filled with cannas, richardias, liliums, and dwarf polyantha roses. Leaden urns, each with its Sciadopitys verticillata, marked the corners of the terrace steps and leaden dolphins poured water into the lily pond. A fine design and well carried out, and one that was thronged with visitors all the time.

A beautiful garden, one of the great features of the great show was arranged in the large tent by Messrs. R. Wallace and Co., Colchester. The general idea was an elongated water garden, with its complement of lilies and groups of Kæmpferi irises and spiræas, all alongside the winding stream of water. Rough stones afforded a crossing, and led to a terrace with its stone walls gemmed with ivy and dainty flowering plants. At either end bold groups of spiræas, eulalias, bamboos, etc., suggested a semi-wild garden, while from the beginning of the water, rough stone steps also led upwards to the terrace. Here a vantage point and resting-place commanded views of the broad borders, filled with brilliant masses of Madonna lilies, delphiniums, eremuri, erigerons, sidalceas, with sweet lavender and fragrant thymes along the margin. A stone terrace wall, itself a perfect garden of blossom, supported this garden on the other side. The whole exhibit was quaintly and beautifully conceived, and carried out with that superb artistic skill which we expect nowadays from this Colchester firm.

Messrs. Russell, Earl's Court Road, W., presented a formal garden, which contained some nice features, especially the garden seats. From Messrs. Pipers, Bayswater, came a wonderful creation in the form of a sunk garden, with terraced borders. The latter were raised by means of old stone slabs, on which were growing rock plants and hardy ferns. The pools were filled with Iris Kæmpferi, nymphæas, sarracenias, and rushes; the background of triellage, clothed with rambling roses, had a fine effect, while the edge of clipped trees looked very natural in their setting of old York stone.

Messrs. J. Cheal and Sons, Lim., Crawley, exhibited a fine wall of old stone covered with suitable subjects, while an old-time paved path, with a border rising naturally from it, contained many interesting plants. These included dianthus, campanulas in variety, mimulus, etc., while the background was formed with variegated shrubs and trees; a few rhododendrons gave a massive effect to the exhibits.

Mr. Clarence Elliott, Six Hills Nursery, Stevenage, presented a beautiful rock garden in the open air. The masses of Campanula pusilla Miss Willmott and C. pulloides were most attractive, as were also masses of Dianthus deltoides superbus, and quite a variety of thymus. The Wargrave Plant Farm, Lim., The Arcade, Liverpool Street, E.C., also had an attractive rock garden, which seemed very popular, judging by the crowd constantly in front of it.

A charming exhibit was that from Messrs. Whitelegg and Page, Chislehurst, who had their exhibit arranged on the floor with a natural setting of stone. The saxifragas, potentillas, violas, and primulas were much admired, while additional were delphiniums, spiræas, heucheras, and gaillardias, with a large variety of other flowers.

Messrs. Harkness and Son, Bedale, Yorks, staged some handsome hardy flowers. The Oriental poppies were just in their full beauty, as were also the gaillardias, gladioli, and irises.

Miniature Japanese gardens from the Yokohama Nursery Company, Craven House, Kingsway, attracted a continual crowd of interested spectators. Some of the little gardens, about 2½ft. long, with rocks, rugged little trees, reeds, bridge, water, tiny temple, lanterns, and gold fish, were very quaint and artistic. In some cases there was quite a garden in a bowl a foot long, and about as much across. Some larger efforts were even more dainty and elaborate, and the ladies called them "sweet little gardens." Messrs. J. Piper and Sons also had a low rock garden in the large tent, and the prettiest feature of the exhibit was a long tuft of Campanula Miss Willmott, running down from the upper portion in an ever-broadening stream.

TREES AND SHRUBS.

A wonderful collection of Chinese plants, chiefly trees and shrubs, all introduced to cultivation since 1900, and all raised from seeds sent home by Mr. Wilson when collecting for the Chelsea firm in China, made up a grand and interesting group from Messrs. Jas. Veitch and Sons, Chelsea. Prominent was Magnolia Delavayi (F.C.C.), a yellowish-flowered species of large size, and with handsome leafage; Lilium myriophyllum, the elegant blue-flowered Thalictrum dipterocarpum; Berberis Wilsonæ, Pæonia Delavayi, Berberis brevi-paniculata, Rubus lasiostylus, with white stems; R. Veitchi, with silky grey leaves; Lonicera nitida, with small shining leaves; Viburnum Henryi, with loose panicles of small white flowers; Ilex Veitchi, Cotoneaster rugosa, C. acutifolia, Stranvæsia undulata, various vitises, and a whole host of other new trees and shrubs. By the side of these were pyramidal and standard bay trees from the same firm.

A very gay group of variegated ivies, gleaming in silver and gold, standards and bushes, green and grey, large and small, was put up by Mr. C. R. Russell, Richmond, and was not the least attractive of the outdoor exhibits; hardy fuchsias in variety, and a fine set of the handsome Dimorphanthus Mandschuricus argenteo-variegatas, also

from Mr. Russell, proved equally attractive. Messrs. Paul and Son, Cheshunt, staged an interesting display of cut hardy shrubs, which were well staged; also a collection of hardy-flowering shrubs. Here one noted the Philadelphus purpureus maculata in fine condition, Kerria variegata, Weigelia aurea marginata, Liriodendron aurea marginata, Loniceras in variety, and a goodly display of other attractive plants.

A beautiful display of acers came from Messrs. W. Fromow and Sons, Sutton Court, Chiswick, which were assisted with bamboos in variety, and similar subjects. The group was formed round the entrance to two tents, and was admirably adapted to the purpose. Messrs. W. Cutbush and Son, Highgate, N., presented a fine display of clipped box and yews. These varied in size from mere bantams to huge specimens of every shape and form. Mr. Carlton White, 53, New Bond Street, had a large display of topiary work, which were chiefly composed of box and yews. Here one could satisfy the most fantastic taste, for they were all shapes and sizes. Mr. G. Reuthe also had a display of hardy shrubs in the open air. The berberis, phaius, and rhododendrons were all more or less the attraction of lovers of this particular section. The same exhibitor also presented a pretty rock display.

Messrs. G. Jackman and Son, Woking, brought out their clematises, and amazed everyone with their big plants of these gloriously-flowered climbers. The same firm put up a gorgeous bank of hardy flowers, where Iris Kæmpferi, gaillardias, delphiniums, and kniphofias were massed in fine style.

STOVE AND GREENHOUSE PLANTS.

The glorious Solanum Wendlandi was grandly shown by Messrs. Jas. Veitch and Sons, Chelsea, whose contribution of stove and greenhouse plants was most interesting. Two new nepenthes, N. Lewis Bradbury and N. atropurpurea, attracted a deal of attention by means of their brilliant crimson pitchers. Gorgeous cannas, in fine variety, the violet-blue Exacum macranthum, and a batch of malmaison and perpetual carnations completed the display. The Chelsea firm presented a bank of orchids, wherein Disa grandiflora was very fine, and L.-c. Canhamiana, Brasso-cattleya Digbyano-purpurata, Cattleya Mossiæ varieties, and some capital hybrid odontoglossums. Messrs. Whitelegg and Page, Chislehurst, showed fruiting canes and picked fruits of the Newberry, which is even larger than the loganberry.

Mr. W. H. Page's fine exhibit of zonal pelargoniums, from Hampton, made one hot to look at. There were three great mounds of plants smothered in glowing bloom, and the varieties, Winter Cheer, Fiscal Reform, and His Majesty, were all first-rate, the latter a grand white-eyed scarlet variety with large blooms and trusses. Caladiums from Messrs. J. Peed and Son, West Norwood, were finely grown, and the pink leaves of Lord Milner and the transparent white ones of Crested Wave stood out conspicuously; carnations were added at one end of the caladiums. The same firm showed gloxinias.

Mr. H. J. Jones, Ryecroft, Lewisham, filled a large space with a bold group of a well-selected strain of cup-and-saucer Canterbury bells, and with a very bold collection of herbaceous phloxes grown in pots, and showing the height and style of growth; Elizabeth Campbell, Le Mahdi, Rosenberg, Rose Queen, Frau Ant. Buchner, G. A. Stroehlin, Goliath, tall carmine-red; Dr. Konigshofer, salmon-scarlet; and Flora Horning, were varieties that attracted our attention.

The begonias from Messrs. Blackmore and Langdon, Bath, were superb, and the group of grandly grown plants was finely arranged, the hanging baskets of Mrs. Bilky, Gladys, and Golden Shower being especially beautiful. Among the double sorts a few of the loveliest were Lady Tweedmouth, Queen Mary, Empress Marie, Duchess of Cornwall (crimson-scarlet), Princess Victoria Louise, and George Pike. Blue hydrangeas, caladiums, cannas, Coleus cordelia, and pelargoniums made a bold display for Messrs. W. Cutbush and Sons.

Mr. A. Ll. Gwillim, Canbria Nursery, Sidcup, staged a collection of begonias in his well-known style. The most prominent varieties were Seashell, Sidcup Beauty, Mrs. J. C. Gwillim, Miss Muriel Edwardson, Margaret Gwillim, Avalanche, and Radience; while the bedding varieties, Washington and Col. Laussedat, were much admired; the double forms were exceedingly well done. A fine group of crassulas came from Lady Northcliffe, Sutton Place, Guildford (gardener, Mr. J. Goatly). The plants were more freely trained than one usually sees them, thereby adding to their beauty; they were well grown, and equally well displayed.

Messrs. Stuart Low and Co., Bush Hill Park, staged a miscellaneous exhibit; the chief features were the fine bushes of Metrosideros floribunda, groups of Pelargonium Juvenal, and Humea elegans. Mr. L. R. Russell, Richmond Nurseries, Richmond, had a splendid exhibit of stove and greenhouse plants arranged in a huge bank.

A most refreshing group of ferns came from Messrs. H. B. May and Sons, Lim., Upper Edmonton, which was carried to the wall of the tent, with fine specimens of davallias, nephrolepis, Lycopodium scandens, etc.; while the forefront contained a wealth of hardy ferns that would gladden the eye of any expert; while some charming plants of Nephrolepis exaltata Wilmottæ attracted much attention, as did also a good clump of Adiantum gloriosum, and a new form of Adiantum trapeziforme named Queen Mary.

Messrs. R. and G. Cuthbert, Southgate, produced a charming effect with tall plants of Humea elegans, well over six feet high, with a central group of Streptosolon formosum, also groups of Lilium longiflorum; while the front was composed of Viscaria oculata Brilliant, annual delphiniums, and

THE LARGE AND BEAUTIFUL GOLD MEDAL COLLECTION OF SWEET PEAS.
Exhibited by Sir Randolf Baker, Bart. (gardener, Mr. Usher), at the Holland House Show.

ivy-leaved pelargoniums, the whole being finished off with palms and ferns. Messrs. W. Treseder, Lim., Cardiff, sent some nice decorative pelargoniums, intermixed with bamboo stands containing dahlias in nearly all sections. From Messrs. Jarman and Co., Chard, came a miscellaneous display of zonal pelargoniums, with carnations, Canterbury bells, and some really fine centaureas. Messrs. H. Cannell and Sons also presented a gay collection of cut zonal pelargoniums which were much admired. Messrs. Pipers, Bayswater, arranged a group of large fuchsias in the open air; these comprised tall pyramids, standards, and plants of a decorative size; they were well grown, and beautifully flowered.

HARDY FLOWERS, ETC.

A delightful group of hardy flowers showed how well Mr. Jas. Box, Lindfield, can grow and stage these popular subjects. It was a grand display, filling the end of one tent, and included water lilies, spiræas, phloxes, Thalictrum flavum, campanulas, delphiniums, gladioli, and a vast number of other subjects. Campanula persicifolia humosa, soft blue; Delphinium Rev. E. Lascelles, and Gladiolus America were outstanding in a fine selection. Very beautiful was the batch of Lychnis Arkwrighti shown by Mr. J. S. Arkwright, Ringham Court, Presteign; the parents are L. chalcedonica and L. Haageana. There is a range of colour from palest salmon to vivid vermilion-scarlet, and some have dark bronzy foliage. They vary from 15 inches to 4ft. in height, and form a very attractive set of plants for garden decoration, as they are very free-flowering.

Gladioli came from Messrs. Barrie and Brown, London Bridge, and alpines from Mr. Reg. Prichard, Wimborne. In the collection from Messrs. Bees, Liverpool, Primula capitata, Campanula Miss Willmott, Trollius Yunnanensis, and Sedum glaucum were conspicuous plants. The Hardy Plant Nursery, Christchurch, also submitted alpines; and Messrs. W. and C. Bull, Frome, had a small bank of hardy flowers. Messrs. Carter Page and Co., of London Wall, gave us a taste of autumn in their cactus and pæony-flowered dahlias, with which pelargoniums and violas were associated. Messrs. W. Fells and Son, Hitchin, had a gay display of fine varieties of gaillardias, delphiniums, etc.; and the Wargrave Plant Farm, The Arcade, Liverpool Street, contributed a selection of delphiniums and other border flowers, as well as a fine lot of gaillardias and a few water lilies.

Mr. Maurice Prichard, Christchurch, arranged a central rock garden backed by select delphiniums, eremuri, verbascums, Romneya Coulteri, etc., and flanked by Japanese irises in fine variety. Dianthuses were lovely in the rock garden, and Campanula Ruddiana, Fuchsia Carmen, were also very charming. Wahlenbergia vincæflora and Lavatera olbia with its satiny pink flowers were other fine things here. Messrs. Carter and Co. had a small tent all to themselves just outside the big tent, and this, with its front open to the grounds, was filled with a selection of sweet peas, dwarf roses, Phlox Drummondi, and a central group of double and single begonias.

Mr. Amos Perry's effort was a considerable one, and a magnificent lot of glorious delphiniums were brought from the Hardy Plant Farm at Enfield, and arranged in bold groups at the back of masses of pinks, erigerons, armerias, etc. In the centre of their big group they had a fine selection of hardy ferns, the lady ferns being especially cool and beautiful. Japanese irises and liliums were grouped in the foreground. Eremurus Warei, Lilium Humboldti, Erigeron hybrida Pink Pearl (A.M.), and such delphiniums as Antigone, Mrs. Perry, Moerheimi (white), and Rev. E. Lascelles, were charming, and the nymphæas in pans provided a fine selection of these lovely water plants.

Noble masses of delphiniums were boldly staged by the Messrs. Bakers, Wolverhampton, behind English irises, campanulas, and selection of alpines, etc. The water garden with its complement of waterside plants, as arranged by Messrs. Phillips and Taylor, Lily Hill Nurseries, Bracknell, had a pleasingly cooling effect in the big tent. Nymphæa Frœbelli, N. tuberosa rosea, N. Wm. Falconer, the lovely N. Gladstoniana, N. chronatella, and N. carnea, were water lilies in fine form on this pool; while Calla palustris, Saxifraga peltata, spiræas, variegated acorus, and alismas were prettily grouped around, and a bank of border flowers filled the end of the display.

Messrs. G. Gibson and Co., Leeming Bar, Bedale, had a small group of hardy flowers, their gaillardias and lilies being specially meritorious. Messrs. Fred. Smith and Co., Woodbridge, brought forward a large collection of hardy flowers, in which Anthemis Kelwayi, gaillardias, verbascums, and Campanula persicifolia Moerheimi attracted our attention. Delphiniums were boldly shown by Messrs. R. H. Bath, Lim., Wisbech, and their vases of Le Danube and Clara Stubbs were very good; perpetual carnations, roses, antirrhinums, and a selection of border flowers were grouped round the delphiniums.

Once again Messrs. Gunn and Sons, Olton, put up herbaceous phloxes in good style, filling large stands with trusses of one variety; Lady Stewart, Gen. Van Henty, Harrisoni, Iris, Le Mahdi, Wilbur Wright, Gruppen Kœnigen (pink), George A. Strochlin (salmon-red), and Frau von Lassberg (white), form a fine selection from this group. A grand strain of Canterbury bells, represented by great sheaves of noble spikes of large bells—white, pink, mauve, lavender, white and violet, formed a great attraction, as displayed by Mr. W. J. Godfrey, Exmouth. The same firm presented zonal and show pelargoniums, and of the latter the white, brown-blotched Bystock was very pretty.

Among the fine selection of delphiniums from Messrs. Blackmore and Langdon, Twerton-on-Avon, there were magnificent spikes of Walter T. Ware, Robt. Cox, the grand Statuaire Rude, Novelty, and The Alake, very dark violet. A large assortment of gladioli of the Colvillei section, together with numerous spikes of the graceful lavender-flowered Sparaxis pulcherrima, and dainty ixias were displayed lightly by Mr. F. Lilley, Guernsey.

Mr. Stuart Maples, Stevenage, and Mr. T. R. Hayes, Keswick, were exhibitors of alpines, and Mr. C. Dixon, gardener to Mary Countess of Ilchester, Holland House, put up a very interesting set of sempervivums and saxifrages, about sixty species of each, and all finely grown and forming a very educational collection. Mr. Howard Crane's violas and violettas were very sweet and pretty, and Mr. Jas. Macdonald's grasses and lawns growing on a textile material were a source of attraction, and, referring to the latter, one lady suggested a few yards for a dress length. Mr. H. Hemsley, Crawley, showed alpines, but a feature of his group was a seedling from Antirrhinum sempervirens and A. glutinosum, crossed with the popular garden form of A. majus. These form an interesting series of semi-creeping rock plants, with gaily-coloured flowers, and an Award of Appreciation was granted Mr. Hemsley for his work in this direction. The Guildford Hardy Plant Nursery, Guildford, and Messrs. Pulhams, Elsenham, staged alpine plants, the latter firm arranging a small rock garden.

A square-based pyramid of annual flowers and a lovely selection of art-coloured antirrhinums was from Messrs. Watkins and Simpson, Covent Garden. The Blue Gem nemesia was particularly lovely, and received as much admiration as the chamois, apricot, coral-pink sulphur-tinted, and red snapdragons.

Messrs. Thompson and Charman, Bushey, Herts, had a large exhibit of hardy flowers, lightly arranged. The dianthus here were prominent, as were also the campanulas and geums. The scarlet pentstemon, Southgate Gem, was very bright and atractive.

Mr. G. W. Miller, Clarkson Nurseries, Wisbech, staged some capital hardy flowers, especially the gaillardias, which were very fine. The delphiniums, also, were good; while Mr. H. Newman, The Watford Nurseries, sent a group of Pink Challenger, which was in fine condition for the late period. A bright bank of hardy flowers came from Messrs. B. Ladhams, Lim., Shirley, Southampton. Prominent features here were the collection of pinks and gaillardias, while Messrs. W. Cutbush and Son occupied the end of the tent with a fine exhibit of delphiniums, liliums, irises, and gaillardias. The water lilies, too, were quite a feature.

From Messrs. Rich and Co., Bath, came a collection of violas in good condition, also Iris Kæmpferi, and a display of hardy flowers. The campanulas were in fine form. Messrs. W. Wells and Co., Lim., Merstham, exhibited a fine collection of phloxes, in which were noted some very fine forms, especially Selma, Elizabeth Campbell, and Andre Laurie. From Messrs. John Forbes, Lim., Hawick, came a fine collection of named pentstemons in pots, also phloxes; both subjects seemed to revel in the heat, and were most attractive, while the pansies and violas had evidently had more congenial weather than that experienced in the south. Robert Sydenham Limited, Tenby Street, Birmingham, had an effective display of sweet peas, in which Scarlet Emperor, Edith Taylor, and Maud Holmes were conspicuous.

A glorious group of eremuri with a base of spiræas came from Messrs. Jas. Veitch and Sons. Most of them were seedlings, and arranged in colours. Some of the most prominent were E. Warei, E. Olgæ, E. Lemon Queen, and E. superbus. From Mr. G. Renthe, Hardy Plant Nursery, Keston, came an interesting exhibit of hardy shrubs and flowers.

From Messrs. Barr and Sons, Covent Garden, came a pretty group of hardy flowers, which included some art shades of Lupinus, Viscaria cærulea—very fine, excellent Canterbury bells, ixias, and a good collection of early-flowering gladioli. The same firm also had an extensive exhibit of Japanese pigmy trees, which were now making their new foliage, and attracted a crush of visitors. Messrs. G. and A. Clark, Lim., Dover, presented a fine exhibit of hardy flowers, which merged to a central pool, which was edged with hardy ferns; while nymphæas in good variety occupied the pool.

Messrs. Paul and Son, Cheshunt, made a speciality of heucheras on their stand of hardy flowers; while the potentillas, delphiniums, verbascums, and campanulas all helped to make a pretty display. The Misses Hopkins, Shepperton-on-Thames, had an effective exhibit of hardy flowers, arranged in a natural style, which was most effective. Messrs. G. Bunyard and Co., Lim., Maidstone, arranged an effective exhibit of hardy flowers. The brilliant colours of the delphiniums, in conjunction with pentstemon Southgate Gem, at once arrested attention, while the collection of liliums were well arranged. The front was charmingly arranged with dwarf alpine subjects. Mention should also be made of the spiræas, early gladioli, and eremuri, which were most conspicuous in a really worthy exhibit of hardy flowers.

Delphiniums in splendid condition came from Messrs. Kelway and Son, Langport. The spikes were huge, and arranged with their side growths complete. Some of the finest were Quakeress, Kitty Wardell, A. C. MacLaren, Athos, Queen of Spain, Star of Langport, and Knight of Langport; also a few late pæonies, and Coreopsis grandiflora. From Messrs. T. S. Ware, Lim., Feltham, came a large exhibit of hardy flowers, arranged most naturally. Delphiniums were most tastefully grouped, while the spiræas were quite a feature. The front was composed of a long winding pool that allowed a number of subjects to be arranged.

FRUITS AND VEGETABLES.

Mr. Thos. Coomber, V.M.H., gardener to Lord Llangattock, The Hendre, Monmouth, contributed twenty-six splendid specimens of Queen pineapples, and was deservedly granted a Gold Medal for the high cultivation this set represented. Messrs. S. Low and Co. showed some well-grown pot trees of Brown Turkey, St. John's, White Marsailles figs.

A splendid array of tempting strawberries from Messrs. Laxton Bros., Bedford, were

It is Unsurpassed for all Horticultural purposes.

CLAY'S FERTILIZER.

IT WILL MAKE YOUR GARDEN A PICTURE.

beautiful and fragrant, and the fine fruits were greatly admired. Of such varieties as The Queen, Givon's Late Prolific, King George, Sir J. Paxton, Laxton's Reward (fine colour), Bedford Champion, of fine size; Royal Sovereign, The Laxton, Profit, Epicure, and The Earl there were splendid baskets of beautiful fruits.

Splendid fruit trees in pots, carrying fine crops, were exhibited by Messrs. Jas. Veitch and Sons; the plums, peaches, nectarines, and apples were very well arranged. Mr. Camp, gardener to S. Heilbut, Esq., Holyport, Maidenhead, contributed some finely-grown and well-cropped trees of plums and of Bigarreau Noir de Gubin and Bigarreau Noir de Schmidt cherries.

A superb collection of very finely-grown vegetables, arranged in splendid style, was submitted by Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree. The Defiance and Early Emperor cauliflowers were beautiful, Quite Content peas were very fine, marrows were capital for the season, while turnips, potatoes, French beans, lettuces, aubergines, edible podded peas, cucumbers, tomatoes, carrots, and radishes were all perfect, and shown in grand style, the whole exhibit being attractive in the highest degree, as well as a striking example of skilful cultivation.

HORTICULTURAL SUNDRIES.

These were very numerous again, and occupied considerable space. The chief exhibitors were: Robert Sydenham Limited, rural table decorations; Messrs. W. Voss and Co., insecticides, etc.; the Three C.'s Company, Liverpool, continuous cloches; Messrs. Valls and Co., 12, Little Britain, garden sundries; Messrs. Barbour and Co., Leeds, lawn sand, worm destroyer, etc.; Messrs. E. A. White, Lim., syringes and Abol insecticides; The Pattison Lawn Horse Shoes; Messrs. J. Weeks and Co., Chelsea, model greenhouses, blinds, etc.; Messrs. Wakeley Bros., hop manure; Messrs. W. Cooper and Nephews, Berkhampstead, syringes, fungicides, and insecticides; Messrs. Barr and Sons, Covent Garden, garden sundries; Messrs. J. Bentley, Lim., Hull, fertilisers; Messrs. Jeye, sprayers and washes; Mr. J. Pinches, Camberwell, garden labels and other sundries; Messrs. Gamage, Lim., Holborn, garden tents and seats; Messrs. Heathman and Co., Fulham, folding ladders; Messrs. D. Robert and Son, Tottenham, garden tub for shrubs; Messrs. Benton and Stone, Lim., Birmingham, spraying machines; The Four Oaks Company, Sutton Coldfield, spraying machines and syringes; Messrs. Pearce and Co., Holloway Road, N., greenhouses and garden seats; the Dryad Co., model seats and summer-houses; the London Provincial Building Co., Wandsworth, summer-houses and seats; Messrs. Lloyd, Lawrence, and Co., 29, Worship Street, lawn mowers; Messrs. Robinson Bros., Lim., West Bromwich, Carmona fertilisers and Alpha sprayers; The Leyton Timber Company, Leyton, summer-houses and rustic work; Messrs. T. J. Syer and Co., Wilson Street, E.C., tents and seats; The Hughes Bolckow and Co., Lim., Blyth, teak garden seats; Messrs. Liberty, Regent Street, W., garden furniture and bamboo work; Messrs. J. Cheal and Sons, Lim., Crawley, garden seats, pergolas, tubs, and fences; Messrs. T. Crowther and Son, North End Road, Fulham, garden ornaments; and Messrs. Castles, man o' war garden seats.

CUPS AWARDED.

Coronation Cup.—Messrs. Sander and Sons, St. Albans, for orchids.

Silver-gilt Cups.—To Mr. James Box, for water garden, sweet peas, etc.; to Mr. L. R. Russell, for stove plants, shrubs, and irises.

Large Silver Cups.—To Sir Jeremiah Colman, Bart., for orchids, carnations, and roses; to Messrs. Wm. Cutbush and Son, for cut trees and flowering plants; to Messrs. G. Bunyard and Co., Lim., for roses and hardy flowers; to Mr. Charles Turner, for roses.

Silver Cups.—To Messrs. Mansell and Hatcher, Lim., for orchids; to Messrs. Stuart Low and Co., for orchids, roses, carnations, New Holland plants, and fruit; to Messrs. J. Piper and Son, for formal garden, rock and water plants, fuchsias, Japanese trees, etc.; Messrs. J. Carter and Co., for water garden and flowering plants; Messrs. J. Veitch and Sons, Lim., for flowering plants, trees, etc.; Messrs. Barr and Sons, for water garden and flowers; Messrs. W. and J. Brown, for roses and herbaceous; to Mr. M. Prichard, for alpine and bog plants; to Mr. A. Gwillim, for begonias and herbaceous plants.

Standard Cups.—To Messrs. Stuart Low, for orchids; to Messrs. Peed and Son, for caladiums and flowering plants; to Mr. Amos Perry, for herbaceous, alpines, etc; to Messrs. G. Jackman and Son, for roses, clematis, etc.; to J. S. Arkwright, Esq., for Lychnis Arkwrighti; to Messrs. W. Fromow and Sons, for Japanese maples.

MEDAL AWARDS.

Gold.—To the Right Hon. Lord Llangattock, for pineapples; to Sir Randolf Baker, Bart., for sweet peas; to the Hon. Vicary Gibbs (gardener, Mr. E. Beckett), for vegetables; to Messrs. Blackmore and Langdon, for begonias; to Messrs. H. B. May and Sons, for exotic ferns; to Messrs. Paul and Sons (Cheshunt), for roses; to Messrs. Wm. Paul and Son (Waltham Cross), for roses; to Messrs. Sander and Sons, for orchids; to Messrs. Sutton and Sons, for sweet peas; to Messrs. James Veitch and Sons, Lim., for fruit trees in pots; to Messrs. James Veitch and Sons, Lim., for Chinese plants; to Messrs. R. Wallace and Co., for ornamental water garden; to Messrs. Charlesworth and Co., for orchids; to Messrs. Dobbie and Co., for sweet peas.

Silver-gilt Hogg Medal.—To S. Heilbut, Esq. (gardener, Mr. H. Camp), for fruit trees in pots.

Silver-gilt Knightian Medal.—To Messrs. Laxton Bros., for strawberries.

Silver-gilt Flora Medal.—To Mr. S. W. Flory, for orchids; to Messrs. J. King and Sons, for sweet peas; to Messrs. G. and A. Clark, Lim., for herbaceous flowers and aquatics; to Messrs. Bakers, for herbaceous flowers and alpines; to Mr. B. E. Bell, for carnations; to Mr. H. Burnett, for carnations; to Mr. C. Engelmann, for carnations; to Messrs. F. Cant and Co., for roses; to Messrs. B. Cant and Sons, for roses; to Messrs. Hobbies, Lim., for roses; to Wilfred W. Gott, Esq., for carnations; to Messrs. J. Cheal and Sons, for ornamental garden.

Silver-gilt Banksian Medal.—To Mr. G. Reuthe, for alpines and shrubs; to Messrs. S. Bide and Sons, Lim., for sweet peas; to Messrs. E. W. King and Co., for sweet peas; to Messrs. Gunn and Sons, for phloxes; to Messrs. Harkness and Sons, for herbaceous and Spanish iris; to Mr. Geo. Prince, for roses; to Messrs. Fred Smith and Co., for herbaceous plants and flowers; to Messrs. G. Stark and Son, for sweet peas and kniphofias; to Messrs. Bees, Lim., for alpines and hardy plants; to Right Hon. Lord Burnham (gardener, G. Johnson), for carnations; to Messrs. John Forbes (Hawick), Lim., for summer-flowering plants; to Mr. H. J. Jones, for phloxes and Canterbury bells; to Messrs. Thos. S. Ware, Lim., for begonias; to Mary Countess of Ilchester, for sempervivums and saxifrages.

Silver Flora Medal.—To Mr. H. Dixon, for orchids; to Messrs. J. Veitch and Sons, Lim., for orchids; to Rev. Chalmers Hunt, for roses, sweet peas, and vegetables; to Messrs. Phillips and Taylor, for water garden, etc.; to Messrs. Whitelegg and Page, for sweet peas; to Robert Sydenham Limited, for sweet peas; to Messrs. R. and G. Cuthbert, for Humea elegans and spiræas; to Mr. Jas. Douglas, for border carnations; to the Guildford Hardy Plant Nursery, for herbaceous plants; to Mr. T. R. Hayes, for heaths and alpines; to Mr. H. Hemsley, for antirrhinums and rock garden; to Mr. Mattock, for roses; to Mr. Notcutt, for roses; to Mr. Reginald Pritchard, for herbaceous; to Mr. Frank Lilley, Guernsey, for sparaxis and gladioli.

Silver Banksian Medals. — To Mr. E. V. Low, for orchids; to Mr. Jas. MacDonald, for exhibit of grasses; Mr. Carlton-White, for clipped trees; to Messrs. Bath, Lim., for roses and herbaceous; to Mr. Webster, for sweet peas; to Messrs. Kelway and Son, for delphiniums, sweet peas, etc.; to Lady Northcliffe (gardener, Mr. J. Goatley), for Crassula coccinea; to Messrs. Carter Page and Co., for flowering plants; to Messrs. G. Bolton and Son, for roses; to Mr. Howard Crane, for violas and violettas; to Mr. Walter Easlea, for roses; to Mr. Clarence Elliott, for alpines; to Messrs. G. Gibson and Co., for herbaceous; to Mr. G. W. Miller, for herbaceous and small plants; to Messrs. Morse Bros., for roses; to Mr. W. H. Page, for flowering plants; to Messrs. Watkins and Simpson, for antirrhinums; to Messrs. W. and C. Bull, for herbaceous flowers; to the Wargrave Plant Farm, Lim., for herbaceous flowers; to Messrs. W. J. Godfrey and Son, for flowering plants.

Certificates of Appreciation.—To Mr. Hemsley, for work in raising new antirrhinums.

AWARDS TO HORTICULTURAL SUNDRIES.

Silver-Gilt Banksian Medal.—To Messrs. T. Crowther and Son, for ornamental stone and ironwork; to Messrs. Gamage and Co., for garden tents, etc.

Silver Banksian Medal.—To Messrs. Abbott Bros., for Osterley table tray, etc.; to Messrs. Benton and Stone, Lim., for spraying machines, etc.; to Messrs. Castles, for garden furniture; to Messrs. Liberty and Co., for Japanese garden ornaments, etc.

Bronze Banksian Medal.—To Messrs. Barr and Sons, for tools and implements; to Messrs. Jos. Bentley, Lim., for horticultural chemicals; to Mr. John Bradley, for bunty tea house; to Miss Edith Fisher, for water-colour drawings; to Four Oaks Spraying Machine Co., spraying machines; to Messrs. Heathman and Co., for ladders, hose, etc.; to Mr. Robert Hughes, for water-colour drawings; to Miss Mitchell, for garden baskets; to Mr. John Pinches, for labels, exhibition boxes, etc.; to Messrs. W. Voss and Co., Lim., for insecticides; to Messrs. E. A. White, Lim., for insecticides, sprayers, etc

AWARDS TO NEW PLANTS.

(Orchid Committee.)

First-Class Certificate.—To Miltonia Sanderæ, from Messrs. Sander and Sons, St. Albans; to Miltonioda Harwoodi, Fowler's var., from J. G. Fowler, Esq., South Woodford; to Odontioda Brewi, from Messrs. Charlesworth and Co., Haywards Heath.

Award of Merit.—To Cattleya Mossiæ, var. Dreadnought, from Messrs. Sander and Sons; to Odontioda Wilsoni, The President, from Messrs. Charlesworth and Co.; to Cattleya serenata, from Messrs. Mansell and Hatcher, Rawdon; to Cattleya Mossiæ Olympia, from Messrs. Charlesworth and Co.

(Fruit Committee).

First-class Certificate. — To Strawberry Connoisseur, from Messrs. Laxton Bros.

Award of Merit. — To Pea King of the Dwarfs, from Messrs. Sutton and Sons; to Pea Superb, from Messrs. Laxton Bros., Bedford; to Pea No. 3,879, from Messrs. Hurst and Son, Houndsditch.

Highly Commended.—To Pea Hundredfold, from Messrs. Sutton and Sons; to Pea Snowdrop, from Messrs. J. Carter and Co.

(Floral Committee).

First-class Certificate.—To Adiantum trapeziforme Queen Mary, from Messrs. H. B. May and Sons; to Magnolia Delavayi, from Messrs. Jas. Veitch and Sons.

Award of Merit.—To Adiantum Sieberti-anum, from Messrs. H. B. May and Sons; to Polypodium Mayi cristatum, from Messrs. H. B. May and Sons; to Rose Ophelia, from Messrs. W. Paul and Son, Waltham Cross; to Nepenthes Lewis Bradbury and Nepenthes atropurpurea, from Messrs. J. Veitch and Sons; to Iris Kæmpferi Morning Mists, from Messrs. R. Wallace and Co.; to Border carnations Virginia and The Baron, from Mr. Jas. Douglas; to Roses Ulster Standard, Muriel Dickson, and Mrs. Godfrey Brown, from Messrs. Hugh Dickson, Belfast; and to Erigeron hybrida Pink Pearl, from Mr. A. Perry

WORK FOR THE WEEK.

THE ORCHID HOUSES.

SUMMER - FLOWERING CYPRIPEDIUMS.—Such species as Cypripedium barbatum, in its varied forms, C. callosum, C. c. Sanderæ, C. Curtisi, C. Lawrenceanum, and their numerous beautiful hybrids, form an interesting and useful class of free-flowering plants that are all the more or less serviceable in gardens generally. The plants may be used for decorative purposes, their foliage being almost as attractive as the flowers; and the durability of the latter, whether cut or allowed to remain on the plants, leaves nothing to be desired. The plants are easily accommodated in a warm greenhouse or a moist position in a stove, and require very little attention, excepting ample root moisture during the season of active growth. During the stages when plants have only two or three growths annual repotting is desirable, but in large specimens potting should not be done more often than is necessary, but it is well to thoroughly overhaul the surface of the compost every year.

REPOTTING.—The best time to repot is shortly after the flowering period. New breaks are then produced, or where the new growths are in a more advanced state the new roots make their appearance, and these quickly become established in the fresh compost with the least possible risk of injury from repotting. In the case of such species as C. Lawrenceanum, the plants continue in most instances to make an annual succession of growths, and, while the older ones may continue to retain their leaves in good condition, they can seldom be induced to produce growth from their base unless something happens to the leading growth or the rhizome be severed. This severing of the rhizomes not only produces larger specimens by increasing the number of leading growths, or those from which flowers are produced, but it also affords the opportunity of increasing stock where it is desirable. The potting compost for all forms belonging to the tesselated section should contain very little, if any, loam. Peat and sphagnum moss will meet their requirements with plenty of broken crocks intermixed to render the compost porous.

CYPRIPEDIUM NIVEUM and its allies, such as C. bellatulum, C. Godefroyæ, and C. G. leucochilum, where a suitable situation is found to meet their requirements, are well worthy of every consideration. There is very little difficulty in growing them when they are first imported for a year or two, but the general experience is that they rapidly deteriorate under artificial conditions. We find in the case of C. niveum in particular, that the plants should not be disturbed too frequently, and when they are attended to for potting requirements a compost of a lasting nature should be used. We find that yellow turfy loam, intermixed with plenty of lime rubble, suits thm best. Provide liberal drainage, and during the winter and autumn give only sufficient root moisture to retain the foliage in a normal plump state.—H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

EUPHORBIA (POINSETTIA) PULCHERRIMA.—The earliest rooted plants should now be shifted into their flowering pots, a suitable compost consisting of two parts loam, one leaf-mould, one peat, half part sand, and a little burnt earth and dried cow manure. For a few days after repotting keep them fairly close, shade from bright sunshine, and maintain close growing conditions. Remove the shading in time to retain a fair amount of sunheat. Pot up later plants as they are ready, and, should there not be a sufficient number, it may be increased by reducing the tops of some of last year's plants to the lower eyes that show signs of breaking. Carefully shake away the old ball of soil, and repot, using 48's, with the view to transferring to a larger size when ready. Such plants will give two or more useful bracts often as good as many of the young plants. When well growing, rather less shade and more air will be necessary, and a little ventilation on mild nights will assist in the production of healthy, short-jointed wood. Water must be carefully applied, as must also artificial or other manures, for the roots are easily damaged, and when this happens the plants suffer from a loss of foliage and produce poorly-developed bracts.

PALMS.—Stove palms are now growing freely, and will require frequent syringings, and the house generally should be kept rather moist. Occasional applications of manure, liquid or artificial, and soot water, will assist in the development of clean, healthy leaves; while a little soot sprinkled between the pots will give off healthy fumes and assist in combating insect pests. This, by the way, will be found a useful practice with most plants when growing under moist conditions. Where the time can be spared, sponging over the foliage will be repaid by the improved appearance of the plants.

STREPTOCARPUSES.—Those raised from seed sown in spring may be transferred to 54-sized pots. These will be valuable for late flowering, and, given careful attention during the few months' comparative rest in the meantime, will prove valuable in spring for shifting into 5½-inch pots to form the early and main batches for next season.

GLOXINIAS.—As the earliest flowering plants pass out of bloom, such as are considered worth keeping may be removed to a warm frame or pit, continuing to water until they show signs of ripening, when water may be gradually withheld. When thoroughly matured, transfer to their resting quarters. Should any variety be considered particularly worth propagating, this may be done by means of leaf cuttings. Seedlings will still require the growing conditions of the stove.—H. PRIME, Hatfield House Gardens.

FRUITS UNDER GLASS.

PEACHES.—As soon as all the fruits have been gathered from the trees, the latter should be frequently syringed to keep the foliage clean and healthy, this being a matter of the first importance, as the proper ripening of the wood, the plumping up of the buds, and the next season's crop will depend upon it. Old trees and others that have been in bearing some time should receive frequent applications of diluted liquid manure, as this will prove of great assistance to the trees. Never allow the trees to become in the least dry at the roots from now onwards until the leaves drop naturally, or bud dropping in the spring is sure to follow. Keep the ventilators wide open night and day, and if the roof lights are removable so much the better, as these may be removed, cleaned, repaired, and painted if necessary.

SUCCESSION HOUSES which contain ripe fruit should be kept fully ventilated night and day, as by these means the highest flavour is secured. Examine the trees daily when the fruits are cool, and gather all that are ready. A little practice will enable anyone to discern when a fruit is fit to gather. Place the fruits in an airy room on a soft surface, and keep each day's gathering separate. Trees which are swelling up a heavy crop of fruit should be liberally assisted with liquid and other stimulants. Pinch all gross shoots and any lateral growths, and otherwise keep the foliage clean and healthy by freely syringing it in the mornings and again at shutting-up time with clear soft water. Push aside the foliage as the peaches change colour, to fully expose them, always remembering that, as a rule, the higher the colour the better the flavour.

LATE HOUSES.—Finally, thin the fruits in these houses, if not already done, reserving all the best-placed fruits. If the trees are all right at the roots there need be no apprehension of fruit dropping at a later stage. Attend to tying and training, and avoid overcrowding; keep the syringe going vigorously, feed liberally, and apply a good mulch of horse-droppings or other similar material, as these mulches will be found of benefit to trees carrying heavy crops.

SUCCESSIONAL FIG HOUSES.—These will now be supplying ripe fruits, and a drier atmosphere will be necessary. Syringing will have to be done sparingly, and this only after all ripe fruits are gathered. The best flavoured fruits are those that are not picked until they are near bursting, but for travelling a long distance they must be picked in a tender but not too ripe stage. Later trees from which only one crop is gathered should have abundance of air and copious waterings at the roots to obtain large fruits of the highest quality. Do not pinch the points of the shoots, but remove altogether any growths which cause overcrowding, and any fruits which show after the main crop is thinned should be removed.—F. JORDAN, Warter Priory Gardens.

THE FLOWER GARDEN.

BORDER CARNATIONS.—In many instances the effects of the past wet winter and spring are still very evident among border carnations; not only are flowers scarce, but the side growths also; in fact, I have noticed that many plants of some varieties are not producing any growths at all, but simply solitary flower stems. This is far from being satisfactory, as another season's display is in danger owing to the shortage of young plants. Plants which are to be treated should have the surface soil between them lightly moved with a small hand-fork, previous to putting down the soil in which the young growths are to be layered; a mixture of light sandy soil will be found suitable for the purpose. In preparing the growths strip all basal leaves off, and make an incision with a sharp knife quite three parts of the way through the stem transversely, below a joint, and carry it upwards for an inch; this is of great importance, for unless the stem is sufficiently severed the young growths will secure enough nourishment from the old plant to keep them going without a check, and consequently the formation of roots is delayed. When pegging down, the tips of the layers should be brought up to nearly an upright position to prevent reunion.

THE ROCK GARDEN.—During spells of hot, dry weather, many subjects in the rock garden will be greatly benefited by occasional soakings of water, and this, quite apart from those which require keeping in a more or less damp condition continually, such as Gentiana verna and G. pneumonanthe, various primulas, hardy cypripediums, etc., as it is not always possible to make provision for them to sufficiently establish themselves to such an extent as to defy a long drought, however well Nature is copied in constructing a rockery. Incidentally there occur sites which consist of only a shallow depth of soil laying over partly hidden stones; such places are death-beds during dry weather if not kept watered. All freshly-planted colonies must be well looked after in this respect until they are established. The present time is very suitable for propagating various rock plants, as many have passed out of flower; generally speaking, the majority of the soft-wooded kinds give no great difficulty in this direction, whether cuttings or divisions are practised. A cold pit containing light, gritty soil is a most suitable place in which to insert the cuttings, etc., and until these have taken root the pit should be kept close and well shaded during bright weather.—T. B. FIELD, Wych Cross Place Gardens.

THE SHOW OF THE MIDLANDS!!

BIRMINGHAM HORTICULTURAL EXHIBITION.

FRIDAY and SATURDAY, July 18 and 19, 1913.

£600 CASH PRIZES.
8 Silver Cups. Gold, Silver-Gilt, Silver, and Bronze Medals.

BOOK SPACE AT BIRMINGHAM.

WILLIAM G. CARRADINE, F.R.H.S., Secretary, Birmingham.

THE GREAT ROSE SHOW OF THE YEAR

Will be held by the

National Rose Society

in the

ROYAL BOTANIC GARDENS, Regent's Park, N.W.,

on

FRIDAY, JULY 4.

The two Champion Challenge Trophies will be competed for, also numerous other Cups and Pieces of Plate, and Money Prizes to the value of over £400.

NEW SEEDLING ROSES IN A SEPARATE TENT.

BANDS OF THE ROYAL HORSE GUARDS (THE BLUES) AND SCOTS GUARDS.

Luncheons, Teas, and other Light Refreshments.

ADMISSION:

Noon to 3 p.m., **5s.**; 3 to 5 p.m., **2s. 6d.**; 5 to 7 p.m., **1s.**

E. MAWLEY,
Hon. Secretary, Rosebank, Berkhamsted.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY.

GRAND QUARTER CENTURY FLOWER SHOW.

SOPHIA GARDENS, CARDIFF,
WEDNESDAY and THURSDAY, JULY 23 and 24.

Specially good Prizes in every section, amounting in money and plate to nearly £500. Tents lighted by electricity. Popular Prices.

Schedules from the Secretary, Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

LEICESTER.—ABBEY PARK FLOWER SHOW, 5th and 6th August next. Open Class, Group of Plants, £20, £15, £10, £6. Liberal prizes for Collections of Fruit, Displays of Roses; Silver Cup, Gold and Silver Medals for non-competitive exhibits. Schedules from JOSEPH BURTON, Supt.

MALVERN ROSE AND SWEET PEA SHOW.

THURSDAY, JULY 10th, 1913.

Open Classes in Roses and Sweet Peas.
Nearly £100 in Prizes.
Entries close July 7th.

For Schedules and Entry Forms apply to A. D. MELVIN, Secretary, The Poplars, Malvern Link.

NATIONAL SWEET PEA SOCIETY.—GREAT EXHIBITION AT ROYAL HORTICULTURAL HALL, WESTMINSTER, July 17, and at CARLISLE on August 13 and 14th. Now is the best time to join the Society. Minimum Annual Subscription, 5s. Schedules on application. Entries for London close July 10th. CHAS. H. CURTIS, Hon. Sec., Adelaide-rd., Brentford, Middx.

ROYAL LANCASHIRE AGRICULTURAL SOCIETY.

GREAT HORTICULTURAL SHOW will be held at BURNLEY, on JULY 31, 1913, and following days. Liberal Prizes are given for Groups of Plants, Hardy Perennials, Carnations, Fruit and Table Decoration, etc.

Entries close July 14th. For Schedules apply—PETER BLAIR.

Trentham Gardens,
Stoke-on-Trent.

WOLVERHAMPTON.

GREAT FLORAL FETE,
JULY 8th, 9th, and 10th, 1913.

NEXT WEEK.

YORKSHIRE AGRICULTURAL SOCIETY. GRAND HORTICULTURAL SHOW will be held in YORK, JULY 23, 24, and 25, 1913. Large Prizes are given for GROUPS OF PLANTS, HERBACEOUS FLOWERS, FRUIT, etc.

For Schedules apply PETER BLAIR, Trentham Gardens, Stoke-on-Trent.

Entries close July 5th.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Norwich Flower Show.

JUNE 25 and 26.

Chapelfield Gardens and the Drill Hall were the delightful venue of an interesting show The competitive classes occupied three tents, while the Drill Hall was well filled with trade exhibits. The weather was fine but cool, with the result that the roses lasted well even through the second day. The attendance of visitors was not so large as could have been wished, there being counter attractions in the Norfolk Agricultural Show, held at Dereham on the same dates.

ROSES.

occupied the greater portion of one of the tents, and in some of the classes there was fairly close competition, some excellent blooms being staged by well-known exhibitors. The leading class was for forty-eight distinct varieties, and here Messrs. Burrell and Co., Howe House Nurseries, Cambridge, were first. The merit of their stand lay in the freshness and evenness of the flowers, which were not exceptionally large, but had good substance. Colonel R. S. Williamson, Edward Mawley, J. B. Clark, Wiliam Shean, and Florence Pemberton were a few of the best. Messrs. Frank Cant and Co., Braiswick Nurseries, Colchester, followed very closely for second place, showing Alice Lindsell, George Arends, Killarney, Mildred Grant, and Duchess of Portland, among other leading exhibition roses. Mr. H. Morse, Westfield Nurseries, Eaton, Norwich, was third. Messrs. Burrell and Co. also led for eighteen triples, showing some beautiful flowers of Dean Hole, Comtesse de Nadaillac, Bessie Brown, and other light varieties for third. Messrs. Burrell and Co. also had for favourite A. K. Williams in good form on their second-prize stand, as well as several recently-introduced varieties. Success still followed Messrs. Burrell and Co. in the class for eighteen teas and noisettes distinct, their Maman Cochet, Mdme. Jules Gravereaux, and Molly Sharman Crawford being especially noteworthy. Mr. H. Morse was second in this class, his stand containing smaller but neat blooms.

For twelve blooms of new roses in not less than eight varieties, Messrs. Burrell and Co. again occupied the premier position with Edward Mawley, Mabel Drew, Duchess of Sutherland, Mrs. Amy Hammond, Mrs. Jos. H. Welch, Ethel Malcolm, Mrs. Muir McKeen, Lady Barham, Mrs. Cory Wright, Mrs. Herbert Hawksworth, Lady Greenhall, and Mrs. Sam Ross. Second prize in this class was secured by Messrs. Frank Cant and Co., Melody, a cream-coloured flower of fine shape being conspicuous in their box. Mr. H. Youngman, gardener to the Executors of R. Steward, Saxlingham Old Hall, Norfolk, took third in this class with a very nice stand of choice varieties. Messrs. Frank Cant and Co. obtained premier honours for eighteen bunches of garden roses distinct. They had a good bunch of Princess Bonnie, a rich red H.T. of good form, Lady Curzon, and Mdme. Pernet Ducher were also of great excellence.

In the amateurs' section the largest class was for thirty-six distinct varieties, Mr. H. Youngman scoring with a beautiful lot of well-grown and well-staged roses. Included in the set was a really magnificent bloom of Mrs. Jos. H. Welch, which received the award for the best bloom of any rose other than tea or noisette. Mr. J. Hinchley, gardener to Rev. J. A. Z. Fellowes, Bunwell Rectory, received second prize, some of his flowers being very good. Third prize was taken by Mr. R. Balls, gardener to Miss Penrice, Witton House, Norwich.

Mr. H. Youngman again led the way for eight triples, staging with fine effect Mrs. J. H. Welch, Bessie Brown, Mdme. Melanie Soupert, and others. He was followed by Mr. R. Balls and Mr. J. Hinchley in the order named. For twelve teas and noisettes Mr. H. Youngman was still to the fore, his flowers including The Bride and White Maman Cochet, Medea, and Comtesse de Nadaillac. Mr. J. Hinchley was second, and he was awarded the prize for the best individual bloom of tea or noisette with a superb example of Muriel Grahame.

In a separate section for growers of less than 500 plants there were some very creditable exhibits. Mr. J. Weeks, gardener to Cecil Wilson, Esq., High House, Thorpe, Norwich, took first prize for twelve blooms distinct, showing Mrs. Edward Mawley, Mrs. Theodore Roosevelt, Joseph Lowe, Mildred Grant, etc. Second prize was secured by Mr. E. Chambers, gardener to Captain H. H. Francis, Long Stratton, Norfolk; and the third prize went to Mr. S. Jackson, gardener to L. E. Garrett, Esq., Chedgrave Manor. There were seven entries in this class, and the quality over all was excellent.

Mr. J. Weeks scored for four varieties in triplets, showing Countess of Derby, Kaiserin Augusta Victoria, Juliet, and Mdme. Melanie Soupert. The second prize was awarded to Mr. S. Jackson, who had three big blooms of Mildred Grant, which rather overpowered the other varieties. Mr. J. Woodrow, gardener to Bishop Fisher, Burgh House, Norwich, was third in this class. Six teas found Mr. R. Lowne, gardener to A. Lewick, Esq., Coonoor, Thorpe, at the head of the class, Mr. E. Chambers being placed second.

Mr. J. Hinchley was awarded first prize for twelve blooms of any one tea or noisette variety, showing Lady Roberts, the flowers being of fine form and rich in colour. Mr. H. Youngman had Souv. de S. A. Prince, for which he received second prize, Mr. R. Balls coming third with Souv. de Pierre Notting. For twelve blooms of any one variety other than tea or noisette, Mr. H. Youngman's Frau Karl Druschki received principal honours; Bessie Brown, shown by Mr. J. Hinchley, being placed second, Mr. R. Balls taking third place with some nicely-coloured La France. For six blooms of any tea variety H. C. Fitzgerald, Esq., Thorpe St. Andrew, secured the first prize with White Maman Cochet, Mr. E. Chambers' stand of Lady Roberts taking second place, third prize going to E. G. Buxton, Esq, Catton Park, with the same variety, but not so rich in colour. H. C. Fitzgerald, Esq., also scored with six Frau Karl Druschki; Mr. J. Woodrow was second with Mrs. W. J. Grant. Mr. H. Youngman excelled in a class, restricted to members residing in Norfolk, for twenty-four distinct varieties, the second prize going to Mr. J. Hinchley.

SWEET PEAS.

Next to the roses, sweet peas were the best feature of the show, the exhibits filling the central stages of the second tent. The chief class in the section was for twenty-four bunches of twelve spikes each, distinct varieties, and the winner received in addition to a cash prize Daniels' Challenge Cup, value ten guineas. Mr. F. Wilby, gardener to F. A. Banbridge, Esq., Cedar Grange, Hethersett, was the winner, and he showed a nicely-arranged collection of up-to-date varieties. Walter P. Wright, Mrs. C. W. Breadmore, Lady Evelyn Eyre, Hercules, Barbara, and Edith Taylor were included in his exhibit.

Mr. T. Bethell, gardener to Major E. W. Denny, Tacolneston Hall, led for twelve bunches, showing very strong flowers, strong in stem and clear in colour. The second prize

was awarded to A. T. Stedman, Esq., Glandford, Cley, who also had a fine exhibit. Mr. Allborough, gardener to Neathes Prior, Esq., Thorpe St. Andrew, was third. Mr. S. Rayner, gardener to Dr. A. R. Kay, The Manor House, Blakeney, had the best six bunches, R. F. Felton, White Queen, Mrs. Cuthbertson, and King Manoel being good vases. Miss L. Spratt, Manor House, Tacolneston, was a good second, and Mr. S. Hurst third.

The Silver Medal for the best single vase went to Mr. T. Bethel, with a strong bunch of Sunproof Crimson of really good quality. Mr. Bethel also won with Mrs. J. C. House in the single vase of any blue, lavender, or mauve variety, and with Clara Curtis, well shown in the primrose or cream class. The best vase of a purple or maroon variety was King Manoel, shown by Mr. S. Rayner. Mr. Bethel had the best vase of a white variety with Nora Unwin, and also for the best flaked variety with well-grown flowers of Mrs. W. J. Unwin.

Mr. W. Chettleburgh, gardener to Colonel Rous, Worstead House, Norwich, received first prize for a collection of forty-eight varieties of cut hardy perennials. He showed Orchis foliosa, Kniphofia repens, Rudbeckia californica, and Tropæolum speciosum among his subjects. Mr. J. Hilson had first prize for thirty-six bunches, showing a nice clean lot of useful border subjects, the best twelve bunches being staged by Frank Neave, Esq., Lingwood, Norwich. Tropæolum polyphyllum and Iris ochroleuca, with Martagon lilies, were among his best bunches.

Mr. S. Hunt, gardener to Mrs. Colman Wells, Southwell Lodge, Norwich, was placed first for six bunches, showing King of Delphiniums, Iris Anglica Bridesmaid, Geum Mrs. Bradshaw, etc. A grand vase of cut carnatons secured first prize for Mr. W. Allan, gardener to Colonel the Hon. C. Harbord, Gunton Park, Norwich, his flowers of Cecilia and other good varieties being large and beautifully finished. Mr. D. Cockerell, gardener to G. E. White, Esq., Eaton House, Norwich, was second, and Mr. F. J. Endersby third.

FRUIT.

A collection of six dishes brought three entries, the winner being Mr. J. Hilson, gardener to Sir Frederick Adair, Bart., Flixton Hall, who showed Black Hamburgh and Buckland Sweetwater grapes, Queen of the West melon, Brown Turkey figs, Givon's Late Prolific strawberry, and Cardinal nectarine. The second prize was awarded to Mr. T. Notley, gardener to E. G. Buxton, Esq., Catton Park, Norwich, and the third to Mr. W. Chettleburgh.

Mr. J. Hilson had the best three bunches of black grapes, and Mr. J. Woodrow the best single bunch. Mr. Woodrow led for three bunches of white, and Mr. Hilson for a single bunch. Mr. Hilson also scored for two dishes of strawberries, showing Royal Sovereign and Givon's late Prolific. The first prize for four dishes of strawberries was awarded to Mr. F. J. Endersby, gardener to J. H. Gurney, Esq., Keswick Hall, the varieties being The Laxton, The Leader, Bedford Champion, and Laxton's Reward.

NON-COMPETITIVE.

Messrs. Hobbies, Lim., East Dereham, specialised in new roses, their stand containing quite a collection of the most recently-introduced varieties. Among a nice lot of roses exhibited by Mr. H. Morse, Westfield Nurseries, Eaton, Norwich, Rayon d'Or was richly coloured, and Duchess of Wellington, Sunburst, Dean Hole, and Mrs. Foley Hobbs were well shown. Messrs. A. J. and C. Allen, Rose Nurseries, Norwich, made a big display of weeping standard and pillar ramblers in pots, as well as a broad mass of cut flowers set up in round baskets.

Messrs. Young and Co., Hatherley, Cheltenham, brought a very attractive lot of perpetual carnations, which were arranged most tastefully; the large blooms of Mrs. Raphael and the clear yellow Cecilia were conspicuous among many of the best sorts, Royal Purple being very distinct and rich in colour. A good display of roses came from Mr. Ernest Morse, "The Dell" Nurseries, Eaton, Norwich.

Messrs. Daniels Bros., Lim., the Royal Nurseries, Norwich, occupied one side of the hall with an exhibit comprising tall weeping standard roses, conifers, and ornamental shrubs, some miscellaneous greenhouse flowering plants, a colony of nymphæas in an improvised pond, and a table of sweet peas.

One of the most attractive exhibits in the hall was a collection of sweet peas staged by Mr. W. J. Unwin, Histon, Cambridge. His flowers were particularly clean and bright in colour, and they were arranged with great taste. Mr. Robert Holmes, Norwich, showed big, bold bunches of sweet peas, most of which were of his own raising, and included a number of promising seedlings. Messrs. G. Stark and Son, Great Ryburgh, showed among other good sweet peas an unnamed seedling of a rich blue colour. They also had Stark's Salmon, one of perfectly even shade throughout.

Mr. G. W. Miller, Clarkson Nurseries, Wisbech, staged a nice collection of orchids, embracing cattleyas, cypripediums, and a few odontoglossums. Mr. Miller also staged a capital collection of hardy border flowers, pæonies and delphiniums being strong features.

City of London Rose Show.

With old-time pomp and ceremony, and in a blaze of ceremonial scarlet and gold, the Lord Mayor of London and the Lady Mayoress attended at the Great Hall of the Cannon Street Hotel, in the City of London, on Thursday, June 26, to open the first real City rose show. Our readers will remember that Mr. A. E. Protheroe started the idea of a City show for City men, but he also worked tremendously hard in organising a society to carry out his idea, acted as hon. secretary and treasurer, and saw his efforts most amply rewarded by a superb exhibition of blooms on the above date. Trophies and pieces of plate were freely offered as prizes, and the competition was altogether first-rate, and the blooms shown were in excellent condition. The lighting of the hall is scarcely of the best for a rose show, and, owing to the strenuous competition, there was none too much space to move in, but these are matters which were only noticeable as a consequence of the success of the exhibition.

NURSERYMEN.

The Turner Challenge Cup for the best forty-eight blooms was capitally won by Messrs. Alex. Dickson and Sons, Newtownards, who led among eleven competitors, and scored with lovely flowers, some of which, to our way of thinking, were a little too much dressed. There were capital flowers of Edward Bohane, Mrs. E. Mawley, Lady Cooper, Frau Karl Druschki, Lady Burnham, Nita Weldon, H. V. Machin, Mrs. Foley Hobbs, and Ulster. Second prize fell to Messrs. B. R. Cant and Sons, Colchester, and third to Messrs. R. Harkness and Co., Hitchin. There were also eleven competitors in the class for a dozen trebles, and here Messrs. G. and W. H. Burch, Peterborough, scored with a good set of Lady Ashton, Lyon Rose, Mdme. Jules Gravereaux, W. Shean, Mildred Grant, Dean Hole, Mrs. Maynard Sinton, St. Helena, Rosamane Gravereaux, and Mrs. Theodore Roosevelt. Mr. George Prince, Longworth, Berks, was a good second, and third prize fell to Messrs. Alex. Dickson and Sons.

Mr. George Prince, Longworth, Berks, led for eighteen tea roses with a good stand of medium-sized flowers; Mrs. E. Mawley, Medea, Mdme. Jules Gravereaux, and Mrs. H. Stevens were capital blooms; Messrs. J. Burrell and Co., Cambridge, second; and Mr. J. Mattock, Headington, third; four competitors. Eighteen bunches of decorative roses made a grand show, and to Mr. J. Mattock, Headington, Oxford, fell the principal award for a lovely stand, in which General MacArthur, Lady Pirrie, A. R. Goodwin, Warrior, and Duchess of Wellington made important bunches; Messrs. W. Spooner and Sons, Arthur's Bridge, Woking, second; and Messrs. Frank Cant and Co., Colchester, third; five competitors.

Messrs. Chaplin Brothers, Joyning's Nursery, Waltham Cross, were a capital first in the class for seven baskets of roses, each basket containing one variety only. The varieties shown were Lady Hillingdon, Pharisaer, Mdme. M. Soupert, General MacArthur, Mdme. Abel Chatenay, Duchess of Wellington, and Prince de Bulgarie; Messrs. A. Dickson and Sons second, their Irish Fireflame, Carine, Queen Mary, Joseph Hill, and Mrs. F. Straker were lovely, and of fine quality and colour; Mr. W. R. Hammond, Burgess Hill, Sussex, third; five competitors.

The best dozen new roses came from Messrs. Alex. Dickson and Sons, Newtownards, who won with Mrs. H. W. Handworth, Mrs. J. H. Welch, Mabel Drew, Mrs. A. E. Coxhead, Lady Barham, Miss Amy Hammond, Mrs. G. Preston, Mrs. Foley Hobbs, Lady Greenall, Edward Mawley, Alex. Hill Gray, and Duchess of Sutherland; Messrs. B. R. Cant and Sons, second; and Messrs. J. Burrell and Co., third.

AMATEURS.

The open amateur challenge cup, presented by A. E. Protheroe, Esq., was won by Mr. W. Onslow Times, Bedford Road, Hitchin, who staged the best two dozen flowers, and showed Mdme. M. Soupert, Mdme. Jules Gravereaux, Gloire de C. Guinoisseau, White Maman Cochet, a fine form, but several of his flowers were weather-stained. Mr. Henry Balfour, Langley Lodge, Headington Hall, Oxford, second; and Mr. E. F. Brown, Lynton, Sussex Place, Slough, third.

In the members' section the City of London Championship Trophy, for the finest twelve roses, was won by Mr. H. L. Wettern, 16, Water Lane, E.C., with a grand box of superb flowers, the varieties being Yvonne Vacherot (one of the best blooms in the show), Mrs. J. Welsh, Mildred Grant, Avoca, Caroline Testout, Rhea Reid, Mdme. Jules Gravereaux, W. Shean, Mrs. T. Roosevelt, Mrs. J. Laing, Hugh Dickson, and Dean Hole; Mr. Lewis S. Pawle, Stock Exchange, came second, and Mr. J. Hart, 21, Spital Square, E.C., third.

Mr. A. C. Turner and Mr. H. L. Wettern were placed as mentioned for six trebles, and Messrs. H. L. Wettern, J. Hart, and A. C. Turner were the prize-winners for nine teas or noisettes, while Mr. A. C. Turner beat Mr. H. L. Wettern for six blooms of one variety with Bessie Brown, Mr. Wettern showing Mrs. T. Roosevelt.

Mr. A. S. Brown, Brokes Lodge, Reigate, led for a dozen blooms in the division open to growers of fewer than 1,000 plants, and he was closely followed by Mr. G. Gally, The Holme, Walton-on-Thames.

Mr. C. W. Edwards, Brantwood, Sutton, beat Mr. S. Hogg, 63, Winchester House, for nine blooms, in a class for flowers of fewer than 500 plants.

Mr. W. G. Padley, Winchester House, led for six blooms among seven competitors, who all grow fewer than 250 plants.

The Metropolitan classes brought out a very keen competition, and were confined to members growing roses near the City. The challenge cup, offered by the "City Press" for the best dozen flowers growing within eight miles of the Royal Exchange was capitally won by Mr. A. E. Coxhead, Ambleside Avenue, Streatham, and his best blooms were of Caroline Testout, Frau Karl Druschki, and Mrs. S. Clarke.

The Inner Suburbs Challenge Cup, offered by Mr. John Collingridge for the best nine roses within five miles of the Royal Exchange, fell to Mr. R. d'Escofet, Kingsley Dene, Dulwich, for a quite good set of popular varieties.

Mrs. A. E. Robinson, Norhyrst, Carshalton, and Mrs. A. C. Brown, Brokes Lodge, Reigate, won prizes for a bowl of roses, the former having Mdme. Abel Chatenay with Rosa rubrifolia foliage, and the latter showing Richmond, with Jersey Beauty foliage.

Mr. A. C. Turner scored for a dozen bunches of decorative roses, and won the

Walter Voss cup with a grand lot, his Lady Hillingdon and Liberty being splendid; Mr. H. L. Wettern a good second.

Medals for best blooms in certain divisions of the show were won as follows: Mr. A. E. Stanger, 21, Finsbury Pavement, with Avoca; Mr. H. L. Wettern, with a grand Yvonne Vacherot; Mr. R. d'Escofet, Dulwich, with Mrs. Myles Kennedy; and Messrs. B. R. Cant and Sons, Colchester, with A. Hartmann, a new rosy-red H.T. variety.

Mr. G. Prince and Messrs. Paul and Son added non-competitive groups of roses, which added greatly to the interest and effectiveness of the show.

Bournemouth Rose and Sweet Pea Show.

JUNE 25 and 26.

In a sheltered part of the beautiful grounds surrounding the winter gardens, a very successful exhibition of roses and sweet peas was held. The members of the Bournemouth Mutual Improvement Society combined on this occasion with the council of the Bournemouth Horticultural Society for the purpose.

Raising funds for the benefit of the last-named society, prizes were awarded only to members of the Mutual Improvement Society for competitive exhibits, medals and certificates being awarded to non-competitive or trade exhibits. Grand displays were made by some of the large nursery firms; Messrs. Carters', Raynes Park; Messrs. Dobbies, Edinburgh; Messrs. E. Webb and Sons, Stourbridge; Messrs. Cooling, Bath,; and Messrs. Keynes, Williams, and Co., Salisbury, being especially represented, each firm staging grand produce. The weather was beautifully fine, and great crowds of people visited the show. Last year the members of the Mutual Improvement Association held a very successful show solely for the benefit of their funds. This year the Bournemouth Horticultural Society is to have the benefit, as it is intended to hold larger exhibitions in future by the members of the council.

In the gardeners' tent the chief attraction was the table decorations of sweet peas and roses respectively. There was keen competition. Mr. W. Shave, of Wimborne, was first for a lovely sweet pea table; Mr. Heath, gardener to G. G. Russell, Esq., being second. Mr. Heath was first for a table of roses, Mr. Evans, gardener to G. J. Fenwick, Esq., coming a close second. Mr. Heath scored in the classes for a basket of roses and an epergne of sweet peas. Mr. Shave had the best bowl of roses, and Mr. Taylor, gardener to Walter Child Clark, Esq., the best six vases of roses. Mr. Weaver staged very high-class blooms of sweet peas in the class for nine and six vases respectively. Mr. Shave scored in the class for a display of sweet peas on a given table space, and was closely followed by Mr. Weaver. Mr. C. Humphries won in the class for roses staged singly, having a lovely specimen of the variety Hugh Dickson.

The large tent was filled to overflowing with non-competitive exhibits, comprising roses and sweet peas, stove plants, carnations, and herbaceous subjects, Mr. M. Prichard's group of the last-named being very noteworthy.

AWARDS.

Gold Medal.—Messrs. Webb and Sons, for sweet peas, Melba, Inspector, Thomas Stevenson, and Mrs. Cuthbertson were charming as regards colour, and all were very fresh; Messrs. Carters', Raynes Park, for sweet peas, White Queen, Edrom Beauty, White Spencer, and Loyalty being attractive varieties; Messrs. G. Watts and Sons, Lim., Palace Nurseries, Bournemouth, for roses and carnations, and stove and greenhouse plants. The roses were very representative, fresh, and well staged.

Silver Medal.—Messrs. Dobbie and Co., Edinburgh, for sweet peas, which were in the best possible condition, but rather short in the stem; Mr. T. Stevenson, Wimborne, Dorset, for a grand collection of about fifty vases of sweet peas, Bertie Usher, Edith Taylor, and May Campbell were noteworthy varieties, and all were staged in a light and graceful way; Messrs. Cooling and Sons, Bath, for climbing and hybrid tea roses, Mdme. d'Arblay, Rubin, Seagull, York and Lancaster, Bar le Duc, and Crimson Damask were lovely in bud and full in bunch or cluster; Mr. T. K. Ingram, Parkstone, Dorset, for charming weeping varieties as standards, and liliums; Mr. M. Prichard, Christchurch, Hants, for flowers of herbaceous plants, delphiniums being well represented, Verbascum vernale, Pæony Geftchen, Chrysanthemum maximum Mrs. Leigh, lupins, Œnothera fruiticosa, Gillenia trifoliata, white-flowered with red calyces, were all beautiful.

Certificates.—Walter Child Clark, Esq., for roses; the Chairman of Council, Councillor Chamberlain, F.R.H.S., for roses, carnations, and sweet peas; Messrs. Kaynes, Williams, and Co., Salisbury, for roses; Mr. Elford, Bournemouth, for border carnations; The Burton Hardy Plant Nurseries, for herbaceous flowers; Messrs. D. Lorrimer, Bournemouth, and Percy Sugden, Wimborne, for displays of roses respectively.

Southampton Rose Show.

By permission of Ellen Lady Swaythling the annual rose show was held in the beautiful grounds attached to South Stoneham House on June 25th, and, if not so large as in some years past, the display was of an interesting character. The roses were of capital quality, fresh, well coloured, and included an extraordinary number of the newer varieties, so much so that we missed many old favourites. The H.P. section was almost unrepresented, so popular have the many H.T. varieties become.

The arrangements were excellent under the guidance of Mr. C. S. Fuidge and Mr. H. E. Molyneux.

In all twenty-seven classes were provided for cut blooms, ten being open to all. The principal one was for forty-eight distinct varieties, and there were four competitors. Mr. G. Prince, Longworth, Faringdon, was easily first with medium-sized, fine quality specimens, the best varieties being Jonkheer J. L. Mock, Lyon Rose, Mdme. Jules Gravereaux, J. B. Clark, Bessie Brown, Edward Mawley, Ethel Malcolm, Lady Ashtown, Mildred Grant, Oberhofgartner Terks (extra fine), Mrs. M. Sinton, Lady Ursula, Mrs. G. Shawyer, Marquise de Sinety, Medea (large), Mrs. A. Coxhead, Avoca (richly coloured), Mrs. Myles Kennedy, Mrs. Sam Ross, Mdlle. Melanie Soupert, and Mabel Drew. Messrs. D. Prior and Sons, Colchester, were second with larger specimens, which, however, were not so clear or well coloured, but Lady Barham was so fine that it was selected as the premier bloom in the open classes. Mr. J. Mattock, Headington, Oxford, was placed third.

Four competitors staged twelve triplets, and Mr. G. Prince was here successful, winning the premier place with a really good set, and Edward Mawley, Lady Barham, Bessie Brown, J. B. Clark, Mdme. Jules Gravereaux, Mildred Grant, Dean Hole, Frau K. Druschki, and Mrs. A. Coxhead were deserving of mention as outstanding varieties; Mr. John Mattock was a good second, staging smaller, fresh examples; and Messrs. D. Prior and Sons third.

Five competed in the class for twelve teas or noisettes, and Mr. Prince followed up his previous successes by annexing the premier award with remarkable blooms of Mdme. J. Gravereaux, Mrs. F. Hobbs, Comtesse de Nadaillac, Mrs. Myles Kennedy, Mdme. Cusin, Souvenir de S. A. Prince, Mrs. Herbert Stevens (a wonderful bloom, pure in colour), Mrs. E. Mawley, White Maman Cochet, and Molly Sharman Crawford. Alexander Hill Gray, Esq., Beaulieu, Newander Bridge, Bath, came second with a good set; and Mr. H. Drew, Longworth, Berks, was third.

In the class for six blooms of any red or pink rose six competed, and Lady Ashtown was the winner of both first and second sets. Mrs. Foley Hobbs won for Mr. A. Hill Gray the leading award for six blooms, any yellow or white variety; Messrs. Prior and Son depending upon Bessie Brown for second place.

For a representative group of roses, 50 square feet, six entered, but only two competed, and the withdrawals at the last moment were a serious loss to the show. Mr. J. Mattock was easily first with a capital display, effectively arranged, of Lady Curzon, Irish Elegance, Crimson Damask, Marquise de Sinety, Lady Hillingdon, Juliet, Mrs. W. J. Grant, Sunburst, Goldfinch, and A. R. Goodwin, etc.; Messrs. W. and R. Rogers and Sons, Red Lodge Nurseries, Southampton, second. Baskets of cut roses in three distinct sorts made a good display, and Mr. J. Mattock was easily first with Ethel Malcolm, Lyon Rose (grandly coloured), and General MacArthur; Messrs. Prior and Sons second, and Mr. Prince following.

AMATEURS.

For eighteen distinct blooms four entered, and Mr. W. Jarratt Thorpe, Gransmoor, Hucclecote, Gloucester, won the prewith good blooms of Mrs. F. Hobbs, Ulrich Brunner, George Dickson (very fine), Jonkheer L. Mock, Bessie Brown, Franccis Michelon, and Princesse M. Mertchersky; Mr. A. Hill Gray second with smaller specimens; Dr. Seaton, Woodside Cottage, Lymington, third. In the class for six triplets five took part, and Mr. A. Hill Gray won with a good set, in which Lyon Rose, Ulster, and R. W. Smith were the most prominent sorts; Mr. W. J. Thorpe a close second. Mr. A. Hill Gray led for twelve teas or noisettes, and had a grand bloom of R. W. Smith; Dr. Seaton second.

In the division open to growers of less than 500 plants, a class for twelve blooms, distinct, was made. Dr. J. F. Gillett, Andover, with small, neat specimens, was first; Mr. J. A. Fort, The College, Winchester, won the piece of plate offered for twelve, for growers of less than 300 plants.

In the classes confined to the county of Hants, Mr. H. E. Molyneux, Brantwood, Southampton, won the Allan Gunn cup for twelve distinct blooms, among six entrants, with an interesting set, composed mainly of new varieties; Mrs. T. H. Vanderbilt, Colleen, Portia, Laurent Carle, Mrs. Muir MacKean, and Mrs. Amy Hammond were all good. Mr. R. C. W. Dixon, Glanville, Hulse Road, Southampton, came a good second. Mr. Allan Searle, Ashton Lodge, Bassett, Southampton, won for twelve teas or noisettes. Mr. Molyneux also secured the leading place for six bunches of decorative varieties with a specially pleasing exhibit of Grace Molyneux, Gustave Regis, Irish Elegance, Goldfinch, and Tausendschon. Mr. A. Searle second with a good set also. Very good indeed were the exhibits in the class for a display of garden or decorative varieties, and Mr. F. M. Vokes, Birch Lawn, Sholing, was first.

LADIES' CLASSES.

For a decoration of cut roses suitable for a dinner-table 6ft. by 4ft. five competed, and Mrs. E. M. Burnett, Westwood Road, Southampton, won with an effective arrangement of Irish Elegance with its own foliage; Mrs. Bealing second with a rather too heavy centrepiece of Mdme. Abel Chatenay. The last-named was first for a vase of cut roses. Mrs. Burnett won for a basket of roses with a quite effective arrangement of mixed blooms, Mrs. Bealing following.

SWEET PEAS.

Good specimens of this annual are invariably found at this show. In the class for six bunches, distinct, three entered, and the premier award fell to Mr. Usher, gardener to Sir Randolf Baker, Branstone, Dorset, for extremely fine blooms of Doris Usher, R. F. Felton, King Manoel, King Alfred, Hercules, and Barbara; Mr. Bealing, Bassett, Southampton, was a close second.

For six bunches (amateurs) Mr. S. T. White, North End, Eastleigh, won.

NON-COMPETITIVE.

Trade exhibits were numerous and effective. Messrs. John K. King and Sons, Coggeshall,

staged a remarkably fine collection of well-grown sweet peas, and gained a Gold Medal. Messrs. Toogood and Sons had sweet peas in quantity effectively displayed. Messrs. B. Ladhams and Sons, Shirley, Southampton, received a Silver-gilt Medal for a grand display of hardy flowers most charmingly arranged. Lavatera Olbia, an effective mallow rose-pink in colour, growing a yard high, was fine. Messrs. W. H. Rogers and Son, Red Lodge Nurseries, Southampton, had roses, hardy plants, and an effectively arranged rockery. Mr. E. J. Wootton, Fair Oak, Eastleigh, sent carnations in variety.

Royal Horticultural Society.

SCIENTIFIC COMMITTEE, June 17.

Present: Mr. G. Massee, V.M.H. (in the chair); Dr. Voelcker, Messrs. J. Odell, A. Worsley, G. Gordon, V.M.H., R. Hooper Pearson, W. Hales, J. T. Bennett-Poë, V.M.H., W. Fawcett, J. Fraser, E. M. Holmes, and F. J. Chittenden (hon. secretary).

COLOURS IN PELARGONIUMS. — Mr. Fraser showed specimens of, and offered remarks upon the manner in which the bright colours of show pelargoniums had developed from what was at first a dull-coloured flower with colours spreading merely along the veins in a double feathered line. This later became intensified, forming two spots of deep colour at the tips of the veins. Later still the colour spread from the spots until the whole of the upper petals became suffused with the same colour, though of probably lighter intensity, and finally the same colour spread to other parts of the flower.

BLUE OAK.—Dr. A. Voelcker showed sections cut across the branches of the oak from which the piece of greenish-grey wood shown by him last year was taken. The oak is at Tewkesbury, and has been struck by lightning, but it is improbable that this has had anything to do with the coloration of the wood. The dead branch had more of the colour developed than the living, but the latter showed it to a considerable extent, though in no part was it so intense as in the dead. The heart-wood was not coloured. The appearance was extremely like that described by Von Schrenk in Bulletin 36 of the "Bureau of Plant Industry," Dept. of Agriculture, U.S. America, under the title of "Blueing of Timber," and attributed to the presence of a fungus.

FOXGLOVE BRANCHED.—Mr. E. M. Holmes showed a spike of foxglove bifurcated about a third of the way up, and showing little, if any, sign of fasciation in the lower part. Other members referred to similar instances.

SAWFLY ON APPLE.—Mr. E. M. Holmes also showed some sawfly larvæ, which he had found feeding on the foliage of the apple. The larvæ belong to Lygæonematus mœstus, which Professor Theobald has only recently recorded as British.

ROSE WITH GREEN PETALS. — Mr. Chittenden showed the flower of Rosa canina with green petals. It had been plucked in a hedge not far from Leatherhead by Mr. Pleese, of Merrow, who had brought it to him.

VIOLA WITH FRINGED FOLIAGE. — Mr. Druery sent the plant, of which a leaf had been shown at the last meeting, of a viola with frilled and fringed foliage. It was found in his garden at Acton, and was evidently not V. odorata, as was at first thought. The species could not be determined from the specimen before the committee, but was perhaps V. Riviniana.

PELARGONIUM HYBRIDS. — Mr. A. Langley Smith showed a series of pelargoniums raised by himself. The first cross was not defined. From it were raised numerous seedlings, varying much in foliage and in habit and colouring of flowers. These were the result of self-pollinating the hybrid. The third set were the result of fertilising the seedlings so obtained with pollen from the original hybrid. These again showed much variation in foliage, etc.

GOOSEBERRIES DISEASED. — Several specimens of gooseberry branches were sent. They had died suddenly after starting into growth. This trouble with gooseberries is usually due to the attack of the fungus Botryosphæria ribesi. It is best to remove and burn the affected branches as soon as they are discovered, not allowing them to remain until the autumn. The branches should be cut away close to their origin, as the fungus fruits near to the base of the affected shoots.

SAXIFRAGE RUST.—Foliage of several of the longifolia group of saxifrages was sent from Hindhead badly attacked by a rust fungus. This fungus is a native of Switzerland, and has previously been recorded as attacking species of this section of saxifraga in this country (see "Journal of Botany," 1908, p. 153). Puccinia Pazschkei differs from P. saxifragæ in having the teleutospores warted instead of striate, and it does not appear to attack the British species of saxifraga.

Gardeners' Royal Benevolent Institution.

As announced in our issue of June 28, the annual festival dinner of this valuable horticultural charity, resulted in the donation of over £3,000 to the fund. Leopold de Rothschild, Esq., presided over a record attendance of ladies and gentlemen, and those present included Sir Jeremiah and Lady Colman, Sir Henry and Lady Veitch, Mr. and Mrs. Leopold Salomons, Sir Fortescue Flannery, Sir Walter Smythe, Right Hon. Colonel Mark Lockwood, M.P., Sir George and Lady Pragnell, and Messrs. G. Monro, H. B. May, A. Mackellar, J. F. McLeod, H. J. Alexander, Jas. Hudson, Jas. O'Brien, G. Bunyard, W. Cobb, W. Crump, G. H. Cuthbert, C. A. Ebblewhite, C. R. Freider, D. Ingamells, J. T. Taylor, A. Metcalfe, H. W. Nutting, J. Rochford, N. N. Sherwood, C. Sherwood, W. Sherwood, W. Atkinson, E. White, S. T. Wright, etc.

After the loyal toasts, the Chairman briefly reviewed the history of the fund, and said that when he presided over a similar function twenty-five years previously there were 134 pensioners, and now there were 258, costing £4,000 a year to maintain. Invested funds promised sufficient income to about defray management expenses, and so the maintenance of the pensions depended almost entirely upon the result of the generous contributions of friends at the festival dinner. He appealed earnestly for liberal contributions to the funds, so that those who had fallen on evil times in the course of their work of producing flowers, fruits, and vegetables might be helped.

Sir Harry J. Veitch, the treasurer, thanked the chairman for his presence and his earnest appeal, and emphasised the need of help by referring to several distressing cases that at present were receiving a little help from either the Victorian Era or Good Samaritan funds, until the next election of pensioners took place. How greatly the help the pensions brought was appreciated was made abundantly evident by the expressions of gratitude which Sir Harry quoted from letters received. Sir Harry pointed out that £145,000 had been expended in pensions by the charity, and the good work was limited by the amounts contributed by friends of gardening and gardeners.

"Horticulture in all its Branches" was proposed by the Hon. W. T. Mackenzie, High Commissioner for New Zealand, and responded to by Colonel Mark Lockwood. Mr. N. N. Sherwood ably proposed "The Chairman," a toast that was very enthusiastically received.

To Mr. G. J. Ingram, the secretary, a word is due for the excellent arrangements, and Mr. Hudson and Mr. Bedford deserve great praise for the floral decorations.

Chislehurst Amateur Horticultural Society.

JUNE 28.

The annual exhibition of this admirably managed society was held in the grounds of Kemmal Warren, Chislehurst, the residence of H. H. Nelson, Esq., on the 28th ult., and proved in every way a great success. The schedule was less comprehensive than is customary at summer shows, but there were ample provisions for the various classes of cut flowers that can be shown at their best at the present time, and, as the awards were liberal, the competition was spirited throughout. The great features were formed by the roses, sweet peas, and hardy flowers, which are exceptionally well grown in the many fine gardens in and around Chislehurst, and groups arranged for effect.

Roses were shown in large numbers and in excellent condition, and formed a delightful feature. Very keen was the competition in the class for twelve distinct varieties of garden or decorative roses, not less than four or more than nine trusses of each. In the result the premier award was made in favour of Mr. R. C. R. Nevill, Croft Cottage, Chislehurst, who had finely-balanced bunches of General MacArthur, Gustave Regis, Blush Rambler, and others of the more useful decorative varieties; and was awarded in addition to the first prize the Royal Horticultural Society's Silver Banksian Medal and the Affiliated Societies' Medal. In competition for the prizes for six bunches of decorative roses, Mr. B. de Quincy, Avonhurst, Chislehurst (gardener, Mr. Read), obtained premier honours with a remarkably fine collection; and Miss de Quincy, Stowcroft, Chislehurst, was a close second.

There was a spirited contest for the honours in the class for twelve blooms of exhibition roses, and the premier award was made in favour of Mr. John Dewrance, Cranmore Place, Chislehurst (gardener, Mr. Salway), who had blooms large in size and high in finish; Sir Corbett Woodall, Walden, Chislehurst, was a capital second. In another class for twelve blooms, Mr. Dewrance and Mr. B. de Quincy staged excellent boxes, and were first and second respectively. For six blooms, distinct, Mr. Harold Margeston was first with a box in which White Kaiserin was represented at its best. In competition for the prizes for six blooms in three varieties, Mr. Stanley George, Redholme, Chislehurst, occupied the first place with superb blooms; and Mrs. Lionel Jackson, The Vane, Bickley, followed closely for second place. In the class for six blooms of any one tea rose, Mr. J. Dewrance staged for first place superb blooms of Madame Melanie Soupert. Mr. Fox, Widmore, was successful in obtaining the first place for a bowl of roses with Irish Elegance, the blooms of high quality, and the arrangement characterised by much taste; Mrs. Harold Margeston had a charming arrangement in the class for a table decorated with roses.

Sweet peas were finely shown, and made

NOTICE.

READERS experiencing difficulty in obtaining "THE GARDENERS' MAGAZINE" at any bookstall or newsagent should write to the

PUBLISHING MANAGER,

London, E.C.,

who will give the matter immediate attention.

a delightful display of colour. Miss McFarlane, Elmhurst, Bickley, was successful in obtaining premier honours in the class for twelve varieties, the flowers large in size and superb in colour. In addition to the first prize Miss McFarlane was awarded a Silver Medal for her vase of Edrom Beauty, and a challenge cup for the best exhibit in the division. Mr. B. de Quincy was successful in obtaining the second prize, staging flowers in a high state of development. The successful competitors in the class for six bunches were Mr. T. Morton, Holbrook, Chislehurst; Mr. Horton Harrild, Walsingham, Chislehurst; and Mr. T. Howard, West Leigh, Bickley; and all staged flowers of considerable excellence. In another class for six bunches, Mrs. Smith, Wyncroft, Bickley, was first; and for a vase of sweet peas Mrs. Waugh, Chislehurst (gardener, Mr. L. Mitchell). Mrs. Fox was successful in a strong competition in taking the first prize for a table decorated with sweet peas.

Hardy flowers constituted a glorious feature, for they were of high quality throughout, and staged with much taste. There were two classes for nine bunches, and in one Mr. J. Dewrance was first, and in the other Mr. A. Robinson, Butainley, obtained premier honours. The entries were numerous, and the flowers highly meritorious in the class for twelve bunches, and Mr. R. C. R. Nevill was successful in winning the first prize, a silver medal, and a challenge cup. Mr. H. Harrild and Mr. J. Dewrance, who were second and third respectively, also exhibited remarkably fine collections. Mrs. G. Smith and Mr. Thomas were among the leading prize winners.

Groups arranged for effect were considerably above the average, and at the head of several exhibitors was Mrs. Tiarks, Foxbury, Chislehurst (gardener, Mr. J. Lyne), who had a richly-coloured and exceedingly tasteful arrangement, the beautiful Vanda teres being used with good effect at the back, and odontoglossums, cattleyas, and Clerodendron fallax in the foreground. Mr. Leonard de Quincy, Oakhurst, Chislehurst, was a close second with a beautiful group. The gloxinias were simply magnificent; and Mr. J. Dewrance and Mrs. O'Brien, Oakleigh, Chislehurst (gardener, Mr. Parks) were first and second. No finer gloxinias than these have been seen on the exhibition stage.

Lavatera Olbia.—It is strange that this pretty flowering member of the mallow family, which was introduced well over three centuries ago, should have been so little known till within a quite recent period. The large flowers, which are of a beautiful satiny pink colour, with deeper veinings, are very freely borne.—T.

Double-flowered Agapanthus.—When first introduced, the double-flowered form of Agapanthus umbellatus aroused much interest, but it never became popular, and is now not often met with. The drawback is that the flowers, though double, do not open properly, however well the plants may be treated.—S. W.

A Bunch of Grapes on Old Vine Rod.—I have, growing from the rod of an Alicante vine, a very nice bunch of grapes. This bunch grows from a smooth part of the rod, and not from any portion of the spur. A fruit-bud had evidently formed, but I have not seen one in such a position before. There is no leaf or leaf-stem, only the solitary bunch. I remember a friend pointing out to me, many years ago, a shoot which had grown in the usual way after remaining dormant for a whole year. The shoot was on an ordinary spur, but this spur did not, during the whole of one summer, bear a growing shoot of any kind; the second year the bud developed in the usual way, but I do not remember whether the branch bore any grapes or not; I believe it did. Perhaps some reader of The Gardeners' Magazine may have had similar experiences.—G. B.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of The Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in The Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

ANNUALS FOR AUTUMN SOWING.—F. G., Bromley: Please give me a list of the best kinds of hardy annuals suitable for autumn sowing in a fairly sheltered and well-cultivated garden.—The following are suitable kinds of hardy annuals for summer sowing: Calendula, candytuft, cornflower, erysimum, eschscholtzia, larkspur, linaria, nemophila, nigella, platystemon, Shirley poppies, sweet peas, viscaria, and Virginian stocks.

GALL WEEVILS IN CAULIFLOWER ROOTS.—T. F. F., Amesbury: I send you some cauliflower roots on which are numerous galls. Many of our plants have flagged badly during the dry weather, and some have died; all those pulled up have shown the same kind of galls on the roots. Is there any remedy for this trouble?—The galls on the cauliflower roots are the result of the irritant action set up by the grubs of the Cabbage-gall Weevil. This weevil (Centorhynchus sulcicollis) lays its eggs in spring and early summer, sometimes later on also, on the roots of all kinds of brassicas; the eggs hatch out in about ten days, feed upon the roots, and so cause the gall-like swellings. If a gall is cut, a grub will be found inside it. Wherever there is danger of an infestation it is an excellent plant to make a thick mixture of water, clay, soot, and sulphur, and dip the roots of young plants into it, as soon as they are lifted from the seed-bed and just prior to planting. Lift and burn all infested plants, and also lift the roots of cabbages and cauliflowers as fast as the heads are cut, as there may be grubs at the roots, though not enough to kill the plant.

ASPARAGUS BEETLE.—R. A. F., Dudley: We experience some trouble from the asparagus beetle, and shall be glad to know a handy cure or remedy for an attack.—The asparagus beetle (Crioceris asparagi) is frequently a destructive pest, and therefore every care should be taken to dispose of an attack. Dissolve 1lb. of soft soap in some hot water, and then add warm water to make up eight gallons; syringe the growths and the surface of the bed with this solution, and follow it by a dusting with soot. Both soot and newly-slaked lime are very useful in combating this pest, and should be dusted over the bed and growths when these are moist with dew or rain.

BORDEAUX MIXTURE AND POTATO DISEASE.—J. B., Forfar: What is the best time of year to spray potatoes with Bordeaux mixture, and how often should the spraying be done, and at what intervals?—Spraying with Bordeaux mixture twice in July, with an interval of ten days or a fortnight, is the most effective preventive of potato disease, and, even though the weather may not be favourable to the spread of the disease, it always pays to be on the safe side. Should the weather be wet a third spraying may be necessary.

STERILE STRAWBERRIES.—P. F., Frodsham: I have two rows of a certain variety of strawberry, and only two plants have flowered and fruited; all the rest showed no signs of flowering, although to the best of my recollection most of them flowered and fruited a little last season. Would it be safe to propagate from this stock?—We should certainly not propagate from a stock that is sterile, or so nearly so as yours. All varieties of strawberries give sterile plants sometimes, and some do so more frequently in certain soils than in others, but no runners should ever be taken from sterile plants, or even from those that are below the average of productiveness, because the risks of utter

failure another season would be very great. Do not propagate even from the two plants which fruited, except for experimental purposes, but get a new stock, or, better still, try a variety that has proved successful in your neighbourhood.

ROSE LINA SCHMIDT MICHEL.—G. R., Walton: I saw some good examples of the decorative rose Lina Schmidt Michel at the City of London Rose Show last week, and was much struck by its beauty. Can you tell me whether it makes a good pillar rose, or what special merit it has in the garden?—In our issue of July 6, 1912, we published a very interesting account of this rose. It is a variety which takes two or three years to thoroughly establish itself, and then, under generous treatment, it will clothe a 10ft. or 12ft. pillar with deep-green, bronzy-tinted foliage and cream-pink vermilion-budded flowers. It is brighter than Dawn, and flowers well in the autumn.

HYBRID BETWEEN PRIMULA BULLEYANA AND P. PULVERULENTA.—D. B. J., Royston: Can you tell me whether a hybrid has been yet raised between Primula Bulleyana and P. pulverulenta? I know it must be very difficult to keep track of these primula hybrids, but you answer so many interesting questions that I ask this in the hope of answer.—We had a dim recollection of such a hybrid appearing last summer, and after some difficulty we found that Professor I. Bayley Balfour, Keeper of the Edinburgh Botanic Gardens, exhibited several primula hybrids before the Scientific Committee of the Royal Horticultural Society on June 4, 1912, and one of these hybrids was P. Inverleith, a hybrid between the species named above. The same hybrid may have been raised elsewhere, but we do not find any further record of it.

NAMES OF PLANTS.

N. S. E., Cheriton.—1, Oxytropis Halleri; 2, Jasminum floridum.

C. L., Abingdon.—1, Cistus monspeliensis; 2, C. ladaniferus maculatus; 3, C. villosus.

L. L., Plymouth.—1, Francoa appendiculata; 2, Hydrangea aspera; 3, Daphne laureola.

B. J., Bradford.—1, Odontoglossum crispum, a very good form; 2, Cattleya gigas; 3, Renanthera Imschootiana.

E. C. W., Romford.—1, Michauxia Tchihchatchewi; 2, Campanula alpina; 3, Leptosyne Stillmani; 4, Eryngium alpinum.

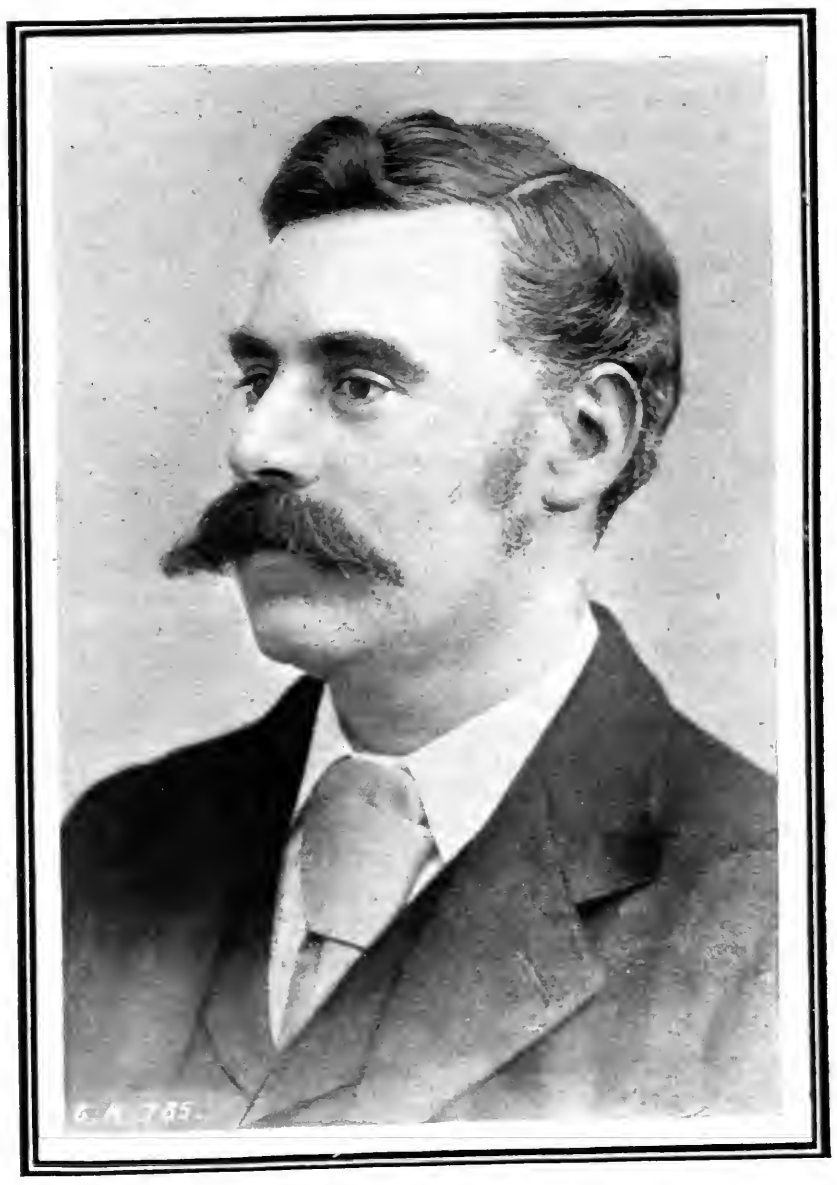
THE GARDENERS' MAGAZINE

NOTE OF THE WEEK.

The Season of Roses.

The season of roses is once more with us, and so prodigal are its gifts that few indeed of those who have a whole-hearted love for these gloriously beautiful flowers, and have lavished care and affection upon their plants, have cause to complain of the return that has been given them either in the abundance or the quality of the flowers. Indeed, so bountiful has been the season, that those who are acquainted with the cultural requirements of the rose, and have made strenuous endeavour to comply with them, have their gardens full of flowers that charm the eye by their diversity of form and exquisite colouring, and load the air with their delightful perfume. The season is somewhat of a surprise even to those who are skilled in rose culture, and are so closely observant as to be fully acquainted with the conditions under which the most successful results are obtained. There were periods in the spring season in which rosarians were very pessimistic with regard to the probable growth and flower development of their roses, and there appeared to be some justification for the fears that were entertained with regard to the effects of the unfavourable conditions to which the plants had been subjected. Did not the brown pith that extended far down the principal shoots indicate imperfect maturity of the wood as the result of the cold, wet weather experienced in the previous autumn, and some injury from frost during the winter? Were not the plants so precocious in starting into growth as to occasion some perplexity in determining when to prune, and to give rise to some anxiety as to the effects of the spring frosts on the tender shoots? Again, did not aphis settle upon the young shoots and multiply amazingly when they were checked in development by the period of cold weather that had so injurious an effect upon the plum crop? These questions must be answered in the affirmative, and wood less mature than usual, activity of the plants at an exceptionally early period, and severe attacks of insect pests at the early stages of the growths on which the flowers are produced, are matters that might well give rise to grave misapprehension on the part of even the most experienced rosarians. Happily the fears have not been realised; the season has been somewhat of a surprise, and gardens wherein good cultivation obtain are—



MR. P. O. KNOWLES.

"Full of roses, roses red and white,
Reddest roses summer ever grew,
Whitest roses ever pearled with dew,
And their sweetness beyond delight."

Everywhere roses are in flower production considerably above the average, and have for some time past contributed with remarkable liberality to the charms of the garden, and greatly enhanced the attractions and the interest of the summer flower shows. In no season that we can call to mind has the value of roses for exhibition purposes been so strikingly shown as in that through which we are now passing. In many of the provincial shows that we have had an opportunity of visiting during the past few weeks there have been wondrous displays of fragrant flowers. At its metropolitan exhibition, held a few days since, the National Rose Society established a record by holding the largest, the finest, and the most beautiful rose show the world has yet seen. All the chief groups into which cultivated roses are divided were shown in immense numbers and in a manner that did credit to the large body of rosarians who took an active part in the competition, and almost every conceivable form of exhibiting roses was demonstrated. Thousands of exhibition blooms were arranged in serried ranks in boxes of the orthodox type, which are unsurpassed for the display of flowers in which individual development is of prime importance. Many exhibition blooms were also staged in vases, and these have the merit of giving increased variety, and huge numbers of garden roses were arranged in bold vases, and produced glorious colour effects. The method of exhibiting both decorative and exhibition roses in wicker baskets of simple design is steadily increasing in popularity among the exhibitors at the National Rose Society's shows; and on this occasion the baskets of roses formed a great and highly-attractive feature. The basket of finely-developed blooms of the new hybrid tea rose Mrs. Carnegie, which we figure on another page, admirably represents this method of showing roses, and we specially commend it to the attention of those who are concerned with the management of provincial horticultural societies, but have not as yet seen roses shown in a similar manner. These baskets are admirably adapted to the requirements of those who do not exhibit largely, for they are inexpensive, not difficult to arrange, and light to carry about. The classes for bowls of roses are also rapidly increasing in favour, and the entries both for exhibition and decorative varieties were very numerous, and it was no light honour, as in the case of the first prize bowl of blooms of a decorative rose, also illustrated in this issue, to obtain the premier award. The groups of roses

occupying a specified area were finer than usual, and produced a distinct and beautiful feature, but unfortunately the exhibitors did not, as in previous years, attach sufficient importance to the stipulation that the judges have to give special consideration to the representative character of the groups, and consequently they contained fewer sections than could have been desired. New roses formed, as usual, a great feature. The number was larger than on any previous occasion, and there was an increase in the exhibitors, two points of interest, as showing the extension which the creation of new roses is undergoing. There was certainly no abatement in the interest evinced by visitors in the new roses, for although the length of the tent was doubled, it was thronged throughout the whole time it was open with long queus outside at either end waiting for admission. It is satisfactory to have evidence of the increased encouragement that is being given to roses at the exhibitions held by the smaller provincial societies. It would be still more so were the value of garden roses in the production of colour displays at exhibitions more fully appreciated. It is too frequently the case when additional rose classes are provided to devote them to specimen blooms of exhibition varieties. These latter, when shown in a high state of development, invariably afford so much pleasure to visitors, that an endeavour should be made to obtain an adequate representation of them. At the same time, the claims of garden or decorative roses for a prominent place in the local flower show should be recognised. Their usefulness for the embellishment of the flower garden and the supply of flowers for decorative purposes in the house fully justify their receiving liberal encouragement, and the majority of those who do not give special attention to exhibition roses find it much easier to stage a few vases of garden roses than they do a stand of exhibition blooms.

Mr. P. O. Knowles, steward and head gardener to Sir Frank Crisp, Bart., at Friar Park, Henley-on-Thames, is such a modest man that it was with some difficulty we persuaded him to send us his portrait, so that readers of THE GARDENERS' MAGAZINE might see the features of a man whose work is known personally to so many, and by reputation practically to every garden lover in the United Kingdom. Mr. Knowles commenced his gardening career in 1874, when he entered the gardens of Claremont, Esher. Here he remained three years, and subsequently served in two other horticultural establishments in the Esher district, the first of these being the gardens of the residence of Mr. Justice Wills, and the other those of Glenhurst. From the last-named place Mr. Knowles went to Greenlands, the residence of the Hon. W. F. D. Smith. In 1889 Mr. Knowles was appointed head gardener to Sir Frank Crisp, Bart. (then Mr. F. Crisp), and within a comparatively short period he afforded ample evidence of his having taken full advantage of his opportunities for becoming acquainted with the details of the gardening art during the course of his training. We first made Mr. Knowles's acquaintance in 1898, eleven years after the gardens were designed by Mr. Milner, and an illustrated account of the many interesting features appeared in our issue of July 9 of that year. Since then we have had many opportunities of observing and admiring the work accomplished by Mr. Knowles in carrying out the extensive alterations and additions that have been made during the past fourtten years. Friar Park possesses the most wonderful rock garden to be found in this country, and the whole, with the exception of bably about one-tenth, has been formed by Mr. Knowles. The collection of plants grown on this remarkable rockery is a most comprehensive one, and most kinds, even rare sorts, are grown in large masses. Although Friar Park is best known for its rock and water gardening, these features form but a small part of the work Mr. Knowles has to control. A fine collection of conifers, trees, and shrubs in great variety, a flower garden, a Dutch garden, a big kitchen garden, a score or more of glasshouses, and estate work, give Mr. Knowes ample scope, and everyone who has visited Friar Park, which Sir Frank Crisp so frequently, generously, and hospitably opens to horticultural, charitable, and political societies, knows full well how admirably Mr. Knowles fulfils the onerous duties that devolve upon him. We may re-echo the wish expressed in these columns fifteen years ago—i.e., "It is earnestly hoped the present proprietor will long live to enjoy his country home, and that his able steward, Mr. Knowles, may long continue to enjoy the support and goodwill of his present generous employer."

Masters Memorial Lecture.—Professor R. H. Biffen, M.A., will give the ninth Masters Memorial Lecture at the afternoon meeting of the Royal Horticultural Society on Tuesday next, the 15th inst. The subject of the lecture will be "Some Factors in the Prevention of Disease in Plants," and the chair will be taken at 3 p.m.

A New Farm and Garden School has been opened at Madryn Castle by the Carnarvonshire County Council. Madryn Castle is an old country seat, and the estate, extending over about 2,240 acres, was purchased for small holdings two years since by the above-named Council at a cost of £45,000. The castle, with eighteen acres of land, has been appropriated for the purposes of the school, and accommodation is provided for thirty-five resident students, together with the members of the staff. The principal is Mr. R. H. Evans, formerly assistant director of agriculture at the University College, Reading. The fruit and vegetable gardens have an area of three and a-half acres, and there will be a winter course in horticulture, and two summer courses for elementary school teachers.

Horticulture and Agriculture.—Encouraged by the splendid successs achieved by the Royal Agricultural Society in holding a flower show in conjunction with their annual exhibition, several other agricultural societies have included a horticultural exhibition in the programme of their annual gathering. We have before us the schedules of three of the agricultural societies who are holding a flower show, and it is interesting to note that these societies have not only followed the example of the first-named body in associating the products of the garden with those belonging to the farm, but they have placed the flower show arrangements in the charge of Mr. Peter Blair, Trentham Gardens, Stoke-on-Trent. This is not altogether surprising, seeing the success achieved by Mr. Blair at the "Royal" shows. The first of these exhibitions will be held by the Lincolnshire Agricultural Society at Lincoln, on the 17th and 18th inst., when £20 will be offered as the first prize for a group of plants, £15 as the premier award for 18 stove and greenhouse plants, and £10 as a first prize for begonias. This is followed by the exhibition of the Yorkshire Agricultural Society at York, on the 23rd inst. and two following days, when £25 will be offered as the first prize for a group of miscellaneous plants, £12 as a first for hardy herbaceous plants and flowers, and £10 as the first in each of the classes for stove and greenhouse plants, orchids, and tuberous begonias. The third show is that of the Royal Lancashire Agricultural Society, which will be held at Burnley on July 31 and August 1, 2, and 4. The schedule is comprehensive, and the most notable class is that for a group of plants with four prizes aggregating £70.

Knole, the Kentish seat of Lord and Lady Sackville, which has been prominently before the public during the past few weeks, is one of the most delightfully-situated and interesting baronial mansions in the country. It was one of the sixteen palaces at one time possessed by the See of Canterbury The estate was purchased in 1456 from Lord Saye and Sele by Archbishop Bouchier, who rebuilt the house, enclosed the park, and left the whole estate to the see. His successor, Cardinal Morton, enlarged the palace, and received visits from Henry VII. By subsequent owners Henry VIII. and Queen Elizabeth were frequently entertained at Knole. The flower garden and pleasure grounds are in keeping with the character of the building, and with their beds and borders of shrubs and hardy flowers they afford a fine example of what may properly be described as Old English gardening. Knole Park has an area of about 1,000 acres, and is highly picturesque, many of the trees with which it is so richly furnished being of great beauty. For many years the exhibitions of the Sevenoaks Horticultural Society have been held in the park, and this year's show will be held on the 23rd inst., when the mansion of Knole, with its remarkable treasures, will be open to the visitors to the exhibition.

Royal Horticultural Society's Daffodil Show, 1914.—We are informed by the Rev. W. Wilks, V.M.H., that the Royal Horticultural Society's daffodil show in 1914 will be held on Wednesday, April 15 and 16, and not on April 21 and 22, as previously notified. The fixing of dates a week in advance of those previously announced is likely to prove highly advantageous to all concerned, for the third week in April is rather late for daffodils grown in the south.

Roses and Dahlias at Kew.—Roses have been particularly attractive at Kew during the past fortnight, and much of their beauty continues, both in the rose garden round the palm house, and in the rose dell and the rose collection near the pagoda. The Lady Gay roses hanging over the stonework round the pond, between the palm house and the museum, are fast expanding their blooms, and there are many interesting ramblers in bloom on the pergola between the rock garden and the herbaceous grounds The summer bedding alongside the Broad Walk is already gay, and in the philadelphus and cistus collections many fine shrubs are flowering. The advice we have so frequently given respecting dahlias—i.e., to secure strong, vigorous plants, ready to put out as soon as frost is over, is borne out in the practice at Kew, where, during the first week of July, a large bed of Kaiserin Augusta Victoria was already white with its numerous large blossoms, and in a neighbouring bed the single variety Miss Roberts was producing numerous flowers. These plants will increase in size and beauty for many weeks to come, and will continue to be a fine feature until autumn frosts close their season.

WOLVERHAMPTON FLORAL FETE.

The show that opened at Wolverhampton on Tuesday, July 8, and continued until Thursday, deserves to be styled as one of the best all-round shows in the country. Excellence was the prevailing characteristic of every section, and from one end to the other there was that which was capable of maintaining the interest and admiration of the visitors, whom, it is pleasant to state, came in gratifying numbers. As has always been the case at Wolverhampton, the organisation and arrangement of the show left no room for improvement, and, as we have stated before, this show offers a pattern to horticultural societies as to how a flower show should be managed.

FIRST PRIZE COLLECTION OF BORDER AND PERPETUAL CARNATIONS,
Shown by Mr. C. Wall, Bath, at Wolverhampton.

GROUPS.

The one-time leading feature of flower shows—groups and trained specimens of stove and greenhouse plants—is steadily declining. Entries decrease, and year by year there is less evidence of the skill and painstaking care involved in producing fine crotons, dracænas, ericas, bougainvilleas, and other plants of this class. Still, in spite of this reluctantly admitted fact, the groups at Wolverhampton this year, three in number, were something to be proud of. The exhibitors deserve high compliment, the society may be congratulated, and British horticulture may take comfort that not yet is the art of growing stove plants a thing of the past. For a miscellaneous group covering 30ft. by 14ft., Messrs. Cypher and Sons, Cheltenham, added another to their long list of highest awards. The group was a grandly arranged mass of plants of great beauty and rare quality. Towering high over a broad arch in the background was a magnificent Kentia Fosteriana supported by elegant cocos, and the tall crotons used skilfully to break the level were underclothed by charming dendrobiums, ixoras, origanum, dictamnus, and splendid alocasias, anthuriums, and caladiums. There seemed to be in this group every plant that could add an item of beauty, and everything was placed just in the best possible position. Mr. J. V. Macdonald, gardener to Sir G. Kenrick, Edgbaston, Birmingham, who came second, had a most praiseworthy exhibit. His crotons were very fine, and he had beautifully-flowered miltonias, cattleyas, and odontoglossums, and other orchids, used with great taste. Dieffenbachias, pandanus, and Nandina domestica figured among the foliage plants, and quite in the foreground Nertera depressa, particularly well berried, and the small Caladium argyrites did good service. Mr. W. A. Holmes, Chesterfield, made a very good effort, and, although placed third, his group, in what may be termed ordinary competition, would have stood well, for it must be recorded that highest opinion expressed itself that these three groups reached highest watermark.

Messrs. Cypher and Sons led the way again in the group of foliage plants. Here the colours of the crotons and caladiums were as rich as any flowers, and the nephrolepis, adiantums, and selaginellas were fittingly used as a setting for the brighter things. Mr. Macdonald again ran very close for second place. There was real quality in every plant shown, and the arrangement was the work of an artist. Third place was taken by Mr. W. A. Holmes, Chesterfield, who had a pleasing variety of the most useful decorative plants, which were well arranged. Mr. W. R. Mannay, Dudley, was fourth with an excellent exhibit. An interesting class that has had a place for several years in the Wolverhampton schedule was for a group of one kind of flowering plant occupying ground space of 50ft. There were five exhibits, and first prize was awarded a group of Clerodendron fallax staged by Mr. J. F. Simpson, gardener to Sir C. Mander, Tettenhall Wood. The begonias staged by Messrs. Blackmore and Langdon, Bath, were placed second, but the opinion was strongly and freely expressed that this fine exhibit should have obtained the premier award. Third prize went to Mr. J. E. Knight, Wolverhampton, who showed standard ivy-leaved pelargoniums.

For twenty plants in pots not exceeding ten inches, Messrs. J. Cypher and Sons won with some effective specimens of Anthurium Scherzerianum, Statice intermedia, Erica ventricosa Bothwelliana, and several good foliage plants. Mr. J. F. Simpson, gardener to Sir C. Mander, Tettenhall Wood, Wolverhampton, was second; his collection included Gloriosa superba, Croton Weismanni, Allamanda Williamsi, Fuchsia triphylla, and Hydrangea Mdme. Moulliére. Mr. C. Weaver, gardener to H. Mander, Esq., Tripull Manor, Wolverhampton, was third.

ROSES

are always well shown at Wolverhampton, and this year was no exception. Entries were strong, and quality very good. The leading class for seventy-two varieties occupied a side of the tent, and Messrs. B. R. Cant and Sons, Colchester, won well with a stand that was representative of the best

roses in cultivation. Mrs. J. H. Welch was immense; Horace Vernet, an old favourite, was good, and so was Her Majesty. Newer varieties were Lady Helen Vincent, Mrs. Geo. Shawyer, Mrs. Cornwallis West, and St. Helena, all of delicate tints. Second place was taken by Messrs. R. Harkness and Co., Hitchin, who had good colour and substance in their flowers, which were just a wee bit smaller than the winners. Gloire de Chedane Guinoisseau was perfect in shape, the Lyon was of correct colour, and Horace Vernet was very rich. Messrs. Perkins and Sons, Coventry, who were third, had Lady Ursula, White Killarney, Mdme. Segond Weber, and Ethel Malcolm in good form. Fourth prize was awarded the King's Acre Nurseries, Lim., Hereford.

Quite a distinct method of showing roses was encouraged by provision of a class for nine circular baskets, not exceeding fourteen inches diameter. There was a good entry, Messrs. Hugh Dickson, Lim., Belfast, scoring highest honours. They had Golden Gem, Archie Gray, Mrs. Mona Hunting, Blush Queen, and William Cooper among an extra good set of new varieties. Mr. J. Mattock, Headington, Oxford, was second, Harry Kirk, Rhea Read, and J. B. Clark being very good on his stand. King's Acre Nurseries were given equal second, and Mr. W. H. Frettingham, Nottingham, received fourth. Mr. W. H. Frettingham, Nottingham, headed the prize list for thirty-six blooms with a very even, fresh lot of flowers. The lemon-coloured Mabel Drew, the dark velvety Lord Macaulay, and White Killarney were very nice. Messrs. B. R. Cant and Sons were second with another fine display; and Messrs. R. Harkness and Co., Hitchin, third. Messrs. H. Dickson's set of twelve varieties not in commerce previous to 1910 was awarded first prize. Leslie Holland (rich crimson), Mrs. Foley Hobbs (cream), and Berthe Gaulis were splendidly shown. Messrs. B. R. Cant and Sons' second prize lot were just a bit weather-beaten, but the varieties were all good, George Dickson was wonderfully rich in colour, as also was that grand-petalled rose Edward Mawley. Messrs. H. Dickson, Lim., again scored for five baskets, the varieties being Sir W. Ewart, Mrs. Jas. Lynas, Mrs. W. Bentley, Countess of Lonsdale, and Archie Gray. Mr. Mattock took second prize. For single basket of a dark variety, Messrs. Hugh Dickson won with Brilliant, an aptly-named, dazzling scarlet rose. For a basket of a light variety the same exhibitor scored, using Mrs. James Lynas.

A VASE OF FINELY-DEVELOPED DELPHINIUMS,
Shown by Messrs. Blackmore and Langdon in their first prize exhibit of these flowers at Wolverhampton.

Mr. Mattock had the lead for eighteen tea roses, showing splendidly such varieties as W. R. Smith, Mrs. E. Mawley, Mrs. Foley Hobbs, and The Bride. Second place was taken by Messrs. F. Cant and Co., Colchester; and third by King's Acre Nurseries, Lim.

For a collection of decorative and garden roses, occupying 12ft. by 4ft., Messrs. Gunn and Sons, Olton, Warwickshire, took first prize. Their exhibit was simply magnificent. Juliet, The Lyon, Marquise de Sinety, Liberty, and Richmond in the foreground, and Rayon d'Or, Irish Elegance, and Lady Hillingdon on tall pillars were backed up by arches of ramblers and big mounds of Frau Karl Druschki, G. C. Waud, etc. Mr. Mattock received second, and had Marquise de Sinety, Simplicity, Betty, and a number of other good things in capital form.

CARNATIONS

were a splendid feature, the entries occupying almost the whole length of one of the big tents. The class for a stand, 12ft. by 4ft., of cut blooms, excluding malmaisons, brought Mr. C. Wall from Bath in strong force. He was worthily awarded first prize, and both for quality of bloom and effective arrangement his exhibit merited great praise. Mrs. C. W. Ward, the lovely rose-pink variety, was grand; Mandarin, one of the best yellow fancies, Pathfinder, and Brilliance, among the borders, were extra good; and Elizabeth Shiffner provided rare colour as well as finely-grown blooms. Messrs. Blackmore and Langdon, Twerton, Bath, were second, their central vase of White Wonder being particularly fine. Third prize was secured by Mr. J. E. Knight, Wolverhampton. Mr. F. Green, Gardener to Lady Grey, Enville Hall, Stourbridge, was awarded first prize for a nice group of cut Malmaisons, including good vases of Maggie Hodgson, crimson, Princess of Wales, pink, and the scarlet Horace Hutchinson. Second prize was taken by Mr. J. B. Lowe, gardener to Capt. Lubbock, Warminster.

HARDY FLOWERS.

Three competitors staged in the collection of hardy herbaceous flowers, occupying 15ft. by 5ft. of staging. Messrs. Harkness and Sons, Bedale, were winners, their display of Oriental poppies, verbascums, delphiniums, gaillardias, etc., being simply gorgeous. Papaver orientalis Mrs. J. Harkness was wonderfully charming; Gladiolus Crimson Gem, and Lupinus polyphyllus roseus were among the most telling subjects used. Second prize was awarded Messrs. G. Gibson and Co., Bedale, who staged Delphinium Rev. Lascelles, Verbascum J. M. Burnie, Scabiosa caucasica, and a variety of other bright and useful things. Messrs. F. Smith and Co., Woodbridge, were third, and on their stand there were many things of more than ordinary merit. Some magnificent delphiniums were staged in the class for a collection occupying 9ft. by 3ft., the winners being Messrs. Blackmore and Langdon, Twerton Hill Nurseries, Bath. Conspicua, Daniel Osiris, Statuaire Rude, Perfection, and Lamartine were varieties of outstanding merit. Messrs. Harkness and Sons' second prize group was an excellent display. Messrs. G. Gibson and Co. were third, their varieties being good, but spikes rather small.

A new class was provided this year for a model garden of original design, it being left to exhibitors to adopt whatever style they desired. Unfortunately, only one exhibitor was forthcoming—Mr. J. E. Knight, Wolverhampton, who had a lily pool surrounded by rough paving, which was reached through a rose-covered arch. Small beds of begonias, dwarf polyantha roses, Verbena Miss Willmott, and early chrysanthemums were cut in a sward of fine grass, each bed being centred with standard heliotropes or fuchsias. The background was

(Continued on page 532.)

NEW PLANTS AND FLOWERS.

ROSES.

Queen Mary.—This fine new H.T. rose was one of the great attractions of the show. The flowers are of fair size, and the broad petals make up a shapely bloom. The colour is a lovely shade of yellow, with glorious pink shading, this deepening over the yellow towards the tops of the petals. It has a great deal of the colouring of Juliet, but more yellow in it, and it should make a capital garden rose. Gold Medal, N.R.S., July 4. Messrs. Alex. Dickson and Sons, Newtownards.

Mrs. James Lynas.—A grand hybrid tea rose, with full blooms made up of fairly broad petals that are cut square across the top in the bud. The colour is a lovely shade of deep pink blush, with delicate rosy fleshing. Sweetly scented. This will probably make the finest exhibition rose in the set shown at Regent's Park, for at 5.30 p.m. on July 4, every flower was as fresh and firm as possible. Gold Medal, N.R.S., July 4. Messrs. Hugh Dickson, Lim., Belfast.

Brilliant.—This grand hybrid tea rose has very broad and flattish petals, and makes up a fine bloom. The colour is most vivid scarlet-crimson all over, and the colour does not seem to fade out badly, as is the case of many brilliant roses. Gold Medal, N.R.S., July 4. Messrs. Hugh Dickson, Lim., Belfast.

Mrs. Ambrose Ricardo.—A fine full rose of large size and globular shape, broad-petalled, with recurving margins. Colour pale cream, with lemon-yellow flushing in the base of the petals. Very sweetly scented, and a good lasting variety. Silver-gilt Medal, N.R.S., July 4. Messrs. S. McGredy and Son, Portadown, Ireland.

Wm. Cooper. — Another enormously-petalled rose, a hybrid tea variety of fine appearance. The colour is deep reddish-rose, the red being very bright in the just opened bloom. Some of the flowers suggest that the colour may not be so "fast" as one could wish, but if the shade holds good in trying weather, the violet-rose tinting will make this a welcome rose. Silver-gilt Medal, N.R.S., July 4. Messrs. Hugh Dickson, Lim., Belfast.

Mrs. J. W. Parker.—A lovely delicate peach-blush coloured hybrid tea rose; it has large flowers and the broad petals curl a little, and so make up a slightly-pointed and very elegantly-shaped flower. Silver-gilt Medal, N.R.S., July 4. Messrs. Hugh Dickson, Lim., Belfast.

Ulster Gem.—This is a very distinct addition to the decorative single roses. It is of robust growth, has dark foliage and large single flowers of bright sulphur-yellow colouring, with brighter yellow stamens. Silver-gilt Medal, N.R.S., July 4. Messrs. Hugh Dickson, Lim., Belfast.

Muriel Dickson.—A glowing rich rose-carmine hybrid Austrian briar rose, with enormously broad petals, though comparatively few of them, but the bloom is of large size and finely scented. Of robust growth. Silver-gilt Medal, N.R.S., July 4. Messrs. Hugh Dickson, Lim., Belfast.

Red Letter Day.—A large substantially-petalled hybrid tea rose that has a bud like Liberty, but is practically single, with an extra petal or two. The petals are very broad and thick, and of a glowing crimson-scarlet colour, with a few dull yellow stamens in the centre. Very free, and should make a very effective garden rose. Silver-gilt Medal, N.R.S., July 4. Messrs. Alex. Dickson and Sons, Newtownards.

Conway Jones.—A brilliant hybrid tea rose with large petals that make up a big bloom. The colour is rich soft scarlet, with soft rose shading over the central petals. The outer petals reflex prettily. Sweetly scented. Silver-gilt Medal, N.R.S., July 4. Messrs. Alex. Dickson and Sons, Newtownards.

Mrs. George Norwood.—This fine deep rose-pink H.T. variety we have previously described and illustrated. It is large and finely scented. Silver-gilt Medal, N.R.S., July 4. Mr. E. J. Hicks, Hurst, Twyford, Berks.

Duchess of Abercorn.—A big, full hybrid tea rose, the beautiful flowers of a soft, creamy-buff or creamy-peach colour. Petals very wide, slightly rolled back at the apex, and sufficiently plentiful to make up a very substantial flower. Card of Commendation, N.R.S., July 4. Messrs. Hugh Dickson, Lim., Belfast.

Mrs. Godfrey Brown.—A charming hybrid tea rose, of large size, and with very wide petals. The colour is a pleasing and lovely shade of rose-pink with a flush of palest salmon in the base. Flowers rather pointed. Card of Commendation, N.R.S., July 4. Messrs. Hugh Dickson, Lim., Belfast.

J. F. Barry.—This is a very bright, light yellow rose of medium size and with a pretty bud. It is a highly perfumed hybrid briar variety, and the shade of colouring is particularly effective; apparently a free bloomer. Card of Commendation, N.R.S., July 4. Mr. G. W. Piper, Uckfield, Sussex.

Naarden.—A pretty hybrid tea rose of Kaiserin Augusta Victoria style; of fine size and shape, soft cream-white, and highly tea-scented. Card of Commendation, N.R.S., July 4. Mr. G. A. Van Rossem, Naarden, Holland.

Mrs. Moyna.—A beautiful hybrid tea rose with delicate fragrance. The wide-petalled flowers are very solid and shapely, white with a faint rose tint on the margins of the inner petals. Card of Commendation, N.R.S., July 4. Messrs. Alex. Dickson and Sons, Newtownards.

Mary Green.—A new H.T. variety of lovely shape and beautiful pale lemon-tinted yellow colouring. Tea-scented. Card of Commendation, N.R.S., July 4.

Pink Pearl.—A beautiful new single and slightly semi-double rose that we have previously described and figured. The flowers are of large size, freely produced, and the long delicate peach-tinted pink petals surround golden stamens. Card of Commendation, N.R.S., July 4. Messrs. Hobbies, Lim., Dereham.

Freda Weller.—A pretty little single rose with small, neat foliage, very free; white, with a dense cluster of golden stamens. Card of Commendation, N.R.S., July 4. Mr. H. Weller, Lower Ashtead, Surrey.

Ophelia.—A charming hybrid tea rose, with long, pointed buds and broad petals. The colour is cream and flesh-pink, with a little yellow as the base of the petals. A.M., R.H.S., July 1. Messrs. Wm. Paul and Son, Waltham Cross.

H.T. ROSE QUEEN MARY.

Colour, yellow and rose; Gold Medal, N.R.S., July 4. Messrs. Alex. Dickson and Son, Newtownards.

Mrs. W. Sargent.—A very strong-growing hybrid tea rose, carrying substantial flowers on stout growths. The shapely-pointed flowers are teascented, and of a soft cream-white colour. Card of Commendation, N.R.S., July 4. Messrs. Hugh Dickson, Lim., Belfast.

Ulster Standard.—A very large and free-blooming single hybrid tea rose, with blooms five inches broad, and of a brilliant crimson hue. A.M., R.H.S. July 1. Messrs. Hugh Dickson, Lim., Belfast.

Mrs. Godfrey Brown.—A pretty rose, after the style of Mrs. W. J. Grant, but with flesh-tinted petals, shaded with rose on the outer surface. It has fine size and good form. A.M., R.H.S., July 1. Messrs. Hugh Dickson, Belfast.

Muriel Dickson.—A hybrid Austrian briar rose of decorative character. The flowers are large, but have comparatively few petals. The colour is bright reddish-rose or carmine. A.M., R.H.S., July 1. Messrs. Hugh Dickson, Lim., Belfast.

CATTLEYA MOSSIÆ DREADNOUGHT.

A wonderful variety, with petals about four inches across. Of fine form and size, it has also good colouring, the sepals and petals rose-pink, and the lip finely marked with crimson, purple and gold. A.M., R.H.S., July 1. Messrs. Sander and Sons, St. Albans.

CATTLEYA MOSSIÆ OLYMPIA.

A large variety, with blush-coloured, rosy-veined flowers, and a fine lip handsomely marked with deep purple. A.M., R.H.S., July 1. Messrs. Charlesworth and Co., Haywards Heath.

CATTLEYA SERENATA.

C. Whitei is the parent of this hybrid, and it lends substance to the broad and handsome flowers. The segments are of good form and coloured brilliant rosy-mauve. A.M., R.H.S., July 1. Messrs. Mansell and Hatcher, Rawdon, Leeds.

MILTONIA HARWOODI, FOWLER'S VAR.

A striking orchid derived from M. vexillaria and Cochlioda Noetzliana. The rosy-cerise flowers are very attractive, and the colouring is enhanced by the neat golden-yellow crest. M. Harwoodi gained an A.M. some time ago, but this variety is a great advance on the original. F.C.C., R.H.S., July 1. J. Gurney Fowler, Esq. (gardener Mr. J. Davies), Glebelands, South Woodford.

MILTONIA SANDERÆ.

An extremely beautiful miltonia; indeed, one of the finest ever seen. Its parents are M. v. Memoria G. D. Owen and M. St. Andre. The large flowers are white, with a lovely shading of soft rose-pink. On the broad lip the basal disc or "mark" is very dark, blackish purple, and the shortly radiating lines are as nearly black as possible. A fine spike of this superb hybrid was shown. F.C.C., R.H.S., July 1. Messrs. Sander and Sons, St. Albans.

ODONTIODA BREWI.

A wonderful secondary hybrid, obtained by crossing Odontioda Charlesworthi with Odontoglossum Harryanum. Only a small plant was shown, but its rich red-brown or bronzy-red colouring attracted all the orchid specialists. The shade of colour is very deep, and lightened by the spreading golden-yellow crest. F.C.C., R.H.S., July 1. Messrs. Charlesworth and Co., Haywards Heath.

ODONTIODA WILSONI THE PRESIDENT.

A pretty hybrid between Odontoglossum Pescatorei and Cochlioda vulcanica. The first-named parent has exercised great influence, as the flowers are of similar shape, but smaller, white, with rosy-violet markings. A.M., R.H.S., July 1. Messrs. Charlesworth and Co., Haywards Heath.

CARNATIONS.

The Baron.—A light yellow-ground fancy variety, with splashes of rose and lilac. The flowers are large and of good shape. A.M., R.H.S., July 1. Mr. Jas. Douglas, Great Bookham.

Virginia.—Another fancy, the buff ground colour shaded and flaked with rose-pink, and being but irregularly bordered with the same shade; a large, full flower. A.M., R.H.S., July 1. Mr. Jas. Douglas, Great Bookham.

ADIANTUM TRAPEZIFORME QUEEN MARY.

The type of this species is not now generally cultivated in private gardens, but the new varietal form should become fairly popular. It has tall spreading fronds carried on black stems, and rising about two feet high. The pinnules are closely set on the fronds, and depend instead of spreading flatly. Moreover, they are broadly fan-shaped, prettily crinkled and fringed at the margin. F.C.C., R.H.S., July 1. Messrs. H. B. May and Sons, Edmonton.

ADIANTUM SIEBERTIANUM.

A beautiful and graceful fern, that is a variety of A. Weigandi, but more slender and of lighter green hue. Should make a useful pot plant for decorating. A.M., R.H.S., July 1. Messrs. H. B. May and Sons, Edmonton.

POLYPODIUM MAYI CRISTATUM.

Sooner or later every fern largely grown seems to enter upon a crested or plumose form, and so the handsome P. Mayi, while retaining all its old beauty, has now added to its fringing, and become crested at the tops of the fronds. A.M., R.H.S., July 1. Messrs. H. B. May and Sons, Edmonton.

MAGNOLIA DELAVAYI.

This broad-leaved, large-flowered species from Southern China has been seen on several occasions, and now it has received the horticultural hall-mark. It is hardy in the southern counties, and makes a handsome shrub from a foliage point of view. The flowers are sparingly produced apparently; they are deep cream-yellow, with red-tinted stamens, and about six inches wide. F.C.C., R.H.S., July 1. Messrs. Jas. Veitch and Sons, Chelsea.

ERIGERON PINK PEARL.

A pleasing and distinct form, much smaller than the finer forms of E. speciosus, but free and of bright pink colour. A.M. R.H.S., July 1. Mr. Amos Perry, Enfield.

NEPENTHE ATROPURPUREA.

A grand pitcher plant, with foot-long pitchers of fine bronzy-crimson colour, with a wide and brighter crimson-frilled rim. N. sanguinea and S. Curtisi superba were the parents. A.M., R.H.S., July 1. Messrs. Jas. Veitch and Sons, Chelsea.

NEPENTHE LEWIS BRADBURY.

A magnificent hybrid between N. mixta and N. sanguinea. Some years ago this would have made a great furore, but stove plants have not the same interest now as then. The big cylindrical pitchers are light crimson, shaded green, and blotched with crimson. Though not so brilliant, it is larger than N. atropurpurea. A.M., R.H.S., July 1. Messrs. Jas. Veitch and Sons, Chelsea.

IRIS KÆMPFERI MORNING MISTS.

An exquisitely beautiful single variety of wonderful size and lovely colouring. The standards are pure white, and the frills are also white, with a little yellow on the claw, and beautifully shaded with light blue on the upper half. A.M., R.H.S., July 1. Messrs. R. Wallace and Co., Colchester.

Orchids for Amateurs.—This is the title of a practical guide to the culture of sixty easily-grown cool, and fifty warm house kinds adapted for small mixed greenhouses. The book is very well illustrated, and can be procured by post for 2s. 10d. from the Publisher, 148-9, Aldersgate Street, London, or through any bookseller, price 2s. 6d. net.

FEEDING LAWN AND SHRUBBERY TREES.

From time to time readers of THE GARDENERS' MAGAZINE are presented with illustrations of single specimen trees, and those grown to form groups on lawns and in shrubberies. One cannot look at these excellent reproductions without experiencing a certain longing to possess such specimens as they represent. One finely-grown tree will afford a great amount of pleasure, and it is really worth more in a garden than a dozen badly-grown specimens.

Too often a visitor to a garden can detect faulty planting, followed by faulty treatment, as regards many kinds of ornamental trees and shrubs. In the first instance (especially where deciduous subjects are planted in association with evergreen ones) overcrowding is evident.

The principal trees and shrubs ought always to be planted first, and in positions where, when fully grown, they will stand clear of all others, and not encroach on drives, paths, or fences. Where possible, the location of the main trees should be decided by the planter while he looks from the windows of the dwelling-house. Having judiciously planted, and, in after years, taken out all those specimens used at first for filling-up solely, the cultivator should feed the permanent ones before they become stunted.

It is frequently the case that every leaf in a shrubbery is raked out in the winter time. I have seen soil so well raked from the surface as to lay bare many roots. If soil was wheeled in and fallen leaves covered by it, in some seasons, the trees and shrubs would derive an immense amount of benefit therefrom.

I saw a photograph recently of a coniferous tree growing on a lawn, and the photograph was taken about forty years ago. A recent photograph had also been taken, and the tree presented much the same appearance in both photographs. It looked as good a specimen forty years ago as it does now. No feeding had ever been done, and now the specimen will begin to deteriorate.

No doubt it is a very wise plan to feed the trees in the autumn and winter time, but much assistance may be given them now. In cases where the grass is allowed to grow right up to the stem of the tree, much attention to cutting and trimming is necessary. It is different with specimens that have basal branches sweeping the lawn evenly and gracefully.

There should, in many instances, be a neat circle cut around the trees, within which they can be fed; and the diameter of the circle must be in proportion to the size of the tree: one 20 feet high should have a circle with a diameter of about eight feet. If the soil on the surface is very poor, and quite devoid of roots, it should be removed down to the main roots, and a rich mixture of fibrous loam, in a rather lumpy state, with rotted manure, be applied. If this added compost be regularly watered throughout the summer or the early part of autumn, if dry, new roots will become fairly plentiful by next spring, and every two years or so fresh soil should be put on. Good soakings of clear water must be given, occasionally followed by diluted liquid manure.

According to the quality of the soil and the way in which it has been prepared, young trees will thrive for a number of years, but their progress should be watched so that food may be given before they show signs of weakened growth.

G. B.

DELPHINIUMS.

The prominence given to delphiniums during the last few years is a very satisfactory mark of progress in the hardy plant world. Few other subjects contribute so charmingly to the beauty of the summer garden, and they are certainly not surpassed by any in the matter of decorative effect.

The splendid improvements which have resulted from the work of the florists is indeed very noticeable, and, added to a glorious range of colourings, we get magnificent spikes and fine, bold blossoms. In the herbaceous borders delphiniums are usually a conspicuous feature, and, if given good attention in the matter of culture, and plenty of space for development, success is assured.

Undoubtedly the best soil for delphinium culture is a deep, retentive loam, well worked to a depth of at least two feet. In poor, shallow, or sandy soils they are never so luxuriant, but no soil is so poor that it cannot be greatly improved by judicious manuring and tillage. Cow manure is most essential on light, dry soils, and no other manure gives quite such satisfactory results, as it provides a cool and lasting food material.

Points worth noting in the race for success are the necessity for removing all flower spikes as soon as the blossoms fade, and the value of keeping the hoe going. The first operation ensures the production of a good second crop of blossom, and the busy hoe aerates the soil and retains the moisture during summer, and in addition secures free movement for the roots.

With us delphiniums are freely used in the semi-wild garden. In free, open spaces out upon the sloping banks they create brilliant sweeps of colour, a veritable glow of varied blues upon the landscape. One can obtain some grand contrasts by massing soft blues against dark blues and purples. By the contrasting of our subjects with golden lupins, scarlet Oriental poppies, or pale-coloured irises, some first-rate effects are obtainable.

A chat concerning varieties is somewhat a difficult matter, for varieties are listed nowadays by the hundred, and there is a certain amount of overlapping among the efforts of the florists. Such forms as Rev. E. Lascelles, King of Delphiniums, Lizzie Van Veen, Statuaire Rude, Moerheimi, etc., are not easily duplicated, but forms of less outstanding merit are easily matched in the same or in a neighbouring collection. For garden decoration few types of delphiniums are the equal of Belladonna and its fine varieties. The light, graceful spikes of pale blue, and the splendid branching habit, makes it a beautiful plant for any garden. The type is easily raised from seed, and plants can be grown and flowered as annuals in one season from an early sowing under glass. Persimmon, Semi-plena, and other varietes are perpetuated by cuttings or division.

With us seedlings of the second generation vary more than those of the first, and we are able to pick out very good forms, some giving exquisite shades of pink mingled with the blue. Furthermore, these seedlings of Belladonna are more continuous than the ordinary run of delphiniums, which is of the greatest importance to those who are desirous of securing a long season of beauty. P. S. Hayward.

H.T. ROSE MRS. JAMES LYNAS.

Blush pink; Gold Medal, N.R.S. Messrs. Hugh Dickson, Lim., Belfast.

INSECT ENEMIES IN THE FLOWER GARDEN.

When we consider the insects which harass the gardener in the pleasure grounds and flower garden, we quickly realise that they pay more than a fair attention to one particular plant, the rose. Before the winter's frosts have gone, greenfly prey on any shoots which may be "soft," and at pruning time the aphis are usually quite established, so that by the time summer arrives, unless stern measures are persisted in, the bushes are sucked dry. Under glass aphis seldom has an opportunity of showing what they really can do, and their potentialities are really appalling.

During the early spring the eggs, which have lain dormant throughout the winter hatch after a few mild days, and the resultant aphides quickly mature, and lay eggs which hatch even more quickly, and so brood after brood becomes fertile. But once summer really sets in this hum-drum method of propagation is far too tame and slow for the greenfly. Discarding the common habit of egg-laying, they rise superior to the average winged insect, and turn viviparous, and produce young insects at a surprising rate. Hence the enormous number which are produced in so surprisingly short a time.

It is not usually possible to treat the outdoor insects in the manner practised under glass, and to kill them by fumigation, or by cyaniding. It seems remarkable that some enterprising garden sundriesman does not evolve a cheap and handy form of adjustable tent, of varying sizes, for outdoor fumigating purposes. This, in conjunction with a simplified method of cyaniding with hydrocyanic acid gas, would be a "boon and a blessing to (garden) men," and by their means we could easily keep in check the many hereditary foes. But at present we have to rely, in our endeavours to restrict the ravages of greenfly, on repeated syringings with quassia extract. Weak petroleum emulsion is sometimes used, but there is an element of risk, which all do not care to take, attached to its use on the tender foliage of roses. Red-spider and thrips also do much damage to roses, and the latter insect is recorded to be particularly fond of the petals of light-coloured roses in certain gardens, although, fortunately, this form of injury is not general.

The attacks of red-spider and thrips are often induced by the practice of mulching rose beds with strawy stable litter, which, during hot weather, becomes very dry, forming a suitable breeding ground for these insects. The summer mulching material should be moisture-holding, and it should not be allowed to become thoroughly dry. If these insects obtain a footing on the roses the under-sides of the leaves should be syringed with a solution of flowers of sulphur and soft soap.

The ordinary scale insects of glass-houses do not often affect roses, but the woolly scale, so common in the Mediterranean region, has put in an appearance in some western gardens. Although this kind possesses a hard scale-covering, it lacks the adherence of the better-known species, and is not so difficult to remove; spraying with petroleum emulsion is an efficient remedy.

These are the chief of the sucking insects which trouble the rose-growers; the biting insects are extremely numerous, and include such as the Rose Chafer, a handsome beetle, which feeds on the pollen of the flowers, and thus spoils them; the pith-borers, caterpillars which bore into the stems and eat the pith; another species of sawfly eats the foliage of roses; the Upholsterer Bee, which cuts semicircular portions from the leaves for lining her nest; and then there are the grubs of the Tortrix Moth, which twist and roll the leaves together with their threads, and later on pierce the rose buds. Many of these grubs and beetles must be hand-picked and destroyed, but where they have previously caused damage the bushes should be sprayed with Paris green, to check them, early in the season. Paris green should always be purchased in the form of paste, to be used at the rate of 1oz. in twelve gallons of water, and, being very poisonous, must be used with extreme care. London Purple, mixed at the rate of 1oz to sixteen gallons of water, is also to be recommended.

The insects above-noticed are common to many other plants in the flower garden, and earwigs, which particularly affect dahlias, are frequently a pest; these should be trapped and killed. Occasionally the larvæ of the iris fly burrow in the leaves, somewhat after the manner of the marguerite leaf-miner, and the remedy is much the same; the larvæ must be killed by pressure, and the foliage rendered distasteful to prevent the fly laying fresh eggs. The carnation grub may be similarly dealt with, and these plants are also subject to greenfly, thrips, and red-spider.

CECIL AUBREY.

ROSE MARECHAL NIEL.

Although there has been a number of really good additions to yellow roses of late years, no yellow climber can compare to Maréchal Niel, which is still head and shoulders above them all. Probably it is the most popular rose under glass, although not so generally grown as was the case some years back.

Maréchal Niel has apparently deteriorated to some extent. We seem to miss the rampant and healthy vigour so characteristic of this Noisette in the past; but with more care in selection when increasing stock, avoiding propagation from an old plant that is obviously on the decline, and striving for a few generations of quite clean, healthy, younger stock, I feel we might still do much to obtain an improved strain.

To grow this rose satisfactorily in the open air we need a warm wall and sheltered position that is almost the equal of cool greenhouse treatment. One of its characteristics being a quantity of rampant growth late in the autumn, necessitates a much better ripening than can be secured in the open. This is not all, for it is one of the first to come into new growth, and so needs extra protection early in the spring.

Providing it is not exposed, I would even prefer a north aspect to one facing due south, and open to the full influence of sun. In the latter case we invariably have a quantity of precocious growth, and, however well sheltered, a few cold days give a serious check. But on a north wall, with shelter from biting winds, the growth is later, and has a much better opportunity to come through without such extreme changes as must necessarily occur when subject to a bright sun just after a cold, frosty morning. The above is the reason why Maréchal Niel is only suited for a few highly-favoured positions in the open, and it is more particularly as a cool greenhouse or conservatory climber that I would treat it.

Canker and mildew are its two worst enemies, and perhaps canker is more prevalent upon this variety than any other. There unfortunately seems to be no certain or reliable cure for this serious disease, and our most indefatigable and scientific workers among roses have apparently failed in even discovering the real cause of it; hence it is less wonder we cannot combat it so effectively as we would wish.

The writer has made numerous and somewhat costly experiments, resulting in disappointment after good prospects of success. Prepared soil of various kinds, selection of stocks, working it upon another variety of rose, and growing upon its own roots, have all failed. The plants may be in the very best of health, and suddenly the enemy puts in an appearance. We know of many things that appear to encourage its development, and may even flatter ourselves we have discovered a palliative measure, but it does not prove sufficiently effective to be classed as a cure.

As a matter of fact, half-a-dozen plants may be treated exactly alike, yet the resulting growth be widely different; so we cannot say for certain that such-and-such a system is truly the means towards a good or unsatisfactory end.

A sudden check to growth will upset the balance between the action of root and top, and induce a tendency to canker. Then we very often find canker prominent at the junction of the stock and rose when foster roots are made use of. That the stock is solely responsible for this I do not credit after my many experiments, but I do think it is more prevalent in cases where stock and rose do not swell evenly at this critical point.

Some of the best specimens I have had in the open were upon the De la Grifferaie stock; also some surprising results from budding upon the Penzance sweet briers; not using these as a purely dwarf stock, but budding in the barrel of stout shoots after the manner of our Continental growers when raising standards. But, after all, I cannot claim that either of these stocks will produce a rose entirely immune from attacks of canker.

Maréchal Niel varies somewhat in colour, and while not so much so as in the case with another grand yellow climber, William Allen Richardson. From my own experience it would seem impossible to correct this variability, as under similar conditions a plant will produce both pale primrose-yellow and the deep golden-yellow flowers.

There can be little doubt that the long-rod system of culture produces the best results, for unless we can secure some good rods of healthy and well-matured wood, satisfactory blooms cannot be forthcoming under any treatment. Too drastic use of the knife is not reasonable when we bear in mind that the roots must naturally be at their greatest activity at this period, and this is why I prefer a more steady, although complete, removal of all wood that has flowered, giving every encouragement to vigorous rods for next season's supply.

If any show signs of failing health, or develop canker, cease to harbour them, and try with fresh plants.

A. P.

THE STORIES OF SOME SHRUBS.

A gardener views his possessions with more interest when he has learnt their histories, legends, and symbols, as well as the methods of their cultivation. We need not despise the least of the poetical fancies that have clustered around trees, shrubs, and plants, since all had their origin in the intellect or the sympathies, all have been preserved from generation to generation, and are now equally in danger of being lost in the passing of the years. Nay, not all, perhaps; it will be long indeed before the oak ceases to be typical of British character and supremacy, the holly of Christmastide; but other charming tales and imaginations exist that are already unfamiliar.

Take the arbutus, or Strawberry Tree, as an example; it is difficult to discover a garden owner or tender who is aware that it is the emblem of unconquerable love. Its fruits used to be generally eaten in Spain and Italy in the early ages, yet the name of the berry, "unedo," is said to have been given it by Pliny, because it signifies that "only one" could be consumed at a time owing to the biting flavour. Horace and Virgil often mentioned arbutus as used at funerals and also festivals; a later poet named it the Generous Shrub, because it offers leaves, flowers, and berries on the same boughs; hence, too, came the lines:

> "The leafy Arbute spreads
> A snow of blossoms, and on every bough
> Its vermeil fruitage glitters to the sun."

Why, it may be asked, is the gorgeous broom the symbol of humility? The most probably explanation is that contained in the story of a prince of the House of Anjou, who, having killed his brother out of avarice, and then repented, scourged himself every night with a rod made of the fibrous stems of this shrub, reminding himself that for gold, as fleet to vanish as its blossoms, he had sinned so grievously. The French name of it is Genêt, from which is derived that of Plantagenet, or planta genista.

In the year 1234 King Louis IX. of France chose the broom as a badge to be worn by the members of a newly-created order of knighthood; the knights had each a chain composed of imitation broom-florets and white fleur-de-lis, from which was hung a golden cross, bearing the motto "Exaltat humiles."

The myrtle is said, in mythological lore, to have gained its name from Myrsine, an Athenian maiden, who was transformed into this shrub, but we are also told that when Venus sprang up from the foam of the sea she was crowned with a garland of the perfumed blossom, for which reason it has always been held as emblematical of love, except with the Jews, who give it instead the signification of peace. In connection with this we are reminded how when the prophet Zechariah beheld the angel who predicted the restoration of Israel, the celestial visitant was standing in the midst of a myrtle grove. The Arabs are devoted to the myrtle, and have a tradition that it is the one shrub that Adam personally carried with him as a souvenir out of the garden of Eden. The Romans used to infuse myrtle berries in their wine, to gain rich flavour, and employed them also in medicines, while myrtle thickets were planted around the baths of great ladies. It is interesting to learn that myrtles were grown in warm parts of England long before greenhouses were invented, but this is in no wise remarkable considering the great dimensions to which the shrub grows now in Sussex, Devonshire, and Cornwall.

Of the gorse, or whin, we know little, except the great love borne to it by the chief of all botanists, Linnæus, who, according to tradition, fell upon his knees in rapture when he first beheld it covering a common near London. He attempted, but in vain, to induce this shrub to flourish in his native Sweden. Elizabeth Barrett Browning has poetically recorded his appreciation.

> "Mountain gorses, since Linnæus'
> Knelt beside you on the sod,
> For your beauty thanking God,—
> For your teaching ye should see us
> Bowing in prostration new.
> Whence arisen, if one or two
> Drops be on our cheeks, O worlds! they
> are not tears, but dew!"

It is stated that the plant is known as gorse in the north, whin in the east, and furze in the south.

It was Linnæus who conferred the classic name of Andromeda, in memory of the nympth who was rescued from the ocean. He said that the shrub is found on some hillock rising out of a swamp, as Andromeda was chained to a rock in the sea, the water bathing its roots as it washed her dainty feet. The Germans consider it emblematical of the question, "For whom do you wait?" but the usual signification, in the Language of Flowers, is "Will you help me?"

Of all the stories of the laurel we may select for remembrance how the Grecian medical students were crowned with its berried branches, from which come the terms both of laureate and bachelor, from the Latin, "Vacca lauri," or fruits of the laurel. The students were not allowed to marry, hence the use of the word that has descended to this day.

ODONTIODA HARWOODI FOWLER'S VARIETY.

Colour, rose-cerise. F.C.C., R.H.S., July 1. J. Gurney Fowler, Esq., Glebelands, South Woodford.

STRAWBERRIES.

Young strawberries should be raised yearly from a healthy stock of plants that have been planted expressly for the purpose of propagation, as from these we obtain the strongest crowns, and the best crops the first year after planting. Royal Sovereign, raised early, and planted for the production of an early crop, leaves little, if anything, to be desired, but it is necessary on some soils to renew the stock, and then a change of stock may be desirable every few years for the production of healthy plants and heavy fruits.

When layering use good soil, and keep the plants well watered. If the land or beds that have been utilised for strawberries for some years is to be replanted, remove a few inches of the top soil, and add a little fresh, with a good sprinkling of soot, bonemeal, and wood ashes. Remove the old plants as soon as they have ceased bearing; make the land ready, and plant whenever the runners are fit. These remarks apply especially to warm borders, suitable for an early supply.

H. Markham.

Wrotham Park, Barnet.

GERMAN IRIS IN THE KITCHEN GARDEN.

The forms of Iris germanica are among the brightest and most attractive of our hardy border flowers, providing a display in the garden during May and June. The earliest varieties bloom at the same time as Darwin tulips, while the later sorts carry on the display until the middle of June. German iris do not call for frequent planting, but when this is imperative or the making of a new border necessary, the present season is most opportune for the work. This is explained by the fact that just now the young growths are being developed from which flowers will be produced the next season, consequently when the plants are established in their new quarters, soon after flowering, there is small chance of losing a season's display.

Planting being only necessary at long intervals, it should be done in a thorough manner, the ground being trenched and manured beforehand. In planting do not bury the rhizomes, as with other subjects, but lay them horizontally and at no greater depth than one inch beneath the surface. The roots, however, should be buried to their greatest depth, and the soil made quite firm about them. Should a dry period follow, soak the border at least once a week with water until it is seen that the plants are growing freely. The illustration shows a double border planted with varieties of Iris germanica treated as advised. Originally the plants were overcrowded and starved, and were transferred to this position in July, 1912, the photograph being taken on June 2 of this year.

German iris are divided into groups, and a representative selection from each includes:

Germanica varieties. — Kharput, an immense early-flowering variety with blue-black falls and dark-blue standards; Atropurpurea, also early, with rich dark-purple flowers.

Amœna varieties.—Calpyso, S., white; F, white and blue; Mrs. H. Darwin, white, reticulated violet, very fine in flower; Penelope, white-veined rosy lilac; Victorine, S., white; Falls, violet and white.

Aphylla varieties.—Innocenza, S., white; F., white with orange; Mdme. Chereau, white, suffused azure blue; Queen of the Belgians, S., white, flushed purple-blue; F., white with purple lines and dots.

Neglecta varieties.—Cordelia, S., rose lilac; F., crimson suffused rose; Cottage Maid, S., silver blue; F., white, reticulated violet; Shelford, S., dark lavender-blue; F., dark crimson-purple, reticulated white at base; Virginie, S., pale-blue; F., blue.

Pallida varieties.—Dalmatica, immense flowers, deep lavender-blue; Garibaldi, rosy mauve; Her Majesty, S., rosy pink; F., light crimson; Oporto, rich purple mauve, yellow blotch on fall; Pallida, S., pale lavender-blue; F., rosy lavender; Queen of May, rosy lilac, nearly pink; Sir Michael Foster, fine shade of mauve; Frantlieb, a uniform shade of pale rose.

Squalens varieties.—Bronze Beauty, S., yellow and maroon; F., white and maroon; Jacquiniana, S., bronzy-crimson; F., maroon; Khedive, shaded rose lilac; Newton, S., heliotrope; F., heliotrope and brown; Van Geerti, S., purple black; F., lavender.

Variegata varieties.—Aurea, rich golden-yellow; Foster's Yellow, citron yellow; Gracchus, F., crimson and white; S., white and primrose; Maori King, F., velvet crimson; S., golden-yellow; Mrs. Newbronner, rich golden-yellow, large, new.

Coombe Court Gardens. THOMAS SMITH.

BEAUTIFUL BORDERS OF GERMAN IRIS
In the kitchen garden, Coombe Court, Kingston-on-Thames.

SOME PERPETUAL-BLOOMING PILLAR ROSES.

For a long time the great drawback to the pillar roses was the fact that most of them failed to bloom satisfactorily more than once during the season. So great a demerit has now been lessened by the introduction of a number of varieties that are more or less continuous-flowering during three to four months of the summer, and a short list of some of the best may be helpful. Already not a few of the pillar roses are over, and only an occasional bloom can be looked for throughout the rest of the year.

A very beautiful pillar rose is found in Florence Haswell Veitch, a new hybrid tea from Waltham Cross. This is one of the brightest roses grown, a brilliant scarlet shaded with deep maroon. Not a large and cumbersome flower, but of good form and substance, with stiff petals that last well. It is remarkably sweet scented, and a most continuous bloomer. Sarah Bernhardt affords us another good dark rose for our special purpose. A little more than semi-double, with long, well-formed

buds in its early stages, opening and retaining its deep crimson colour, shaded with the deepest of scarlets. I have never known this rose burn in the hottest sun, while it is very hardy, and one of the sweetest scented of all. Gruss an Teplitz is well known for its deep crimson, shaded with a fiery velvety red. Its handsome foliage and fragrance also deserve mention.

William Allen Richardson gives us a rich orange yellow that is very good both early and late, also producing a goodly number of flowers between these two main crops. Madame Pierre Cochet is another good yellow that is almost orange in its younger stages, and a grand flower for the coat. The foliage of this variety is particularly pleasing. Climbing Mrs. W. J. Grant is an even better individual flower than the normal type, and can generally be found in bloom. A clear, rosy-pink of wonderful size and form.

Climbing Caroline Testout, while not quite so floriferous as its first type, is more continuous than many, and gives massive flowers of a clear bright rose, that have the additional merit of lasting well, both upon the plant and when cut. Climbing Lady Ashtown is a clear light rose with a shading of yellow at the base of its petals. Very large and well formed. Its rather drooping habit is not so much a drawback when used in its stronger form as a pillar rose.

Lady Waterlow, a clear salmon-rose, beautifully edged with carmine, is a particularly long-lasting flower, backed by the deepest green foliage, that with me it is as near mildew-proof as any pillar rose. Madame Charles Monnier does better as a pillar rose than in any other form with me. The body of this flower is rosy-flesh, shaded with yellow, salmon, and orange.

Madame Hector Leuilliot is difficult to surpass if a warm position can be given. A clear golden-yellow, shaded with ochre-red. Large, globular, and one that enjoys fine, sunny weather Rather upon the tender side, but deserves a selected spot in every collection. Madame Morreau is another coppery-yellow, deeper in the middle, and the reverse of outside petals a rosy-apricot; handsome copper and bronze foliage, and quite one of the best for pillars.

Papillon produces spreading trusses of small, pointed buds, varying in colour from pink, white, and coppery-salmon. A grand rose to last, and very free blooming. Trier favours the musk roses very much, if it does not belong to that class. A thoroughly perpetual bloomer, large, spreading trusses of creamy-white, semi-double blossoms, with prominent dark yellow anthers. Very hardy, and in bloom until the frosts set in.

Climbing Mrs. W. H. Cutbush is very valuable as a pillar rose, with its continuous trusses of clear but pale-pink blossoms that are almost always with us. In Graf Zeppelin also we have a good climbing form of brilliant coral-red in large trusses that somewhat favour Gruss an Teplitz, but is yet distinct.

A number of other pillar roses that were used in the past are not to be compared to the above, and unless a glorious display of colour were wanted at one time only, I would much prefer to replace them with those now enumerated. ROSARIAN.

FIRST PRIZE BOWL OF A DECORATIVE ROSE.
Shown by Mrs. J. Hicks, Twyford, Berks, at the N.R.S. Exhibition.

ASTER AMELLUS.

This is one of the European species of aster, and one of the first to be grown in this country, being introduced in the time of Queen Elizabeth. The species, perhaps, is not much grown now, but there are half a dozen or more varieties of it, though they do not differ very much from the type in their general habit and form of flower. Some of them are familiar to everyone with their comparatively short, erect growth, each stem bearing only a few large flowers, usually of a violet-purple colour. Some varieties are almost the first Michaelmas daisies to flower, reminding us every year soon after the middle of August that autumn is near. It does not increase so rapidly as most of the family, and on a wet clay soil does not always come successfully through a damp winter. It seems to thrive best on a rather light soil, rich in lime. It is a good plant for naturalising when the general conditions are favourable to it.

The best-known forms are Bessarabicus, with large, deep-violet flowers, and strong, erect habit: Distinction, of a rosy-mauve tint, carrying more flowers on the stem than the type; and Framfieldense, with flowers of a violet-blue shade. A. C.

A FINE BASKET OF H.T. ROSE MRS. CARNEGIE.
For which Messrs. Cocker and Sons were awarded the first prize for any variety other than a T., N., or H.P., at the N.R.S. Show.

TALL PERENNIALS.

Those who give up any considerable portion of their gardens to hardy perennials must often have felt that it is unfortunate that many of them grow so tall. This is especially the case with those of the late summer and autumn, which do so much to lighten up the garden in these seasons, when the occupants of the flower beds are at least past their best, and, moreover, prove such a stand-by as a source of cut flowers for the house. A small town garden, or what we usually understand by a suburban garden, has room for hardly any of these tall-growing plants in fitness, except so far as it is necessary to provide some kind of screen, and even gardens of a quarter to half an acre must not have very many of them unless the effect of the whole is to be marred. If they are in the front of borders they hide something else from every point of view, and if they are at the back they make the wall or fence behind them useless, while if they are in beds in the central parts of the garden they need to be used with great care.

In this matter we must exercise considerable restraint, growing few of these tall plants, but so using them as to produce the maximum effect. Many of them are but little branched, producing nearly all their flowers at or near the summit, and the sight of a small clump of one of the tallest varieties of helenium, echinops, perennial aster, sunflower, inula, senecio, achillea, or thalictrum, growing by itself, with plants of lower growth all round it, can scarcely be considered beautiful. If such plants are grown it should be recognised that the size of the clump or group should bear some proportion to its height, thus lessening its apparent height, and making the length of flowerless stem, and often sparse and unattractive foliage, less prominent. If this principle is adopted, it follows that only gardens of a certain size can grow any of these tall plants, and that it needs large gardens indeed to grow many different kinds. To grow such plants on a narrow border is out of the question, and to fill a small bed on a lawn is scarcely less so in the case of the tallest varieties. A few examples of their use for decorations may serve as suggestions for others.

That tall sunflower, Miss Mellish, made a very effective object last summer grown in a mass about six feet in diameter, reaching almost from the back of the border to the front, with some self-sown nasturtiums climbing amongst the outer stems and festooning them with gorgeous wreaths. A few stakes had been driven amongst the stems early in the summer, and most of the stems, at least all the outer ones, received some support from them, either directly or indirectly, and so kept the whole in an upright position—a necessary precaution with stems eight feet high, carrying leaves a foot in length. Aster cordifolius Ideal—a really tall variety—appeared quite low-growing by the side of it.

The golden rods have been relegated to the wild garden of the wildest type, but that variety known as Golden Wings—its species seems doubtful—made another fine display in the same garden as the above. A large clump a foot or more in diameter at the crown was put in a specially prepared bed on a lawn, where it had the run of good soil for three or four feet all round and quite two feet downwards. It grew quite six feet in height, and as the outer stems inclined outwards at an angle of 45 deg. the spread of the whole clump was not less than eight feet, while, all the stems being clothed with laterals, it produced the effect of a handsome flowering shrub during the greater part of August and September, and was not without beauty up till Christmas with its masses of fluffy seeds.

Hollyhocks are so different from all other tall plants, that they must be mentioned separately. Grown in masses even in the largest garden much of their beauty is lost. A group of three plants together is the utmost that should be allowed, and even two are enough if they are large plants, with three or four more main flowering stems each. The best way of all is as a double row, one on each side of a path, or even along one side only, as, for instance, along the margin of the kitchen garden. There they show off to perfection, for when coming up the path we see the whole of the plants at once.

The untidiness or unattractiveness of some tall plants after flowering may be effectively screened by a proper use of some of the later-flowering tall perennials. Not only will they grow up in front of, or alongside them, so as to mask them as summer advances, but some with less stout stems, such as Rudbeckia Golden Glow and Aster Novi-Belgii Wm. Marshall, may be trained horizontally over them. Less tall plants, such as Oriental poppies and Achillea ptarmica The Pearl, both untidy subjects after flowering, may be grown amongst gypsophila or some of the branching Michaelmas daisies, which will grow over them and completely hide them later in the summer.

It is, perhaps, as a screen that the greatest value of these tall perennials lies, and there are few gardens which cannot use some of them to advantage in this way. There are two important features in their cultivation which must not be neglected. They must always be given good cultivation, any attempt to grow them on starvation lines resulting in plants of poor weedy growth, which are but little better than the objects they are sometimes planted to hide, and the same applies for whatever purpose they are grown. People often condemn perennials because they spread so much or are weedy in appearance. Spreading can always be checked if the soil is properly cultivated among them, and many are better for being taken up and divided each autumn or spring, and some good rotted manure dug into the ground. They will never appear weedy then, especially if the weaker shoots are all pulled out in the spring. Even the old prairie sunflower, Helianthus rigidus, or harpalium as it used to be called, makes a handsome decorative plant when so grown. The other important feature is staking. If the stems are once allowed to fall down, and they are liable to do this very early in the summer sometimes, their beauty is marred, and it may even be spoiled for the rest of the season.

ALGER PETTS.

EDIBLE FUNGI.

A number of species of fungi that are of value as food are allowed to go to waste in this country. As a people we have been taught that every fungus, except the common mushroom, is poisonous, or at any rate the idea prevails, and every other form of fungi is looked upon with grave suspicion. The fact that in Continental countries many species are utilised in the preparation of toothsome dishes does not tend to destroy the prejudice that exists, and, although but few of us can reconcile ourselves to a wide selection, there cannot be two opinions as to the wisdom of our Continental friends in utilising more than one kind. Horticultural lecturers are doing a splendid work, under the auspices of the various County Councils, and I have often thought that they might, by ocular demonstration and description, give much useful information with regard to both edible and poisonous fungi. This knowledge, if not spread amongst a small body of persons in each district, would rapidly be disseminated, and in time the country dweller would become familiar with the characteristics and use of the native species.

We are all acquainted with the common mushroom (Agaricus campestris), and apart from natural supplies in autumn, they are produced artificially in enormous quantities at all seasons. Other edible forms of agaricus are seen in a tricholoma, familiarly known as toadstools, which, as children, we were told to carefully avoid. When well cooked they are very appetising and palatable, and the same applies to an astreatus which is generally found round the base of trees in September and October. The colour is dull white, and the species is commonly known as the oyster mushroom.

The basal part of elm tree trunks is often smothered with Agaricus ulmarius, and they are by no means to be despised. A. procerus is very popular in France, and is said to form very fine ketchup. The St. George's Mushroom (Agaricus gambosus) appears in enormous quantities in pastures in some districts, and takes the form of rings, and is characterised by its delicacy of flavouring. The Horse Mushroom (Agaricus arvensis) is sold in our great cities and towns as the common species. It attains to enormous dimensions, and, apart from being coarse, often causes stomach trouble if not well cooked.

Polyporus giganteus, as its name implies, also attains to a great size, and specimens have been known to weigh upwards of thirty pounds. When fully developed, it is leathery, but very good when young. Those of epicurean tastes will find much to admire in a dish of the Giant Puff Ball, whose botanical name is Lycoperdon giganteum. It must be gathered when young

Boletus edulis must not be forgotten, being one of the very best edible species, but great care must be exercised as to the proper time of gathering. Its chief characteristic is its brown cap, whose under surface is white, followed by a yellow hue, when it should be eaten. It is unfit for food during the last stage, which is marked by a dark-green colouring.

The genus Lactarius are known as the milky agarics, the best-known being L. deliciosus. It contains a considerable quantity of juicy fluid, which, in its first stages, is red, and later green.

I have simply touched upon a few of the more important species, and, if every country dweller were acquainted with these, many tons might be utilised as food every year.

WALTER H. AGGETT.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

AUTUMN-FLOWERING CATTLEYAS.—Such species as C. labiata, C. Warscewiczi (Gigas), C. aurea, and C. Boweringiana, among the autumn-flowering kinds, and the numerous hybrids, will have their new growths in different stages of development, and will require every care that will assist them. The earlier flowering kinds will be found to have the greatest tendency to produce what we term sappy or soft growth. This is only natural when we consider the amount of protection required by other occupants of the same house, to prevent strong light from disfiguring the foliage. This may be also considered detrimental to the plants, for it is rarely we obtain satisfactory flowers from the best forms, unless the growths are properly ripened before the flowers expand. It will also be found that immature growths, especially the early ones, have the greatest tendency to start into activity a second time, and unless we have very favourable conditions, such secondary growths are rarely induced to mature late in the season. In the case of C. Warscewiczi it was a common practice a few years ago to place the early plants in a cool, dry house, where they were subjected practically to full light. This is a very good method where space is available.

BLACK SPOT.—Some weeks ago a correspondent wrote asking what method could bulbs, or any portion of the leaf, appearing on his cattleyas. The black spotting, I am convinced, is the effect of two distinct diseases. There is one which attacks the bulbs, or any portion of the leaf, appearing first as a tiny spot, and rapidly developing into a large black patch, which very quickly causes the whole growth to become a black, rotten mass, which may kill the plant. This is caused by bacteria, and if we take a pin and prick the leaf affected, and then, without cleaning the pin, prick a leaf on a plant which is perfectly healthy, the effect will be apparent the following day, and the development will be so rapid that the disease spot quickly reaches the size of a shilling. I cannot advise anything better, with safety, than to cut off the diseased bulb, or leaf, as the case may be, and burn it. The other evil is a fungoid growth which spreads with a star-like appearance on the leaves. This had best be cut off whenever observed. We have been experimenting here with mercury, or ultra-violet, rays on these and some other pests, and the results have been most remarkable. Space does not permit of my dealing with the results that have been apparent from the use of this lamp, but I hope, with the Editor's permission, to submit an article on the subject for publication in the near future. [We shall be delighted to give publicity to the results of the experiments which Mr. C. Cookson and Mr. Chapman have been making with the electrical mercury lamp at Oakwood.—Ed.].—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

MALMAISON CARNATIONS. — To prolong the season of flowering the blinds must be left down all through the day. The floors and stages should also be sprinkled with water frequently on hot days to cool the atmosphere. Select some of the most promising of the one-year-old plants, and shift them into 8in. or 9in. pots. It is necessary to grow a good batch of these where large supplies of flowers are required. The potting must be done carefully and firmly, using a compost of fibrous loam, leaf-soil (which has not been fermented), coarse sand, and a little finely-broken old brick rubble. A small quantity of well-seasoned soot and crushed bones will meet their requirements in the matter of manure. For a week or two after potting the plants must be shaded from bright sunshine, and syringed two or three times daily with rain water. As soon as possible after flowering layering must be proceeded with. For this purpose a box frame should be placed on a south or west border. A good quantity of fine light soil will be necessary in which to peg down the young growths. This should consist of two parts loam to one of leaf-soil and a good sprinkling of sand. Keep the frames close and shaded during the hottest part of the day, and syringe the plants frequently. When the plants are rooted, gradually inure them to plenty of air and exposure to the sun.

CYCLAMEN.—As the plants become well rooted, a mild stimulant may be given them. This should take the form of a little weak soot water, which will not only strengthen the plants, but will also help to keep the soil free from insect pests. They should have an abundance of air at all times and during warm, congenial weather the lights may be removed for the night. Primulas, cinerarias, and bouvardias may be given similar treatment when they are established in the pots in which they are to flower.

CLIMBING PLANTS. — These are now making rapid growth, and in order to keep them within bounds it will be necessary to periodically thin them out, especially the stronger-growing kinds. Dead flowers must also be removed with as little delay as possible. Watering and feeding with manures must be carefully attended to. Some of the old-established plants also need an annual surface dressing of some rich materials. The young growths of climbing roses must be regulated and tied in as the case demands. These plants need abundance of moisture at the roots at this season. Give them a vigorous syringing every evening.—E. Harriss, Lockinge Park Gardens.

HARDY FRUITS.

SUMMER PRUNING PLUMS.—This work may now be taken in hand and pushed forward, so that light and air may assist in the formation of good fruitful buds, and the ripening of the wood for next year's crop. Do not shorten the young shoots too far back this time, but attend to the trees again in a month or six weeks' time and then shorten them to within a few eyes of the base. Preserve sufficient young pieces at intervals all over the trees, as very frequently these produce the best fruits the following season. Keep a look out for insects, and syringe well with quassia extract or some other approved insecticide, following this with clear water until the whole of the leaves and growths are clean. Many of the trees are very thinly cropped, and will make a more free growth than when bearing heavy crops, so that little or no feeding will be necessary. But water will be needed if the weather continues dry, and, when given, let the ground be thoroughly soaked. Train all leaders carefully, using soft material wherewith to fasten them in the required position, and give young trees that were late planted plenty of moisture at the roots, so that the growths do not become stunted. The ruin of many a young tree may be traced to a severe check during the first year or so after planting, caused by drought.

ORCHARD TREES.—Where these are growing on grass land keep the grass short, and allow, if possible, sheep to graze among the trees. We have an orchard planted over 20 years ago, in which poultry have had a run, and, although the soil is very light and gravelly, the growth of the trees, the crops of fruit, and colour, are all that could be desired. The failures in orchards laid down with grass are due chiefly to the grass being allowed to grow and then cut down for hay. With us this year apples of all sorts are heavily cropped, and thinning will have to be done.

GOOSEBERRIES.—If large fruits are required for dessert purposes, let the trees have a good soaking of liquid manure before covering them over with nets to protect the fruits. Cordons must have the young shoots not required for extension shortened to prevent a mass of useless wood, and to allow air, etc., to reach the fruits. Keep the foliage free from red spider and caterpillars, and maintain a free, clean growth and leafage.

MORELLO CHERRIES.—Lay in the shoots of Morellos, training them like the peach; give the roots a good soaking with liquid manure, to which a little lime has been added. Mulch well if the land is light, and net early. Cherries, like all stone fruit, should not be allowed to suffer at the roots during the stoning process, otherwise many fruits may drop.—H. Markham, Wrotham Park Gardens.

THE KITCHEN GARDEN.

CABBAGE.—Spring cabbages are so highly esteemed, and so much in demand, that every possible effort should be made to secure them as early as possible. Much depends upon the quality of the seed and the selection of varieties, and if more care were taken in these respects we should have less complaints of the plants bolting. It is advisable to make two, or even three, sowings, so that if one does not succeed there is a reserve to fall back upon. The first sowing should be made about the 18th of this month, other sowings to follow at intervals of a fortnight. The varieties Harbinger, April, and Flower of Spring can be thoroughly relied upon, the two first-named are small, but of the highest quality; Flower of Spring needs no further mention, being regarded as a standard variety. To those desiring a later and larger type of cabbage, Emperor is one of the finest varieties grown. The seeds should be sown broadcast in an open position on a moderately rich ground. If the soil be dry, give a thorough watering a day before sowing takes place, and afterwards as occasion requires. Watering is best done towards the evening. Net the beds securely against birds.

VEGETABLE MARROWS.—The plants should be examined once a week, and have all superfluous growths removed, and those retained should be pegged down, ample room being allowed for the young foliage to develop. An abundance of water is necessary during dry weather, and when the plants are fruiting, give an occasional dose of liquid manure. Remove the fruits as fast as they become fit for use, and if the weather be dull and cold it will be necessary to fertilise the female flowers.

TURNIPS.—Preparations should be made for sowing for the last crops. The first sowing should be made about the middle of the month, and others at intervals of two or three weeks, till the first week in September. It is preferable to make small and frequent sowings, the smaller roots being superior in flavour to large ones, and they keep the best when stored. The position of the beds in the present month should be cool, and the land should have been recently manured. The August and September sowings require land in good heart. The plants soon bolt or become a prey to the turnip flea, if the soil is dry. The turnip, when growing in well-drained land, is not damaged by a few degrees of frost, and in mild winters the roots may be left in the ground until the spring, when excellent "tops" may be taken from them. Before sowing, apply a dressing of soot and wood ashes, or slaked lime and wood ashes.—W. Messenger, Woolverstone Park Gardens.

EXHIBITIONS AND MEETINGS.

National Rose Society.

Although the day was not a promising one, especially in the early morning, July 4 turned out to be a first-rate day for a rose show. Rain kept off, occasionally the sun shone, but usually there was what a photographer calls "a good light," and a pleasant breeze. There were crowds of visitors, and the ladies put on their lightest and brightest summer frocks so that the scene, both in the tents and in the Royal Botanic Society's Gardens, was a very bright and animated one.

There was never a finer rose show than this one. Every one of the hundred and eleven classes was well filled, and in some cases there were more than a score of competitors for the place of honour. The flowers were bright and clean, and lacked nothing in size, and they were present in such abundance that they quite defeated the suggestion that this is a bad rose year. The comparatively cool day was in their favour, and they lasted well. The ladies' classes for arrangements of roses for floral decoration formed a very interesting feature, and incidentally demonstrated the high value of Irish Elegance rose for decorating, as it was by far the most popular rose with exhibitors.

New roses attracted general attention, and the Irish raisers had a great day. Four policemen had all their work cut out to keep the visitors steadily moving through the wide tent in a stream two or three deep. We think that, if the tabling had been about a foot or so higher, visitors would have been better able to see the blooms, because those on the outer side of the stream would then have had a view of the new varieties that was denied many of them (especially if of low stature) on this occasion. However, the arrangements for the new roses were better than before, and we refer our readers to our description of the medal varieties, and those commended, under "New Plants."

NEW ROSES.

The following were in competitive classes:

In the class for nine blooms of any new rose, Messrs. Jas. Cocker and Sons, Aberdeen, scored with Mrs. Andrew Carnegie, and Mr. G. Prince came second with the blush Mrs. Maynard Sinton.,

For a dozen new roses, Mr. G. Prince was placed first with Countess of Ilchester, Ethel Malcolm, Mrs. H. Hawksworth, Mrs. Muir Mackean, British Queen, Mrs. F. Hobbs, Elizabeth, etc.; Messrs. Perkins and Sons second; and Messrs. Alex. Dickson and Sons, third.

Mr. J. Mattock had the best nine vases of new decorative roses, and scored with Mrs. H. Taylor, A. R. Goodwin, Mrs. E. J. Holland, Walter Speed, His Majesty, Duchess of Wellington, Jas. Coey, Mrs. A. Tate, and Lady A. Stanley; Mr. E. J. Hicks second.

The Hammond Cup for six blooms of new roses was won by Mr. F. Dennison with Mrs. A. E. Coxhead, Mabel Drew, Alex. Hill Gray, Duchess of Westminster, Mrs. A. Hammond, and Mr. J. Welch; Mrs. R. Fortescue second.

SILVER MEDAL BLOOMS.

The society awarded silver medals to the following "best" blooms in the show:

Nurserymen. — H.T., G. Dickson, from Messrs. Frank Cant and Co.; H.P., Mrs. John Laing, from Messrs. R. Harkness and Co.; T. or N., Mrs. E. Mawley, from Mr. George Prince.

Amateurs.—H.T., Avoca, from Dr. Pallett; H.P., Horace Vernet, from Mr. Foley Hobbs; T. or N., Mrs. Foley Hobbs, from Mr. C. Eversfield.

NURSERYMEN.

The nurserymen's championship was won on this occasion by Messrs. Benjamin R. Cant and Sons, Colchester, from five competitors. This firm staged a fine set, and had particularly heavy blooms of Mrs. Sam Ross, Edward Mawley, Mdme. Jules Gravereaux, Mrs. T. Roosevelt, Caroline Testout, J. B. Clarke, Bessie Brown, Lieut. Chaure, Mildred Grant, Earl of Warwick, British Queen, White Maman Cochet, and the brilliant Augustus Hartmann. Messrs. Alex. Dickson and Sons, Newtownards, second with a beautifully bright set that contained a lot of red and crimson varieties; Messrs. Frank Cant and Co., Colchester, third; and Messrs. R. Harkness and Co., Hitchin, fourth.

First prize for forty trebles fell to Messrs. Alex. Dickson and Sons, Newtownards, for a famous set that included Denis, Mrs. David McKee, Lyon Rose, Bessie Brown, Mabel Drew, Mdme. Jules Gravereaux, and H. V. Machin in fine form; there were five competitors, and second place fell to Messrs. B. R. Cant and Sons, Colchester, who had heavy blooms; Messrs. Frank Cant and Co., Colchester, third.

The China Trophy for forty-eight blooms, distinct, had eleven competitors, and the lucky prizewinner was Mr. George Prince, Longworth, whose box of grand blooms contained superb specimens of Florence Pemberton, Mrs. Maynard Sinton, Mrs. Foley Hobbs, Mrs. L. Welch, Mrs. Miles Kennedy, Lyon Rose, G. C. Waud, Bessie Brown, F. K. Druschki, Countess of Caledon, and Mrs. T. Roosevelt; Messrs. Perkins and Sons, Coventry, came second with smaller and very clean flowers; Messrs. G. and W. Burch, Peterborough, third. There were nine entries of forty-eight blooms, distinct, and here Messrs. Chaplin Bros., Lim., Joynings Nursery, Waltham Cross, annexed the chief award with a heavy set of clean flowers; Mr. W. R. Hammond, Grovelands, Burgess Hill, second; and Mr. J. Mattock, Headington, third. The best set of sixteen trebles among six entries was from the King's Acre Nursery Company, Hereford, and this firm staged Horace Vernet, Mabel Drew, Mdme. C. Soupert, Bessie Brown, and Queen of Spain well; Messrs. G. and W. H. Burch, Peterborough, second; and Mr. W. H. Frettingham, Beeston, Notts, third.

NURSERYMEN'S TEA ROSES.

The Dombrain Cup for two dozen tea or noisette roses fell to Mr. George Prince for a glorious set, his finest examples being Mrs. E. Mawley, a superb flower; Souv. de Pierre Notting, Mdme. C. Soupert, Molly Sharman Crawford, Mrs. M. Kennedy, Boadicea, and Medea; there were six entrants, and second place fell to Mr. Henry Drew, Longworth; and third to Messrs. B. R. Cant and Sons. Mr. J. Mattock, Headington, scored for a dozen tea and noisette roses, and was followed in order by Messrs. J. Burrell and Co., Cambridge, and Mr. E. Hicks, Wallingford, Berks; there were twelve boxes staged. Sixteen trebles of tea or noisette varieties is a severe class, but there were six competitors, and Mr. H. Drew won, and showed Mdme. Jules Gravereaux, Mrs. Foley Hobbs, Mrs. E. Mawley, Medea, Mdme. C. Soupert, and White Maman Cochet finely; Mr. George Prince had to be content with second place, and Mr. J. Mattock came third.

Messrs. Frank Cant and Co., Colchester, led for twelve white and twelve crimson roses with F. K. Druschki and Gloire de Chedane Guinoisseau; Messrs. B. R. Cant and Sons second, and Mr. W. Bentley, Leicester, third.

ROSES IN VASES AND BASKETS.

A beautiful class was the one for a dozen vases of roses not more than six tea or noisette varieties, and out of six entries, Messrs. D. Prior and Son led with lovely flowers of Pharisaer, Lady Ashtown, Bessie Brown, Leslie Holland, Mdme. J. Gravereaux, Mrs. T. Roosevelt, White Maman Cochet, Mrs. J. Bateman, E. J. Hill, Lyon, Kaiserin A. Victoria, and Mrs. A. Coxhead; Messrs. Alex. Dickson and Sons second, and Mr. G. Prince third. Nine varieties of tea or noisette roses, seven blooms of each in vases, was a fine class, and a most effective one, but we could find no trace of a first prize winner, though we sought for some time after the public was admitted.

Five baskets of cut roses, baskets not to exceed 14in. in diameter, formed a magnificent class, as there were six competitors, and consequently thirty baskets of lovely blooms. The premier award fell to Messrs. Chaplin Bros., Waltham Cross, for grand flowers of Lyon, Mdme. Abel Chatenay, Duchess of Wellington, G. C. Waud, and Pharisaer; King's Acre Nursery Company second; Messrs. R. Harkness and Co. third.

Nine baskets of roses found four firms competing, and Messrs. Paul and Sons, Cheshunt, led the way with Marquise de Sinety, Mdme. Melanie Soupert, Mdme. A. Chatenay, Lady Ashtown, Molly S. Crawford, Harry Kirk, Lyon, Andre Gamon, and Joseph Hill; Messrs. D. Prior and Son second, and Mr. J. Mattock third.

Mr. George Prince had the best basket of any tea or noisette rose, his variety being Mrs. Foley Hobbs; Mr. J. Mattock second with Mrs. T. Roosevelt; seven entries. The baskets of Rayon d'Or were gorgeous, and prizes went in order to Mr. George Prince, Messrs. D. Prior and Son, and Mr. W. Bentley.

The Rev. J. H. Pemberton, Romford, showed the best three baskets of flowers, his varieties being Danae, Mrs. Alfred Tate, and Mdme. Abel Chatenay; Mrs. Wightman, Bengeo, Herts, second; and Mr. H. V. Machin, Worksop, third.

Mr. Eversfield beat Mr. G. A. Hammond in the amateurs' class for seven vases of five blooms each, and Mr. J. Hart, Little Heath, Potters Bar, beat Rev. J. B. Shackle, Dropmore, Maidenhead, for five vases of blooms. In other vase classes Dr. Panckridge; Mr. E. F. Brown, Sussex Place, Slough; Mr. D. Davies, Beaconsfield; and Mr. S. F. Jackson, Epsom, were other leading prize-winners.

All the basket classes were a huge success; for a basket of eighteen blooms of other than a tea or noisette or H.P. variety, Messrs. Jas. Cocker and Son, Aberdeen, scored with superb flowers of Mrs. Andrew Carnegie; Mr. W. Bentley second, and Mr. J. Mattock third; sixteen entries. Messrs. R. Harkness and Co., Hitchin, scored for a basket of H.P.'s; Messrs. F. Cant and Co. second; ten entries.

AMATEURS.

The competition for the amateurs' championship and gold medal for the best three dozen blooms was very keen. The winner was Mr. Franklin Dennison, Cranford, Leamington Spa, and he scored with glorious flowers, his finest being Oberhofgartner Terks, Gustave Piganeau, Florence Pemberton, Mrs. J. Welch, Mrs. Foley Hobbs, White Maman Cochet, Mabel Drew, Queen of Spain, Yvonne Vacherot, Mdme. Jules Gravereaux, J. B. Clarke, Mildred Grant, Duchess of Sutherland, and Princess Marie Mertshersky; Dr. T. E. Pallett, Earls Colne, Essex, was a close second, and Mr. C. C. Eversfield, Horsham, third; eleven competitors. In the open amateurs' class for two dozen blooms the awards fell in order to F. Dennison, Esq., who was in great form on this occasion; Dr. T. E. Pallett, and Tom Park, Esq., Askew Mill, Bedale. For a dozen trebles, Mr. Dennison continued his conquering way, and in this class he showed as finely as in the others; Mr. Conway Jones, Hucclecote, Gloucester, came second, and Mr. G. A. Hammond third.

For the best nine blooms of any rose other than a tea or noisette variety Dr. T. E. Pallett scored with Avoca, a rose he grows in superb style, as evidenced at Ipswich and Colchester last week; Mr. Alexander Hill

Gray, Beaulieu, Bath, second with Florence Pemberton, and Mr. F. Dennison third with the last-named variety The Hobbies Cup, open to growers of fewer than 3,000 plants, was won by Mr. W. O. Times, Hitchin, but some of his twenty-four flowers were rather weathered; Mr. W. Boyes, Leicester, second, and Mr. H. R. Darlington, Potters Bar, third. In this section Mr. C. C. Eversfield had the best nine roses of any but a tea or noisette variety with a splendid box of Dean Hole.

Captain W. Jarratt Thorp, Gransmore, Hucclecote, won the Ben Cant Memorial Cup for two dozen varieties, in the section open to growers of fewer than 2,000 plants; his Miss Foley Hobbs and Hugh Dickson were fine. Mr. H. L. Wettern, Waratah, Sanderstead, second, and Mr. G. Speight, Market Harborough, third. Mrs. Croft Murray, Perivale, Ryde, led for eighteen blooms, and Mr. G. Speight showed the best six blooms of one variety (Her Majesty) in this section. Dr. Chas. Lamplough, Kirkstall, Alverstoke, put up a splendid dozen flowers in his stand that won the President's Cup, open to growers of fewer than 1,000 plants; Mr. Lewis S. Pawle, Beaconsfield, second, and Mr. F. H. Cook, Birch, Colchester, third.

Mr. G. Curnock Sawday, Beechfield, Weybridge, and Mr. J. J. Williamson, Hawkshill, Walmer, and Dr. Chas. Lamplough were leading prizewinners in the section open to growers of fewer than 750 plants; while in the division for growers of fewer than 500 plants Mr. J. Smart, Mr. Sherwood, Stevenage, and Mr. F. H. Fieldgate, The Cottage, Shrubend, Colchester, were the leading prizewinners.

In the division for smaller growers we noticed that Mr. W. Moore, Priest Hill, Caversham; Mr. S. P. Page, Nottingham; Mr. H. Clinton Baker, Bayfordbury; Mr. B. J. Walger, Chatteris, Cambs.; Rev. J. T. Kershaw, Corsley Rectory, Warminster; Mr. A. Searle, Ashton Lodge, Bassett; Mr. H. F. Matthews, Stevenage; Mr B. Fortescue, Dropmore, Maidenhead; Mrs. M. M. Murray, Horsendon, Isle of Wight; Mr. G. B. Ash, Bushey Heath; and Mr. J. W. Roff, Wood Green, were among the successful competitors.

The Suburban Championship Cup for six roses grown within eight miles of Charing Cross, was won by Mr. L. W. Atkinson, Rosebourne, Palmers Green, with good flowers of Dean Hole, F. K. Druschki, Gloire de Chedane Guinoisseau, Mildred Grant, Wm. Shean, and Mrs. Foley Hobbs; Mr. W. E. Martin, Bromley Lodge, North Finchley, second, and Mr. Ramon d'Escofet, Kingsley Deane, Dulwich, third. Mr. G. W. Cook, Radstock, Whetstone, was first in the metropolitan class for six flowers.

Mr. Eversfield, Horsham, was first for twenty-four roses in the class open to those who have never won the Challenge Trophy. The Harkness Cup, for a dozen blooms, an open amateur class, was won by Dr. Chas. Lamplough with fine examples of Mdme. Jules Gravereaux, Mrs. M. Kennedy, Avoca, F. K. Druschki, and White Maman Cochet. Mr. F. Crawley, Luton, showed the best six blooms each of Mdme. M. Soupert and Lyon.

The Amateurs' Tea Rose Trophy was won by Mr. Alexander Hill Gray, Beaulieu, Bath, with a grand box of Medea, Lady M. Corry, Miss A. de Rothschild, Nita Weldon, A. Hill Gray, Mdme. J. Dupuy, Souv. de P. Notting, Mme. Leon Cambertini, Mrs. H. Taylor, Mrs. E. Mawley, Mdme, Jules Gravereaux, Muriel Grahame, White Maman Cochet, Molly S. Crawford, Mrs. Foley Hobbs, R. W. Smith, Mdme. C. Soupert, and Maman Cochet. Six entries. Mr. C. C. Eversfield Horsham, second, and Mr. B. Fortescue third. Mr. Eversfield scored for a dozen tea and noisette blooms, with Mr. A. Hill Gray second, and Mr. Conway Jones third.

The Prince Memorial Cup for eight trebles, teas and noisettes was won by Mr. Alex. Hill Gray, whose Maman Cochet, Souv. de Pierre Notting, Mrs. F. Hobbs, and White Maman Cochet were superb, Mr. Eversfield coming second. Mr. Hill Gray had the best six blooms of one tea or noisette rose, and led with perfect examples of White Maman Cochet in a close competition. Mr. F. Slaughter, Steyning; Mr. H. Balfour, Headington Hill, Oxford; Dr. Chas. Lamplough, Mr. J. Smart. Jun., Mr. A. Searle, Mr. G. C. Sawday, and Mr. W. Upton (Leicester) were other prize-winners in tea rose classes.

Mrs. H. Taylor was the tea variety that Mr. A. Hill Gray won a first prize with for a basket of bloom; Dr. Panckridge, Petersfield, second.

DECORATIVE ROSES.

Mr. J. Mattock led for eighteen bunches of perpetual decorative roses, and showed Duchess of Wellington, Mdme. M. Soupert, Mrs. H. Stevens, Lady Rossmore, and Mrs. P. Blair beautifully; Mr. John Pigg, Royston, second. Mr. W. Bentley, Belgrave, Leicester, led for nine varieties of perpetual decorative roses, with lovely flowers of Mdme. A. Chatenay, Jos. Hill, Molly S. Crawford, Duchess of Wellington, G. Shawyer, Mdme. M. Soupert, Koningen Carola, Lady A. Stanley, and Ethel Malcolm; seven entries. Messrs. Chaplin Bros. second, and Mr. E. J. Hicks third.

For twenty four varieties, five blooms of each, staged in a vertical line, Mr. Elisha Hicks, Hurst, Berks, was a good first, his flowers being Rayon d'Or, Lyon, Mrs. A. Tate, T. C. Waud, and Laurent Carle; Mr. J. Mattock second. Mr. J. Mattock won the Turner Cup for a display of three dozen bunches of decorative roses, and did so with a lovely exhibit and glorious bunches of Simplicity, Gen. MacArthur, Goldfinch, Crimson Damask, Lady Hillingdon, Marquise de Sinety, Irish Glory, etc.; Messrs. Frank Cant and Co., Colchester, second, and Messrs. W. Spooner and Sons, Woking, third.

Messrs. W. Spooner and Sons, Woking, led for eighteen bunches of summer roses, and their set included Celestial, Jersey Beauty, Helene, Gardenia, and Hiawatha. Mr. E. J. Hicks was first prize winner for eighteen bunches of decorative roses, and made a special feature of Blush Rambler, Edu Meyer, Coronation, and Moschata alba; Mr. Ernest Hicks, Wallingford, second.

A capital dozen bunches of polyantha roses won a first prize for Messrs. F. Cant and Co., and the chief varieties were Leonie Lamesch, Philippine Lambert, Perle d'Or, White Pet, Marie Pavie, and Perle des Rouges; Mr. G. Prince second; four competitors. For a dozen bunches of Wichuraiana roses, Mr. E. J. Hicks scored with such varieties as Jos. Billard, Jersey Beauty, Hiawatha, and Alberic Barbier; Messrs. F. Cant and Co. second, and Mr. J. Pigg third.

In the amateurs' division for decorative roses, the competition was keen. Mr. J. Hart led for eighteen blooms in not fewer than six varieties, and Mr. H. R. Darlington came second. Mr. H. Vessey Machin, Worksop, was a capital first for eighteen bunches of roses, and he had goodly blooms of Killarney and Lady Curzon; Rev. J. H. Pemberton second. The latter, however, showed the best seven bunches of seven blooms each.

Mr. Stevenson, gardener to E. G. Mocatta, Esq., Addlestone, put up a fine set of six bunches of decorative roses, and set up Gustave Regis, Trier, Harry Kirk, Irish Elegance, Aennchen Muller, and Carmine Pillar grandly; Rev. J. B. Shackle second. Mr. Stevenson was also first for fine stands of decorative roses, and here Alberic Barbier, Irish Elegance, and Orleans were fine. Dr. Williams, The Moat, Harrow, staged the best set of six bunches of Wichuraiana roses, and Mr. R. C. Nevill, Chislehurst, beat Mr. H. L. Wettern for a dozen bunches of decorative roses, with a beautiful set of Macrantha, Una, Gustave Regis, etc.

LADIES' CLASSES.

In the ladies' class for table decoration Miss E. M. Davies, Burgess Hill, was placed first for a capital arrangement of Irish Elegance. Mrs. Oakley Fisher, Egremont House, Sudbury, second, with Irish Elegance, and Miss Brill, Ivy Bank, Sutton, third. This class was for those who had not previously won a prize for table decoration at a N.R.S. Show.

In the table decoration class, where single roses were barred, Miss Maud West, Frith Dene, Reigate, scored with an arrangement of Richmond roses; Mrs. Sawday, Beechfield, Weybridge, second, with Mrs. Alfred Tate; Mrs. A. Robinson, Carshalton, third, with Mdme. Abel Chatenay. For a table decoration of single roses Mrs. E. M. Burrell, Holly Lodge, Westwood Road, Southampton, was first with a glowing design of the new single variety Irish Fireflame; Mrs. F. Peters Wood, Weybridge, second, and Mrs. J. W. Smith, Sparrows House Hall, third, each with Irish Elegance.

Lady amateurs showed baskets of roses very finely, and Mrs. E. F. Brown, Lynton, Slough, won capitally with Lyon Rose, elegantly set up; Mrs. Sawday second, with an erect vase-shaped basket of Irish Elegance. Mrs. Colston Hale, Virginia Lodge, Warminster, won first prize for a basket of roses, other foliage allowed, with a large design of Irish Elegance and Mrs. A. Tate; Miss J. B. Langton second, and Miss D. F. Brown, Brokes Lodge, Reigate, third, with a bold basket of Mrs. Sharman Crawford.

Mrs. Jane B. Langton, Rayment, Hendon, set up the best bowl of Wichuraiana roses, and used the soft pink Francois Jourauville; Mrs. E. B. Burrell second with René André. For a bowl of roses, any kinds, Mrs. F. E. Mead, Hemel Hempstead, led with Irish Elegance, finely set up; Mrs. A. Allen Hope, Addlestone, second, and Miss Brill, Sutton, third.

In an open class, Mrs. E. J. Hicks scored for a bowl of roses with the glowing Lyon, associated with Rosa rubrifolia foliage; Mrs. A. R. Bide second with Mrs. Mona Hunting, and Mrs. E. F. Brown, Slough, third, with Lady Flora Wilson.

The best bowl of exhibition roses was one of Kaiserin Augusta Victoria, arranged by Mrs. L. Courtenay Page, who was followed by Mrs. E. Burnett with Mdme. M. Soupert, and Mrs. J. Bide, Uxbridge, who staged the variety Mrs. G. Shawyer. In a somewhat similar class Mrs. A. Robinson, Carshalton, led with Mdme. Abel Chatenay; Miss J. B. Longton second with Dawn and Lina Schmidt Michel, and Mrs. L. Courtenay Page, Enfield, third, with Sunburst.

GROUPS OF ROSES.

Messrs. Hobbies, Lim., Dereham, secured the gold medal for a large display of pot and cut roses; they had weeping standards of Hiawatha and other Wichuraiana varieties, hanging baskets of the brilliant Rayon d'Or, and a groundwork of baskets of popular tea and hybrid tea roses, and stands of the pretty single variety Pink Pearl. Messrs. Paul and Son, Cheshunt, second; Messrs. A. J. and C. Allen, Norwich, third.

Premier award and gold medal for a big representative group of roses was won by Messrs. W. and J. Brown, Stoneford, with splendid stands of Lyon, Hugh Dickson, Frau Karl Druschki, Avoca, Mdme. Abel Chatenay, Crimson Rambler, Mdme. C. Soupert, Marquis de Sinety, and other fine varieties. There were seven fine displays in the class for a 10ft. high group of roses, and these contributions were a great feature. Messrs. G. Jackman and Son, Woking, won with a fine effort, and made free use of Frau Karl Druschki, Lyon, and Le Progrès; Mr. Karl Thirkildson, Old Southgate, second, and Messrs. Morse Bros., Woodbridge, third.

Gold Medal.—To Queen Mary (H.T.), from Messrs. Alex. Dickson and Sons, Lim.; to Brilliant (H.T.), and to Mrs. James Lynas (H.T.), from Messrs. Hugh Dickson, Lim.

Silver-gilt Medal.—To Mrs. Ambrose Ricardo (H.T.), from Messrs. S. McGredy and Son; to Wm. Cooper (H.T.), Mrs. J. W. Parker (H.T.), Ulster Gem (H.T.), single, Muriel Dickson (hybrid Austrian), and Mrs. Hugh Dickson (H.T.), from Messrs. Hugh Dickson, Lim.; to Red Letter Day (H.T.) and Conway Jones (H.T.), from Messrs. Alex. Dickson and Sons, Lim.; and to Mrs. G. Norwood (H.T.), from Mr. E. J. Hicks.

Card of Commendation.—To Duchess of Abercorn (H.T.), Mrs. Godfrey Brown (H.T.), and Mrs. Wm. Sargent (H.T.), from Messrs. Hugh Dickson, Lim.; to Naarden (H.T.), from Mr. G. A. van Rossen; to J. F. Barry (Austrian hybrid), from Mr. G. W. Piper; to Mrs. Moyna (H.T.), and to Mary Greer (H.T.), from Messrs. Alex. Dickson and Sons, Lim.; to Freda Weller (Wichuraiana), from Mr. Henry Weller; and to Pink Pearl (single H.T. climber), from Messrs. Hobbies, Lim., Dereham.

The Royal Show at Bristol.

The great show at Bristol, which opened under the auspices of the Royal Agricultural Society on July 1, and continued until July 5, was remarkable in every respect. The horticultural section occupied three large tents, and within them were fine displays of plants, flowers, fruit, and vegetables. A deputation from the Royal Horticultural Society attended the show on Wednesday, and expressed themselves well pleased with what they saw. Great credit is due to Mr. Peter Blair and the Hon. John Boscawen, who had control of this section.

PLANTS.

Three exhibitors staged in the class for a group of stove and greenhouse plants, and Messrs. J. Cypher and Sons, Cheltenham, secured the first prize with a very bright and effective arrangement. Tall, highly-coloured crotons formed an outstanding feature, orchids were freely distributed over a groundwork of small ferns and foliage plants, and tall kentias were used in the background. Mr. W. A. Holmes, West End Nurseries, Chesterfield, received second prize, his plants being rather flatly arranged, although some of the crotons were of good height. Polyantha roses were used, with white lilies, and a few examples of Verbena Miss Willmott. Mr. C. J. Ellis, Weston Nurseries, Weston-super-Mare, was third, his exhibit having many bright-coloured flowering plants which somewhat overpowered the foliage subjects that are undoubtedly most acceptable in groups of stove and greenhouse plants.

Messrs. Armstrong and Brown, Tunbridge Wells, secured first prize for a collection of orchids occupying 100 superficial feet. The plants were arranged in the form of a steep bank, long sprays of Odontoglossum crispum hanging from a great height at the back, with bulbophyllums, anguloas, and Cœlogyne pandurata among other rather uncommon orchids in the foreground, as well as good cypripediums, cattleyas, and oncidiums. Messrs. J. Cypher and Sons were second with a collection that contained a number of fine specimens of really good orchids, which, however, were staged at the side of a tent where they appeared to be rather cramped for room.

Mr. Charles Wall, Melrose Nursery, Bath, was the only exhibitor in the class for a group of carnations, flowers and plants combined. His exhibit was worthily awarded first prize. Perpetual-flowering varieties were shown in choice variety, and were well displayed over a groundwork of ferns. Messrs. Harkness and Sons, Bedale, Yorks, scored for a collection of hardy flowers arranged on the ground on a space 25ft. by 10ft. Oriental poppy Mrs. Harkness was grand, and some choice verbascums, delphiniums, and rich-coloured gaillardias were tastefully grouped with English irises, gladioli, and a host of useful and seasonable flowers. Messrs. G. Gibson and Co., Leeming Bar, Bedale, were second, Lilium davuricum, pæonies, Spiræa palmata rosea, and Verbascum Ivanhoe being among their best subjects. Messrs. W. Artindale and Son, Sheffield, came third. They had some fine examples of Eremurus Bungei in their exhibit. Messrs. Artindale received first prize for a model water garden planted with suitable bog and aquatic plants. Nymphæas occupied the pools, while the margins were planted with phormiums, bamboos, ferns, and spiræas, some dwarf alpines being used in the marginal band along the front.

Messrs. Blackmore and Langdon, Twerton Hill Nurseries, Bath, had the only group of begonias, receiving first prize. Needless to say, the quality of the flowers was up to high-water mark, one delicate salmon variety named Princess Victoria Luise attracting much attention.

CUT FLOWERS.

Messrs. Alex. Dickson and Sons, Lim., Newtownards, co. Down, were successful in obtaining premier honours in the class for 72 roses, with a fine set of the best of exhibition varieties. Lady Barham, Florence Pemberton, Mildred Grant, Lohengrin, and Mrs. Forde were a few of the best blooms. The second prize was secured by King's Acre Nurseries, Lim., Hereford, who had excellent flowers, Bessie Brown, Dean Hole, Miss A. de Rothschild, and Mildred Grant being the most noteworthy. Messrs. English, Lim., Gloucester, were third, staging some of the newest of varieties in good form.

There were four entries for a collection of sweet peas arranged on 20ft. by 5ft. of staging. Messrs. E. W. King and Co., Coggeshall, secured first prize, showing Scarlet Emperor, Empress, Barbara, Thos. Stevenson, Hercules, and many other good varieties in capital style. Miss Hemus, Holdfast, Upton-on-Severn, was second, her varieties being the best of the Paradise strain, shown in fine bunches and shower bouquets. Mr. J. Stevenson, Wimborne, had third prize. He showed Birdbrook, Agricola, Edith Taylor, and Elfreda Pearson in a set of up-to-date varieties.

Mr. Chas. Wall led the way with a group of cut carnations, in which were fine blooms of Carola, Cecilia, Mandarin, and a fine new perpetual variety named Lady Fuller, the colour of which is a particularly rich salmon-pink, and the flowers are delightfully clove-scented. The Duchess of Somerset, Maiden Bradley, Bath, was second, the exhibit being very strong in Malmaisons. Mr. C. Engelmann, Saffron Walden, was third. His Carola was well shown, as also was the yellow fancy Sunstar.

Mr. Rowland Adams, Whitewell's Nurseries, Bath, occupied the first place in the class for roses, arranged in decorative fashion. The blooms were shown in tall bamboo stands and on arches, and were finely developed. Lady Hillingdon, Marquis de Sinety, Kaiserine Augusta Victoria, Rayon d'Or, and Irish Elegance are the names of a few varieties that attracted special attention.

FRUIT.

This was not shown in great quantity, but that staged was very good. Mr. Jas. Gibson, gardener to the Duke of Portland, Welbeck Abbey, Worksop, obtained the premier award for thirty dishes on a table decorated with plants and flowers. He had some splendid Kentish Favourite and Royal Sovereign strawberries, some good melons, James Grieve apple, Hale's Early peach, and a nice lot of grapes. Mr. Gibson also secured first for four bunches of grapes, and again for two bunches of Madresfield Court and for two clusters of Black Hamburgh. Mr. John Ricketts, Batheaston, near Bath, took first for four dishes of strawberries, the varieties being Royal Sovereign, Sir Joseph Paxton, The Laxton, and President. The second prize was awarded to Edward Fisher, Esq., Batheaston. Mr. Gibson won firsts for both peaches and nectarines.

NON-COMPETITIVE.

The non-competitive exhibits formed an important section of the show, and were highly attractive and of much interest. Immediately on entering the main tent was a magnificent group of orchids staged by Mr. Alexander, grower to Lieut.-Colonel Sir George Holford, Westonbirt, Tetbury. Some splendid examples of Lælio-cattleya Canhamiana and Cattleya gigas provided some rich colour, while a good contrast was afforded by Miltonia vexillaria Constance Wigan, of which a very fine specimen was shown. Oncidium divaricatum, Ærides odoratum, Brasso-cattleya Heatonensis, and Brasso-cattleya Euterpe were also most noteworthy. Every specimen evinced skilful culture of a high order, and the arrangement of the group was faultless.

Messrs. John Waterer and Sons, Lim., Bagshot, exhibited shrubs and rhododendrons in choice variety. Kalmia latifolia was well shown in good, well-flowered plants, and some of the acers were very beautiful.

Messrs. Blackmore and Langdon showed delphiniums in quantity and choice variety. Robert Cox, Elsie, Henri Moissan, Ampere, and Moerheimi were especially good and quite distinct varieties that would make a good set to plant. Messrs. Mallett and Co., Cheddar, arranged a rock and water garden, on which were planted a choice lot of suitable alpine and moisture-loving plants. Œnothera serotina was very freely flowering, the clear yellow showing up remarkably well. Hypericum olympicum was another good yellow flower, and Dianthus graniticus was a good pink-flowered subject. Iris Kæmpferi, spiræas, and Zillema trifoliata were well used on the margin of the water.

Messrs. Jas. Carter and Co., Raynes Park, S.W., staged an attractive collection of choice vegetables. Seakale, beet, aubergines, kohl rabi, Brazilian beet, and asparagus lettuce were somewhat uncommon kinds, and attracted much attention. The King's Acre Nurseries, Lim., Hereford, staged fruit trees in pots. They had some fine trees of Lady Sudeley apple, Duke of York peach, standard gooseberries, Swan plums, etc., all grouped in attractive style, showing the fruit to best advantage. The same firm exhibited also a group of hardy flowers.

Mr. A. Chapman, gardener to Lieut.-Colonel Sir George Holford, exhibited a group of glorious hippeastrums, ranging in colour from pure white to richest velvety-crimson, with many delicate shades, and attractively marked varieties of grand quality. The size of the flowers was immense, and the exhibit justly received high compliment from the visitors, who were lavish in their expressions of admiration. Messrs. W. Cutbush and Son, Highgate, had carnations, dwarf polyantha roses, a few caladiums, coleus, etc., arranged with attractive foliage plants.

Messrs. Young and Co., Hatherley, Cheltenham, arranged a splendid exhibit of perpetual-flowering carnations. The quality of the flowers was excellent, and the tasteful arrangement was well up to the firm's high reputation. It was, in fact, of quite exceptional excellence.

Messrs. J. Jefferies and Son, Lim., Cirencester, staged a highly meritorious group of conifers. Messrs. Geo. Massey and Sons, Spalding, had a very effective exhibit of hardy flowers arranged in a natural and pleasing manner. A group of ornamental trees and shrubs came from Messrs. G. Cooling and Sons, Bath. Messrs. Stuart Low and Co., Bush Hill Park, Middlesex, had a group of orchids and a display of carnations. Messrs. Whitelegg and Page, Chislehurst, showed The Newberry, which was trained on an arch, and bearing abundance of fine fruit, the flavour of which is very pleasing.

Messrs. Sutton and Sons, Reading, contributed a remarkably fine collection of vegetables, which were made the more attractive by the tasteful use of sweet peas and small groups of gloxinias. The vegetables included excellent cauliflowers, Longpod beans, tomatoes, white Leviathan onions, and some fine aubergines. Melons of good quality were largely shown, the whole stand being extremely effective and interesting. A small group of choice orchids came from Messrs. A. J. Keeling and Sons, Westgate Hill, Bradford, and a group of schizanthus from Messrs. Garaway and Co., Bristol. Mr. C. J. Ellis, Weston-super-Mare, had an exhibit of alpines arranged in the form of a sloping bank.

Messrs. Rich and Co., Bath, showed border flowers and roses. Mr. W. J. Unwin, Histon, Cambridge, had a good bank of sweet peas. Messrs. H. B. May and Sons, Dysons Lane, Edmonton, contributed an interesting collection of ferns, Nephrolepis Willmottæ being very finely shown; Selaginella cæsia, and several fine platyceriums were good features. Messrs. W. Artindale and Son, Nethergreen, Sheffield, exhibited violas, roses,

CARDIFF AND COUNTY HORTICULTURAL SOCIETY.

GRAND QUARTER CENTURY FLOWER SHOW.

SOPHIA GARDENS, CARDIFF.

WEDNESDAY and THURSDAY, JULY 23 and 24.

Specially good Prizes in every section, amounting in money and plate to nearly £500. Tents lighted by electricity. Popular Prices.

Schedules from the Secretary, Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

LEICESTER.—ABBEY PARK FLOWER SHOW, 5th and 6th August next. Open Class, Group of Plants, £20, £15, £10, £6. Liberal prizes for Collections of Fruit, Displays of Roses; Silver Cup, Gold and Silver Medals for non-competitive exhibits. Schedules from JOSEPH BURTON, Supt.

ROYAL LANCASHIRE AGRICULTURAL SOCIETY.

GREAT HORTICULTURAL SHOW will be held at BURNLEY, on JULY 31, 1913, and following days. Liberal Prizes are given for Groups of Plants, Hardy Perennials, Carnations, Fruit and Table Decoration, etc.

Entries close July 14th. For Schedules apply—
PETER BLAIR.
Trentham Gardens,
Stoke-on-Trent.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

and sweet peas. Delphiniums were the chief feature of Messrs. Kelway's fine exhibit, Lord Napier, Dusky Monarch, A. C. Maclaren, and Somerset being a few of the best varieties. Mr. Vernon T. Hill, Mendip Nurseries, Langford, showed sweet peas and hardy plants.

A group of rock plants came from Messrs. Bowell's, Cheltenham; and a capital display of sweet peas was made by Messrs. Dobbie and Co., Edinburgh, who also had violas in considerable and excellent variety.

Messrs. W. J. Godfrey and Son, Exmouth, showed a splendid lot of their large-flowered Canterbury bells in shades of pink and blue, as well as pure white. Messrs. Jarman and Co., Chard, showed roses and sweet peas. Messrs. Isaac House and Son, Westbury-on-Trym, staged alpine plants in pans, and a large assortment of hardy flowers in vases. Mr. A. F. Dutton, Iver, Bucks, showed carnations, arranging them in ornamental baskets. The varieties represented being May Day, Carola, Marmion, Mrs. A. F. Dutton, Empire Day, and other useful varieties.

Messrs. Parker and Sons, Lim., Bristol, had The Lyon and Richmond roses in fine order. Zonal pelargoniums were extensively shown by Mr. Vincent Slade, Staplegrove Nursery, Taunton. Mr. H. N. Ellison's ferns from West Bromwich were a very choice selection. Nephrolepis Marshalli, Platycerium grande, some good gymnogrammas, and adiantums may be mentioned as leading features. From Mr. J. Milburn, Victoria Nursery, Bath, came an interesting little group of rock plants.

Mr. J. Macdonald, Harpenden, showed his grasses, samples of various species being exhibited as well as the growth on felt, which is Mr. Macdonald's speciality. Messrs. A. A. Walters and Son, Kensington Nurseries, Bath, were large exhibitors of weeping standard and pillar rambler roses, as well as flowers of hybrid teas and other sections. Olearia insignis on Messrs. R. Veitch and Son's stand, from Exeter, was a most interesting plant with thickly felted leaves and white daisy-like flowers. Celmisia Monroi, Leptospermum Nicholli, and Mitraria-coccinea were other rarities among a host of things but rarely seen. This was without doubt a most valuable exhibit from an educational point of view, and reflects great credit upon this well-known firm.

Messrs. E. Webb and Sons, Wordsley, Stourbridge, had a capital display of potatoes for this season of the year, and the swedes and mangolds represented the firm's well-known stocks. High-class seed corn was another item, and grasses once more figured in a capital and comprehensive exhibit. Messrs. Dicksons, Lim., Chester, made a brave show of hardy flowers, which might well have graced the horticultural tents, but farm crops, trees, and shrubs were also shown. Messrs. Dickson and Robinson, Manchester, always manage to make their stand highly attractive, and the roots, vegetables, seeds, and specimens of growing grasses were so arranged as to make an imposing display of high-class produce. Messrs. Dickson, Brown, and Tait, Manchester, decorated the pillar supports of their stand with crested nephrolepis ferns, and had also rambler roses, liliums, etc., to add colour and beauty to the less picturesque though eminently useful edible produce.

Some good things in the way of vegetables were seen on Messrs. J. K. King and Sons' stand, the Coggeshall firm of seed growers also showing capital samples of seed corn. Pot-grown examples of Scottish Chieftain oats showed wonderful cropping qualities. A good display of well-grown sweet peas was of purely horticultural interest, and a good many growers of our acquaintance paused to admire the long-stemmed, large-flowered examples of first-rate varieties. Sweet peas were also splendidly shown by Messrs. Harrison and Sons, Leicester, and culinary peas, potatoes, seeds of vegetables, and both dried and growing specimens of grasses and clovers were here seen staged in skilful manner.

Had time permitted of notes being taken of all the exhibits of horticultural buildings heating installations, garden implements and requisites, of the British-grown tobacco, and of the engrossingly interesting and highly instructive forestry exhibits, space, alas! would not be available to record the marvellous, extensive, and varied character of the really wonderful display; but it must suffice to say that, even from the point of view of the horticulturist or estate forester, the Royal Agricultural Society succeeds in bringing together probably a more valuable and meritorious exhibition than could be seen in any other country in the world.

Jarman and Co., for sweet peas, roses, etc.; Messrs. Isaac House and Son, for alpine, herbaceous plants, and sweet peas; Messrs. John Jefferies and Son, Lim., for conifers; King's Acre Nurseries, Lim., for pot fruit trees; Messrs. H. B. May and Sons, Lim., for ferns; Messrs. Stuart Low and Co., for carnations, roses, and orchids; Messrs. Young and Co., for carnations; Messrs. E. W. King and Co., for sweet peas; Mr. W. J. Unwin, for sweet peas.

Silver-gilt.—Messrs. J. Cypher and Sons, for group of plants; Messrs. G. Cooling and Sons, for roses, trees, and clematis; Mr. H. N. Ellison, for ferns; Messrs. J. Garaway and Co., for schizanthus, etc.; Messrs. W. J. Godfrey and Son, for Canterbury bells, etc.; Messrs. A. J. Keeling and Sons, for orchids; Messrs. Kelway and Son, for delphiniums; Messrs. Parker and Sons, for roses; Messrs. A. A. Walters and Son, for roses; Messrs. Robt. Veitch and Son, for rare plants; Mr. A. F. Dutton, for carnations; Mr. Jas. Macdonald, for grasses; Messrs. J. Waterer and Sons, for shrubs; Messrs. W. Artindale and Son, for violas, etc.; Messrs. Blackmore and Langdon, for delphiniums.

Silver.—Mr. E. C. Bowell, for alpine plants;

NATIONAL ROSE SOCIETY'S EXHIBITION, REGENT'S PARK.
Some of the visitors, and the Hon. Secretary (Mr. E. Mawley, V.M.H.).

MEDAL AWARDS.

Large Gold.—Lieut.-Col. Sir George Holford, for orchids, and also for hippeastrums; Messrs. Sutton and Sons, for vegetables, melons, etc.; Messrs. G. Mallet and Co., for hardy plants.

Gold.—Mr. Vernon T. Hill, Langford, for herbaceous and alpine plants; Messrs. J. Carter and Co., for vegetables; Messrs. Dobbie and Co., for sweet peas, violas, etc.; Messrs. A. Dickson and Sons, Lim., for roses; Messrs. W. Cutbush and Son, for carnations, etc.; Mr. C. J. Ellis, Weston-super-Mare, for miscellaneous plants; Miss Hemus, Upton-on-Severn, for sweet peas; Mr. John Milburn, for hardy plants; Messrs. Rich and Co., for hardy flowers; Messrs. Geo. Massey and Son, for hardy flowers; Messrs. Toogood and Son, for vegetables.

R.H.S. DEPUTATION'S AWARDS.

Gold Medal.—Lieut.-Col. Sir Geo. Holford, for orchids.

Silver-gilt Cup.—Sir Geo. Holford, for amaryllis; Messrs. Blackmore and Langdon, the Duke of Portland, Messrs. H. B. May and Son.

Large Silver Cup.—Messrs. J. Cypher and Son, King's Acre Nurseries, Lim., Messrs. Isaac House and Son, and Messrs. Sutton and Sons.

Silver Cup.—Mr. Wm. Holmes, Messrs. Harkness and Sons, Messrs. Stuart Low and Co.

Standard Cup.—Messrs. Mallet and Co., Messrs. J. Carter and Co., Messrs. G. Gibson and Co., Messrs. J. Jefferies and Son, Messrs. A. Dickson and Sons, Messrs. W. J. Godfrey and Son, Mr. C. Wall, Messrs. Armstrong and Brown, Mr. Hill.

Silver-Gilt Flora Medal.—Messrs. Dobbie and Co., Mr. Adams, Messrs. Young and Co.

Silver-Gilt Banksian Medal.—Messrs. E. W. King and Co., Messrs. Jarman and Co., Mr. W. J. Unwin, Messrs. Cooling and Son.

Silver Knightian Medal.—Messrs. Toogood and Son.

Silver Flora Medal.—Messrs. W. Artindale and Son, Messrs. A. A. Walters and Son, Messrs. J. Kelway and Son, Messrs. R. Veitch and Son, Mr. A. F. Dutton, Mr. H. N. Ellison, Messrs. Garaway and Co.

Silver Banksian Medal.—Messrs. A. J. Keeling and Son, Mr. V. Slade, Miss Hemus, Mr. Parker.

Ipswich.

The Ipswich and East of England Horticultural Society held its summer show under pleasant weather conditions in the spacious, well-timbered, and beautiful Christchurch Park. A good rain the previous night laid the dust and cleaned the foliage, and so the weather on Thursday, July 3, with a little sunshine and pleasant breezes, was just the thing for a flower show. The exhibition itself was a good one. Roses and sweet peas were in fine form, and, as the competition was fairly keen all through, the display in the numerous classes was a large one. Floral arrangements were of a fairly high order, vegetables were good, but not extensively staged, while the same may be said of fruit. There was nothing super-excellent in the plant classes, and there is need of more artistic ability in the group classes but cut hardy flowers made a capital feature. From a horticultural point of view, Ipswich has every reason to be pleased with its show.

ROSES AND SWEET PEAS.

Messrs. W. Prior and Son, Colchester, won the silver challenge cup for three dozen roses, and showed very clean examples of Lyon Rose, Madame Jules Gravereaux, Mildred Grant, White Maman Cochet, Gloire de Chedane Guinoisseau, Killarney, etc.; Messrs. B. R. Cant and Sons, Colchester, second, and Messrs. W. Crisp and Sons, Fordham Heath, third. Messrs. B. R. Cant and Sons led for twelve trebles, and they had lovely blooms of Mrs. T. Roosevelt, J. B. Clark, and Muriel Grant; Messrs. D. Prior and Sons second, and Messrs. W. Crisp and Son third. Messrs. D. Prior and Sons scored for a dozen teas and noisettes, and had first prize for six blooms of any H.P. or H.T., winning with the old favourite, Mrs. J. Laing. For six flowers of any tea or noisette rose, Messrs. D. Prior and Sons led with lovely clean examples of White Maman Cochet, and the same firm were second respectively for a dozen teas with Madame Jules Gravereaux, and for a dozen of any H.P. rose with the crimson and fragrant Gloire de Chedane Guinoisseau.

Dr. T. E. Pallett, Eden House, Earl's Colne, had the best two dozen roses in the amateur's section, and he won first place capitally with full, clean blooms, his Avoca, Florence Pemberton, and Mrs. T. Roosevelt being very good. The Rev. J. A. L. Fellowes second, and the Rev. Hugh Berners, third.

Dr. Pallett was also first for eight trebles, and here he had grand blooms of Frau Karl Druschki, Dean Hole, Hugh Dickson, Mrs. J. Laing, Avoca, Dr. O'Donel Brown, Francois Michelin, and Mildred Grant; Rev. F. L. Fellowes second.

Dr. Pallett had the best dozen teas and noisettes, and here he had Mrs. Foley Hobbs, W. R. Smith, Maman Cochet, and Molly Sharman Crawford in fine form; Rev. Hugh Berners second. For six blooms of any tea or noisette variety, Dr. Pallett scored with White Maman Cochet, a beautiful set.

Mr. Hammond, gardener to E. H. Taylor, Esq., Endscliffe, Corder Road, led for a dozen bunches of sweet peas with a glorious set of Birdbrook, Agricola, Mrs. Hardcastle Sykes, Mrs. E. Cowdray, Muriel Quick, Clara Curtis, Sunproof Crimson, White Queen, Anglian Fairy, R. F. Felton, Mrs. W. J. Unwin, and Wenvoe Castle; Mr. M.Cheveney second. In another class for a dozen bunches, Mr. Andrews led, and showed Barbara, Chas. Foster, and R. F. Felton in capital style. Mr. J. F. Cheesman, Barham, was first for a dozen bunches of sweet peas, arranged with gypsophila, and though he had good blooms he rather overdid the use of the added flowers. Mr. Roderick Dow, Mr. Andrews, Mr. Bradbury, and Mr. H. Hanson won in other classes, the latter showing large flowers well placed on long stems.

CUT FLOWERS AND DECORATIONS.

Messrs. Fred Smith and Co., Woodbridge, were the only exhibitors of three dozen bunches of hardy flowers, and they deservedly gained the first prize. Some of their best bunches were of Gaillardia Lady Rolleston, Anthemis Kelwayi, Campanula Moerheimi, Alstrœmeria aurantiaca, Malvia Olbia, and delphiniums. Mr. Andrews was placed first for a dozen bunches of hardy flowers, and he staged grand bunches of Spiræa Queen Alexandra, Campanula Moerheimi, Iris aurea, and Lilium pardalinum; Mr. W. Dunnett, gardener to Roderick Dow, Esq., Ipswich, second, and Mr. Luther Holden, Ipswich, third.

Messrs. F. Smith and Co. led for a dozen spikes of delphiniums, and Mrs. H. Barton had the best six spikes, winning in a close competition with the varieties Francis Fox and Rev. C. Lascelles. Six bunches of annuals was a popular class, and Mr. H. G. Haggis, The Laurels, Woodbridge Road, won first place, with Mr. A. G. Munford second; the former had good stocks, sweet peas, Statice Suworowi and Delphinium Blue Butterfly.

First prize for a table decoration was won by Miss M. Snell with Irish Elegance roses; Mrs. H. Barton second with Irish Elegance roses; and Mrs. W. L. Hubbard third with pale-pink carnations and lily of the valley.

For a round table decoration, sweet peas, Miss V. Clair, Hempson, with Barbara, and Mrs. W. H. Burroughs, with lavender and pink varieties, were placed equal first. Mrs. Barton third with cream-pink flowers. Mrs. Barton had the best bowl of roses, and Mrs. Burroughs staged the finest vase of flowers—a great sheaf of Blush Rambler rose.

FRUITS AND VEGETABLES.

Mr. Messenger, gardener to C. H. Berners, Esq., Woolverstone Park, Ipswich, won first prize for a decorated dessert table, and presented a fine collection of Brown Turkey figs, Dymond and Crimson Galande peaches, Pineapple nectarines, grapes, and melons, and used the lovely Irish Elegance rose as decoration. Second prize fell to Mr. Andrews, gardener to the Right Hon. the Speaker, Campsea Ashe, Wickham Market, and Mr. Moores, gardener to W. F. Paul, Esq., Orwell Lodge, came third. Mr. Messenger scored for black grapes with deeply-coloured Black Hamburgh, and was the only exhibitor of white grapes, winning the first prize with Buckland Sweetwater. Mr. Messenger had the best four dishes of strawberries, fine fruits of Gunton Park, Waterloo, Utility, and Givon's Late Prolific; Mrs. Andrews second. Currants, raspberries, cherries, and gooseberries were all well shown.

Messrs. Sutton's prizes for six dishes of vegetables fell to Mr. Messenger, who staged Magnum Bonum cauliflowers and Perfection tomatoes in fine style. Mr. Andrews a good second with capital onions and carrots. For Messrs. Webbs' prizes for six dishes of vegetables the competition between these same exhibitors was exceptionally close, and a double set of judges had to decide the merits of the two sets. Mr. Messenger led by 1½ points, scoring heavily on Early Mammoth cauliflowers and Midlothian Early potatoes; while Mr. Andrews' Duke of Albany peas, Ailsa Craig onions, and Champion Horn carrots were excellent.

GROUPS AND PLANTS.

Mr. Moores, gardener to W. F. Paul, Esq., was easily first for a group 9ft. by 5ft., and he set up a good display of crotons, Humea elegans, Kalanchoe flammea, coleuses, and campanulas; Mr. Chastney, gardener to V. D. Colchester, Esq., Ipswich, second. Mr. H. Southgate, St. Helens Nursery, was the only exhibitor in the large group class, and he made effective use of blue hydrangeas, white liliums, and scarlet pelargoniums.

For three hydrangeas Mr. Boughey, gardener to Rev. A. C. Johnson, Capel St. Mary, Ipswich, came to the front with very large freely-flowered specimens, and the same competitor scored for three fuchsias with large-flowered varieties. Mr. Moores put up the best three ferns in a keen competition, and he also had the best specimen foliage plant, showing a good croton in competition with ferns, asparagus, araucarias, maples, and coleus. Mr. Grout, gardener to Mrs. W. H. Burroughs, Burlingham, Ancaster Road, was easily first for six tuberous begonias, showing massive specimens freely flowered.

NON-COMPETITIVE DISPLAYS.

These were good in quality, and of fair size. The chief exhibitors were: Mr. R. C. Notcutt, hardy flowers, and large circular group of roses, carnations, palms, etc. (gold medal); Messrs. Buck, Ipswich, floral designs (silver medal); Messrs. J. K. King and Sons, Colchester, fine sweet peas (silver-gilt medal); Messrs. Thompson and Morgan, Ipswich, choice hardy flowers (silver-gilt medal); Messrs. E. Abbott and Sons, Ardleigh, sweet peas (silver medal); and Messrs. Morse Brothers, Woodbridge, roses (silver-gilt medal).

Cambridge Horticultural Society.

JULY 3.

This long-established and admirably-managed society held its annual exhibition in the grounds of Trinity College, and a more delightful site for a flower show could hardly be desired. The space was ample both for tents and visitors, the turf closely shaven and soft and elastic, and the fine trees, with their wide-spreading branches, are sufficient to afford shade, had shade been wanting. The weather, however, was dull, and there was therefore no occasion to seek the shelter of the trees. Hitherto, when the show has been held in association with Trinity College, the authorities have readily given permission for the Fellows' garden, with its wealth of choice trees and beautiful flowers, to be open to visitors; but this year they were apprehensive of the action of a certain section of the community, and thought it wise to avoid all risk by keeping the gates closed. Much interest is usually associated with instituting comparisons between the past and present exhibitions, but the pressure on our space in the present issue is such as to render the utmost brevity necessary. It must therefore suffice to say that the exhibition was thoroughly representative in character, and that the cultural skill evinced by the greater proportion of the products was remarkably high.

Roses, as usual, formed an important and highly attractive feature, although a few of those who are resident some distance from Cambridge had failed to fulfil their entries. We are not sure that we have seen the rosarians within the district quite so strong as on this occasion, but, however that may be, they produced a fine display of blooms. The principal open class was that for forty-eight blooms, distinct, and here Messrs. J. Burrell and Co., Cambridge, was a magnificent first, staging blooms, comprising both new and old varieties, that were remarkable for their large size, superb form, and splendid colouring. To particularise is hardly necessary, but special mention may with advantage be made of George Dickson, Mrs. E. Mawley, and Commandant Faure. Messrs. J. Burrell and Co. also occupied the post of honour in the class for thirty-six blooms, distinct varieties, and had a fine set, in which Duchess of Sutherland, Mabel Drew, and The Lyon were very conspicuous. The same firm were again first in the class for twelve teas or noisettes, with blooms exquisite in finish.

Very keen was the competition in the amateurs' class for twelve blooms, and at the head of the competitors was Mr. W. Dunn, with finely-developed blooms, which were tastefully set up as well as being finely grown. Mr. R. Coulson had a fine box of blooms for second place. Mrs. R. M. Biffen was successful in obtaining the premier position in the class for six blooms, staging superbly-developed examples of W. Shean, Dean Hole, and other varieties of much merit. Mr. W. Dunn and Mr. W. Hobbs were second and third respectively with finely-grown flowers.

In the members' class for six blooms Mr. Coulson was first with medium-sized blooms remarkable for their high finish; Mr. Dobbs was a close second, and Mr. W. Dunn and Lady Lucy Braybrook were placed equal third. The contest was keen in the classes open to amateurs not employing a regular gardener, and in that for six blooms, Mr. A. C. Dunn was a splendid first; and in the corresponding class for six teas or noisettes, Mr. W. Dunn occupied the premier position with a meritorious stand, in which the exquisitely coloured Madame Constance Soupert was especially well represented. The amateurs' classes for triplets were also well filled, and the blooms of much merit.

Groups for effect formed an attractive and interesting feature, and Mr. W. P. Neal obtained premier honours with a highly attractive arrangement, in which begonias, crotons, dracænas, and caladiums were of much merit. Mr. P. L. Hudson was a good second. Exotic ferns were finely shown by Miss Smith and Mr. P. L. Hudson, who were first and second respectively, the former staging fine examples of the Bird's Nest and Stag's-horn ferns. Mr. R. J. Hall had a fine set of specimens for first place in the class for six British ferns, those of Scolopendrium vulgare crispum and Lastrea filix-mas cristata being especially well-developed; Miss Smith second.

Tuberous begonias were largely and finely shown, and produced a rich display of colour. The chief prize-winners in the several classes were Mr. W. Dobbs, Mr. Matthew, Mr. R. J. Hall, Mr. W. P. Neal, and Mr. A. J. Hall. Miss Smith obtained premier honours in the class for six coleus, staging finely-coloured specimens, and was successful in the classes for zonal pelargoniums. Mr. P. L. Hudson obtained first place for six stove and greenhouse plants in flower, for six fine foliage plants, and for nine orchids. Mr. A. Briscoe had an excellent set of six plants for table decoration, and was a splendid first, Phœnix Rœbelini and the crotons being particularly noteworthy.

Cut flowers were of much merit throughout, and special mention must be made of the twelve vases of delphiniums shown by Mr. C. Smith, who occupied the post of honour in the class. For a similar number of vases of annuals, Mr. A. Briscoe scored with finely-developed flowers. In competition for the prizes for twelve vases of hardy flowers, Mrs. R. Burn and Mr. Matthew were very closely matched in point of merit, and the awards were made in the order of their names. Mr. Hiam was the most successful of the exhibitors of sweet peas, winning both for twelve and six vases, and Mr. Hawkes, who was second in each class, also staged well-developed flowers.

Fruit and vegetables were hardly so plentiful as usual at the summer exhibitions of this society, but the quality was decidedly high. The strawberries were almost marvellous as examples of cultural skill for the whole of the fruits were of quite exceptional size, and splendidly coloured. In the competition for four dishes of these fruits, Messrs. Jones and Sons were a splendid first with Royal Sovereign, Givon's Late Prolific, Utility, and Sir Joseph Paxton; Mr. A Lellicot was a capital second. The same exhibitors occupied similar positions in the class for a single dish, the variety in the first prize exhibit being Givon's Late Prolific, the fruits weighing about three ounces each. Mr. Lellicot obtained the premier award for a dish of strawberries for flavour, with Sir Joseph Paxton at its best. Peaches were finely shown, and the first place was occupied by Mr. E. Nyson, with large, finely-coloured fruits of Bellegarde, and in the class for nectarines he was first with Lord Napier, the fruits of exceptionally large size.

Vegetables were of a high order of merit, and in the class for a collection of eight dishes, Mr. W. A. Briscoe was first, the cauliflowers and tomatoes being of great excellence.

Beckenham.

The Beckenham Society has a fine record, for it has held a long series of excellent exhibitions; it holds meetings of educational value and interest regularly throughout the winter months, and has a horticultural library of its own. The exhibition held in the delightful Recreation Grounds at Croydon Road on July 9 was a good one, though scarcely so large as some of its predecessors. Roses, sweet peas, groups, plants, and floral arrangements were all well represented, the latter filling one large tent, the exhibitors being ladies.

Beckenham is fortunate in having secured Mr. T. J. Jackson as secretary, in succession to Mr. Thornton, who is now the treasurer. Mr. E. Burge, the chairman, is a tremendous worker, and the president, Rev. Canon Arnott, is an enthusiast who was taught botany by the famous Dr. Lindley. Mr. Henry Cannell was at one time a regular judge and exhibitor at Beckenham, and so the committee made a special effort on this occasion to help the fund being raised for his assistance. In this connection Mr. Thornton had reprinted and circulated our recent reference to the misfortune that has befallen the old Swanley florist.

Three good groups of miscellaneous plants were arranged, and chief honours fell to Mr. W. Lane, gardener to A. W. D. Oakes, Esq., Knockwood, Scotts Lane, for a pretty combination of clarkias, gloxinias, liliums, pink spiræas, and pancratiums; Mr. R. Robinson, gardener to M. Bartholomew, Esq., Grassington, Hayne Road, came second, and he made free use of francoas and Humea elegans; Mr. Hewitt, gardener to H. F. Ashton, Esq., Whitmores, Kelsey Park, third, with Trachelium cœruleum, used most effectively. For a group of ferns—a pretty class—Mr. Fane was first, and his arches of Lygodium scandens were charming, as was his large central specimen of Polypodium Knighti; Mr. A. Hewitt second. A capital group of carnations secured a first prize for Mr. A. E. Smith, gardener to A. F. Scott, Esq., The Firs, Blakeney Road; Mr. Smith is a single-handed gardener, and his carnations did him great credit.

Mr. J. Bedson, gardener to R. Barber, Esq., Southwood, South Hill, led for six miscellaneous plants, and had a good Sobralia macrantha in his set; Mr. Fane came second with a big variegated hydrangea and a large Anthurium crystallinum. Mr. Marshall, South Bank, Chislehurst, scored for a foliage plant with a huge Asparagus plumosus. Mr. Fane was an easy first in the open class for three specimen plants, with Begonia coccinea, a stephanotis, and a fine Aerides odoratum carrying eight good spikes.

Mr. A. L. Cole had the best fuchsia, Mr. Fane the best pair of ferns, that included a fine Adiantum cuneatum gracillimum; Mr. J. Bedson the best four gloxinias, a handsome set; Mr. J. Bedson scored for table plants, and Mr. W. J. Green for begonias.

In the amateurs' section Mr. C. Luff, Birkbeck Road, did well with pelargoniums, and won for a specimen plant in flower with a splendid zonal pelargonium. Mr. L. H. Hurst, Dunbar Road, scored for coleus, and Mr. C. Brewer, Clock House Road, scored for a pair of pelargoniums in a capital class. Mr. Brewer was also successful in several other plant classes.

Messrs. G. and W. H. Burch, Peterborough, scored for forty-eight roses, distinct, with fair-sized blooms of F. K. Druschki, Ben Cant, Mrs. T. Roosevelt, Lyon Rose, Comtesse de Raimbaud, Leslie Holland, Mrs. Myles Kennedy, and Mrs. Dudley Grant; Mr. E. Hicks, Wallingford, second, and Mr. F. J. Jefferies, Thornton Heath, third. The Messrs. Burch were also first for two dozen tea and noisette roses, and their best blooms were Innocenta Pirola, Mrs. Foley Hobbs, W. R. Smith, and Souv. de Pierre Notting; Mr. F. J. Jefferies second. Mr. W. G. Green, gardener to Major Bowater, Bickley, had the best dozen roses in the amateur class. Mr. Hicks led for a dozen blooms in an open class, and here he put up a capital set of Dean Hole, Mdme. Jules Gravereaux, Bessie Brown, and Mrs. S. Clark; Messrs. G. and W. H. Burch second, and Mr. F. J. Jefferies third. For six blooms of any variety, Mr. E. Hicks scored with Mrs. R. G. Sharman Crawford, Mr. F. J. Jefferies second with Wm. Shean. For a dozen vases of decorative roses, Mr. E. Hicks was an easy first, and his bunches of Rayon d'Or, Mdme. Ravary, A. R. Goodwin, Mdme. Abel Chatenay, Ecarlate, Lady Hillingdon, and Mdme. M. Soupert were splendid.

Mr. Julian Lemon, Brassfield, Godstone, Surrey, was a fine first for a dozen vases of sweet peas, using with splendid effect vases of Edrom Beauty, R. F. Felton, Dobbies' Thos. Stevenson, John Ingman, Etta Dyke, Hercules, Dobbies' Cream, Dobbies' Sunproof Crimson, Mrs. C. W. Breadmore, Gladys Burt, and Melba; Mr. C. Jackson, gardener to F. D. Bolton, Esq., Haimer, Bickley, second. Mr. Julian Lemon was the only exhibitor of eighteen bunches of sweet peas in nine varieties, and here he had superb flowers of Dobbies' Cream, Nubian, Hercules, Melba, Sunproof Crimson, Dobbies' Thos. Stevenson, R. F. Felton, and Etta Dyke.

In a very keen competition Mr. F. Wells, gardener to the Misses Roberts, Rosenberg, Bromley, led for six bunches of sweet peas; Mr. W. J. Green, gardener to Major Bowater, Bickley, came second; and Mr. J. Jordon, gardener to W. Howard Wood, Esq., Homewood, South Eden Park, third. Mr. L. P. Purton, The Avenue, led for six bunches of hardy flowers, and Mr. F. Wills was a good first for a dozen bunches of hardy flowers in a close competition. Mr. Frostick, Thornton Heath, was well to the front for cut carnations.

In the class for a table decoration of roses, Mrs. A. E. Brown, Brokes Lodge, Reigate, was first with a charming design of Irish Elegance; Miss Bashford second with small blooms of Mdme. Abel Chatenay; and Mrs. Trossell, Albemarle Road, third with Mdme. Abel Chatenay and Lady Gay. In a local class Miss Bashford scored with blush carnations; Mrs. A. G. Brown second with sweet peas; and Mrs. Stevens third with carnations.

In the local class for a table decoration, any flowers, Mrs. Trossell scored with blush carnations and gypsophila; Miss L. W. Grantham, Thornbury, Shortlands, second, with a daring and original design of Alstrœmeria aurantiaca; and Miss E. Higinbotham, Vernon House, Albemarle Road, third, with a pretty combination of carnations and sweet sultans. Mrs. A. A. Stewart, Shaftesbury Road, led for an epergne of sweet peas; and Miss Potter, Elmside, Lawn Road, was successful for a bowl of sweet peas, with Mrs. L. Wheeler, Woodhall Gardens, a close second, with crimson blooms and small sprays of ramblers. Miss Hilda Brown, Brokes Lodge, Reigate, was a capital first for a fine bowl of flowers, and Miss Bashford second.

In the vegetable classes, Mr. D. Gardner, gardener to Sir Harry Oram, K.C.B., St. Arvans, Bromley; Mr. J. W. Harrison, gardener to R. Girvan, Esq., Ashbourne, Sydenham; Mr. P. Field, gardener to Mrs. Munro, Bromley Road; Mr. E. H. Marshall; and Mr. T. W. Stevens, gardener to W. H. Stone, Esq., Donnington, Sydenham, were the leading prize-winners in the vegetable classes.

Mr. Mark Webster, gardener to E. J. Preston, Esq., Kelsey Park, put up a large and artistic group of grandly-grown and beautifully-flowered standard specimens of Acalypha hispida, their scarlet tails

attracting a great deal of attention; a few Oncidium flexuosum underneath rendered the group additionally attractive. A Silver-gilt Medal was deservedly awarded to this non-competitive display. Mr. G. Reuthe, Keston, and Mr. Lakeman, each put up good non-competitive displays, the former staging choice hardy flowers, and the latter some excellent border carnations. Mr. Currey and Mr. C. J. Dicks, both of Beckenham, contributed respectively succulent plants and alpines.

Scottish Horticultural Association.

JULY 1.

The monthly meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 1st inst. Mr. King, the president, was in the chair, and there was an attendance of 60 members.

The evening was devoted to the reading of short papers by juniors on subjects of their own selection, for which prizes were offered by the President. There were eleven entrants, and the judges, Dr. Smith and Messrs. Highgate and Pirie, awarded the prizes as follows: First, W. H. Allan, Edinburgh, subject, "Soil Sterilisation"; second, E. G. Extence, Stoke Bishop, Bristol, subject, "Onions"; third, John Smith, Castlemilk, Lockerbie, subject, "Begonia Gloire de Lorraine"; fourth, Peter Kerr, Mauldslie Castle, Carluke, subject, "Hardy Fruit Interest"; highly commended, C. T. Mackintosh, Quarter House, Stirlingshire, subject, "The Gardener: An Artist"; commended, F. G. Barrie, Gosford, East Lothian, subject, "Culture of Cyclamen in Pots." The first prize, a gold medal, was presented to the winner by Mrs. Whytock, and, on the motion of Mr. C. Comfort, a cordial vote of thanks was given to the President for providing the prizes, a similar vote being accorded to the judges. The papers were thereafter read to the meeting.

The exhibits were: Crassula coccinea, from Mr. F. Fulford, Montgomerie Castle Gardens, Talbolton, Ayrshire; hydrangea, from Mr. John Whytock, Edinburgh; single white pink, from Messrs. James Grieve and Sons, Edinburgh.

At the meeting on August 5 a paper on "Villa Gardening from the Professional Gardener's Standpoint," will be read by Mr. John Highgate, Hopetoun Gardens, South Queensferry.

Wolverhampton Floral Fete.

(Continued from page 516.)

also occupied by standard heliotropes, ivy-leaved pelargoniums, etc., with bamboos.

Mr. A. R. Dempster, Kidderminster, showed violas very well, winning first prize in the class for a collection arranged effectively on 7ft. by 3ft. of tabling. With a mirror at the back, and tall epergnes in the foreground, the arrangement was very attractive, and such varieties as Monarch, C. B. Murrey, Mrs. Mason, and A. J. Bastock were shown in well-grown flowers. Messrs. Pemberton and Son, Bloxwich, came second, showing good masses of flowers, third prize going to Mr. J. Bastock, Birmingham, with whom the yellow Moseley Perfection was a strong point.

SWEET PEAS

had practically a tent to themselves, what with the exhibits on stages, and the extensive array of table decorations. The leading open class was for eighteen vases of twenty-five stems, the winner being Mr. A. E. Usher, gardener to Sir R. S. Baker, Blandford, who showed in his own splendid style. Barbara was grand, and so, indeed, were Lavender George Herbert, Maud Holmes, Marks Tey, and all the other varieties put up. Mr. T. B. Lowe, gardener to Captain G. Lubbock, Warminster, came second, Flora Norton Spencer, Stevenson's White, Melba, and Florence Nightingale doing good service on this stand. Mr. F. G. Bealing, Southampton, came third with quite a nice exhibit.

The sweet pea table decoration found Mrs. T. Batchelor, Hampton-in-Arden, at the head of the winners, her effort certainly being most charming. Long trails of selaginellas were used with the peas to good purpose. Mrs. W. Marple, Wolverhampton, was second, showing exceedingly well-grown flowers of Anglian Pink and Mrs. Routzahn, arranged with capital taste. Third prize was secured by Mr. T. Cope, Birmingham, there being no less than thirteen entries in this very fine class. In the other table decoration class, admitting any flower, Mr. J. V. Macdonald scored a good win, using miltonia, phalænopsis, and Oncidium flexuosum with great judgment. Mrs. Greaves, Wolverhampton, came second with cattleyas, pancratiums, francoa, etc.

FRUIT.

This section was not extensive, neither was quality exceptionally great. There was only one entry in the big class for a decorated table of thirty dishes, and this came from Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton, Chester, who received first prize for his exhibit. The grapes shown were Black Hamburgh, Madresfield Court, Muscat of Alexandria, and Buckland Sweetwater. Mr. Barnes also had Brunswick figs, splendid Royal Sovereign strawberries, Jefferson plums, James Grieve apples, and a number of other fine dishes on his table. Two entries in the class for twelve dishes of fruit found Mr. J. Doe, gardener to Lord Saville, K.C.V.O., Ollerton, in first position. He had very good black grapes and fine fruits of Early Gros Mignonne peaches, a beautiful melon, etc. The other exhibitor was Mr. S. Sims, Borrowash, Derby, who was awarded fourth prize.

Mr. Doe took the lead for four bunches of grapes, and for two bunches of black, Mr. N. F. Barnes scoring for two bunches of white.

VEGETABLES.

The prizes in the vegetable classes were provided by seedsmen, Messrs. Webb and Sons' class for eight dishes finding Mr. A. R. Searle, gardener to the Marquis of Northampton, to the fore. Stourbridge Marrow pea was splendidly shown. Early Mammoth cauliflower was very good, and other dishes were Defiance Intermediate carrot, Colonist potato, Emperor tomato, and Reliance Globe beet. Mr. J. R. Tooley, gardener to H. Anderson, Esq., Winchcombe, was second with a well-grown lot of useful vegetables.

Mr. Searle again took the lead in Messrs. Sutton and Son's class for six dishes, showing White Leviathan onion, Centenary pea, Purity cauliflower, Sutton's Favourite carrot, May Queen potato, and Sutton's Perfection tomato. Mr. E. Winchester, Birmingham, was second; and Mr. E. Deakin, Hay Mills, Birmingham, third. There were a large number of classes set apart for amateurs, gentlemen's gardeners, and cottagers, and some grand exhibits were staged in these sections.

NON-COMPETITIVE EXHIBITS

were present in great number and variety, and in point of quality, there was no question as to their equality with anything prevously seen at Wolverhampton. Our space admits of nothing more than the briefest description of the outstanding features of the efforts of the trade, but it must be admitted that the material was worthy of infinitely greater praise and descriptive record.

Messrs. Sutton and Sons, Reading, confined themselves to sweet peas, occupying a large stand, on which big vases of the best of present-day varieties were well displayed.

Miss Hemus, Upton-on-Severn, was an exhibitor of sweet peas on a large scale, her best varieties being shown in big masses with great effect. The tasteful arrangement of the exhibit of sweet peas from Messrs. E. W. King and Co., Coggeshall, justly received high compliment from the visitors, and it may be added that the flowers evinced such quality as can only result from expert culture.

Messrs. W. H. Simpson and Sons, Birmingham, were also sweet pea exhibitors, their stand being very attractively arranged with the aid of tall pyramidal stands, and also dwarf vases. Messrs. W. J. Godfrey and Son, Exmouth, showed a splendid lot of Canterbury bells. The firm have brought these flowers to a wonderfully high state of perfection, and the colours, as well as the size of the flowers, were very pleasing. Ferns were finely shown by Mr. H. N. Ellison, West Bromwich. Polypodium glaucum crispum, P. Knightæ, and P. phylloides were very noticeable on account of the length and beauty of their fronds.

Messrs. John Forbes, Lim., Hawick, Scotland, showed phloxes, pentstemons, and delphiniums, as well as a fine lot of border carnations and show pansies. Salvia dealbata was a distinct plant staged, and Hedysarum multijugum was also a bright spot on the stand. Messrs. Young and Co., Hatherley, Cheltenham, showed perpetual carnations, the quality of which was first-class. May Day, one of the best-formed flowers among the perpetuals, was well shown, as also were Mikado, Scarlet Glow, Cecilia, and other well-known varieties.

The Key Fertilizer Company, Starling Place, Norwich, showed a model lawn of fine, even grass, grown by the aid of their special lawn manure. Miss S. S. Thompson, Handsworth, Birmingham, had an interesting collection of cacti and other succulent plants, some of the specimens being wonderfully developed, and the whole exhibit being of great merit and interest.

Messrs. E. Webb and Sons, Wordsley, put up one of their fine stands, which included floral and vegetable products of great merit. Webbs' New Emperor tomato, melons of several good varieties, and some excellent (for so early a date) potatoes were particularly noteworthy, and among the floral features were gloxinias, begonias, sweet peas, arranged on a series of arches, and some grand Clarkias. Messrs. Dickson's, Lim., Chester, put up hardy flowers in choice variety. English iris were distinctly good. Lilium Hansoni, Campanula Burghalti, and Galega Lady Wilson being other good things noted. Messrs. Dobbie and Co., Edinburgh, made a bold display of sweet peas, their flowers being very fine, and the colours were as bright as could be imagined. Thomas Stevenson, Red Star, Ruby Palmer, and Sunproof Crimson were among the brightest, Blue Picotee, Lady Knox, and Dobbie's Cream, all of delicate tints, affording pleasing contrast. Zonal pelargoniums provided much rich colour on Messrs. Jarman and Co.'s stand from Chard, Somerset. Their roses, sweet peas, and centaureas were also of good quality.

The most extensive, and, in its way, the most noteworthy, exhibit in the show was the rock and water garden arranged by Messrs. Pipers, Bayswater. The design was clever, artistic, and as pleasing as any flower show garden we have seen. The subjects used were good in quality, and suitable in character. We could not overlook Spiræa palmata, its colour was so good, and the spikes of Astilbe Venus were also fine. To name the choice alpines used on the rockery would occupy more space than can be spared, but those who affirm that rockeries cannot maintain floral dress after midsummer should have seen the masses of blue, pink, yellow, and white on Messrs. Pipers' exhibit. Mr. W. A. Manda, St. Albans, had a group of cacti, orchids, and ferns, and Messrs. H. J. Jones, Lim., Lewisham, showed a big group of phloxes, which were well arranged on the ground.

MEDAL AWARDS.

Large Gold Medals.—To Messrs. Pipers, Bayswater, London; Messrs. Sutton and Sons, Reading.

Gold Medals.—To Mr. A. F. Dutton, Iver; Messrs. Dobbie and Co., Edinburgh; Messrs. Webb and Sons, Wordsley.

Silver-Gilt Medals.—To Messrs. J. Forbes, Lim., Hawick; Mr. W. Lowe, Beeston; Messrs. Dickson's, Lim., Chester; Messrs. E.

Award of Merit.—To a new bronze sunflower, exhibited by Messrs. Sutton and Sons, Reading.

OBITUARY.

MR. LIVINGSTONE S. REID.

Mr. Livingstone S. Reid, gardener to Mrs. Rogerson, of Marchmount, Dumfries, died in the Dumfries and Galloway Royal Infirmary on July 2, and was interred in St. Michael's Cemetery, Dumfries, on July 5. Mr. Reid was well known in the Lanark district as a successful gardener, and only went to Dumfries about six months ago, when he entered the service of the late Mr. Rogerson as gardener. He did good work while at Marchmount, and was rapidly becoming a favourite with his fellow horticulturists when his death occurred. He was keenly interested in horticulture, and was an active and valued member of the Dumfries and Galloway Gardeners' Association, and contributed an excellent paper to the association. He had suffered for some time from a painful internal malady, but was able to attend to his duties until two or three days before his death. Mr. Reid is survived by Mrs. Reid and three young children, for whom much sympathy is felt.

GARDENING ENGAGEMENTS.

Mr. J. Davis, for ten years head gardener to Colonel E. R. Stuart Richardson at Ballathie, Perthshire, has been appointed head gardener to Sir Felix Schuster, Bart., Verdley Place, Fernhurst, Sussex.

Mr. T. W. Smith, foreman for five years at Wych Cross Place Gardens, Sussex, has been appointed head gardener to H. K. Lethbridge, Esq., at Wood, Okehampton, Devon.

Figs.—Fruits from the earliest trees having been gathered, the trees should be thoroughly cleansed prior to starting them to swell the second crop. The reduction in moisture at the roots during the ripening of the fruits gives the trees a little rest. Red spider or other insects, which affect the fig, may have increased, and these must now be got under by thorough syringings with soft water and occasional syringings with insecticide. Give the trees a dressing of artificial manure, and water occasionally with liquid manure, the best of all stimulants for fig trees.—F. JORDAN, Warter Priory Gardens.

ANSWERS TO CORRESPONDENTS.

YELLOW ASPARAGUS SEEDLINGS.—F. D., Crowborough: I am forwarding a few plants of seedling asparagus. About three weeks ago they commenced to go off, and I can find no trace of grub or wireworm attacking them. I shall be very grateful if you will kindly tell me what is wrong, and what remedy to apply.—We should like to receive a few more specimens. In those sent the roots appear to be quite healthy, and, though the growth is slightly paler than usual, and has a yellow tinge, it does not suggest disease. At the ground-line or collar of the plant, however, there is a slight constriction, caused probably by the soil settling hard and baked around the tender seedlings. Thin the seedlings, give abundance of water, and keep the surface soil loose by hoeing.

INFESTED GOOSEBERRY LEAVES.—Y. W., Abinger: You will very much oblige me by saying what is the matter with the gooseberry leaves I am enclosing. The bushes do not look at all happy, although they have carried fairly good crops of fruits, all of which were picked green. If you can tell me the cause and cure of the trouble I shall be very grateful.—The leaves sent were badly infested with the gooseberry red spider, a pest which often does a great deal of damage by sucking out the sap of the leaves, and thereby reducing the vitality and cropping power of the trees. Gooseberries so infested should be marked in some way so that they may be readily observed, and receive special treatment. During May and June, and also July, the gooseberry red spider is very busy laying its tiny, shining, red-coloured eggs, which are easily seen, by the aid of a hand magnifying-glass, on the twigs and in the tiny nooks and crannies around the remains of the old bud-scales. Not until the following spring do the eggs hatch, and the young, which closely resemble their parents in general appearance, come forth. It is of the greatest importance that this infestation should be promptly dealt with directly it is observed. Should a single bush show the least trace of red spider it must be cleared at once, or it will become a centre for the pest to spread from the following year. Where the mites are already known to be in possession of a bush, the best means of combating and destroying them is by spraying the infested bushes with the summer insecticide and fungicide wash. This should always be done after nine a.m., when the leaves are dry and the sun is shining brightly, as the majority of the mites will then be at work upon the surface of the leaves. On the leaves sent the spiders can be seen plainly without the aid of a glass, but under a lens they are rendered very obvious as well as the tiny silky webs they weave. Spray with kerosene emulsion made by dissolving ½lb. of soft soap in a gallon of water, and while this is still boiling add 2 gallons of kerosene oil. Stir the mixture vigorously, and while it is still hot pass it through a sprayer or spray syringe, so that a proper emulsion is secured. Bottle this mixture for general use, and use it at the rate of one part to 30 parts of water for spraying the bushes. Try one branch or bush first, because under certain conditions the leaves may be too tender, and a weaker solution be necessary.

DAMAGE TO ROSES.—E. M., Upminster: I am sending you some branches of roses which are troubled with some disease. I shall be much obliged if you will kindly let me know, through the "G.M.," what is the cause and remedy, so that I may prevent further attack and failure. The soil the roses grow in is light and warm, and the disease is most prevalent where the plants receive the full power of the morning sun. I have used no insecticide.—The chief cause of trouble, though, perhaps, not the only one, is the rose slugworm (Eriocampa rosæ), a sawfly that does no end of harm to roses in some districts. This pest devours the green part of the leaves and works from above, and soon renders the leaf useless for the fulfilment of its proper functions, and consequently the growths suffer more or less from starvation, and the whole plant loses vitality. The flies are shiny black with smoky wings, and the grubs are yellowish-

green with an orange-coloured head. The grubs fall to the ground when full fed and pupate in the soil. There are two broods, possibly three, in a year, hence the great need for a patient and persistent fight against the pest. Spraying with a nicotine or hellebore wash will kill the pest, but the surface soil must be removed and burned to destroy the pupæ, fresh soil being placed over the roots. Cut back the badly damaged growths and encourage the new growths, so that they may be kept clean and become properly ripened in the autumn. Use pure nicotine 1oz., and soft soap 2oz., to 10 gallons of water.

POTTING ODONTOGLOSSUMS. — F. L. J., Matlock: I have some odontoglossums that need potting, as the pots are filled with old pseudo bulbs, and the new growths have little chance of doing well. I did not pot in the spring, as there were numerous spikes showing. When would be the best time to pot? I have had little experience with orchids, but so far have managed very well with those under my charge, thanks to your notes under "Work for Week."—Odontoglossums should not be potted in hot weather; it will therefore be best to leave the matter until August has well advanced, but you will receive full instructions in due course under "Work for Week," which, by the way, we are pleased to hear has been of such value to you.

RUST ON VIOLAS. — E. G., Daventry: The viola growths I enclose seem to be affected by a kind of rust. Please tell me how to get rid of this disease.—The growths sent show an attack of rust that is closely akin to the disease which so often attacks mint. In the latter case, as with violas, we have noticed that the disease is most likely to obtain a footing where the plants have been propagated for several generations from division of the roots, and where the same crop has been grown on the same site for a considerable period. Lift and burn all the affected plants, propagate a clean stock from the cuttings of healthy specimens, and in due course plant the youngsters on a new site. Be sure to lift the diseased specimens and burn them, root and branch.

NAMES OF PLANTS.

A. P., Westmorland. — Gloriosa superba.

H. H., Bury.—1, Skimmia japonica; 2, Ligustrum chinensis; 3, Escallonia macrantha.

L. B. H., Manningtree.—1, probably a Phyteuma, send again; 2, Saxifraga hypnoides.

S. E. R., Harrogate. — 1, Campanula rapunculus; 2, Sedum rupestre; 3, Hypericum Coris.

G. A., Cowes.—1, Stachys grandiflora; 2, Dianthus deltoides; 3, Chrysogonum virginianum; 4, Taxodium distichum.

B. R., Guildford.—1, Mesembryanthemum tricolor; 2, Olearia macrodonta; 3, Cotoneaster horizontalis; 4, Hydrangea aspera.

N. G. W., Sandy.—1, Campanula persicifolia Moerheimi; 2, Thalictrum flavum; 3, Sedum acre; 4, Gaultheria procumbens.

F. G. C., Oswestry.—1, Dianthus alpinus; 2, a Saggitaria leaf; 3, Nuphar lutea; 4, Selaginella Emileana; 5, Fuchsia Riccartoni.

C. M. B., Peterborough.—1, Dryas octopetala; 2, Gentiana septemfida; 3, Veronica spicata; 4, V. incana; 5, Escallonia macrantha.

FORTHCOMING ENGAGEMENTS.

NEXT WEEK.

MONDAY, July 14.—United Horticultural Benefit and Provident Society; Committee meeting.

TUESDAY, July 15.—Royal Horticultural Society: Committees meet at 12 o'clock; Ninth Masters Memorial Lecture on "Some Factors in the Prevention of Diseases in Plants," by Professor R. H. Biffen, M.A.; Scientific Committee at 4 o'clock.
National Rose Society's Provincial Show at Gloucester.
Southampton Summer Show; two days.

WEDNESDAY, July 16.—Reigate Summer Show.
Nottingham Summer Show; two days.
Birmingham Rose Show.
Bishops Waltham Rose Show.
Luton Summer Show.
Harrogate Flower Show; two days.

THURSDAY, July 17.—National Sweet Pea Society's Exhibition at the Royal Horticultural Hall, Westminster.
Dunfermline Summer Show; two days.
Dulwich Flower Show.
Lincolnshire Horticultural Exhibition; two days.

FRIDAY, July 18.—National Carnation Society at the Royal Horticultural Hall.
Ulverston Rose and Sweet Pea Show.
Birmingham Summer Show; two days.
National Sweet Pea Society's outing to Messrs. J. K. King and Sons, Coggeshall.

SATURDAY, July 19.—Blackburn Flower Show.
Gourock Rose Show.

THE GARDENERS' MAGAZINE

NOTE OF THE WEEK.

Control of Plant Diseases.

Although in dealing with some of the factors in the prevention of plant diseases at the meeting of the Royal Horticultural Society on Tuesday, Professor Biffen referred with greater fullness to the agricultural side of the subject than to that with which horticulturists are the more immediately concerned, his lecture was of immense interest to those who are engaged in garden management, and contained much information with which they should be fully acquainted. The lecture, which attained to a high level, was essentially practical in character, and its value was greatly enhanced by the clearness with which both scientific truths and cultural points were stated. At the outset reference was made to the divergence in the views held with regard to the increase or otherwise of fungoid diseases of plants, and Professor Biffen stated that, in his opinion, they were increasing, and with some degree of rapidity, one good reason for this increase being the extension of the practice of growing plants in larger masses than was at one time the case. It will be readily understood by those who have some acquaintance with the biological characteristics of parasitic fungi, and are well versed in cultural methods, that when large numbers of the same, or allied, kinds are grown in the same or contiguous plots or quarters, they are more liable to suffer from diseases of fungoid origin than are those widely distributed, because of the greater facilities they afford for the spread of the spores of the fungi. This increase is likely to continue so long as intensive culture obtains favour, and is more or less progressive. Considerable attention had, it was pointed out, been given to fungicides, but unfortunately much has to be learnt about their action upon the plants liable to infection and the biological characteristics of the parasites before they can be used to the best possible advantage. Bordeaux mixture is considered by Professor Biffen to be the most useful of the fungicides, but it is not, in his opinion, a specific for all plant diseases. It has the drawback of requiring skilful preparation, and there is a risk of it being otherwise than satisfactory where those responsible for its use do not prepare the supplies themselves. This fungicide has also the drawback, in the case of potatoes, for which it is the most largely used, of delaying the maturation of the crop, and thereby preventing the lifting of the tubers until the late autumn rains, and thereby increasing the risk of deterioration in quality. If fungicides cannot be used with a full measure of success, cultivators must, observed Professor Biffen, find substitutes, and, as recognised by observant cultivators, attacks of fungi can in many cases be prevented by suitable modifications of cultural methods. Cucumbers were mentioned as affording a concrete example of what can be accomplished in this direction. In their culture under glass for commercial purposes the practice is to liberally enrich the beds with nitrogenous manures, to maintain a high temperature and a humid atmosphere. Under these conditions the growth is very rapid, and the fruits tender and delicate in flavour; but the stems and leaves are soft and sappy, and should the leaf spot fungus (Ceriospermium melonis), for example, attack the plants, they are quickly destroyed. With a more moderate use of nitrogenous manure, and less warmth and moisture, the risk of any considerable damage to the crop can be prevented. In like manner, the attack of the "Damping-off Fungus," which sometimes inflicts heavy losses upon growers of small salading, can be prevented by growing the crop under drier conditions. While it is not possible to control plant diseases in the open so readily as can be done under glass, it is, in Professor Biffen's opinion, possible to do so to a marked extent. Scientists do not, he said, fully appreciate the influence of food supplies on plant life in relation to the diseases to which they are more or less susceptible, but there could be no question that the highly-fed plants are the most likely to suffer severely from the attacks of parasitic fungi. The experienced cultivator will call to mind many proofs of this that have come under his notice in the course of his practice, and a most conclusive proof was mentioned that had been found in the plots devoted to wheat at the Rothamsted Experimental Station. On one set of plots wheat had been grown for upwards of fifty years with the aid of several manures. In these plots there was a considerable difference in the intensity of the attack of the common rust, and, with a view to determine the relative severity of the attacks, he marked the plot in which the wheat was the most badly attacked as 10. On the unmanured plot there was no disease, and the plot was marked as 0. In that where mineral manures were alone used there were sufficient traces of rust to justify the attack being estimated at 2. The plot on which the mineral manures had been supplemented by sulphate of ammonia showed an increase of rust of 50 per cent., and the number allotted was 3. Where the dressing of the latter was doubled the rust had increased to 4, and

MR. HARRY BOSHIER,
Hon. Secretary of the Croydon Gardeners' Association.

where quadrupled to 5. In the plots which had received applications of nitrate of soda, the disease was so rampant as to justify estimating the intensity of the attack at 10. Some experiments in water culture that had been conducted at Cambridge, with a view to obtaining further evidence of the effect of the food supply upon the susceptibility of plants to disease, were described, and these were of interest as confirming the results obtained at Rothamsted, where the manuring had been continuous over a period of more than 50 years. Barley was used in the water culture experiments, and the plants grown with nitrate of soda and sulphate of ammonia were very badly affected with rust, which gradually decreased with the substitution of phosphates and potash. By cutting down the food supplies to one-half and one-quarter there was almost complete immunity from disease. Much the same result followed from the addition of lithium to the other constituents, and as not more than 1 per cent. is necessary, Professor Biffen thinks it probable that lithium might be employed commercially in crop production. Reference was also made to the possibilities of rendering crops immune by judicious cross-breeding and careful selection, and to the remarkable results that had been obtained in Western Australia in connection with wheats. For a long period it was hardly possible to grow wheat in the colony owing to the prevalence of rust, but with the rust-proof varieties that had been obtained, all exceptional difficulties had vanished. It will not be easy to make any considerable progress in the breeding of garden plants because of the many factors that have to be taken into consideration, the most important of all being, perhaps, public taste. No potato, however great may be its disease-resisting powers, will be grown unless it is of high quality, and lovers of roses will certainly not buy varieties immune from mildew, unless their flowers possess the attributes of beauty in a marked degree.

Mr. Harry Boshier, the hon. secretary of the Croydon and District Horticultural Mutual Improvement Society, has seen his society grow from small beginnings to be one of the strongest in the country, and, following Mr. J. Gregory as hon. secretary, he has very largely helped to make the association the successful educational body it now is. Mr. Boshier turned his attention to farming after his schooldays were over, but found farm work too slow, and entered service with Mr. Henry Deverill, of Banbury, to whom he was apprenticed for three years. Seeking further experience, he came to London, and was with the One and All Association for three years. Later on he became manager to Messrs. E. M. and S. Rogers, corn and seed merchants, of Croydon, a position he still occupies. Mr. Boshier was chiefly instrumental in securing the union of Horticultural Improvement Societies in affiliation with the Royal Horticultural Society. He is a member of the executive of the Croydon Horticultural Society, and this year organised a sale of flowers in connection with the famous show. The sale realised £6 2s., which was handed over to the Royal Gardeners' Orphan Fund. Mr. Boshier is a capital organiser, and a very popular man among the horticultural fraternity of the Croydon district.

Horticulture at Cambridge.—From the report recently issued by the Syndicate for the management of the Cambridge Botanic Garden we learn that there has been considerable activity among those engaged at Cambridge in experimental work connected with horticulture. The Professor of Genetics has rented four allotments for experimental purposes, and experiments in plant breeding have been carried out by several workers. Miss Saunders has continued her researches in the cross-breeding of stocks and other plants. In the experiments pit Mr. Gregory has continued his investigations of Primula sinensis, with special reference to the development of giant races. Insufficiency of space prevented more than a small proportion of the previous crop of seeds saved being sown, but the plants raised did remarkably well, and gave good results. Miss Gairdner has continued her experiments with tropæolums, with a view to obtain definite information relating to the transmission of variegation in these plants, and is investigating an abnormal type of wallflower. Miss Killby, Mr. Compton, and other investigators have been busily engaged with research in other plants of interest. The forestry students have, we learn, made free use of the Botanic Garden, and the Reader has given instruction of a practical character there.

Perpetual Flowering Carnation Society.—Mr. T. A. Weston, of Floradale, Orpington, the society's secretary, writes: "Owing to the fact that our financial year closes on October 31, my committee desires me to announce that all new subscribers after this date will be covered by their subscription until October 31, 1914. New members will thus receive the current season's Year Book, and will be entitled to all privileges of the society until the date above mentioned."

Mr. J. S. Chisholm, who has for some years past occupied the position of horticultural instructor for Northumberland, has been appointed chief lecturer in horticulture to the Edinburgh and East of Scotland Agricultural College, and adviser in horticulture to the twelve counties in association with the college. Mr. Chisholm, who thus succeeds Mr. J. P. Berry in both the appointments he vacated on his taking up the duties of general horticultural inspector in the Horticultural Branch of the Board of Agriculture, has done splendid service in the position he occupied under the county of Northumberland, and his retirement therefrom is regarded as a loss to the county.

A Lady Lecturer at London University.—Dr. Marie C. Stopes, Fellow of University College, has been appointed lecturer on fossil botany at the London University.

Bicentenary of St. Petersburg Botanic Garden.—The bicentenary of the Botanic Garden of St. Petersburg, which was founded by Peter the Great, has been celebrated in a manner befitting so important an occasion. The functions commenced in the evening of the first day by a special service in the cathedral, at which delegates from kindred establishments at home and abroad and the garden staff were present. At this service a wreath of roses was laid on the tomb of Peter the Great. On the second day there was a great gathering at the Botanic Garden in a building contiguous to the old herbarium, at which several Princes, members of the Russian Government, and a host of scientists were present. The meeting was opened by M. Kriwoshen, the Minister of Agriculture, and the announcement was then made that the Emperor of Russia had commanded that the garden should in the future be known as the Imperial Botanic Garden of Peter the Great. Professor A. Fischer von Waldheim then gave an address in which he dealt with the history and objects of the garden, and at its close there was a reception of the delegates followed by the presentation of medals and other mementoes of the bicentenary. The third day was devoted to an inspection of the Botanic Garden, a visit to Peterhof, and an operatic performance. The garden has an area of about fifty acres, and is well provided with grass structures, and the herbarium, library, museum, and laboratory are spacious and admirably equipped. The directors of the garden, who in the past specially distinguished themselves, included F. E. L. Fischer, Trautvetter, E. Regel, and C. Maximowicz. The present Director, Professor A. Fischer von Waldheim, has occupied the position he holds since 1897, and during the sixteen years that have elapsed, he has so completely reorganised the establishment as to immensely improve it in every way, thereby greatly increasing its capacity for good work, and to obtain the warmest expression of praise from the botanists taking part in the bicentenary celebration.

Horticultural Club Outing to Friar Park.—It has been found necessary to change the date of the annual club outing from July 16 to Thursday, July 24. On the latter date the club will be entertained, on the kind invitation of the president, Sir Frank Crisp, Bart., at Friar Park, Henley. The party will leave Paddington in special saloon carriages at 9.57 a.m., and proceed to Marlow Station. The president's launch will be in waiting there to convey the party by river to Henley, where the president will entertain the members at lunch in the boat-house. After lunch an inspection of the gardens will be made, and, after tea has been taken, the president's launch will convey the party to Reading, where saloon carriages will be in waiting for the return journey to Paddington, which will be reached at 8.58 p.m. The price of tickets, including all charges, will be 11s. It being necessary to limit the number of guests, members should apply for tickets not later than July 16, to the hon. treasurer, Sir Harry J. Veitch, East Burnham Park, Slough, Bucks, who has kindly undertaken to make the necessary arrangements.

"**Botanical Magazine.**"—The following interesting plants are figured in the issue of this publication for the current month: Podachænium eminens, a distinct composite introduced from South America about seventy years ago, and for some time known as Ferdinanda eminens. The plant is rather straggling in growth, but it can be kept in shape by frequent stopping, and when grown in comparatively small pots, the flowers, which are white with yellow disk, are freely produced. Sedum pilosum, a charming stonecrop of small growth and bearing a profusion of bright rosy flowers; it is a native of the Caucasus, and is found at an altitude of between 4,000 and 5,000 feet. Cunonia capensis, a handsome tree, producing elegant spikes of small white flowers, and described as fairly abundant in the forest tracts of South-eastern Africa. It has long been in cultivation in this country, and in the days when Cape and New Holland plants were appreciated, fine specimens were to be met with at Syon and other of the great gardening establishments. Crotolaria agatiflora, a handsome shrub, producing in a wild state "long racemes of large greenish-yellow, but nevertheless brightly-coloured flowers"; the species is a native of Uganda and British East Africa, and has been grown for the first time in this country in the gardens of Pylewell Park, Lymington, the residence of Ingham Whitaker, Esq.

where, under the care of the gardener, Mr. W. F. Hamilton, it has grown and flowered most satisfactorily. Vinca difformis, a distinct and pretty species, extending over a wide range in Southern Europe, and bearing lavender-blue flowers; it is similar in character to V. major and V. minor, but is not so hardy

R.H.S. Daffodil Year Book.—Lovers of daffodils will be interested in hearing that the Royal Horticultural Society is publishing, the first week in August, a Daffodil Year Book. The cost, in cloth covers, is this year fixed at 2s. 6d., but, if sufficient support is afforded to the venture, it is hoped next year to be able to lower the price. It will contain papers by several eminent growers, together with lists of varieties recommended for various purposes, and notes on new and recent introductions. Reports of all the chief daffodil shows throughout the country, with lists of the winning flowers, will also be a feature of the publication.

Proposed Purchase of Box Hill.—An offer has been made by a gentleman, whose name has not been disclosed, to provide the money for the purchase of Box Hill, or the more important part of it, with a view to handing it over to the National Trust, or some other public body, to be preserved in perpetuity.

Visit to Escrick Park Gardens.—A few evenings since about sixty of the members of the Ancient Society of York Florists visited Escrick Park, the residence of Urban H. Broughton, Esq., for the purpose of enjoying the charms of the beautiful gardens. Much that was noteworthy was seen and appreciated by the members of the party in their walk through the gardens and plant and fruit houses, but the fine displays of roses and violas appeared to attract the most attention. These, in common with other features, testified in no uncertain manner to the cultural skill of Mr. W. Stanton, the head gardener, who acted as guide to the visitors.

New Classification of Chrysanthemums.—The "Transactions" of the National Chrysanthemum Society for the current year are of quite exceptional interest, and can hardly fail to receive a warm welcome from the members, and, indeed, from all who are concerned with chrysanthemums. Of special importance is the text, with illustrations, of the lecture given by Dr. E. J. Russell at the conference held on November 20, 1912, on "Chrysanthemum-growing in Partially Sterilised Soil." Not less deserving of attention is the report on the new classification of chrysanthemums, which was adopted last year with much success. In the new classification there are six sections—namely, Incurved, Japanese, Anemones, Pompons, Singles, and Spidery-plumed and Feathery, and in each of the sections provision is made for both large and small-flowered varieties. The section for incurved varieties is, for example, divided into two sub-sections, one to include the large-flowered varieties, such as Buttercup and Duchess of Fife; and the other the medium and small-flowered varieties, as Daisy Southam and Mrs. G. Rundle. The Japanese are grouped under the sub-sections of Japanese, Incurved Japanese, and Hairy Japanese; and the Japanese sub-section is divided into three groups, comprising large-flowered, as Lady Talbot and F. G. Vallis; medium-flowered, as R. F. Felton and Cranford Pink; and small-flowered, as Roi des Blancs and Source d'Or. In the Incurved Japanese there are two groups, the large-flowered with Mrs. Gilbert Drabble and Mrs. A. T. Miller as types, and the medium and small-flowered as Mrs. Roots and Le Pactole. The anemone section contains two groups, one including varieties with blooms three inches or more in diameter, as W. W. Astor and Sir Walter Raleigh; and small-flowered varieties, with blooms of a diameter less than three inches. Of the pompons there are two groups, one containing such large-flowered varieties as Mdlle. Elise Dordam and William Westlake, and the other such small forms as Snowdrop and Anastasia. There are three sub-sections of singles, the first to include the varieties with one or two rows of florets, the second with three to five rows of ray florets, and the third with anemone centres; and in the first and second there are two groups, one for varieties with blooms having a diameter of three inches, and the other for varieties with blooms of a diameter less than three inches. The new classification should at no distant date effect an appreciable change in the character of chrysanthemum shows, and bring into prominence the many beautiful varieties with blooms of moderate size.

The People's Palace Horticultural Society will, by permission of the King, pay a visit to the Royal Gardens, Windsor, on the 26th inst. His Majesty has expressed his intention of entertaining the members of the society to tea on the occasion of their visit.

The Crystal Palace Purchase.—The appeal made by "The Times" for £90,000 to complete the sum required for the purchase of the Crystal Palace met with so generous a response that the whole amount was obtained within a fortnight. The sum of £24,900 has yet to be raised to complete the total of £230,000, the purchase price of the Crystal Palace and grounds; but this apparent deficit is mainly due to the fact that certain local bodies and several of the City Companies have not yet met to consider the donations that the Lord Mayor has reason to expect from them. "The Times" fully completed its task, and may be heartily congratulated on the splendid results.

Vacant Land Cultivation Society.—This society was formed in London in 1908 for the purpose of affording facilities to men who are wholly or in part out of employment to profitably utilise their spare time in the cultivation of vegetables and flowers on the vacant land within the Metropolis. According to the report of the society for 1912-13, which is now before us, the total area of vacant building land in the county of London is 14,000 acres, and the method of procedure is to select such properties as are suitable for the cultivation of garden crops, and obtain permission from the owners for the loan of the land on the condition that the tenure may be terminated at any time on a week's notice being given. The society then proceeds to prepare the land, under the direction of Mr. R. L. Castle, the superintendent, and allot plots thereon without any charge for rent to the applicants, who, it may be added, are largely in excess of the available plots. The report states that the weather of 1912 suited the greater part of the land admirably, and with the improvement effected by four years' continuous good cultivation, the crops surpassed any previously obtained. It is further stated that the gross retail value of the produce on all the plots during the past year exceeded £3,000, and that during the summer months the rows of vegetables and flowers on the whole of the area would have formed a continuous line 200 miles in length. The gross retail value of the produce raised and used, or sold, during the five years over which the operations extended is stated to have been £9,000. During this period the income of the society has aggregated £2,000. Mr. Joseph Fels, 39, Wilson Street, E.C., is the hon. secretary.

Fairy Rings.—In the course of her investigations of fairy rings Miss Baylis has obtained satisfactory evidence that Clitocybe gigantea and Marasmius oreades, by which the rings are formed, are parasitic on the roots of the grasses, which are killed by the toxic substance secreted. Some secretion, whether the same as that which destroys the grass, is not clear, is toxic to the fungi, and effectually prevents their growing in the same position for three consecutive years, with the well-known result of an increase in the extension of the rings. The great increase in the growth of the grass on the inner and outer margins of the rings, as compared with that of the ring itself, is due to the increase in the additional nitrogenous food that is set free by the action of the fungi.

Mr. James Gibson, of Welbeck Abbey Gardens, like many other gardeners, is good at bowls. At the Nottinghamshire meeting recently he won a forty-guinea challenge cup and the championship gold medal in fine style.

Enclosure and Regulation of Commons.—The Select Committee of the House of Commons, appointed in March last to inquire into the existing requirements of the law as to the procedure prescribed in connection with the enclosure and regulation of commons, and to report whether any alterations are desirable, have issued their report as a Parliamentary Paper (85). With regard to the area of commons in England and Wales the committee state that, in their opinion, the return of 1874 (3,368,465 acres) is inaccurate, but they assume that the area of common or waste land still remaining unenclosed approaches 2,000,000. The total area of common land regulated is 48,373 acres. Briefly summarised, the recommendations of the committee are as follows: (1) That procedure for enclosure should substantially be left to be dealt with by the machinery of the present Acts. (2) That an Act be passed complete in itself containing procedure for regulation. (3) This new Act should contain the following provisions: (a) No change should be permitted in the legal estate of any interested party; (b) the method of applying for regulation should be simplified; (c) the procedure of the Act of 1899 should be adopted with the necessary modifications; (d) the absolute veto of any person or group of persons upon a scheme of regulation should be abolished; (e) where agreement between interested parties, including the local authorities, can be arrived at, recourse should not be had to Parliament; (f) where no agreement can be arrived at the usual procedure of a Provisional Order Bill should be adopted with the modification that the Select Committee on Commons should be substituted for the Provisional Order Bill Committee; (g) increased regard should be given to the rights or privileges of the "labouring poor," and to the rights exercised by the neighbouring public over commons which are not part of manors; (h) where no one can prove a title to a village green, this should be vested in the Parish Council; (i) the present provisions as to the confirmation of bye-laws should be altered.

Mons. Albert Truffant, of Versailles, one of the most widely-known of Continental nurserymen, has been honoured by election to the rank of Officer of the Order of Mérite Agricole.

AMONG OLDEN ROSES.

Modern roses reflect the greatest credit upon horticulturists, but the question has long been raised whether too many new varieties are not annually named and distributed. Roses with great distinctive qualities are rare; roses of too great similarity are plentiful. In consequence flower-lovers are paying more and more attention to the older varieties and species; and when these can be discovered, usually in far-away country spots, and removed to the pleasure grounds, the result usually proves that our ancestors knew well what are the good points of a rose. Probably florists would find a ready sale for old-world favourites, if they were to advertise them as such when the winter planting season comes again.

The globular shape was once more in request than the high-pointed one chosen by modern taste; however, it would be wise to allow hybrid perpetuals to retain the former conformation of petals, which certainly better conserve the scent, and require only the elegance seen in the spicily perfumed teas and hybrid teas.

Take the ancient Alfred Colomb for example; it yields a brilliant light carmine that does not quickly fade, it is of superb, round, closely-petalled shape, and probably no other rose so reproduces the true rose fragrance. For perfect cup shape, long-lasting qualities, and delightful flesh-pink shade, can any rose surpass Baroness Rothschild? This has, too, that sturdy, compact growth that defies gales, the closely-studded stems that keep it almost immune from caterpillars and grubs, and the kindly habit of raising each bloom erect so that the beauty is fully seen. Fill vases with blossoms of Baroness Rothschild, others with Madame Abel Chatenay, and, though the latter is admirable in lasting qualities among modern roses, the former will be looking beautiful still when all the others are faded and limp. In some old catalogues Charles Lefebvre is described as otto-scented; the perfume is undeniably distinct, and when care is taken to grow this for all it is worth the colour is unequalled, and the size immense. Unfortunately it is seldom a free bloomer.

A cottage garden path, edged on either side by a hedge of Commandant Beaurepaire, is a vision that will dwell in memory. This is a striped rose, an improvement on the old York and Lancaster, having a peculiar wealth of attractive foliage; altogether it can be cordially recommended for ordering for autumn planting wherever strong and striking boundary lines are required. It has been said that Countess of Oxford is one of the best hybrid perpetuals to experiment with for the production of a blue rose; its bright carmine petals are always shaded with violet at the base, and this hue overruns them as soon as the richer hue begins to fade. The effect of a bush the first glory of which has departed is a quite new one in the lawn beds, but the effect is, of course, seen most where whole borders are given up to this useful hardy variety. It is a large rose, too, with a pronounced cup.

Amateurs have lately been curious as to the relationship that an old hybrid perpetual named Danmark bears to La France de '89—if any. Danmark used to be described as "in the way of La France, but deeper in growth, and with stouter wood." The colour was very fine, and long lasting, and the foliage had that vigour that the leaves of the two La Frances too frequently lack.

What has become of Emilie Gonin, a remarkable tea rose indeed? The white petals were gradually shaded with yellow that reached actual orange, and each of those petals showed a broad edge of carmine. No visitor to a garden ever passed this beauty by without inquiries as to name and class, yet now it is looked for in vain. We still cultivate Madame Falcot, but Emanuel Geibel, a sport from it, with deeper and brighter colour, a fuller rose, too, is seldom seen.

The hybrid perpetual Eugène Appert was always recognised among scarlet-crimsons by reason of its rich dark foliage. Heinrich Schultheis could be trusted to flourish almost anywhere, and expand quantities of its large, sweet, full, pale pink blossoms. Henriette de Beauvan deserved to live on instead of the shy and eccentric Duchesse d'Auerstaedt that it so closely resembled; Johanna Sebus, a hybrid tea of cherry-rose, and satin finish, shot with yellow, of unfading tints, and a wonderful autumn bloomer, should be in every garden.

Thirteen years ago a rose catalogue gave this description of La France de '89: "Climber. Exhibition H.P. Brilliant red, sometimes lined with white, of enormous size, almost like a pæony; free flowering, and very vigorous." The question naturally arises in the mind—Is the La France de '89 now in commerce of similar parentage? With all its merits, it can scarcely claim to be lined with white, and enormous as a pæony. Lastly, it may be suggested that the hybrid perpetual Mrs. Rumsey supplied a true rose-pink of immense size. E. G.

COLOUR GARDENS.

Gardens of symmetry, gardens of natural grace, gardens of prize plants with blossoms of the largest, gardens of novelty, all have their merits, but it is to be doubted if any give as much delight as does the garden of colour. It may be great or small, established at cost of many tens of pounds or of but few shillings, yet it is bound to be regal in its beauty. A wealth of colour, we say—and truly there is no wealth like it. When the summer is dawning is the time to create new colour masses inexpensively and easily. There are other methods, of course, for we may plant dozens of costly bedding subjects, or we may wait to introduce in autumn hundreds of rare perennials; but at present we will consider the quick and fairly cheap ornamentation by gay hues of such portions of the pleasure grounds as look dull and lifeless.

One simple expedient is sowing carmine candytuft among the shrubs, varied by the flesh-rose and the lilac varieties. Long before summer is passing the stretches of flower will be glorious, while next year self-sown seedlings will be there in myriads. Seeding must not be permitted too soon; one of the gardener's frequent tasks later on must be visiting the annuals, scissors in hand, to cut off all those dead sprays that are turning the vigour of the plants into seed-forming and so checking further bud production. The candytufts under copper beech and Prunus Pissardi trees, or near Berberis aquifolium, will be found especially charming, yet one way to gain a gorgeous display that will linger in memory is to use the carmine kind alone wherever golden shrubs can form a background. There are other annuals to use similarly, godetias and clarkias, for example, and the single and double Jacobæas are singularly generous with magenta, violet, mauve, and rose shades; in many gardens these Jacobæas will spring up, and reappear season after season, as surely as does the wild groundsel to whose family they belong, but they are only reckoned half-hardy, and will not flourish everywhere.

Snapdragon planting is a rapid method of locating colour; they can be purchased in yellow or scarlet for a few pence the score, and it is unusual for an antirrhinum to fail to thrive anywhere when it is once set; the fact that they bloom incessantly till winter should further recommend them. Many an insufficiently filled, poor, dry border against a wall, either of the house or the boundaries, could be turned into a glorious bank of snapdragons if a barrow-load of loam was thrown down so as to raise the back of the bed, and the slope is left sufficiently abrupt to prevent the foreground plants from hiding the others.

The golden bedding calceolaria is another of the flowers most precious to the gardener who values colour. It makes a magnificent display if used to cover both summits and sides of banks among the shrubs usually there. Front gardens can be made striking by this means, and, should there be two prominent banks one may be devoted to the brown calceolaria, the terra-cotta hue of which gives quite a leading note in sunshine.

For brightening shady borders nothing can excel day lilies, which can be planted early in summer, without preventing their season's yield of bloom, so long as the soil is rich and moist about their roots and handling is tenderly done. With golden euonymus behind them, and a carpet of one of the many reliable kinds of giant yellow bedding pansies, they will give a result of supreme charm. One of the most vivid colour shows ever witnessed was made last year with a mingling of orange African marigolds, and orange English calendulas, near a house of lime-washed walls: here and there edging groups, as distinct from stiff lines, had been arranged of dwarf royal blue cornflowers and Phacelia campanularia.

To stock a big garden with permanent plants of colour merit is the simplest summer work, considering that delphinium seed will germinate out of doors, and the seedlings grow on quickly where they arise. Care must be taken not to sow thickly, and to provide a two-inch layer of good compost above well-forked and manured garden ground. Seed of rose and red Michaelmas daisies can also be cordially recommended for outdoor sowing. A five-shilling collection of herbaceous phlox plants of any vivid rosy hue bought now will give flower in the autumn. Sometimes the clumps sent admit of immediate division, but in any case they can be lifted in late October, split up, and the stock increased then. These pink phloxes are seen at their best with an edging of white violas, or near silver-foliaged shrubs. Hollyhock seed should be sown in nursery beds, for this noble plant offers remarkable hues raised to such a height that the whole landscape is affected by them. For quick gain of somewhat similar hues the giant double annual poppies can be sown in the vacant spaces that the hollyhocks are to eventually occupy.

Early-flowering chrysanthemums are as willing to flood the land with gold and bronze, rose, mauve, scarlet, and lemon here as in the eastern countries famed for their splendour. A collection of one of the orange-scarlet varieties should be set by any dark evergreens, the yellows may be used lavishly near purple and mauve clematises that may be counted on for late flowering, and the rose shades are successful alternated with lemon African marigolds, sunflowers, and dahlias. M. H.

HARDY AZALEAS.

To the botanist there are no Azaleas, for the plants which were at one time included in that genus are now grouped with the rhododendrons, because the chief difference (that of the number of stamens found in the flowers, namely, 5 for azalea and 10 for rhododendron) has broken down in species which have been introduced since the founding of the genus Azalea. But to the owner of a garden there will always be azaleas, for, in addition to the two names being very useful to distinguish between deciduous and evergreen species, there are certain kinds which appeal to him under the one name with greater force than under the other. Therefore, so far as horticulturists are concerned, it seems unlikely that the deciduous species will ever be known to him by any other name than Azalea.

Originally, the name was applied to certain species from North America and one from the Caucasus, and to the evergreen Indian Azalea; but later years have brought others in the Chinese A. mollis, or A. sinensis, as it is often called, certain Japanese kinds, etc. Then there are the hosts of hybrids and garden varieties which are spoken of collectively as Ghent Azaleas, and better known than the species, and this group is likely to go on increasing for many years to come. It is, in fact, to the garden hybrids and varieties that the group owes its popularity, for among these may be found many of the most brilliant and delicate shades of colouring produced by any flowers grown in the outdoor garden. Moreover, so well do the various shades tone with each other, that in a mixed collection it rarely happens that a discordant note is struck, even though many shades of yellow, orange, pink, red, and white are mixed indiscriminately. That the flowers have a delicious perfume is another point in their favour; while in autumn, previous to the fall of the leaves, there are few more brilliant plants.

Azaleas require similar cultural treatment to rhododendrons. In moist, but well-drained soil, which is fairly free from lime, they thrive, but they abhor heavy, water-logged ground, and also very limey soil. Peaty soil is often suggested for this class of plant, but it is not essential to growth; in fact, if peat is not the natural soil of a district it is inadvisable to introduce large quantities for azaleas, but rather mix a little peat with the natural soil of the place. By filling beds with peat, it is liable to turn sour or decay before the roots can take advantage of it, and in the end acts as poison rather than food. Azaleas thrive both in sunny and moderately shady places, the most satisfactory results being obtained from plants which obtain a fair amount of sun. But in several large gardens they answer quite satisfactorily when planted as an undergrowth to thin pine woods, and such plantations are very charming when the plants are in flower. Named varieties are raised by cuttings, grafts, and layers; but, except in the case of species, it is not necessary to obtain these, for quite as good results are to be obtained from mixed seedlings, which may be purchased in large quantities from nurserymen who make a speciality of ericaceous plants. Of the various species of azalea the following are suitable for general cultivation:

A. calendulacea.—This is found on the mountains of Pennsylvania, Carolina, Georgia, etc., growing in fairly moist situations either in thin woods or in the open, often covering considerable areas. Growing from 3 to 8 feet high, it forms a rather dense bush, and produces orange, orange-scarlet, or reddish flowers. It has been used largely by the hybridist, and from it some of the richest-coloured hybrids have been obtained.

A. pontica (R. flavum) is a Caucasian plant noted for its large, fragrant yellow blossoms. Mature specimens may be found 6 or 8 feet high, though plants 4 to 5 feet are more common. Its influence may be traced in those forms which have large yellow or orange-coloured blossoms. As it forces easily it is often used for that purpose.

A. nudiflora, the Pinxter Flower of North America, is widely distributed from Canada to the Southern United States. Of similar size to A. calendulacea, it differs from that species by having white, pink, or red flowers. From it many of the best of the light-coloured kinds have been raised, and, with calendulacea, it has been responsible for the production of many reds.

A. mollis (R. sinensis).—Of late years this Chinese and Japanese species has been grown in enormous quantities for forcing, while it is also grown extensively in the outdoor garden. It is distinguished from the North American kind by its stiffer and more upright habit and its larger flowers, which more closely approach

AN EFFECTIVE GROUP OF HARDY AZALEAS.
In the garden of Kenview, Highgate.

the shape of those of the large-leaved evergreen rhododendrons than do those of the American kinds. The flowers show a remarkable range of colouring, for there are many delicate shades of red, yellow, and pink. All the forms blossom with remarkable freedom, but they lack the fragrance of the American and Caucasian hybrids. For outdoor culture they are scarcely so useful as the other kinds, for they bloom during the early part of May, a fortnight or so in advance of the others, and are sometimes injured in consequence by late frosts. Crossed with the American kinds, some lovely hybrids have been obtained. Plants for forcing are usually grown for that purpose in Holland and Belgium, and examples carrying from 30 to 40 heads of flower may be obtained through English nurserymen for a small sum each in the autumn.

A. viscosa (R. viscosum), sometimes called the Swamp Honeysuckle, is another North American species. It grows about 4 feet high, and blossoms in July. This species and its progeny may be distinguished from others by their lateness of blooming, and by their viscous shoots and flowers.

A. occidentalis and A. arborescens are two North American species, the former from California and the latter from Pennsylvania, Carolina, Tennessee, etc. They are of upright habit, growing 8 or 10 feet high, and produce white or pink flowers in June. Crossed with other kinds, and particularly with A. viscosa, a number of late June-flowering hybrids have been obtained which prolong the flowering season by several weeks.

In addition to the above-mentioned kinds, which are those usually grown, the following rarer sorts are worth attention:

A. ledifolia (R. ledifolium).—This is a native of Japan, China, etc., and is closely allied to the well-known Azalea indica, although much hardier than that species. It is distinguished by its evergreen, hairy leaves, which are 2 to 2½ inches long and ¾ inch wide, and by its white flowers, which are about the same size as those of A. mollis. Hardy in the neighbourhood of London, it is an excellent shrub for the southern counties. The variety narcissiflorum has double pinkish flowers.

A. linearifolia (R. linearifolium) is a Japanese species, remarkably distinct by reason of its long, narrow, hairy leaves, and by the long narrow petals of its rosy-purple flowers. Of rather low stature, it forms a spreading bush in the south of England, and is well worth growing on account of its distinct character.

A. quinquefolia (R. quinquefolium). — This is one of the rarest of the Azalea group. It is distinguished from other kinds by reason of its leaves being in whorls of five. The leaves are very pretty when young, for they are bronze at first, then for two or three weeks, after the centres have turned green, the margins retain a bronze or brownish shade. Flowers have rarely been produced in this country, but they are of a reddish hue.

A. rhombica (R. rhombicum).—This is a showy and interesting Japanese species. Growing three feet or so in height, it bears large rosy-purple flowers during late in April and early in May.

A. serpyllifolia (R. serpyllifolium), an interesting species from Japan, is of rather weak growth, and peculiar by reason of its tiny leaves. The flowers are rosy-purple in colour.

A. Vaseyi is a very pretty species from the mountains of North and South Carolina. Attaining a height of 3 to 4 feet, it bears shapely white, pink-flushed, or wholly pink flowers, in profusion during early May.

A. indica.—The only variety of A. indica which can be relied on for outdoors is the variety Amœna, and that does remarkably well in many places. The double-flowered balsaminæflora also does well in some gardens, whilst the allied Kæmpferi from Japan can be compared with Amœna for hardiness. The latter is very showy, and bears red or reddish-purple flowers.

Kew. W. Dallimore.

NOTES FROM SCOTLAND.

The genial weather of the past month has exercised a most beneficial effect upon hardy fruits, and, with few exceptions, good average crops of the earlier kinds are now being secured.

Strawberries.

These promise to be a record crop, both in quantity and quality, providing the weather continues favourable for ingathering. The week ending July 6 saw the first of the Scotch-grown crop placed upon the Glasgow market, though an abundance of the English-grown fruit had been in evidence for some ten days previous. The extent to which this trade has grown may be estimated by the statement, made public by the firm most largely engaged in the dessert fruit trade in the city of Glasgow —Malcolm Campbell, Lim.—that 14,321 baskets of strawberries, amounting to upwards of twenty-five tons weight, were thus received, and disposed of at the various retail places belonging to the firm, but mostly from the depot at 18, Gordon Street. The fruit is packed entirely in chip baskets, a method new to the northern city, and so well is this done, and the means of transit carried out, that very few of the berries show signs of bruising or other injury when opened out.

This, of itself, is remarkable, as the bulk of this fruit, being grown in the neighbourhood of Southampton, would have a long railway journey, and, afterwards, several hours in possession of the firm before it could be disposed of, and was then quite fresh, and almost unblemished in appearance.

Raspberries.

Various accounts have from time to time been issued as to this crop in Scotland, and reports from the principal district—Blairgowrie—were, a few weeks ago, not at all promising. The first large consignment for the open market reached Glasgow Bazaar on Tuesday, July 8, when, in the early morning, a couple of lorry loads, packed very neatly in the afore-mentioned chip baskets, and having a clean and very business-like appearance, awaited the opening of the building. As stated, this was the commencement of the season by some of the larger growers, and if the same high quality can be maintained, the crop is admittedly a heavy one, and not much complaint will be heard of the at one time feared shortage.

Gooseberries.

The crop is variable—in places very heavy, but in others meagre. The samples of fruit so far exposed for sale have been somewhat uneven in size, but a marked improvement in this respect has been noticeable during the past week.

Market Methods.

The chip basket referred to supplants the one of wickerwork so long used. In future the former only will be used for soft fruits—strawberries, raspberries, currants, and a few others, and they are made in sizes varying from two to six pounds as holding capacity. The great convenience of these is at once apparent, as the fruit is never in large bulk, and escapes any manipulation after being once placed in the receptacle, while the speedy and easy manner in which large quantities are worked through a market stall or shop, as well as the convenience of conveyance therefrom by the purchaser, commend the system to all. The old adage of first come best served may also apply in this case, but, on the other hand, in the case of strawberries, those who purchase in the evening do so at a considerably reduced price to that paid by others earlier in the day, and there is no material difference in the quality of the fruit.

Glasgow. James Day.

MESEMBRYANTHEMUMS.

Mesembryanthemums are not everybody's flowers, for there are but few spots in this country where they will succeed permanently in the open. A mild temperature, gritty, porous soil, and propinquity to the sea appear indispensable to their well-doing. All the best collections are grown close to the salt water. That in Tresco Abbey Gardens, Isles of Scilly, where about a hundred and twenty species are grown, is surrounded by the sea. At Abbotsbury Castle, in Dorsetshire, there is another very fine collection. The spot where they are growing in these gardens is situated just above the Chesil Beach, and in westerly gales the plants are drenched with the flying spindrift. At Kingswear, at the mouth of the Dart, they also thrive exceedingly well on the rocks overhanging the salt water.

The commonest species is Mesembryanthemum edule, commonly called the Hottentot Fig. This is a weed in the Scillies, and at Kingswear drapes the cliffs, and in the summer is bright with thousands of its large yellow flowers. A handsome species is M. acinaciforme, which bears deep, rose-coloured flowers about four inches across. This, in Start Bay, veils the rocks to a height of over twenty feet, its lower growth resting on the pebbly beach.

Much uncertainty exists in the nomenclature of the mesembryanthemums. In many cases the published descriptions of species are entirely dissimilar to the plants grown under the same names in the best collections. The following are handsome species: M. aurantiacum, deep orange; M. aureum, yellow; M. caulescens, deep red; M. curvifolium, flesh; M. inclandens, rose; M. lepidum, white; M. lineolatum, pink; M. productum, rosy-purple; M. roseum, bright rose; M. rostratum, yellow; M. tenuifolium, scarlet; and M. tigrinum, chiefly remarkable for the fiercely-spined leaves that suggest a tiger's open jaws. Mesembryanthemums are difficult to procure in the trade, the enquiry for them being so limited that nurserymen seldom find it worth their while to stock them.

Wyndham Fitzherbert.

Turneria ulmifolia elegans.—

This uncommon shrub might be taken for a member of the mallow family, but in reality it belongs to the order Turneraceæ. It will flower freely in an intermediate house when about eighteen inches high, forming as it does a branching shrub, clothed with oblong-lanceolate, coarsely-serrated leaves, of a rather thin, harsh, texture. The flowers, freely borne, are upright, fully two inches across, and of a bright yellow colour. Those that are suggestive of the flowers of Linum trigynum are the best forms of T. ulmifolia, a species which varies considerably. It is of easy propagation and culture.—W. T.

CLERODENDRON THOMSONÆ.

This lovely stove climber is probably seen at its best when grown on a wall, or covering a good space of trellising, and is useful as a vase plant for house decoration when grown on a balloon-shaped frame or trained evenly on five or six slender stakes carefully placed around the sides of the pot. Moreover, if started according to the time it is required to bloom, and given warmer or cooler conditions, as may be deemed necessary, it may be flowered at any time from April until August. Such plants now flowering require to be kept in the intermediate house until the flowers are past their best, when they may be relieved of useless wood and flower spikes, and be given stove conditions to ensure sufficient strong, healthy growth for the production of flowers next year. A topdressing or a little assistance from artificial manure will be of material assistance. One or two young plants rooted in the spring will afford a good display of flowers within two years, and such plants grown in a ten-inch or twelve-inch pot will remain in a healthy, free-flowering condition for several years.

Hatfield House Gardens. H. Prime.

CREEPING SNAPDRAGONS.

To the majority of cultivators the genus Antirrhinum stands expressly for the richly-coloured forms of A. majus, and so varied are the bright and attractive flowers of the varietal forms that they have attained a degree of popularity that makes their presence in every garden almost a necessity.

In addition to these erect forms, there is a charming group that partakes of the character of alpines, having prostrate or procumbent stems, bearing soft, downy, grey-green leafage, and from whence spring delightful minature flowers of true snapdragon form. The flowers of these dwarf species do not exhibit the wide range of colour that is so prominent a feature in the erect forms; they are usually white or cream, with delicate pencillings of purple upon the lip or upper segment; they are also exquisitely modelled and characterised by great refinement, and their beauty instinctively appeals to one, from the manner in which the flowers nestle among the hoary leaves.

These alpine snapdragons present no serious difficulty in cultivation, provided their special requirements are recognised and an endeavour made to meet them. They are extremely susceptible to excessive moisture in winter, hence a light soil and well-drained position are necessary, and they usually succeed best in the hottest exposure the rock-garden affords. The greatest success I have had with them was as dry-wall plants; here rooted cuttings and seedlings were used, and inserted in the wall, usually in quite a small state, and their subsequent behaviour was entirely satisfactory, the plants passing through several winters without the slightest injury, and presenting a display of their attractive flowers that lasted from May till September.

Of the creeping snapdragons, A. asarina is probably the best known. It is an Italian species, having rounded leaves and large, creamy-white flowers; it is larger in its parts than the others, but is an attractive species, and a good dry-wall plant. A glutinosum is a most captivating species, having soft, downy leaves, and pretty creamy-white flowers, that are borne erect and crowd the slender branches during June and July; an attractive feature in the flowers are the fine veins, suffused with purple, that traverse the lips of the flowers.

A. molle and A. sempervirens are two species having much in common, and like glutinosum, they are partial to the hottest exposure the rock-garden affords. In A. molle the flowers are white, the lip being yellow, with darker veins of purple; the leaves and also the slender procumbent branches are densely clothed with fine woolly hairs. In A. sempervirens the flowers are almost pure white, the leaves and stems being hirsute like the others.

These species of antirrhinum succeed in any light soil, but all are partial to that containing an appreciable quantity of limestone or chalk; they are readily propagated by seeds or cuttings, the former sown as soon as ripe in pans of sandy soil, and the seedlings wintered in a frost-proof structure, planting them out permanently in the succeeding spring. If sown during March, in the ordinary way, and the resulting seedlings grown exposed from the start, strong plants will result, and be ready for permanent planting by the beginning of August of the same year. Cuttings of the young shoots, taken during July and August, and inserted in pots of sandy soil, will root readily if kept moderately close for a few weeks, when they can be potted up singly, and treated in the way advised for seedlings.

Thomas Smith.

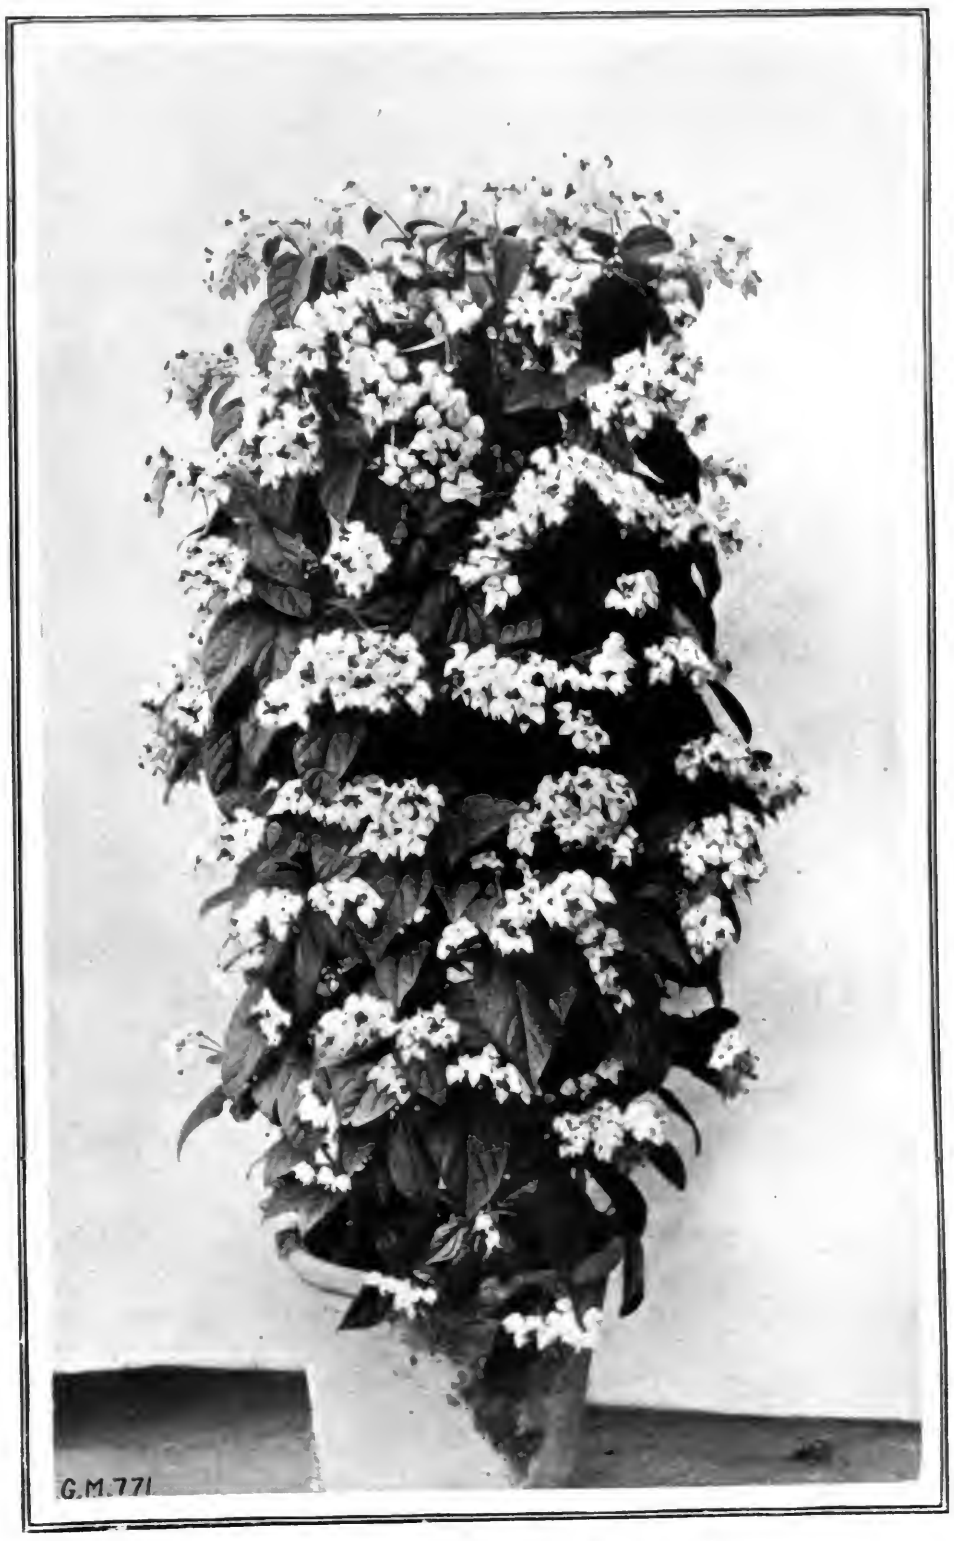
Coombe Court Gardens.

LIBONIA FLORIBUNDA.

The final potting of the main batch of plants should be done as soon as possible now, so that everyone will form a good specimen before the flower-buds show. If retained too long in smaller pots the buds form prematurely, and then the best attention as regards re-potting and feeding will not have the desired effect.

Cool treatment at this season is good for the plants. When newly potted in an open compost made moderately firm the lights of the frame should be closed all night, and only opened a few inches during the daytime for about ten days. Afterwards gradually give more ventilation until full exposure is reached. When the nights become cooler put on the lights. This treatment, coupled with judicious feeding after the pots are well filled with roots, will result in the growth of grand plants, bearing richly-coloured flowers.

M. L.



CLERODENDRON THOMSONÆ.

A finely-flowered specimen, as grown for decorative purposes by Mr. Prime, Hatfield House Gardens.

Spinach Beet.—In many places the ordinary winter spinach cannot be relied upon to provide pickings throughout the winter and early spring, and where this is so it is advisable to sow a good breadth of the perpetual or spinach beet. A sowing may be made forthwith on well-manured and deeply-dug land. Draw the drills 15 inches apart, and thin out the plants to 9 inches apart.—W. Messenger, Woolverstone Park Gardens.

AMONG THE ALPINE FLOWERS.

"The sunshine at our waking
Is still found smiling by;
With beamingness and earnestness,
Like some beloved eye;
And all the day it seems to take
Delight in being wide awake."

Leigh Hunt

In these bright days it is almost incredible to us that the "longest day" has come and gone, and that we are fast coming to the time when our alpine flowers will be fewer than in the early part of the year. That is a sad meditation, however, and it is well for us to enjoy to the full what Flora has poured out for us from her chalices of beauty, and to delight in the bright blossoms of the present. Bright, indeed, are they, and, though to many of us who are lovers of the alpine plants spring is by far the most winsome season, we are almost lured from our allegiance by the charms of the flowers of to-day. So far, it has been for a long time a gladsome season for the alpinist. Seldom over a long period has one had so much reason to "rejoice and be glad" in the beautiful flowers which have come to fill us with delight as they glow among the slopes and crevices of the rock garden. Swift as the days fly, the flowers have lasted longer than is oft-times their wont; and we have abundant reason to be grateful for the light they shed into our lives. Happy do they seem in the sunlight, and we are churls indeed if we do not respond to their efforts to woo us from dullness and gloom. It is impossible to wander among them and not to feel that we are the better for their companionship, and that our little ministrations to their welfare are rewarded tenfold.

Campanula Raddeana.

What a fine alpine plant is this! As it grows in size we are all the more enamoured of its beauties and its real value. It is absolutely hardy to all appearance; and on a flat part of the rock garden, or in the moraine, it is a gem. From nine to twelve inches high, and soon making a good plant, it looks extremely handsome with its delightful foliage and its large, open, cup-shaped flowers of deep purple-blue, whose colouring is enhanced in a high degree by the way in which the yellow styles project from the cups. In a light soil of loam, sand, and grit, and with a few chips about it, C. Raddeana increases at the roots so that it soon forms a good plant indeed. Here it has become associated in one part with a good plant of a charming little masterwort called Astrantia gracilis, and the combination is very pleasing indeed.

Astrantia gracilis.

So far as I can recollect, I have not mentioned this masterwort until now in these notes. It found its way here about two years ago, a small plant, recommended as being prettier than the far from common Astrantia minor, for which much larger plants are sometimes substituted, by the way. Astrantia gracilis has thriven, and the little crown has now spread into a goodly plant for an alpine of its character, and is now giving a shower of its dainty little blossoms of that curious form which shows us that in the masterworts we have members of that strange and generally unattractive natural order of the umbelliferæ. Compared, however, with the larger masterworts, Astrantia gracilis is elegance indeed, and we can appreciate this plant from Carniolia (not to be confused, as has been, however, with A. carniolica). Here it is a better grower than A. minor, and has more plentiful and whiter flowers than those of that species. In front of Campanula Raddeana, at a little lower level, its showers of feathery-looking blooms look graceful, and quite justify the name of "gracilis." It came to me from a noted Yorkshire garden, and is growing here on one of the lower levels of the rock garden, and in soil of loam, with a little leaf-soil, sand, and grit. It is about nine inches high here, and has stood the two last winters without the slightest injury.

Dianthus neglectus.

Opinions differ as to which of the great choice of alpine pinks is the best. It is safer, perhaps, not to be compelled to choose one out of so many lovely flowers, but among the first half-dozen I should be inclined to place very highly the beautiful Dianthus neglectus. But this must be done with a saving clause, as there are individuals known by the name of D. neglectus which are very inferor to others of the same appellation. It is rarely indeed that one meets with the old type of D. neglectus, which was a very low-growing dianthus with spiny leaves and large flowers rising but little above the plant, and of a deep yet brilliant rose, with nankin colouring on the backs of the petals. It is now many years since the writer grew this form, which was unfortunately lost in the convulsions of removal to another garden, and it is but seldom that he has come across an almost equally good one. The cause of this is that it is now largely raised from seeds, and that the seedlings, good, bad, and indifferent, are put into the market by those who raise them. To see a stock raised from seeds is to notice a vast difference among the plants, as a rule. Some are too long in the stem for a choice alpine; some lack the brilliant colouring; many are without the nankin backs, and wonderfully few possess all the good qualities of the real Dianthus neglectus of the olden days. We want a wholesale holocaust of many of these plants. There is no great difficulty in cultivating D. neglectus in sand, grit, and loam in the rock garden, in the moraine, or in the wall garden.

Other Flowers.

Many glowing and softly beautiful pinks meet us as we walk along. Some of them are species, but a number are hybrids and seedlings. Wonderfully beautiful are they for the rock garden, where the single varieties seem more in consonance with the genius of the place than the doubles. Yet all are so fine that we can hardly dispense with either form. Then there are campanulas galore, now very beautiful indeed; there are potentillas and geums; late-flowering Alyssum sinuatum, coarse, perhaps, but giving sheets of gold; helichrysums, such as the yellow rupestre, or the dainty little white H. frigidum; violas in the most amazing variety; æthionemas, androsaces, helianthemums, lithospermums, arenarias, erodiums, geraniums, alpine, Iceland, and other poppies, coronillas, astragaluses, and many other flowers which have come to greet the July days and to add to the garden's "pomp," as the poet called it, though with a winsomeness and modesty hardly in accord with the term.

S. Arnott.

JULY ROSE GOSSIP.

From this time onwards there is important work to be done among pot roses, and unless we give them careful attention now we shall not reap the desired success later on. All should be in the open air, and upon a warm border.

Bad autumnal weather often interferes with the efficient ripening of plants in the open ground, but with a little care in the matter of watering there should be no difficulty with pot roses. Too often this is left to chance, but more depends upon judicious watering than many apparently imagine.

Let any necessary repotting be done at once, and be sure to have efficient drainage. If the pots are half plunged upon a worm-proof base it will be better for them in many ways. Weak liquid manure may be given freely, and will do more good than an occasional dose at greater strength, which is often a little too powerful for the young roots. Nor should any liquid stimulant be supplied to newly-potted plants, these being much better if the roots are allowed to thoroughly permeate the soil first. Keep the centres of normal growers open and uncrowded. Climbers, and those of extra vigour, will throw better flowers, as a rule, from a smaller quantity of long growths, provided this can be properly ripened.

During the first few days of exposure to the open air, more than usual care must be given to the watering, for pot plants dry up very rapidly when first exposed, and one parching of the roots does much harm. I would not cease to use the syringe as freely as when under glass, for, above all, we must have clean growth to obtain anything like satisfactory results when forcing for winter bloom. Stop flowering to a great extent, and thin out indifferent wood. It is from now onwards that we are endeavouring to afford our pot plants something like an equivalent to natural autumn ripening, and the nearer we can attain to this the better will it be.

I feel that not a few growers do more harm than good by unduly withholding water with the idea of inducing a more rapid ripening of the wood. If kept too dry the roots must naturally suffer. Frequent syringing of the wood will be a great help, and save much of the strain upon their roots.

In the case of climbers, standards, and weepers, some method should be found of keeping them from wind waving and chafing each other. Two or three stout strings stretched horizontally will afford a good support, and allow plenty of air to circulate among them.

Rosarian.

Tacsonia insignis.—Most of the tacsonias and their near allies, the passion flowers, have leaves more or less lobed, but in this species they are entire, or nearly so. These leaves, which are dark green above, are, in common with the young portions of the shoots, clothed on the undersides with a rusty tomentum. It is a native of the Andean region of South America, and, like many plants from that district, is, under cultivation here, very liable to be attacked by red spider. Where it thrives, however, it is a particularly showy climber, the large, pendulous flowers being violet-crimson in colour.—T.

TWO NEW SINGLE ROSES.

Among the score and one roses that gained awards at the National Rose Society's exhibition at Regent's Park on July 4, there were two which merited close attention from those who love garden roses, and make a feature of rose decorations in the home. One was Red Letter Day, a vivid velety-crimson, hybrid tea rose, almost single, but with a few extra and broad petals that give the blooms more "staying power" than singles usually have. The brilliance of this variety commands attention, and in the garden it should be very fine. This was raised by Messrs. Alex. Dickson and Sons, Newtownards. The other rose was Ulster Gem, a true single hybrid tea, with very large straw-yellow or lemon-yellow petals; it is a fine thing, and should be especially useful in large cut-flower decorations, for association with other colours. This was from Messrs. Hugh Dickson, Lim., Belfast. Both varieties were fully described in our previous issue, and both gained a Silver-gilt Medal from the N.R.S.

ROSE ULSTER GEM.

A decorative single variety; flowers, sulphur-yellow. Silver-gilt Medal, N.R.S., July 4. Messrs. Hugh Dickson, Lim., Belfast.

QUERCUS DENTATA.

This Japanese oak is remarkable on account of the large size of its foliage, for it is not unusual to find leaves a foot or thirteen inches long and eight inches wide. It is known to the Japanese as "Kashiwa," and is sometimes found under the botanical name of Quercus Daimyo. Mature trees sometimes attain a height of 80 feet, but Japanese travellers tell us that as a full-grown specimen it is by no means imposing, the branch system being of a loose character, and lacking the symmetry which is usually associated with the head of a full-grown oak.

Professor Sargent, in the "Forest Flora of Japan," says that he found it growing on high mountains in Central Houdo, but that it is more abundant towards the more northerly parts of the island, where it is found on dry, gravelly hillsides at a comparatively low elevation. He gives an illustration of old trees growing in the vicinity of Sapporo, and these trees certainly give one the impression that a mature specimen is much inferior in beauty to a moderately well-developed common oak. As a young tree, however, it is worth including in the decorative part of the garden, for its leaves are very imposing, while another distinct feature is noticed in the large number of loose, narrow, brownish scales which surround the rather large terminal buds.

The species is better adapted for the southern than the northern parts of the country, and must be planted in good loamy soil to ensure a full development of its distinctive characteristics. W. D.

SUMMER PRUNING OF FRUIT TREES.

The practice of summer pruning fruit trees has much to commend it, but, on the other hand, if it is not properly carried out it is capable of causing much harm. One of the greatest mistakes is to commence the work too soon, and if this is done a considerable amount of growth is sure to be made afterwards, and if the basal buds do not actually break into growth, they are sure to be unduly excited. lation of sap throughout the tree. The growths proceeding from the spurs should be shortened back to about five leaves or buds from their base; it is not advisable to cut them any closer until they are pruned in winter.

Sweet cherries are treated on similar lines, and should be attended to at an early date. Plums usually make a good deal of growth, and in dealing with these, or other buds break into growth, and next year's fruit prospects are ruined.

Pear trees on walls can be dealt with next, and, in their case, the treatment is very similar. Cordon apples may be pruned towards the end of July. August is soon enough to summer prune bush and pyramid trees of apples and pears, with the exception of very early varieties, that may be done a little sooner. When training young trees leave a growth wherever it can be done without overcrowding, providing, of course, that it is well placed, as this will help to build up a good foundation. Old trees that are somewhat thin, as certain varieties of spreading growth are liable to become, are greatly improved by having shoots retained full length in blank spaces, and I have found this a means of greatly increasing the fruit-

ROSE RED LETTER DAY.

A decorative single variety; flowers glowing crimson-scarlet. Silver-gilt Medal, July 4. Messrs. Alex. Dickson and Sons, Newtownards, Co. Down.

The advantages of summer pruning are that it assists in the formation of fruit buds, and allows the wood that is retained to become more fully ripened owing to it being more exposed to light and air. It also assists the fruit to swell by directing the sap from the superfluous growths into the fruit.

One of the first trees to receive attention is the apricot, and in dealing with this it is important to lay in young growths in various parts of the tree where this can be done without overcrowding, as the finest fruit is usually produced on these young growths.

The shoots at the ends of the main branches should be preserved their full length, as this encourages a free circu- kinds of trees that are inclined to make more vigorous growth towards the top, it is preferable to prune the upper portion of the trees first, so as to allow the branches near the base to attain a greater development, as under the circumstances they would receive a greater proportion of sap. After the upper parts of the trees have been pruned about a fortnight the work may very well be finished off. Endeavour to keep the trees furnished with young wood towards the base, where they are so liable to become bare if care is not taken to lay in growths when summer pruning, and, moreover, do not cut back the later growths too hard, as more trees are probably ruined from this cause than any other; the basal bearing capacities of such trees. Unless the growths of apples and pears are very strong it is preferable to leave the main growths full length; by this means the balance of sap is better preserved, and it is an easy matter to shorten the branches to the desired length at the winter pruning.

J. GARDNER.

Batsford Park Gardens.

French Plum Crop.—The crop of plums in France is as unsatisfactory as in England, Germany, and other parts of Europe, and the French growers will not be able to contribute otherwise than sparingly to the supplies in the English markets. The crops of mirabelles and prunes are very poor.

OZOTHAMNUS ROSMARINIFOLIUS.

An extremely beautiful shrub, that hails from Australia and Tasmania, is Ozothamnus rosmarinifolius, and it is one that deserves wider cultivation, especially in southern gardens, where it becomes extremely beautiful when in flower. The rosemary-like leaves make the shrub always interesting, the small white, daisy-like flowers being produced very thickly in dense clusters along the upper part of the branches. From four feet and upwards in height, sometimes up to ten feet, it is only when in a sunny position that its greatest beauty is developed. The fragrance of the flowers is an added grace, and the hawthorn-like odour is delicate and pleasing.

The specimen figured was one of the features of Mr. F. M. Elgood's garden at The Close, Northwood, Middlesex, three weeks ago, and the plant was very greatly admired by those of Mr. Elgood's friends who enjoyed his hospitality on the occasion of the Northwood Rose and Sweet Pea Show. Mr. Elgood is chairman of committee of the local and enthusiastic amateurs' society, and his garden is full of interest. Roses were very much in evidence on the occasion referred to, and Solanum jasminoides was blooming on the garden front of the house while dianthuses were perfect pictures on the rock garden, and Nierembergia rivularis was a charming plant, flowering in a moist spot.

OZOTHAMNUS ROSMARINIFOLIUS.

A beautiful white-flowered Australasian shrub in the gardens of F. M. Elgood, Esq., The Close, Northwood, Middlesex.

SOME EFFECTS OF THE BLIGHT.

We use the word blight in its comprehensive sense, just as it is used in rural places, as an inclusive title for every insect pest that fruit tree life is heir to, and we would point out how blight, as in many a past and gone year, has very considerably altered the outlook for the season's fruit crops. For the purpose of our illustration, we will take a big mixed fruit plantation of upwards of a hundred acres, where the promise only a short time ago could hardly have been more fair. We saw this plantation when the plum trees in it were sheets of living blossom, pearly white, fully open and vigorous, and the general verdict was that if no frost came there would be a record crop. Up to a point climatic conditions were favourable; no frost came, the flowers set, the white petals flickered to the ground, and tiny plums were left in place of the blossom. So far all things promised well, healthy-looking leaves protected the infant fruits, and then a change came. The skies cleared, warm days, cold days, cloudy days, and sunny days followed each other, the green plums began to turn yellow, the leaves curled, the shoots became twisted and distorted, while the plum aphis, which took possession of the trees, multiplied by the thousand. And what a change now! Just an odd plum or two here and there, but not half a crop, and foliage, where it has not fallen, blackened, twisted, and distorted. Why weren't they sprayed? Some of them were, but before the whole area could be dealt with the leaf-curling aphis was safely protected by the folding of the leaves, and the fluid had little effect. This is a picture of one plantation after the blight, but it is representative of a score of others, and in the locality of which we write what promised to be one of the most prolific plum crops on record is now changed entirely, and fortunate are the growers whose trees did not get the worst of the plague of blight.

In the plantation referred to apples are intermixed with the plums, and we saw these, too, when in bloom, after the stone fruit flower had gone, and when the rosy-pink of the apple blossoms made one of the prettiest sights we have ever seen. From an adjacent hillside we looked a short time since over the plantation, when every apple tree could be detected, not by the bright green of its foliage, or the rosy-pink of its flowers, but because it was brown and seared, and looked as if it had been scorched with fire. A near approach and a close examination revealed the wreck and the ravage of the blight. Most of the enemies had gone, but they had left the traces of their deadly work behind them, and the trees looked as if it would take them all their time to recover. On most of the twigs there were lacerated leaves on which the caterpillars of the winter moth had fed, at the end of several shoots cob-webs and skeletonised foliage showed where the caterpillars of the lackey moth had been at work, and withered brown flower trusses, which fell off when you touched them, all pointed to the ravages of the apple sucker.

Here and there was a flower stalk on which the petals, instead of expanding and falling, had turned brown and curled inwards, and when we removed them there was nothing inside, because the essential organs had made a meal for the grub of the apple blossom weevil. The points of many shoots, white, powdery, and curled, bore evidence of the apple mildew, and here and there an apple was swelling into maturity, but how few they were when compared to that beautiful blossom. But perhaps, worst of all were the ravages of the apple aphis. Black leaves, yellow leaves, brown leaves, fallen leaves, twisted leaves, curled leaves, they all bore evidence of this particular blight, and, as we unfolded the locked-up foliage, there we saw the insects in their thousands sheltered from harm by the leaves that accommodatingly curled over them.

Nor was that all, for on more than one of the trees there were colonies of American blight, raising warts and swellings on the shoots, and the aphides hung in bunches, protected by the woolly substance from which they take their name. These are the pests, then, that have crippled and checked, if not nearly killed, hundreds of apple trees this season, and growers, except those of the most enlightened order, class them all under the common heading of blight, and it is a word, by the way, which has a terrible meaning this season, for the above is no mere pen picture.

There is a bottom as well as a top crop in the plantation of which we write, and the former consists mostly of black currants and gooseberries. Blight again is the story, for, after the bud mite had prevented hundreds of the black currants from breaking into shoots, aphis had come in a swarm, infesting leaves and shoots, and, in spite of spraying, the fruits were falling wholesale, and what were left were probably sticky and dirty when the time came to pick them. We could not help thinking that, if the quassia and soft soap remedy had been tried for the big bud, whatever had been its effect on this enemy, it must have been helpful in keeping the aphis down. Gooseberries had mostly escaped the caterpillar, and the little spider that often sucks the juices from the leaves, so there was something to be thankful for, as the gooseberries looked green and healthy, and the bushes were bearing good crops of fruit.

But wait a little; there is another story to be told, for this particular plantation is an infected area within the meaning of the Act. Government inspectors visit it from time to time, and serve notices about pruning and picking, and all the rest of it. We saw the unmistakable white mildew on many of the berries, and some of the twigs, and the former had to be picked and destroyed by a certain date by Government orders. Dear, dear! And what an anxiety to see that the pickers did not drop some of those tainted berries into the baskets, and drag the owner into the risk of having to appear in the Court and pay for the error with a fine.

This latest blight, the American Gooseberry Mildew, is costing much money, and giving a host of trouble, and it is quite likely that the mildew, or the Order, or a combination of both, will lead to a reduction of the area under gooseberries, because growers of bushes that are affected seem disposed to grub up their trees and plant other crops rather than be hampered by the restrictions under the Act. A question also that is being asked is whether, as the result of legislation, we are getting any nearer to the eradication of the disease, and even is it being materially reduced?

The natural question that arises, in conclusion, is how much of this general—shall we say national—havoc in our orchards and plantations through blight could have been avoided by spraying? Many occupiers of orchards and plantations do spray, and some crops, as we have reason to know, have been saved this season by the process, but there are scores of others who do not spray, either because they have yet to be convinced of its value, or else they hope that the fruit will be pulled through, and then will be saved the expense, until it is too late. Spraying is, of course, expensive; but, as a grower put it to us the other day, if by spending ten pounds you can save fifty pounds' worth of fruit, it is worth doing, and when a crop has been ruined through the blight, there is nothing coming in to help pay rent and taxes. Whatever legislation may do for gooseberry mildew, it is obvious that the introduction of appliances and insecticides, and the spread of technical knowledge, have done little to prevent attacks of blight, though we have better means of fighting it than our forebears ever possessed, and they doubtless looked on these troubles as being something that could not be avoided. A living example of the necessity of fighting blight is the hop-grower. He buys a sprayer or washer as being part of his apparatus, and uses it as an item of the cultural routine, because he knows that, in an average season, he cannot grow hops unless he sprays.

The experience of 1913 rather points that fruit-growers generally will have to fall in line with the hop-grower, and spray by rule. Perhaps if we had a coalition of fighters, we should be less troubled with blight.

FRUIT GROWER.

LIFTING NARCISSI AND TULIPS.

Bulbs of narcissi and tulips that are to be lifted this season, if not already dealt with, should receive attention without delay, or they will commence making new roots. Dealing with narcissi first, some varieties become crowded in much less time than others. The small-flowering types are usually most susceptible to this, as those of the large trumpet class do not produce offsets so freely; but, nevertheless, it is advisable to lift all varieties every third season. This procedure enables the ground to be worked and enriched to better advantage, and prevents the less robust kinds from deteriorating. The bulbs, when lifted, should be thoroughly dried, and afterwards stored in a dry, airy shed, laying them out thinly. Previous to replanting again early in the autumn, the bulbs must be graded, selecting first all those of flowering size, as these will give an effect the following spring, and can be utilised wherever required for that purpose, while the small bulbs can be planted back, in beds, to develop. Tulips require similar treatment, but they should be lifted every second season, otherwise they soon go back, especially in heavy, cold ground. Undoubtedly the finest flowers are produced from bulbs lifted annually, as young bulbs are produced each season, and consequently they soon become crowded, a condition adverse to fine blooms with plenty of substance.

CARNATIONS AT HOLLAND HOUSE SHOW.

Perpetual carnations form a fine feature at the late spring and early summer shows, and exhibitors show considerable taste and enterprise in the manner of displaying their blooms. A particularly pleasing exhibit at the great exhibition at Holland House, a fortnight ago, was the one arranged by Mr. Bertie Bell, Guernsey. A suitable background was provided, and the fine blooms produced in the sunny Channel Isles were skilfully disposed in artistic baskets, and in vases of varying height and size. In this manner, not only were the flowers and the varieties seen to full advantage, but visitors saw what beautiful and varied arrangements could be made by the use of carnation flowers and carnation foliage. Mr. Bell secured a Silver-gilt Flora Medal for his exhibit.

AN ARTISTICALLY-ARRANGED GROUP OF PERPETUAL CARNATIONS.

Exhibited by Mr. B. E. Bell, Guernsey, at Holland House, on July 1 to 3, and described in the report which appeared in our issue of July 5. The award of a Silver-gilt Flora Medal was made.

Francoa ramosa.—This most useful and beautiful greenhouse plant is now in full bloom, and to maintain it in a flowering state, the greater part of the summer months the roots must be kept well supplied with moisture. Stimulants also must be given for assisting in the development of later spikes of flowers. When the plants have finished flowering the largest specimens may be cut up for propagating purposes. Plants grown from cuttings make much larger specimens than do those raised from seed. The smaller plants may be shifted into larger pots, and will make fine specimens capable of carrying eight or ten flower spikes next season. Young plants raised from seed sown in the spring may now be placed in cold frames.—E. HARRISS, Lockinge Park Gardens.

PROPAGATING ZONAL PELARGONIUMS.

Usually the bulk of the zonal pelargonium cuttings are inserted during the month of August, or in September, the tendency being to delay the work as long as possible so as not to mar the beauty of the flower-beds. This is, of course, a great consideration, especially in some establishments. There are, however, many surplus plants grown in most gardens from which cuttings may be taken, then the flower-beds are not much interfered with.

But I wish to advocate the insertion of small cuttings in open borders in July. Many inexperienced cultivators coddle their cuttings too much, and then lose them in winter-time through the damping off of the more sappy specimens.

When, as a youth, I worked on my father's farm, I also had a flower garden, one devoted to bush fruits and vegetables, and an unheated greenhouse. Zonal pelargoniums were my favourite bedding-out plants in those days, and I was always very eager to put in cuttings. It was this eagerness, and not experience, which induced me to take off quite young slips from the central or the lower parts of the plants, and just dibble them into the soil between their parents. I commenced to insert the cuttings in this way early in July, at noon, or in the evening, and found slips suitable to my purpose.

I rarely lost a single cutting. I was, of course, eager to find out whether roots had formed, and directly they had the young plants were lifted and transferred to boxes and pots. Of course, since that time I have found that many good, experienced gardeners insert cuttings so, and had done so for many years previous to my efforts in this direction. But in these days cuttings are not treated in similar fashion to any great extent, yet it is an excellent plan. They make beautiful sturdy plants before the severe weather of winter comes, and amateurs and others would do well to stock their greenhouse shelves or frames with them in due course. GEO. GARNER.

GRAPE LADY HUTT.

This very distinct white grape will prove to be, I feel sure, a good one for amateurs to grow where they fail with Muscat of Alexandria, and wish to have a good late white variety to follow Foster's Seedling. I have Lady Hutt growing in a house which has not been quite closed since last March, neither has any heat been turned on, although pipes are laid from the boiler, and I could not wish for a variety to do. The vine was pruned in the same way that Black Hamburghs usually are, and nearly every shoot carries bunches of grapes, some having two. The berries set very freely, and give good promise of finishing satisfactorily if a little artificial heat be given during the ripening stages. Last autumn, when the pipes were kept cool for a time, the berries discoloured a little, but they will not do so if they receive a little artificial heat. B.

Grape Culture.—An illustrated guide to the culture and management of vines is published at GARDENERS' MAGAZINE Office, 148, Aldersgate Street, London, price 1s. net (by post 1s. 2d.), or bound in cloth 1s. 6d. (by post 1s. 8d.).

WORK FOR THE WEEK.

THE ORCHID HOUSES.

ODONTIODAS.— The numerous hybrids derived from Cochlioda Noetzliana or C. vulcanica and different species of odontoglossums are unquestionably proving the most desirable additions to cool house orchids we have had since the introduction of Odontoglossum crispum in quantity. The plants are very easily grown, and the attractiveness of their flowers is combined with durability in almost all cases, and this renders them not only suitable for lending colour to our odontoglossum collections, but extremely serviceable also for exhibition, and for all cut flower purposes. The plants are now plentifully distributed in gardens, and, as they are daily becoming more numerous, they are easily procurable at a modest outlay. They are worthy of every consideration, and should be well represented in all gardens where orchids are appreciated. The hybrids and varietal forms are too numerous to be listed here, but I might add that the flowering season is considerably prolonged by having a selection of kinds derived from the various species of odontoglossums which flower at different seasons of the year. The later the odontoglossum parent flowers the same or about the same period will the odontioda seedling produce its flowers also. I might mention, as an illustration, O. Charlesworthi, derived from C. Noetzliana and O. Harryana. This hybrid flowers in late summer, say, from July onward, and O. Harryana is flowering at the present season.

THE TREATMENT OF ODONTIODAS is similar to that for odontoglossums, but the temperature of the house in which they grow should not fall below 50 deg. at any season of the year. Very cool, moist treatment results in spotted and decayed leaves. When the plants are in active growth and well rooted, they require a liberal supply of root moisture. Potting requirements are best attended to immediately after the plants pass out of flower. The roots of the odontiodas are in most cases much finer than those of the odontoglossums, and thus a compost of a more fibrous nature is desirable. We find a mixture of about two parts fibrous peat, the remainder consisting of broken oak-leaves, chopped sphagnum moss, broken crocks and sand, a good one. The pots selected should be large enough to contain the plants, and be comfortably drained to about one-third their depth with clean broken crocks and chopped bracken roots. The compost should be pressed moderately firm. Give a good watering as soon as potting is completed, and keep shaded from strong light until the roots push into the fresh material. Spray the plants daily overhead in warm weather, and retain ample moisture about the plants at all seasons Increase of stock is secured in the same manner as for odontoglossums, by severing the rhizome connecting the back pseudo-bulbs —H. J. CHAPMAN, Oakwood Gardens.

STOVE PLANTS.

PLEROMA ELEGANS.—Since its flowering season is now over, this beautiful rich blue-flowering plant is now commencing to grow freely, and should receive such attention to potting or top-dressing as is necessary to encourage the production and thorough maturing of the growths to yield next season's flowers. The soil most suitable is a mixture of loam and peat in good fibrous condition, with the addition of a little sand and dried cow manure or sheep manure passed through a sieve. The longest growths may be stopped once or twice during the growing season to keep the plant shapely, and attention must be given to keeping it clean and free from insects. Propagation may be effected by means of cuttings inserted now in small pots, and kept close until rooted.

PLEROMA MACRANTHA.—This requires cooler treatment, and is suitable for training on a wall or trellising of the intermediate house, or warm conservatory. It is grown best if planted out or in large tubs or pots. Attention should be paid to keeping the growths fairly thinned, tying as is necessary, and keeping them clean and free from insects.

MEDINILLAS. — These lovely plants, flowering usually in May and June, will now be commencing to make the growths which are to produce the flowers of next season, and should also be top-dressed or repotted. The soil they prefer consists of equal parts fibrous loam, peat, and well-decayed leafmould, with the addition of about a sixth part of silver sand. Cuttings of the young growths may be taken when large enough, and kept very close until rooted. During the growing season medinillas revel in a moist atmosphere and high temperature. The variety magnifica has beautiful rosy-pink, pendulous racemes of flowers, while amabilis has more erect panicles of flowers of nearly the same colour.

APHELANDRA ROEZLI.—Raised from seeds as previously recommended, the plants should by this time be ready for their flowering pots; soil as recommended for medinillas will suit very well. Pot firmly, and see that the pots are well drained. An open position in the stove or on the shelf will suit it.

SCUTELLARIA MOCCINIANA.—This is a very pretty and useful plant, which bears racemes of bright orange-scarlet, tubular flowers, each two inches or so in length. It is propagated by cuttings taken in the spring. The plants should by this time be ready for their flowering pots, into which they should be placed fairly firmly, using a similar compost to that above recommended. —H. PRIME, Hatfield House Gardens.

THE FLOWER GARDEN.

ROSES.—So far the present season is proving favourable to roses, and for some time they have been giving a wealth of blossom. Among those grown either as dwarfs or standards, varieties of the tea and hybrid tea sections are deservedly the most popular, alike for their elegantly shaped flowers of innumerable tints, and their charming foliage, as well as their perpetual flowering habit. Apart from picking off all old blossoms regularly, the plants should be examined occasionally, and the growths which have borne flowers be shortened; this encourages back buds to break more freely, and it is from these that we obtain young shoots which flower almost continuously until late in the year. Frequent applications of liquid or artificial rose manure do much to maintain the vigour of the plants, which in some free-flowering varieties is in danger of becoming overtaxed. In districts where the soil is not particularly suited to rose culture, feeding the plants is important, and the manure which should be used for the purpose can soon be determined by the results. Many failures in rose growing can be attributed to mildew, and I am convinced that it is not recognised by many as being so far-reaching in its effects as it really is. A plant once attacked by it is weakened constitutionally if the malady is allowed to pursue its own course, and is thus more liable to become a victim to other diseases and pests. Sudden changes in the weather and temperature at this season are usually followed by attacks of mildew, in districts where it is prevalent, and at the first indication every effort should be made to check it. Spraying with a solution of sulphide of potassium (1oz. in one gallon of water) will be found very effective, and as a preventive it can be used periodically from a week to ten days throughout the season, as I advised in a previous calendar.

SPRING BEDDING PLANTS.—Many of these raised from seeds sown last month are now far enough advanced to be planted out, choose an open position in which to plant them, as the need for sturdy plants capable of withstanding rough, wintry weather must be kept in view. In preparing the ground dig in a good dressing of light rotten material, as to this the roots will adhere, and so the plants can be lifted with a good ball of earth attached when being transferred to the beds and borders in the autumn.—T. B. FIELD, Wych Cross Place Gardens.

FRUITS UNDER GLASS.

PINEAPPLES.—The months of May and June were, on the whole, highly favourable to the swelling of early fruits, and, under favourable influence, the early Queens made good progress. Bright, highly-flavoured fruits cannot be obtained without the aid of strong solar heat, light, and air. Therefore, as the fruits change colour, increase the circulation of air and reduce the supply of moisture; indeed, root-watering must almost cease, and atmospheric moisture be gradually decreased. The next set of fruiters will now be making rapid progress, and daylight having reached its limit, the temperature may be about 75 degrees at night, falling to 70 degrees in the morning, with 85 degrees throughout the day, and 95 degrees after closing with sun heat and moisture. Do not syringe the plants overhead in the morning, only damp the beds and other available places, but lightly spray them overhead at closing time in the afternoon. High feeding is necessary when the pots are full of roots, and a great deal can be accomplished by syringing weak liquid manure and guano water into the axils of the leaves, and by filling the evaporating pans, and also sprinkling the floors at closing time with the same. At all times the Queens require the greatest care in watering. Cayennes and others are more robust, and naturally require a larger quantity of stimulating liquids. Remove all gills as they appear, support the fruits, and do not allow more than two suckers to remain on each plant.

SUCCESSIONAL PINES.—Plants to be started early next year should now be growing fast, and must be encouraged to make steady progress by generous treatment with weak stimulants and other careful attention. A little fire-heat may be necessary, but solar heat is best, and early airing and early closing should be the rule.

SUCKERS.—These should be regularly examined and drawn out for a shift before they become too pot-bound, for, as not infrequently happens, they require a shift before one is aware of it. Shading is necessary, but it must be of a light character, as pines with plenty of roots rarely scald, and, of two evils, it is better to have them a little brown than drawn and soft in texture.

MELONS.—A constant relay of fresh young plants must still be kept in readiness for use as vacancies in pits and frames occur. Seeds cost little, and germinate as freely as marrows, and young plants give the best results when put out early; but for quick succession it is necessary they should be established in their fruiting pots and be 2ft. to 3ft. high by the time the last fruits are cut from their predecessors. For frame culture late in the summer and autumn, the compost should always be rather poor, as it is easier to feed than to repress strong growth. Melons in hot, dry summers will stand any reasonable quantity of water, but should always be watered with care, fed moderately when swelling, and what they lose in size they will gain in flavour.—F. JORDAN, Warter Priory Gardens.

CARDIFF AND COUNTY HORTICULTURAL SOCIETY.

GRAND QUARTER CENTURY FLOWER SHOW.

SOPHIA GARDENS, CARDIFF,
WEDNESDAY and THURSDAY, JULY 23 and 24.
Specially good Prizes in every section, amounting in money and plate to nearly £500. Tents lighted by electricity. Popular Prices.
Schedules from the Secretary, Mr. A. MAURICE BAILEY, 24, Duke Street, Cardiff.

LEICESTER.—ABBEY PARK FLOWER SHOW, 5th and 6th August next. Open Class, Group of Plants, £20, £15, £10, £6. Liberal prizes for Collections of Fruit, Displays of Roses; Silver Cup, Gold and Silver Medals for non-competitive exhibits. Schedules from JOSEPH BURTON, Supt.

ROYAL LANCASHIRE AGRICULTURAL SOCIETY.

GREAT HORTICULTURAL EXHIBITION.

GREAT HORTICULTURAL EXHIBITION will be held at BURNLEY on JULY 31st, 1913, and following days. Liberal Prizes for Groups of Plants, Table Decorations, Sweet Peas, Roses, Carnations, Collections of Fruit and Vegetables. Apply for Schedules, PETER BLAIR, Trentham Gardens, Stoke-on-Trent, Manager.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

Tuesday, July 15, was the first "off day" at the Royal Horticultural Hall this season, and, comparatively speaking, the exhibition was a small one, while visitors were few owing to the weather, and the large number of people now out of town. Mr. W. Atlee Burpee was over from Philadelphia, and early visitors included The Speaker, Colonel M. Lockwood, and Sir Randolf Baker, Bart., M.P. Hardy flowers were the chief subjects on view; orchids were not numerous, but pot fruit trees and standard fuchsias made capital exhibits. The orchid exhibitors who only brought a plant or two with them evidently thought it not worth while to stay, for they and their plants had mostly disappeared before four o'clock—which things should not be.

At the afternoon meeting the first of the two Masters Lectures for the current year was given by Professor R. H. Biffen, of the Cambridge University. The subject was "Some Factors in the Prevention of Plant Diseases."

HARDY PLANTS AND FLOWERS.

A large and capital exhibit of hardy plants was well arranged by Mr. Jas. Box, Lindfield, Haywards Heath. A central lily pool was a pretty feature, and round this were Japanese irises, the lovely deep pink Spiræa Venus, backed by Thalictrum flavum, astilbes, agapanthus, and verbascums. There were flanking groups of phloxes, Gladiolus princeps, heleniums, galegas, and the bold Salvia turkestanica. In the group of hardy flowers from Messrs. G. Bunyard and Co., Maidstone, Platycodon Mariesi and P. M. alba were prominent, and there were capital bunches of Campanula lactiflora, Astilbe Silver Sheath, the deep-hued Heuchera Shirley, the lovely Romneya Coulteri, Spiræa venusta magnifica, a beautiful pink shade, and some good vases of pentstemons of the Newbery Gem type.

Mr. G. W. Miller, Wisbech, had a quite pretty exhibit of hardy flowers, and used Spiræas Venus, Ceres, Rose Perle, and Brunhilde effectively with delphiniums, the popular Pyrethrum Queen Mary, and varieties of Chrysanthemum maximum. Mr. G. Reuthe, Keston, had many interesting subjects, such as Romneya Coulteri, Escallonia Ingrami, a fine bush of Desfontainea spinosa in full bloom, the pink Asclepias speciosa, etc.

A bank of hardy flowers from Messrs. T. S. Ware, Lim., Feltham, included a good selection of popular border kinds, and we made note of Isatis glauca, Lysimachia vulgaris, Eryngium Oliverianum, Spiræa palmata elegans, and Lupinus Moerheimi as specially good. Very well staged were the hardy flowers from Messrs. Fred Smith and Co., Woodbridge. This firm had grand sheaves of Chrysanthemum maximum, The Speaker, Phlox Aurora Borealis, Verbascum Caledonia, Romneya Coulteri, Bocconia cordata, Alstrœmeria aurantiaca, Eremurus Bungei, Scabiosa caucasica, and the golden Anthemis Kelwayi.

Mr. Maurice Prichard, Christchurch, had a fine lot of hardy flowers, and in his group the leading features were Astilbe Vesta, A. Salmon Queen, Japanese irises, the double Delphinium Curiosity, Spiræa palmata, Lavatera Olbia, and the fragrant Clematis recta. Messrs. Fells and Son, Hitchin, submitted a low rock garden exhibit with pretty colonies of Campanula rotundifolia, C. pusilla alba, Silene armeria, Œnothera speciosa alba, and the golden Œnothera riparia.

CARNATIONS AND VIOLETTAS.

Very splendid were the border carnations shown in large vases; the varieties were of tip-top style, and the flowers marvellously fine. Firefly (A.M.), a deep scarlet-red; Bookham White (A.M.), large and white; Rosy Morn, Elizabeth Shiffner, buff yellow; Cecilia, bright yellow; Hercules, maroon; Amy Robsart, white; Agnes Sorrel, maroon crimson; and Jean Douglas, scarlet, were all grand, and shown in the finest condition. Mr. L. R. Russell, Richmond, showed hardy flowers, and a fine lot of well-berried plants of Nertera depressa. Messrs. H. Cannell and Sons, Swanley, brought up a bright lot of cut pelargoniums, and also some cut roses.

Among the dainty violettas exhibited in pans by Mr. Howard H. Crane, Highgate, Chloris, Sulphurea, and Rock orange were the best yellows; Vestal, Violetta, Sweetness, and Estelle are white or pale blush; Adeline, Celeste, Iva, Eileen, and Rhona, blue shades; and Cynthia, Forget-me-not, and Larinca, pink or rosy-lavender. These are charming plants for the rock garden. Messrs. Carter Page and Co., London Wall, were also exhibitors of violas, and set their fresh, clean flowers up in low bowls in pleasing fashion.

Choice ferns were well displayed by Messrs. H. B. May and Sons, Upper Edmonton, but even more attractive than the ferns were the standards of Thalia and Coralia, both beautiful hybrids from Fuchsia triphylla. The plants were about 3ft. to 4ft. high, with good heads of pendulous clusters of long-tubed, orange-coloured flowers. These varied in age, but averaged three or four years old, and they were very beautiful. Messrs. W. Cutbush and Sons contributed greenhouse flowering plants, including liliums, blue hydrangeas, Fuchsia coralle, Justicia carnea, Coleus cordelia, and verbenas.

A very free flowering hardy border carnation, named Downer's Pride, was very finely shown by Messrs. G. and A. Clark, Dover; it has white flowers, and carries these freely on very wiry, erect stems. It is fragrant, but only faintly so. A few bunches of border flowers made a setting for the carnations. Among the good roses from Messrs. Hobbies, Lim., Dereham, we noticed Lemon Queen, a cross between Frau Karl Druschki and Mdme. Ravary; Effective, a crimson, fragrant pillar rose; Lady Bird, the lovely single Pink Pearl, Lyon Rose, Decorator, and Rayon d'Or.

ROSES, SWEET PEAS, ETC.

Roses were shown somewhat extensively by Messrs. G. Bolton and Son, Buntingford, Herts. Both stands and boxes were used to display the flowers. The leading varieties were Mrs. A. Munt, Avoca, Mrs. D. Jardine, Hugh Dickson, Lyon Rose, Mrs. Leonard Petrie (yellow), the pink Mrs. Wakefield, Christie Miller, and Mrs. Joseph Hill, the latter a lovely thing. The roses from Messrs. Stuart Low and Co., Enfield, consisted chiefly of the varieties Lady Pirrie, Miss Alice de Rothschild, Pharisaer, Hugh Dickson, the famous Rayon d'Or, Mdme. Melanie Soupert, Lyon Rose, and Mdme. Abel Chatenay, all set up in large stands.

Messrs. Dobbie and Co., Rothesay, evidently do not believe the sweet pea is losing popularity, for they staged bunches of varieties they propose to send out in 1914, and bunches of selected seedlings for 1915-16. Of the former, Ruby Palmer, Blue Picotee, Mrs. McIlwrick, King White, Grey Lavender, and Margaret Atlee—an improved Constance Oliver. Among the "futurists" there was a fine bluish-mauve, a lovely coral pink, a Stirling Stent seedling, and a seedling a shade brighter than Dobbies' Scarlet.

Thladiantha dubia, a quaint cucubit with oval crimson fruits, was shown by Mr. Bagg, gardener to Colonel Mark Lockwood, Bishops Hall, Romford, three large specimens in pots being shown. Delphinium Van de Weyeri, a white, sparsely-flowered, fragrant species, came from Mr. W. Van de Weyer, Corfe Castle, Dorset. Delphinium Mrs. W. J. Sanderson, from W. J. Sanderson, Esq., Eastfield Hall, Workworth (gardener, Mr. Sage), gained an A.M.; it is a vividly brilliant blue variety with white centre, and the spikes are very shapely, with close-set flowers.

ORCHIDS.

Messrs. Charlesworth and Co., Haywards Heath, presented an interesting group of orchids, their hybrid odontoglossums being very fine. The orange-coloured Lælio-cattleya Ceres, Dendrobium Dearei, the quaint Paphinia cristata (A.M.), and the handsome Sophro-cat.-lælia Anguloa Cliftoni were among the good things shown. From Gatton Park, Reigate, Sir Jeremiah Colman sent Anguloa Cliftoni, very fragrant, and the pretty Odontioda papilio Gattonense. A small group of orchids staged by Messrs. Stuart Low and Co., Enfield, contained Cattleya Harrisonæ, Miltonia Bleuana, odontiodas, and Renanthera Imschootiana.

A large Aerides odoratum, with eight spikes, noticed the other day in our Beckenham Show report, was exhibited by Mr. W. Fane, gardener to A. W. D. Oakes, Esq., Shortlands, Kent; the specimen was imported in 1908. Mr. Davidson, Orchid Dene, Twyford, brought up Odontioda Thwaitesi Coombe var. (A.M.), carrying a fine spike of large magenta-purple flowers. Odontioda Cooksonæ venustum (A.M.) was a beautiful richly-coloured form with white-tipped lip, exhibited by Mr. H. Alexander, grower to Sir George Holford, Westonbirt, Gloucester. Dendrobium Dearei McBean's var., a fine-flowered form, with its white blooms in racemes, gained a F.C.C. for Messrs. A. and J. McBean, Cooksbridge.

Vanda cærulea, the pretty and graceful Saccolabium Blumei, Odontioda Magali Sander, Dendrobium Dearei, and Cattleya Mossiæ Wagneri Snow Queen were a few of the chief features of the group of orchids from Messrs. Sander and Sons, St. Albans.

FRUITS.

Messrs. Jas. Veitch and Sons, Chelsea, put up a superb lot of fruit trees in pots, grown at their Feltham nurseries. Trained standards of Crimson Galande and Early Alfred peaches were finely fruited, and so were the bushes of Souv. du Congrès pears, and Lady Sudeley and Jas. Grieve apples; but more splendidly cropped than these even were the wonderful trees of Early Transparent gage, Jefferson's and Denniston's Superb plums, which were grandly cropped. It was altogether a fine group of highly-cultivated plants.

Splendid fruits of Waterloo and Givon's Late Prolific strawberries made a tempting exhibit from Mr. Metcalfe, gardener to Lady Wernher, Luton Hoo, Beds. There were seven boxes of fruits, and the fruits were of wonderful size, and represented splendid cultivation.

CERTIFICATES AND AWARDS.

First-class Certificate.—To Dendrobium Dearei McBean's var., from Messrs. A. and J. McBean, Cooksbridge.

Award of Merit.—To Odontioda Thwaitesi Purple Emperor, from Mr. E. H. Davidson, Orchid Dene, Twyford; to Odontioda

Cooksoniæ venustum, from Sir George Holford (grower, Mr. H. Alexander), Westonbirt, Gloucester; to Paphinia cristata, from Messrs. Charlesworth and Co., Haywards Heath; to Delphinium Mrs. W. J. Saunderson, from W. J. Saunderson, Esq., Warkworth, Northumberland; to Carnations Firefly and Bookham White, from Mr. Jas. Douglas, Great Bookham; to Strawberry Laxton's 1904, from Lady Egerton, Thame.

MEDALS.

Gold.—To Messrs. Jas. Veitch and Sons, Chelsea, for pot fruit trees.

Silver-gilt Banksian.—To Mr. Jas. Box, Lindfield, for hardy flowers.

Silver Knightian.—To Mr. A. Metcalfe, gardener to Lady Wernher, Luton Hoo, for strawberries.

Silver Banksian.—To Messrs. G. Bunyard and Co., Maidstone, for hardy flowers; to Messrs. Dobbie and Co., Rothesay, for sweet peas; to Messrs. Stuart Low and Co., Enfield, for roses; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. Stuart Low and Co., Enfield, for orchids.

Silver Flora.—To Mr. Jas. Douglas, Great Bookham, for carnations; to Messrs. H. B. May and Sons, Edmonton, for ferns and standard fuchsias; and to Messrs. Fred Smith and Son, Woodbridge, for hardy flowers.

Bronze Flora.—To Messrs. G. and A. Clark, Dover, for carnations, etc.; to Messrs. Carter Page and Co., London Wall, for violas, etc.; to Mr. Maurice Prichard, Christchurch, for hardy flowers; and to Messrs. T. S. Ware, Lim., Feltham, for hardy flowers.

Bronze Banksian.—To Mr. G. W. Miller, Wisbech, for hardy flowers.

AWARDS AT WISLEY.

At their meeting on Tuesday last (July 15) the Council of the Royal Horticultural Society approved the following recommendations for awards, made by the Fruit and Vegetable Committee at Wisley on July 7, to the subjects indicated:

First-Class Certificate. — To Strawberry British Queen, from R.H.S. Gardens.

Awards of Merit.—To Strawberries Cropper, *Fillbasket, Progress, and Rival (of these, Fillbasket has already received an Award of Merit), from Messrs. Laxton, Bedford. To the following peas: *Alderman, from Messrs. Dickson, Newtownards; and Messrs. Dobbie, Edinburgh; *Exhibition, from Messrs. Wheeler, Gloucester; Favourite, from Messrs. J. Veitch and Sons, Chelsea; Masterpiece, from Messrs. Sutton and Sons, Reading; *Premier, from Messrs. Bell and Bieberstedt, Leith; *Quite Content, from Messrs. Dobbie and Co., Edinburgh; Sir Arthur Bignold, from Mr. Holmes, Tain; Warriston Wonder, from Messrs. Bell and Bieberstedt, Leith.

Highly Commended.—To Peas *America (Holmes), Battleship (Carter), Best of All (Wheeler), Discovery (Dickson), *Harvestman (Carter), *International (Carter), *Laxtonian (Hurst), *Magnum Bonum (Sutton), Marquis of Stafford (Holmes), *Peerless (Sutton), *Prodigy (J. Veitch), The Clipper (Sydenham), Up-to-Date (Sutton), *Victor (J. Veitch), and Orwell (Staward).

Commended.—To Pea *Ideal (Sutton).

The varieties marked (*) have already received awards.

The National Rose Show at Gloucester.

The National Rose Society is to be congratulated on the success of its provincial show, which took place at Gloucester on Tuesday, July 15. Not only did the Gloucestershire Rose Society welcome the National to its midst, but saw to it that the arrangements were excellent, and thanks for this are largely due to Mr. Conway Jones and Mr. W. H. Pickford, the hon. secretary of the local society. The number of entries, i.e., 353, was a record for the provincial shows of the N.R.S., nearly 1,000 feet of tabling were required for their accommodation, and, with the exception of the new seedling roses, the whole of the exhibits were accommodated in one large tent.

All the way through the competition was good, as also were the blooms in most of the classes, while the numerous visitors who passed through the tents showed by their enthusiasm that a National Rose Show is appreciated in Gloucester. Mr. Edward Mawley, the veteran hon. secretary of the National Society, was, of course, in attendance, but all the arrangements appear to have been so well made beforehand that he did not even look busy. The Mayor of Gloucester, Councillor Jas. Bruton, kindly entertained a large party of officials and friends to lunch.

NURSERYMEN.

In the class for thirty-six blooms, distinct varieties, the Nurserymen's Jubilee Challenge trophy, gold medal, and first prize were won by Messrs. Hugh Dickson, Lim., Belfast, with a remarkably fine stand of flowers. Every specimen was fresh and well-formed, and the varieties most admired were David Gilmour, Mrs. James Lynas, Mrs. George Shawyer, Mabel Drew, Mrs. James Williamson, Queen of Spain, Mrs. Foley Hobbs, Brilliant, and Archie Gray. Both weight and quality were represented in this stand. Very creditable to Messrs. B. R. Cant and Sons were the flowers which won second prize, and here we thought the colour was better than in the first prize stand, though the size was not so great. We looked in vain for a weak bloom, and fine in colour and form were Charles J. Grahame, Horace Vernet, J. B. Clark, Ben Cant, Florence Veitch, and Mabel Drew. Messrs. A. Dickson and Sons, Newtownards, who won third prize, also had some very fine flowers, and indeed, the competition between these three exhibitors was remarkably keen, so close, in fact, that all the rosarians who gathered round the stands did not agree with the awards of the judges.

There were five entries in the class for seventy-two blooms, distinct varieties, and here Messrs. A. Dickson and Son, Lim., Newtownards, were placed in the front. With a few exceptions, the flowers were clean and bright, the most telling specimens being George Dickson, Mrs. Chas. Hunter, Koningin Carola, Gustave Piganeau, and Victor Hugo. Messrs. B. R. Cant and Sons, Colchester, were awarded second prize, and, in placing the two, no one could disagree with the decision of the judges. Messrs. Hugh Dickson, Lim., Belfast, took third prize with flowers that were large, but somewhat loose.

There was a very keen competition in the class for twenty-four trebles, and here Messrs. A. Dickson and Sons, Lim., Newtownards, led the way with a fine stand, in which The Lyon, Mrs. Cornwallis-West, Mrs. Foley Hobbs, H. V. Machin, Horace Vernet, and George Dickson were very good. Messrs. H. Dickson, Lim., Belfast, were a good second in this class, their best flowers being Archie Gray, Kate Read, J. W. Parker, and David Gilmour. Messrs. B. R. Cant and Sons, Colchester, were a good third.

A beautiful box of blooms won for Mr. George Prince, Longworth, the first prize in the class for thirty-six blooms. Freshness was a characteristic of the flowers, and the specimens mostly admired were Charles J. Grahame, Lyon Rose, Bessie Brown, Mrs. T. Rooseveldt, George Dickson, and one or two others that were unnamed. Mr. John Mattock, Oxford, won second prize with a nice lot of flowers; and Mr. E. Hicks, Wallingford, Berks, came third. Mr. George Prince, Longworth, had the best sixteen trebles, his finest flowers being The Lyon, His Majesty, George Dickson, and Hugh Dickson. The second prize was won by Messrs. English, Lim., Gloucester, with a very second-rate lot of blooms.

For eighteen tea and noisettes, Messrs. D. Prior and Son, Colchester, won with a good stand, in which there were large and shapely blooms of White Maman Cochet, The Bride, Mrs. Edward Mawley, Bridesmaid, and Mrs. Herbert Stevens. Mr. George Prince was a close second in this class, and Mr. Henry Drew, Longworth, third. For twelve blooms in this section, Mr. John Mattock, Oxford, won first prize, his best flowers being Mrs. Herbert Stevens, Maman Cochet, and Mrs. Foley Hobbs. Mr. E. Hicks, Wallingford, was a moderate second; and Messrs. J. Jefferies and Son, Cirencester, third.

NURSERYMEN AND AMATEURS.

In the class for twelve new roses, distinct varieties, Messrs. A. Dickson and Son took the leading place, and in this stand were fine flowers of Mrs. A. E. Coxhead, George Dickson, Sunburst, and Mrs. A. Hammond. In Messrs. B. R. Cant and Sons' exhibit, Colchester, which won second prize, there were fine specimens of George Dickson and Edward Mawley; and the third award went to Messrs. Hugh Dickson, Belfast. For twelve blooms of any new rose, Messrs. B. R. Cant and Sons won with fine flowers of Helena; and Messrs. Perkins and Sons, Coventry, came second with British Queen. Messrs. B. R. Cant and Sons had the best twelve blooms of any H.P., winning with good flowers of A. K. Williams. The King's Acre Nursery Company, Hereford, were second with Horace Vernet; and Messrs. F. Cant and Co., Colchester, third with Hugh Dickson.

Messrs. D. Prior and Son had the best twelve blooms of any rose other than H.P. or T., or N., winning with Dean Hole. Messrs. H. Dickson, Lim., were second with Mrs. J. Lynas; and Messrs. B. R. Cant and Sons third. Mr. George Prince, Longworth, won, in a keen competition, the first prize for twelve blooms of any tea or noisette, showing White Maman Cochet; Messrs. F. Cant and Co. were second, with the same variety; and Mr. H. Drew, Longworth, third.

For twelve distinct trebles, teas and noisettes, Mr. George Prince, Longworth, was a good first, his best flowers being Molly Sharman Crawford; Messrs. D. Prior and Son, Colchester, second; and Messrs. F. Cant and Co. third.

The Challenge Cup for nine blooms of Harry Kirk in a vase was won by Mr. George Prince, but the class was not particularly attractive. The nine baskets of cut roses made a very effective display, and Messrs. H. Dickson and Son won with beautiful masses of Lady Pirrie, Sunburst, Mrs. George Gordon, Brilliant, Evening Glow, etc.; Messrs. J. Mattock, Oxford, were second. Mr. E. J. Hicks had the best five baskets of cut roses, Messrs. W. Spooner and Son, Woking, coming second.

In the class for decorative roses, eighteen distinct varieties, Mr. John Mattock, Oxford, was placed first, the flowers of Simplicity, Mrs. H. Stevens, and Lady Pirrie being very good; Messrs. F. Cant and Co. came second, and Messrs. J. Jefferies third. Messrs. W. Spooner and Son, Woking, had the best twelve distinct varieties, Mr. E. J. Hicks second, and Rev. J. H. Pemberton third. Messrs. F. Cant and Co. won with twelve varieties of dwarf polyantha roses, followed by Messrs. W. Spooner and Sons, and Mr. E. J. Hicks in the above order.

AMATEURS.

There was a keen competition in the trophy gold medal class for twenty-four blooms, and the judges awarded pride of place to Mr. Tom Park, Bedale, who had some finely-formed flowers, including a grand bloom of A. K. Williams. Mr. F. Dennison, Crawford, Leamington, was a very good second, and Dr. E. Pallett, Colne, third. There were eight entries in this class. For thirty-six blooms, open to all amateurs, Mr. Tom Park was again to the front, the Rev. J. H. Pemberton being second, and Dr. T. E. Pallett third. Mr. Tom Park had the best eight trebles in this section; Mr. Conway Jones, Hucclecote, second, and Dr. T. E. Pallett third. For nine blooms of any variety, Mr. Tom Park won with Mildred Grant; Mr. R. Foley Hobbs second, with Her Majesty; and Rev. J. H. Pemberton third, with Earl of Warwick.

In the class open to growers of less than

2,000 plants, the first prize for the best eighteen blooms was won by Mr. W. Jarratt Thorpe, Hucclecote; Mr. W. J. Nash, Coventry, coming a good second, and Mr. G. Speight, Market Harborough, taking the third award. For six trebles, Mr. G. Speight was the first prize winner; and for six blooms of any one variety, Mr. W. Jarratt Thorpe was first with the Lyon, and Mr. G. Speight second with His Majesty.

In the class for growers of fewer than 1,000 plants, Mr. H. Balfour, Oxford, had the best twelve roses, followed by Mr. M. Whittle, Belgrove, Leicester. Mr. W. Reed, Flaxley, showed the best nine blooms; and in the class for growers of less than 500 plants, Mr. W. Upton, Leicester, had the best twelve blooms. Mr. F. G. Hayes, Dunster, Somerset, second, and Mr. R. G. Rolt, Hereford, third. Mr. J. Dodwell, Hereford, had the best six blooms in a good competition, Mr. J. W. Kaiser, Penarth, coming second, and Captain Kilbee Stuart, Newbury, third.

In the class for twelve teas and noisettes open to any amateur, Mr. Conway Jones led the way, followed by Mr. Tom Park. Mr. F. Dennison, Leamington, had the best nine blooms of one variety, showing White Maman Cochet; Mr. Tom Park coming second, and Mr. H. V. Machin third. The first prize for nine blooms, open to growers of less than 500 plants, went to Mr. M. Whittle, Leicester; and in the class for six teas and noisettes, Mr. F. G. Hayes was the leading exhibitor.

Mr. Conway Jones had a fine stand, which won the first prize for six trebles, teas and noisettes; and for six blooms of any one variety, Mr. W. Upton, Leicester, was easily first.

In the decorative rose classes, Mrs. Gordon Canning, Hartpury House, Gloucester, won first prize with a splendid collection; Mr. Conway Jones second, and Mr. H. V. Machin third. Mr. F. A. George, Worcester, was to the front with six varieties, followed by Mrs. Ancrum Upton, St. Leonards, and Mr. H. A. Gerhold, Penarth, third. Roses in decoration were well shown. Mrs. C. Hall, Warminster, won with a bowl of roses, showing Lady Pirrie; Mr. G. W. Cook, Whetstone, second; and Mr. H. A. Gerhold, Penarth, third. For a vase of cut roses, Mr. F. A. Gerhold came out on the top, followed by Mrs. C. Hall, Warminster; and for a basket of cut roses, the last-named exhibitor was first prize winner. For a decoration of cut roses for a dinner table there were four exhibitors. The first prize was given to Mrs. W. G. Cook, Whetstone, N., who made up her decoration with Irish Fireflame; Mrs. C. Hall, Warminster, won second prize with the Old Gold rose; and Miss E. E. Riddle, Cranham, Stroud, won third prize with a pleasing decoration.

NEW ROSES.

A keen interest was taken in the classes for new seedling roses, and for an exhibit of any new seedling or distinct sport grown in the open, Messrs. S. McGreedy and Son, Portadown, Ireland, sent a number of varieties, which included Mrs. Franklin Dennison, Edith Part, a lovely rose, Edgar M. Burnett, Irene Osgood, The McClintock Moore, a rich crimson but wanting in scent, Florence Forrester, white, and Maud Davis, beautiful in the bud. Rev. J. H. Pemberton sent his new rose Danae, also Moonlight and Ceres.

Gold Medals were awarded to Gorgeous, Mrs. Archie Gray, and Countess Clanwilliam, shown by Messrs. H. Dickson, Belfast; Messrs. A. Dickson and Sons showed several new roses, including Dennis, a new H.T.; G. A. Hammonde, Janet, a new H.T.; and Mrs. Wakefield Richardson.

MEDALS FOR BEST BLOOMS.

In the nurserymen's section medals for the best blooms were granted to: Messrs. A. Dickson and Sons, Newtownards, for H. V. Machin; to Messrs. D. Prior and Son, for Mrs. E. Mawley; and to the King's Acre Nursery Company, for A. K. Williams. In the amateurs' section J. H. West, Esq., had the best tea in Mrs. Foley Hobbs; Mr. H. G. Rolt, Hay, had the best H.T., George Dickson being given the honour; and Mr. Tom Park, Bedale, was awarded the Medal for the best H.P. for a fine bloom of A. K. Williams.

THE LOCAL SECTION.

Naturally the interest in the local classes was overwhelmed by the National Show, but in the chief local class for thirty-six varieties, that well-known grower, Mr. Conway Jones, won the solid silver challenge bowl with a fine lot of flowers; Mr. W. Boyes, Middleton-on-the-Wolds, was a good second; and Mr. R. Foley Hobbs, Worcester, third. Mr. W. Jarratt Thorpe, Hucclecote, won the challenge cup for twelve varieties, and Mr. C. R. Bonnor, Barnwood, had the best nine teas. Mr. B. W. Price, Gloucester, had the best six vases of roses, and Mr. J. G. Orpen won the amateurs' challenge cup open to the City of Gloucester. Classes were also arranged for novices and cottagers, in each of which good roses were shown, but the show was a fortnight too late for Gloucester flowers.

SWEET PEAS.

For several years past sweet peas have figured conspicuously at this show, and, in spite of the roses, they attracted a good deal of attention, for no other reason perhaps than the fact that Gloucestershire people are keen on sweet peas. The premier award for twenty-four distinct varieties was won by Mr. A. Moring, gardener to A. W. Goring, Esq., Goring-on-Thames, who had a splendid lot of flowers in which all the best varieties were represented. Mr. W. Jarratt Thorpe, Hucclecote, and Mr. E. R. James, Wroxton Abbey, were put equal first prize for a collection of twelve varieties with very fine collections in each case.

Mr. E. R. James had the best vase of white peas, showing Moneymaker, and in the yellow or buff class the same exhibitor won with Dobbies' Cream. Again Mr. James won in the cream-pink class with Mr. R. Spencer, and also in the best pink class with Hercules. Mr. A. W. Stirling had the best orange flowers, winning with Helen Grosvenor, and Mr. E. R. James won in the rose class with John Ingman. Quite dazzling were the Scarlet Empress in the class for scarlets, which won first prize for Mr. A. W. Stirling, and the same exhibitor was first for crimsons. Mr. A. E. Usher, gardener to Sir Randolf Baker, Blandford, had the best vase of maroons, showing Tom Bolton, and the same exhibitor was first with lavenders, showing R. F. Felton. Mr. Usher was again to the front with blues, and in the picotee-edged section Mr. E. R. James was to the front. The last-named exhibitor also won with bicolours, showing Mrs. C. W. Breadmore; and for a red-flaked variety Mr. A. E. Usher was to the front.

A very interesting class was that for a display of sweet peas, and here Mr. E. Horwood, gardener to C. P. Allen, Esq., Stroud, was first; and Mr. H. Prentice, Hartpury House Gardens, second. In the local amateurs' and cottagers' classes the sweet peas were remarkably good as a whole, and the competition quite keen. Indeed, it may be said that a better sweet pea show has not been seen in Gloucester.

Manchester.

The Royal Botanical and Horticultural Society has this year provided a liberal schedule for its patrons, and a splendid hall for the exhibitions. The schedule for July 11 and 12 comprised twenty-five classes for roses, five for sweet peas, nine for plants and cut flowers, and generous awards for non-competitive exhibits. The Exhibition Buildings, Rusholme, are unusually roomy and well lighted, and admirably suited for the purpose.

NURSERYMEN.

The class for 60 roses, distinct, brought a splendid display of fine blooms, and Messrs. Hugh Dickson, Belfast, secured the chief position with fine flowers richly coloured, the most noteworthy being William Cooper, Mrs. George Gordon, Mabel Drew, Countess of Gosford, Mrs. Geo. Shawyer, Mdme. Jules Bouche, Rhea Reid, Brilliant, Gorgeons (fine colour), Mrs. Foley Hobbs, Rosy Morn, and Edward Mawley; Messrs. A. Dickson and Sons, Newtownards, followed closely with fine massive blooms; Messrs. W. and A. Frettingham, Beeston, third. For thirty-six, distinct blooms, the Irish contributors still held their own, with Mr. G. Prince as third.

For twenty-four teas or noisettes, Mr. G. Prince occupied the position of honour, staging excellent blooms, and he was followed by the Newtownards firm. The first and second places for twelve teas or noisettes were similarly held, with Messrs. W. and J. Brown taking the remaining award.

Twelve of any white or yellow roses found Mr. George Prince first with White Maman Cochet; Messrs. H. Dickson second with Mrs. Archie Gray; and Messrs. A. Dickson and Sons third with Mrs. Cornwallis West. For twelve of any other light rose, Messrs. A. Dickson and Sons scored with Mrs. Theodore Roosevelt; Messrs. Hugh Dickson second with Gorgeons; and Messrs. W. and H. Frettingham third with Lyon Rose. Twelve of any crimson found Messrs. A. Dickson and Sons first with J. B. Clark, highly coloured; Messrs. W. and H. Frettingham second with Horace Vernet; and Messrs. Hugh Dickson third with Sir W. Q. Ewart.

AMATEURS.

In the class for twenty-four distinct roses, Dr. T. E. Pallet, Earl's Colne, Essex, came first with telling flowers of Avoca, Charles Lefebvre, C. J. Graham, Mrs. Foley Hobbs, Edward Mawley, etc.; Mr. F. Dennison, Leamington, second, with a fine box, the remaining award going to Mr. Foley Hobbs. For twelve blooms, distinct, Mr. F. Dennison, Dr. T. E. Pallett, and Mr. T. Park, Bedale, were placed as named; while for eighteen teas or noisettes Mr. T. Park and Mr. Foley Hobbs came first and second.

For twelve teas or noisettes, distinct, the prizetakers were Messrs. T. Park, F. Dennison, and Foley Hobbs. For any twelve white or yellow roses, Mr. F. Dennison scored with Frau Karl Druschki, Mr. Foley Hobbs and Dr. T. E. Pallett taking the remaining prizes. For any other twelve light roses, Mr. R. F. Hobbs led with Her Majesty, while for any twelve crimson blooms Dr. E. T. Pallett scored with Avoca.

For a display of roses, Messrs. W. and J. Brown led with a well-arranged collection. The best tea or noisette bloom in the show was White Maman Cochet, from Mr. G. Prince; the best H.P. or H.T. was a large H. V. Machin, from Messrs. A. Dickson and Sons.

SWEET PEAS.

For the best collection, not less than fifty, or more than 100 vases, Messrs. Castle Bros., Carnforth, came first; Mr. R. Wright, Formby, second; and Mr. J. A. Robinson, Styal, third. For a collection of not less than twenty-five vases, Mr. J. S. Procter, Altrincham, was successful. In the class for the best exhibit of sweet peas, Mr. O. Robinson was first, and Mr. W. J. Garner second.

GROUPS.

The best miscellaneous group of plants arranged for effect came from Messrs. J. Cypher and Sons, and was a fine group of crotons, palms, ixoras, etc.; Mr. W. A. Holmes, Chesterfield, second; and Mr. W. J. Garner third. For the best display of herbaceous cut flowers, Messrs. Harkness and Son, Bedale, won with a grand collection. For ten stove or greenhouse plants, Messrs. J. Cypher and Sons were the first, and the only exhibitors, with fine specimens of Erica ventricosa Bothwelliana (2), Statice intermedia (2), S. profusa, Allamanda nobilis, Ixora Duffi, Clerodendron Balfouri (2), and Bougainvillea Sanderiana. For six fine foliage plants the Cheltenham firm again led.

NON-COMPETITIVE.

Some fine collections were contributed which enhanced the beauty and interest of the exhibition. Gold medals were awarded to Messrs. E. Webb and Sons, Stourbridge.

for sweet peas, liliums, vegetables, and fruits; Mr. A. G. Dutton, Iver, for carnations; Messrs. Bakers, Wolverhampton, for delphiniums, etc. Messrs. Dickson and Robinson, Manchester, for herbaceous flowers and lawn grass; Mr. W. J. Unwin, Histon, for sweet peas; Mr. R. W. Lee, Heywood, for fruit trees in pots; Mr. A. J. A. Bruce, Chorlton-cum-Hardy, for sarracenias and allied plants.

Silver-gilt medals were awarded to Mr. L. Broadhead, Huddersfield, for a rock garden; and Messrs. Caldwell and Sons, Knutsford, for delphiniums, etc.

Dr. McLeod, Manchester, staged orchids, and the Rev. J. H. Pemberton sent his new decorative roses Danae and Moonlight.

Finchley Horticultural Society.

JULY 10.

The fifty-fourth annual exhibition of this society was held on the 10th inst. in the beautiful grounds of the Manor House, Finchley, the residence of A. W. Gamage, Esq., and, as usual, the three or four huge marquees were filled to their utmost capacity with plants, flowers, fruits, and vegetables of the highest quality. Unfortunately, the weather was unfavourable, and the heavy rain that fell during the greater part of the afternoon must have seriously affected the financial results. The society has for some years past made special features of roses and sweet peas, and, as usual, they were splendidly shown. In giving special encouragement to these fragrant flowers the executive have not overlooked the claims of the many other subjects usually shown at this season of the year, and, as the result of this wise policy, the exhibition was comprehensive in character and rich in interest.

There were thirteen classes for sweet peas, and the first prizes included a silver challenge shield of the value of twenty-five guineas and two ten-guinea silver challenge cups. The first of the several classes was for twenty bunches distinct varieties, open to trade growers only, and the premier award comprised the "Monro" challenge cup and a cash prize. The entries were hardly so numerous as might have been expected, but the flowers staged were of high quality. Mr. H. D. Tigwell, Harrow View, Greenford, occupied the post of honour with superbly developed flowers of Hercules, Mrs. Hugh Dickson, John Ingham, White Queen, R. F. Felton, Sunproof Crimson, T. Stevenson, and other of the finest varieties, new and old.

Mr. A. E. Usher, gardener to Sir Randolf Baker, Bart., Ranston, Blandford, showed magnificent flowers in the collection he staged in the class for eighteen bunches, and was the winner of the "Leicester" silver challenge cup, offered with a sum of money and the certificate of the National Sweet Pea Society as the first prize. The stems were of good length and stout, but free from coarseness, and few indeed were those carrying less than four flowers, which were large in size and splendidly coloured. Conspicuous among the several varieties were Barbara, Elsie Herbert, Hercules, Audrey, Crier, Mrs. Routzahn, Clara Curtis, Marks Tey, and Anglian Pink.

Of quite exceptional merit were the flowers with which Mr. A. E. Usher won the "Gamage" silver shield, offered with a silver medal and cash prize as the premier award in the class for twelve bunches. The varieties included those mentioned above and Edith Taylor and Mrs. Cuthbertson, both at their best. Mr. G. P. Highatt, Stanley Road, East Finchley, occupied the second place with large, finely developed flowers that had evidently suffered somewhat from a heavy rain. Mr. Clark, High Barnet, also staged flowers of great excellence. Mr. A. E. Usher and Mr. H. Tigwell were successful in winning the first and second prizes in the class for nine varieties, and Mr. A. F. Dunkley, North Finchley, was third, the flowers being throughout of much merit. For six bunches Mr. A. W. Ball, Stoneleigh Park, New Barnet, was a splendid first, and Mr. H. Auckland, who was second also staged flowers of a high order of merit. The cottagers' classes for sweet peas were all well filled with excellent flowers.

Fourteen classes were provided for roses, and in all of them there was a spirited contest, and blooms that did credit to the cultural skill of the exhibitors. The most important class was that for twenty-four blooms in not less than twelve varieties, the premier award being the "Fisher" cup and a cash prize. The competition was keen, and Mr. G. Speight, Market Harborough, was successful in obtaining the premier position with a fine box containing Her Majesty, Lyon, Avoca, J. B. Clark, Mrs. J. Laing, C. W. Waud, and other well-known varieties in a high state of development. Mr. G. P. Highatt and Mr. C. Ames, Friern Park, who were second and third, also exhibited blooms of excellent quality.

The more successful of the exhibitors in the several classes for twelve, six, and four blooms were Miss B. H. Langton, Raymead, Hendon; Mrs. G. W. Cook, Radstock, Whetstone; Mr. J. W. Rolf, Wood Green; Mr. G. P. Highatt, Mr. C. Ames, Mr. Kennedy Jones, Knighton, East Finchley, and Mr. A. Wilkinson. The competition in the classes for vases and bowls of roses was very keen, and the large array of arrangements formed an immensely attractive feature. For a vase of cluster roses, Miss Langton and Mrs. Cook were first and second, with Blush Rambler and American Pillar respectively, and these exhibitors were first and second also for a bowl of roses with Caroline Testout and Frau Karl Druschki. In a strongly contested class for decorated dinner-tables, without restriction as to the kind of flowers used, Mrs. G. W. Cook was successful in obtaining the premier award with an exquisitely beautiful arrangement of Irish Elegance rose, the flowers being sufficient to produce a good effect without there being one too many. Mrs. G. W. Cook was equally successful in the class for baskets of flowers, and occupied the first place with a basket of roses that was as near perfection as we can hope to see, it being the most beautiful basket of these flowers we have seen this season. Mrs. Dunkley had a charming basket of flowers of annuals and perennials. Border flowers were admirably shown, the most noteworthy collection being that of twelve vases, for which Mr. J. Westwood, Oakdene, East Finchley, was awarded the first prize.

The tents devoted to plants were admirably filled, but the groups arranged for effect were hardly so numerous as usual. Here, two classes are provided for groups, one for plants remarkable for the beauty of their foliage and the other for plants in bloom. In each class Mr. Kennedy Jones, East Finchley, was first with an arrangement that did much credit both to the cultural skill and taste of his gardener, Mr. T. Aley. In the group of flowering plants zonal pelargoniums were admirably utilised. Zonal pelargoniums, in fours, were of much merit, as shown by Mr. J. Westwood and Mr. J. D. Carr, Ryhope House, Woodside. Fuchsias were also of great excellence, as shown by the exhibitor last named and Mr. T. Simmons, North Finchley, who were first and second. Mr. Dunkley scored for six fuchsias, and included a finely-flowered pyramid of the brilliantly coloured Fuchsia triphylla in his set. Mr. Carr also obtained premier honours for four stove and greenhouse plants in bloom, in which Clerodendron Thomsonæ was especially well represented. The same exhibitor was first also for six celosias, and Mr. Windbrook won for the same number of caladiums.

There was a keen competition in the class for six ferns, and Mr. J. Turk, Fairlawn, Totteridge, was well in advance of other competitors, with splendidly developed specimens of well-known kinds. Mr. R. E. Cooper, Muswell Hill, followed closely for second place with a set that contained a magnificent specimen of the Stagshorn fern. Coleus were well shown by Mr. J. W. Gregory, whose specimens were large and well coloured.

Fruits and vegetables were strongly represented, and in competition for the prizes offered for collections of fruit, Mr. J. Turk and Mr. C. Ames were the most successful. There were numerous classes for collections of vegetables, but space will not permit of their being particularised. It must therefore suffice to say that the entries were numerous, and the produce of excellent quality. The competition in the class for salads was particularly keen, and Mr. J. Townsend was successful in occupying the first place.

The silver cup presented by Mr. G. Munro, jun., for a rock and water garden, was awarded to Messrs. Piper, Bayswater, for a charming arrangement. Mr. Amos Perry, Hardy Plant Nursery, Enfield, filled the end of one of the large tents with a large collection of finely-developed delphinium spikes, which were tastefully arranged, and proved highly attractive.

The general arrangements were, as usual, admirably carried out under the direction of Mr. J. Speller, the secretary.

Liverpool.

The society held its summer show on July 10 in the well-lighted Corn Exchange, and, although the weather has been somewhat against growth, most of the classes were well filled, sweet peas being the exception.

For twenty distinct vases of sweet peas, Mr. N. Hughes, gardener to R. R. Anderson, Esq., led with a meritorious collection; especially fine were Thomas Stevenson, Mrs. Hugh Dickson, May Campbell, R. F. Felton, Edrom Beauty, Earl Spencer, Nubian, Dobbies' Cream, Nellie Jenkins, etc. Mr. W. Davies, gardener to Dr. J. E. Phillips, also staged well for second place.

For twelve distinct vases, Mr. Davies secured the chief award. For twelve, distinct, with waved standards, Mr. W. Bond, gardener to J. R. Heron, Esq., took the lead; and for twelve vases, distinct varieties, Mr. E. Smith, gardener to B. C. Harrison, Esq., was to the fore. In the amateurs' section Mr. Joseph Roberts was successful in the three classes for twelve vases, and two of six vases.

Roses showed an improvement on former years. Twelve hybrid teas, distinct, found Mr. J. R. Ball, gardener to Joseph Booth, Esq., in the coveted position, having good blooms of Mrs. W. J. Grant, Mdme. Melanie Soupert, Arenburg, Gen. McArthur, etc.; Mr. C. Smith was second with good blooms. For eighteen blooms, distinct, Mr. J. George, gardener to Thomas Henshaw, Esq., led with fair blooms; for twelve blooms, Mr. J. R. Ball was again successful; for six distinct varieties, Mr. A. Griffiths, gardener to J. Watson Todd, Esq., took the lead; and for two vases hybrid tea or tea, Mr. J. George was successful. In the amateurs' section, Mr. Loo Thompson was to the fore with good blooms, and Mr. Edgar M. Allen won for six distinct blooms.

In the class for twelve vases hardy herbaceous flowers, Mr. J. George won with heavy bunches. Mr. G. Haigh, gardener to Sir W. H. Tate, Bart., proved successful in the three classes devoted to carnations and picotees, with excellent blooms of the Countess of Lathom.

Miss Newsome proved the winner in the sweet pea table decoration class; and Mrs. Edgar M. Allen led for the table (orchids excluded), which was tastefully arranged with roses, the variety being Irish Elegance. Mr. J. Gilbourne was successful for herbaceous cut flowers, Mr. J. Macfarlin for single begonias, and Mr. A. B. Spence for double varieties. Mr. H. Lunt led for six carnations and one vase of carnations.

Some pleasing collections were staged not for competition, to which the following awards were made:

Gold Medals.—Messrs. A. Dickson and Sons, Newtownards, for the finest feature of the show, a large display of roses; Mr. H. Middlehurst, for sweet peas; the Liverpool Orchid and Nursery Company, for a bank of orchids.

Silver Medals.—Mr. R. Manson, Messrs. Jones Bros., and Mr. W. Rowlands, for cut roses; Messrs. R. P. Ker and Sons, for stove and greenhouse plants and gladioli.

The Elstree Horticultural Society.

This society was again most fortunate when they held their fifth annual show on July 9, the weather being all that could be desired. As in former years, Aldenham Park was kindly lent to the society for the purposes of its exhibition by Lord Aldenham, and the gardens, which prove such a great attraction, were again thrown open to the public by the Hon. Vicary Gibbs, the society's president. This year's show far exceeded anything previously held, the number of entries in the cottagers' and amateurs' classes being a record; while the number of visitors also was a record.

This year the society offered for the first time two additional silver cups, one in open competition for sweet peas, the other for roses. The former was won with a truly magnificent display from Lord North, Wroxton Abbey, Banbury (gardener, Mr. E. R. Janes), and was acknowledged by many horticulturists present to be one of the most remarkable for size of bloom and quality yet seen. In addition to the cup, the exhibition was also awarded a gold medal. The twelve varieties were as follows: Mrs. Cuthbertson, Moneymaker, Tennant Spencer, Thos. Stevenson, Mrs. Routzahn, Melba, Edith Taylor, Clara Curtis, Nubian, Mrs. C. W. Breadmore, Florence Nightingale, and Maud Holmes. The Rose Cup was won by J. B. Wellington, Esq., Elstree (gardener, Mr. G. Allen), with remarkably even and well-grown blooms. H. F. Thomas, Esq. (gardener, Mr. Bates), was second, staging fine blooms.

The cup for roses previously competed for was again won by Messrs. Frank Cant and Co., Colchester, with a fine exhibit, most tastefully arranged. Among the many fine blooms, particularly conspicuous were the pyramids of Rayon d'Or, Juliet, General McArthur, The Lyon, and Frau Karl Druschki. The exhibit from Messrs. V. R. Harkness and Co., Hitchin, who were second, was also very pleasing, and contained splendid blooms of well-known varieties. Messrs. Wm. Cutbush staged polyantha and other choice varieties in good form, and were awarded a gold medal. From Messrs. Paul and Sons, The Old Nurseries, Cheshunt, came a fine exhibit of cut roses, and the award of a silver medal was made.

Facing the entrance to the tent of honorary and trade exhibits was a large collection of vegetables from the President (gardener, Mr. E. Beckett, V.M.H.), comprising some hundred dishes, all of which were in the highest state of development, a few of the more conspicuous being Early Giant cauliflower, Duke of Albany pea, Sutton's Table Dainty vegetable marrow, King Edward and May Queen potatoes, sugar peas, Perfection tomatoes, globe artichokes, Sutton's Black beet, Kohl Rabi, King George cucumber, Canadian Wonder French bean. The award of a large gold medal was awarded the exhibitor.

From Mrs. Vasmer, Caldecote, Aldenham (gardener, Mr. Paul), came a most artistically and well-arranged group of orchids and stove flowering and foliage plants. Amongst the principal subjects were Cattleya gigas and other orchids, nepenthes, gloriosas, streptocarpus, caladiums, etc. Awarded a large silver medal.

From K. Edgcumbe, Esq. (gardener, Mr. Eggleton), came a good exhibit of fuchsias, coleus, begonias, etc. (silver medal); and from G. W. Atkins, Esq. (gardener, Mr. Lawrence), another prettily-arranged group of flowering and foliage plants (silver medal). Hardy plants were shown by Messrs. Thomson and Charman, who had a nice exhibit with several novelties, well arranged. Mr. H. Newman, of Watford, showed a nice group of hardy alpine and herbaceous. Messrs. M. Gleeson and Co., of Watford, showed floral decorations, and also herbaceous.

Other interesting exhibits were those in the classes for queen wasps, the winning exhibit comprising no fewer than 375. Table decorations brought together eight competitors, the first prize table being a novel arrangement of nemesias by Miss Leach.

Formby.

The annual summer show of this society was held in the grounds of Briars Hey, by the kind permission of W. Rockliff, Esq., on July 10. The large marquee was well filled with exhibits, the three most popular sections being roses, sweet peas, and decorated tables. The queen of flowers worthily held her own both in quantity and quality, and the day being cool and dull, the charm of the flowers was well sustained throughout.

Twenty classes were devoted to roses, and eight cups were offered as first prizes, these being generous gifts of gentlemen residents. For twelve distinct varieties, Mr. A. E. Gunson held the premier position with flowers of high merit, and amongst them were notable blooms of Richmond, Dean Hole, Mrs. W. J. Grant, and Caroline Testout; Mr. Joseph Booth occupied the second position, having in his stand a fine William Shean, which was selected as the best bloom in the show. For twelve blooms, in six varieties, the leading award went to Mr. W. Rockliff, who had excellent examples of Mrs. W. J. Grant and Mrs. Theodore Roosevelt. For the box of twelve blooms, in four varieties, Mr. W. Rockliff was again successful; and for six distinct varieties Mr. T. Carlyle led, having a brilliant J. B. Clarke. The latter exhibitor also scored in the class for six light roses in three varieties. For six dark roses, Mr. George Lunt led with smart flowers; and for six of any one variety Mr. E. M. Allen won with well-coloured Lyon Roses. Mr. W. Rockliff was to the front with two vases, and Mr. Joseph Booth for one vase; Mr. A. W. Arden led for one vase cluster roses, whilst Mr. Loo Thomson led in the minor section for six dark, six light, and six distinct roses.

The sweet pea section was slightly down in quantity owing to the lateness of the season. In the class for twelve vases, Mr. E. M. Allen stood well out, having long stems carrying fine flowers of intense colouring; his best varieties were Melba, Mrs. Cuthbertson, Edith Taylor, King Edward Spencer, Hercules, Thomas Stevenson, and Mrs. Cowdy. Mr. J. K. Heron was second. For nine vases Mr. A. Rushforth scored with a good collection; and for six vases Mr. J. Gilbourne had the leading lot; while for three bunches Mr. T. B. Burnett was successful.

Mr. H. S. Hodgkinson and Mr. J. Booth were first for six double and six single begonias. Mr. Joshua Rea had the leading double geraniums, and Mr. F. C. Calthorp led for violas in two classes; while Mr. J. Gilbourne scored for hardy and half-hardy cut flowers.

Mr. Joseph Booth won for three single zonal pelargoniums with good plants, and also for three petunias. For three stove or greenhouse ferns, Mr. A. Storey led with good specimens, Mr. W. Rockliff having the leading hardy kinds. Mr. H. S. Hodgkinson scored for gloxinias, and Mr. J. Booth for single begonias. Mr. H. S. Hodgkinson was first for a single plant in bloom with a good odontoglossum.

Among the non-competitive exhibitors were Messrs. A. Dickson and Sons, Newtownards, roses; Mr. Karl Thirkildsen, roses; Mr. H. Middlehurst and Mr. R. Wright, sweet peas; Messrs. Woodward and Cuthbert, herbaceous cut flowers.

Bougainvilleas.—These are now practically at their best, and where growing on trellising or rafters in a warm house provide a very effective display. The creamy-white and green of the foliage of the B. Sanderiana variegata affords a beautiful contrast to its rosy mauve-coloured bracts. It is very useful for cutting purposes, as also are B. Sanderiana and B. glabra, and each may be grown successfully as a trained pot plant. After flowering they will require rather drier conditions to assist in well maturing the wood. These all require fairly severe pruning before starting in the spring. B. spectabilis, in direct contrast to the others, flowers on the wood made the preceding year, and should be pruned as soon as the flowers are over.—H. PRIME, Hatfield House Gardens.

ANSWERS TO CORRESPONDENTS.

HARDINESS OF NIEREMBERGIAS.—S. S., Henley.—Please let me know how many of the nierembergias are hardy in this country. I have A. rivularis, and believe there are other pretty species.—As the years go by we become less inclined to be dogmatic concerning the hardiness or tenderness of many subjects because we have seen reputed tender plants growing well under conditions that did not appear suitable. Broadly speaking, there are no perfectly hardy nierembergias, but N. rivularis seems to be the hardiest, as it is one of the best of the several species. In a semi-shaded spot, in moist sandy soil, it is quite a success in many gardens, but a failure in others. It comes from South America, and needs shelter from cold winds and draughts. N. frutescens, from Chili, is shrubby, and has blue, white-edged flowers. It is hardy in many gardens in the south, but succumbs in a severe winter, consequently a few cuttings should be struck every year to maintain a stock of plants. N. filicaulis, with lilac and yellow flowers, and N. calycina, with white and yellow flowers, come from Buenos Ayres, and are best raised from seeds sown in heat in February, the seedlings being duly hardened off, and planted out at the end of May or in June.

SCALE ON APPLE TREES.—J. S. N., Margate: On some espalier trees in my garden there are scaly little bodies adhering to the bark. I enclose a few specimens, and should like to know whether they are injurious insects, and, if so, what I had better do to get rid of them.—The scaly bodies are specimens of the apple mussel scale (Aspidiotus conchiformis), and when a tree is badly infested considerable damage may be done. Very little can be done at this season of the year because remedies strong enough to kill the scale would kill the foliage. After leaf fall the stems and branches must be scrubbed with a stiff-haired brush and warm soapy water, followed by a spraying with a paraffin emulsion. Write us again in the autumn.

ROYAL HORTICULTURAL SOCIETY'S EXAMINATION.—J. K., Roade: Will you kindly inform me which is the best course to take with a view to obtaining the Royal Horticultural Society's Certificate for Gardeners, and would the examination be open to anyone living in South Africa?—If you apply to the secretary of the Royal Horticultural Society, Vincent Square, Westminster, enclosing a stamped addressed envelope, you will receive particulars of the society's examination, and a printed list of books recommended for study. This will help you considerably. Attend classes for horticulture and elementary botany, if possible, and pay the keenest possible attention to the work of the garden in which you are employed, using a diary to record times of planting, sowing, etc., soil, methods of culture, results obtained, trees and shrubs that do particularly well and those that do badly, with reasons for their behaviour. Use your powers of observation to the fullest extent in the gardens of the district, and do not be afraid to ask questions when you want to know "the reason why" of things. At the same time, pay attention to your general education, because carelessness in regard to weights and measures, orthography, etc., may mean the difference between success or failure. Learn to express yourself clearly in diagrams, where these apply, and make yourself familiar with remedies for plant pests and diseases, as well as with the life histories of the chief insect and fungus pests with which a gardener has to deal. Make a time-table for your own use, so that your studies may be properly regulated. Let recreation have its proper place in your time-table, but let cricket, football, etc., be used only as a means of keeping you fit, physically and mentally. From the R.H.S. offices you can obtain the sets of questions set at the various examinations, for 2s. post free; these

questions will give you a good idea of the style and scope of the examinations, and attempts to answer the questions set in previous years will be excellent practice, especially if you can persuade some competent person to examine and correct the answers for you.

CASSINIA FULVIDA, OR GOLDEN HEATH.—M. E., Aldershot: The shrub, of which I enclose a specimen, is very beautiful here. We know it as the golden heath. Kindly say what the correct name is, and how the plant can be propagated. Some of our specimens are a bit leggy, and we should like to raise some new stock if that is not a too serious business.—The golden heath is correctly Cassinia fulvida, but it is very commonly cultivated in the south under the name of Diplopappus chrysophyllus. It is not a difficult matter to raise new stock from cuttings. The latter should be half-ripe, flowerless shoots, and August or early September are the best months to insert them. Use a sandy mixture of peat and loam, insert the cuttings firmly, and cover them with a bellglass or handlight until well rooted. Keep them in a cold frame the first winer. Seeds sown as soon as ripe, in sandy peat and loam, in a cold frame, germinate well, and the seedlings must be potted separately as soon as possible, and then treated as in the case of cuttings Plant out late the following spring.

PEACH EARLY BEATRICE.—B. I., Worcester: We have an old tree of a peach named Early Beatrice, which has fair-sized fruits of good quality that are now almost ripe out of doors. This variety I have not seen growing elsewhere. Can you tell me its history? —Early Beatrice Peach was raised by the late Mr. Rivers, of Sawbridgeworth, and was obtained from a stone of Rivers' White Nectarine; it first fruited in 1865, and the fruits ripened on July 4 of that year. It was named in honour of Princess Beatrice, now Princess Henry of Battenberg, and mother of the Queen of Spain. It is a very hardy and very early peach. The larger Early Rivers which came into being a few years later was probably responsible for the decline of Early Beatrice, but where the latter does well it should certainly be retained.

FAILURE WITH GYPSOPHILA SEEDLINGS.—G. A., Axminster: I sowed seeds of Gypsophila paniculata in a warm place in April, and, not long ago, pricked out the seedlings into another bed, proposing to transplant them to permanent quarters in the autumn. But by far the greater number of seedlings have failed utterly, and I am at a loss to account for such loss. The soil is in good condition, and contains a fairly good percentage of lime, and some plaster rubbish was crushed and added to the soil before the seedlings were pricked out.—Under specially favourable conditions of weather seedlings of Gypsophila paniculata may be transplanted with fair success from a seed bed, but losses are often considerable when conditions are unfavourable. The better plan is to pot each seedling separately as soon as it can be conveniently handled, giving additional root room as necessary until the plants can be placed in their permanent quarters with practically no root disturbance. The trouble in this connection is that the gypsophila makes tap roots rather than a number of fibrous roots, and so transplanting the seedlings becomes a very risky matter as the size of the plants increases.

PROPAGATION OF ROCK ROSES.—H. J. H., Carisbrook: Kindly tell me the best method of increasing a stock of rock roses or cistuses, and the best time to proceed?—Propagation of rock roses is effected both by cuttings and layers. The former should be inserted in sandy, peaty soil in early autumn, selecting firm growths three or four inches long. Cover with a handlight, or place in a cold frame. Layering may be done at any time, and is a capital method where only a few extra plants of certain sorts are needed. It is a quite easy matter to raise a stock of seedlings from seeds sown in a warm greenhouse in early spring; the seedlings must be potted singly when a couple of inches high, and as soon as established a process of hardening off must be commenced. In favoured localities autumn planting may be successful, but in most cases it pays to pot the seedlings once or twice and keep them in a cold frame the first winter, planting them out soon after they are a year old.

MOSSY POT PLANTS.—T. G. W., Leicester: For certain of our indoor decorations it is necessary to use a very low-growing plant of mossy character, and, of course, we use Selaginella denticulata freely, but I should like to know the names of other subjects that would be similarly useful.—We think all the following would be of use to you: Helxine Solieroli, Selaginella apoda (S. apus), S. azorica, S. conferta, and S. helvetica.

NAMES OF PLANTS.

A. E. P., Chipping Norton.—Adlumia cirrhosa.

T. G., Bletchley.—1, Liriodendron tulipifera; 2, Spiræa palmata.

H. H., Clifton.—1, Aciphylla squarrosa; 2, Rosa centifolia; 3, Cuphea miniata.

E. W. H., Ware.—1, Œnothera biennis Lamarckiana; 2, Gaura Lindheimeri.

F. S. G., Saltaire.—1, Helonias bullata; 2, Dactylis glomerata variegata; 3, Cystopteris fragilis.

C. N. K., Shields.—1, Abies nobilis; 2, Gladiolus byzantinus; 3, Lilium pardalinum; 4, Chelone barbata; 5, Eryngium alpinum.

O. S., Radnor.—1, Lathyrus grandiflorus; 2, Clianthus puniceus; 3, Campanula garganica; 4, Francoa sonchifolia; 5, Pratia angulata.

E. K., Driffield.—Both the specimens sent are Centranthus ruber, a plant that varies a good deal in the colour of its flowers, from white to red.

L. N. A., Caversham.—1, Gentiana asclepiadea; 2, Galega officinalis; 3, Chenopodium atriplicis; 4, Alternanthera paroychioides major aurea.

NAMES OF FRUITS.

G. W. S., Horncastle.—Such soft fruits as strawberries are very difficult to determine, especially after a long journey. We believe your variety is Bedfordshire Champion.

PUBLISHERS' ANNOUNCEMENTS.

THE GARDENERS' MAGAZINE may be obtained by order from all Newsagents, price Twopence, every Friday. If any difficulty be found, a copy will be posted weekly direct from the Publisher, 148 and 149, Aldersgate Street, London, on the following terms: Twelve Months, 10s. 6d.; Six Months, 5s. 6d.

INDEX to Volume LV. may be obtained through any Newsagent, price 2d.; or 2½d. post free from the Publisher.

BINDING CASES for binding the 12 months' numbers, green cloth, ornamented in gold, price 2s., post free.

VOLUME LV., bound in green cloth, containing the 52 weekly numbers, 1912. Price 12s. 6d.; by post, 13s. 4d.

VOL. LVI.—No. 3,117. SATURDAY, JULY 26, 1913.

THE GARDENERS' MAGAZINE

NOTE OF THE WEEK.

Wood.

To the horticulturist or general garden lover wood appears as the least interesting feature of plant growth, a mere accretion of material to form a framework for the foliage, fruit, or flowers, which constitute their peculiar cult. Many of the plants indeed, which are prized for their floral merits, form little wood proper, or even none, merely fleshy stalks and stems sufficing to carry and display their leaves and flowers during the period necessary, and then sharing their fate by dying down to the ground and disappearing altogether. This is the case with all annuals and bulbous plants, but it is very different when we turn to robust vegetation of the tree and shrub type. In all these we find the formation of wood to be a constant and esential feature. It falls naturally into two distinct categories, known to botanists as exogens and endogens. The exogens embrace the major part of the trees with which we are familiar in the temperate zone, and as their name, which means "outside growers," implies, form annually just beneath the bark a ring of new wood, while the "endogens" increase their girth by internal additions, and not by forming rings, nor is there any bark proper on the outside, though this is usually harder and tougher by virtue of special cell arrangement. In many endogens, such as palms and tree-ferns, the trunk is contributed to by the persistent bases of the otherwise dead leaves or fronds, or, in the latter case, by the accumulated roots which spring from the crown and traverse the trunk on their way to the soil. The bamboos give us a typical form of endogenous wood of quite another kind, which forms no sort of trunk, but is in reality identical in structure, on a maybe gigantic scale, with a common grass stalk., viz., a tube with knots at intervals, hollow in the centre, and very hard on the surface. It is, however, in the woods of exogens that we find the greatest diversity. Every species and every variety of exogenous tree has its own particular peculiarity of texture, hardness, colour, and other characters, which only the actual users of such woods can properly appreciate. The woods of the various pines and conifers are, perhaps, predominant commercially, constituting as they do the commonest builders' material and the inner fittings of our domiciles. In our furniture, however, we find a large use for very different woods, mostly of exotic origin; and we have only to examine finely-cut and polished specimens of these to note what beautiful and varied grains and intricate designs are revealed by their section at different angles. Take, for instance, a panel of high-class birdseye maple, and see how far its internal cellular structure must depart from what we may term the common straight up and down run of an ordinary pine plank. Many woods indeed are so pervaded by variant possibilities in the ornamental direction, that they are only used as veneers little thicker than paper; and by judicious selection of these and their juxtaposition, most beautiful symmetrical designs can be produced, which no artist could imagine for himself. Nevertheless if we study the genesis of any exogenous tree, it appears to be of so simple a character as to preclude such an eventual display. A tree commences as a tiny twig developed from the seed, a tiny centre of wood protected by a ring of bark. The second year we find that a larger ring, or rather really, a slender, conical cylinder of wood, has grown over the first, the ring of bark expanding to encloso it. This is the simple process, and as the tree grows the same thing continues, as if, it has been said, a fresh cone of larger diameter and taller growth were slipped annually over the previous ones. In the meantime, however, this simplicity has been modified by the fact that from lateral buds on the original twig, now commencing to show as a trunk, other twigs have sprung, and acted independently on precisely the same lines of annual growth; so that, however old a tree may be, we can easily ascertain the age of any branch or twig by a section showing the number of rings it contains, precisely as if we fell the tree to the ground level we shall find its age revealed by the number of rings, by assuming that the centre point is the surviving centre of the original twiglet produced from the seed. Now this process of growth and lateral budding varies in every tree, and is affected by climate, environment, and seasonal changes. Of these lateral buds a large number perish as the tree develops, but their existence is permanently registered within the tree at the point of original generation by the consequent modification of the cell-growth. We see this in the obvious form of knots where they have formed branches before being lopped or destroyed by overgrowth or other causes.

MR. E. A. EBBLEWHITE, J.P., F.S.A.,
Clerk of the Worshipful Company of Gardeners.

Mr. E. A. Ebblewhite, J.P., F.S.A., whose portrait we have the pleasure of giving herewith, is fully entitled to a prominent position in the fraternity of gardeners, for if he is not actually engaged in the practical work of the craft he,

as Clerk of the Worshipful Company of Gardeners, is rendering splendid service in the cause of gardening. To have materially assisted in resuscitating an old guild that, through the apathy of those engaged in the industry with which it was closely associated, had been allowed to remain in abeyance for a long period, was no small achievement, and to place it in the forefront of horticultural institutions has been an accomplishment deserving of the heartiest congratulations. About twenty years have elapsed since measures were taken to revive the Gardeners' Company and place it in a position that would enable it to resume its activities in the advancement of good gardening, and during about one-half of this period Mr. Ebblewhite has occupied the important position of Clerk, and by his well-directed efforts, in association with other of the chief officers, has so materially improved the status of the company, and increased its capacity for work as to enable it to render substantial aid in the furtherance of horticultural progress. This achievement is all the more deserving of attention from the fact that, unlike many of the City guilds, the Gardeners' Company is not a wealthy body. Indeed, its only funds have been raised since the revivification of its activity, rather more than two decades since. This reference to the Gardeners' Company reminds us of the fact that 300 years ago gardeners were as fully alive to the importance of those engaged in garden management being thoroughly trained as are the most advanced members of the craft at the present time. The Gardeners' Company was incorporated by James I., in 1605, on the petition of the gardeners carrying on their avocation within a distance of six miles of the City, who were greatly hindered in selling their produce by outsiders. Eleven years later King James gave the company further powers and privileges; but it appears that considerable difficulty was experienced in carrying out the provisions contained therein, owing to the opposition of unqualified persons. At the commencement of the reign of Charles II. (1660) matters had become still more unsatisfactory, and both the skilled master gardener and the journeyman gardener felt the unfair competition of the large numbers of labourers imported by the designers of large gardens in and around London, for these, on the completion of the contracts, donned the blue apron, and settled down as professional gardeners. Thirty years later this evil was increased by the importation of many hundred labourers from country districts for assisting in the work of laying out the grounds of Hampton Court and Kensington Palace, and numerous great gardens. In 1699 a committee was formed for the purpose of dealing with the difficulties experienced by the professional gardeners owing to the competition of unqualified men, and as the result of their labours a Bill was presented to the House of Commons in 1700, and this, it was hoped, would improve matters, but it failed to pass. It will thus be seen that the chief object of the Company since its incorporation has been to encourage efficient training in gardening, and to protect the skilled gardener against the unskilled. Since its revival the Company has done much to promote horticultural education, chiefly by providing scholarships for the most successful candidates in the examinations held under the auspices of the Royal Horticultural Society. From this brief reference it will be seen that the Gardeners' Company has done useful service, and that it has possibilities difficult to estimate. It is therefore cause for much satisfaction that it has for its Clerk a gentleman possessing the ability and enterprise of which Mr. Ebblewhite has given such conclusive proofs. It should be added that Mr. Ebblewhite by no means limits his energies to the affairs of the Gardeners' Company, as evidenced by the fact that he is a barrister-at-law of the Middle Temple, a member of the Welsh Circuit, a J.P. for Middlesex, and Deputy-Coroner, ex-Mayor of Hornsey, Clerk of the Company of Tinplate Workers, and Hon. Fellow of the Royal Botanic Society.

Birmingham Parks.—The Birmingham parks, and Mr. Mortar, the able superintendent of the parks and other open spaces belonging to the Corporation of the city, received a full measure of praise at the luncheon in connection with the flower show held in Handsworth Park on the 18th inst. Sir Harry Veitch, who, with other members of the R.H.S. deputation, had made a tour of the parks, described them as unsurpassed by any public parks he had seen, and congratulated the Corporation in having so able an officer as Mr. Mortar. In view of the high keeping of the existing parks, it is a matter of considerable interest that the Parks Committee of the Corporation have, since the date mentioned, issued a report in which they recommend the purchase from Lord Calthorpe of 87 acres of land surrounding Perry reservoir to be utilised as a park for the northern part of Birmingham for the sum of £6,983. The purchase is also recommended of Bilberry Hill, with an area of 50 acres, from Lord Plymouth, for £3,400. The land round the Perry reservoir possesses great natural advantages, and it is proposed to sow the arable portion with grass seeds, and, as far as practicable, leave the area in a natural state. Bilberry Hill has during the past twenty-one years been held on a lease from Lord Plymouth, and been open to the public, and much appreciated. In the first case the cost will be £80 per acre, and in the other £68 per acre, which is not an excessive price for land within a penny tram-ride of the centre of Birmingham.

The Future of the North of England Society.—With reference to the future of the N.E.R.S., the Rev. J. Bernard Hall, Rawdon, Leeds, writes: "Allow me, as a private individual, to intimate to the gardening fraternity in general, and northern horticulturists in particular, the opportunities that exist at present for development. The cards have been dealt, and the call for trumps has been given. Has it been noticed, and will the response be forthcoming? There are two grand openings lying right in front of the N.E.H.S., and it would appear that too much caution may prevent an advance through these open doors. Without going into details, which are being thoroughly overhauled by legal and other interested persons, there is undoubtedly a crying need for a northern school of horticulture. The general idea is a Government Garden Institute, with the N.E.H.S. co-operating, with the object of training horticulturists capable of developing the economic resources of the soil at home or in the Colonies. There is another clear call—the establishment of a N.E.H.S. rock garden. Such a Mecca for lovers of rock gardens would be popular and useful. To me one thing is certain. When, at a general meeting, to be called shortly, the music is faced, the tune will be played, for it is preposterous to think that the many enthusiasts who have sacrificed, gladly and willingly, their time and money, will allow this northern movement to end in failure. It is not as if cash was not forthcoming. All that is required is a strong lead, and similar enthusiasm such as was displayed over the new R.H.S. hall and the R.H.S. gardens. Notwithstanding deaths and withdrawals, the N.E.H.S. still increases its membership. Several Fellows and members have proved by their withdrawal their ignorance of elementary forces in nature. A seedling cannot be forced without harm being done.

Royal Botanic Society.—In reply to a question asked by Mr. Mac-Callum Scott, Mr. Runciman stated that the Royal Botanic Society had not so far as he was aware extended the educational advantages of the gardens, and the scheme for the formation of a botanic institute (which would have involved the erection of more buildings) fell through. Bona-fide students from recognised schools or colleges are admitted to the gardens by passes granted free of charge for the purpose of study, and a large number of botanical specimens are given away annually by the Society to students and others. The Office of Woods had no reason to consider the present financial condition of the Society unsatisfactory. No consent in writing appears to have been given to the Office of Woods to the use of the gardens otherwise than for the purpose of a botanic garden, but it is known that for a long period the gardens have been used for some other purposes not interfering with the main purposes of the gardens, and no objection has been taken by that Department. He was not aware that there are any botanists with degrees or diplomas on the Council of the Society.

A Giant Foxglove.—Lady Dorchester, Grovewell, Hants, writes: "I have just been watching my gardener measure a common foxglove growing in a partially shaded border. It stands 10 feet 3 inches high, and along its stem are 172 seed cases, and 33 blooms yet to be developed.

Cowper's Parlour at Olney.—The Trustees of the Cowper and Newton Museum, Olney, Bucks, have published an etching by Mr. Philip Pimlott of "Cowper's Parlour at Olney," which is especially deserving the attention of those who are interested in Cowper and his poetical works. In this room were written many of Cowper's principal poems, and on the left is seen the stairs leading to his bedroom, in which was written "John Gilpin." Through the doorway on the right can be seen the hall, in one of the walls of which is a porthole (not shown in the picture), through which Cowper's hares were admitted to their evening gambols in the hall and parlour. The objects in the parlour include Newton's chair and Mrs. Unwin's spinning-wheel. This exquisite etching is being sold for the benefit of the museum, and as the price of artist's proofs is only 5s., the number that has been printed should be quickly sold.

Roses at Saughton Park, Edinburgh.—At the present time the rose garden in Saughton Park, one of the most attractive of the open spaces belonging to the Edinburgh Corporation, is aglow with flowers, and affords visitors an opportunity of enjoying one of the most noteworthy feasts of roses that has been provided in the United Kingdom. The rose garden is situated on the northern side of the grounds, and contains upwards of 13,000 plants, all of which are flowering freely, and produce a glorious colour effect. About thirty varieties are grown, and these have been selected by Mr. J. McHattie, the superintendent of the Edinburgh Parks, with special reference to their adaptability to the conditions that obtain. Conspicuous among them are Caroline Testout, Frau Karl Druschki, Captain Hayward, J. B. Clark, Hugh Dickson, Ecarlate, Richmond, Madame Ravary, Mrs. John Laing, Mdme.

Abel Chatenay, Betty, General McArthur, and Pharisaer. The effect is greatly enhanced by the varieties being planted in separate beds. The rambler roses, which are largely planted, are just coming into bloom, and will be highly attractive for some time hence. The Old English garden as Saughton, with its ancient yews, will be highly attractive at no distant date, for the magnificent masses of antirrhinum and pentstemons give promise of flowering in the most profuse manner.

Gift of Orchids to Kew.—The Kew collection of orchids has, we learn from the "Kew Bulletin," been greatly enriched by the gift of about 150 large plants of cattleya, lælia, lælio-cattleya, brasso-cattleya, cymbidium, and cypripedium by Lieut.-Colonel Sir George Holford, from his famous collection at Westonbirt. While the collection of orchids cultivated at Kew must be essentially botanical, its main object being to represent the family in as comprehensive a way as possible, the great progress made in recent years in the breeding of hybrids, many of which are botanically interesting as well as possessed of exceptional claims as garden plants, necessitated the addition of a selection of them to the collection. Increased accommodation was provided last year by the erection of an intermediate house adjoining the T Range, and, thanks to Sir George's generosity, Kew now possesses some of the best of the cattleyoid hybrids.

Wart Disease of Potatoes.—We are informed by the Board of Agriculture that cases of wart disease of potatoes (Synchitrium endobioticum, Percival) have occurred in Lancashire, and asked to remind growers that they are required to report the presence of this disease to the police or other officers appointed for the purpose, under penalty of a fine. Notifications may be sent to the Secretary, Board of Agriculture, 4, Whitehall Place, London, S.W.

BEGONIA KING GEORGE.

A new and beautiful variety, with flowers of a rich orange-salmon colour, exhibited by Messrs. T. S. Ware, Lim., Feltham, in their Gold Medal collection of Begonias at Birmingham. (See page 570.)

NATIONAL CARNATION SOCIETY.

This society held its London show on July 18, and the competition was fairly good, and the flowers of good average quality. Not much interest was taken in the show varieties on boards, but the flowers shown in vases received a great deal of attention, and were very beautiful.

Many of the traders who exhibited sweet peas at the great show of the day previous left their exhibits in position, notably Messrs. R. H. Bath, Aldersey, Jones and Son, J. Box, E. W. King and Co., J. Carter and Co., G. Stark and Son, W. J. Unwin, S. Bide and Son, Webster, J. Stevenson, and Williams, while Messrs. Frank Cant and Co. sent roses; Mr. M. Prichard contributed hardy flowers; Mr. J. Douglas, carnations; Messrs. Phillips and Taylor, Bracknell, carnations; Mr. Lakeman, carnations; and Messrs. W. Cutbush and Son, perpetual, Malmaison and border carnations to make up, with palms, etc., a large central group.

FLOWERS SHOWN AS GROWN.

A series of classes was provided for flowers shown as grown, nine blooms to be staged in a vase. For nine of a pink or rose self Mr. W. H. Parton, Moseley, led with the rich-hued Rosy Morn, and Mr. Jas. Douglas was second with Miss Berkeley; four entries. The best vase of nine white blooms came from Mr. Jas. Douglas, who staged Bookham White in fine form; Mr. H. Lakeman, Thornton Heath, second; six entries. For a dark red or maroon self Mr. Jas. Douglas scored with superb flowers of Mrs. George Henwood, a splendid variety; Mr. Lakeman second. Yellow selfs were good, and from six entries Mr. Jas. Douglas scored with Daffodil, of a fine colour; Mr. H. Lakeman second.

Mr. Jas. Douglas secured first place for a red or scarlet self with capital specimens of Fujiyama, a fine flower that shows occasionally a few pale specks; Mr. H. Lakeman second with Cardinal. Mr. Lakeman was the best exhibitor of a terra-cotta variety, and gained the first prize with Elizabeth Shiffner; Mr. J. Douglas second with the same variety. Mr. Jas. Douglas was placed first for "any other colour," and won with Purple Emperor; Messrs. A. R. Brown, Lim., second. Mr. Jas. Douglas won first prizes monotonously, and led for yellow-ground picotees with John Ruskin; Mr. W. H. Parton second. Yellow or buff ground fancies were fine; Mr. J. Douglas had the best vase of nine blooms, and he was well ahead with Edenside, heavily marked with deep crimson; Mr. Hayward Mathias, Medstead, second. For white ground fancies Mr. J. Douglas scored with the beautiful scarlet marked Daisy Walker, a lovely flower.

In the seedling classes, the flowers had to be raised by and in the possession of the exhibitor; there were few entries, and names of varieties were chiefly conspicuous by their absence. Mr. H. Mathias had the best self, a rose-pink; he was also first for a fancy with a buff-ground, rose-coloured flower of good size; Mr. H. R. Taylor, Cheam, scored for a yellow-ground picotee with Aureus, with a wire edge.

Mr. Jas. Douglas scored for three flowers, each of four distinct self varieties, in vases, and won with Basuto, Daffodil, Miss Willmott, and Farthest North; Mr. C. Blick second; and Mr. H. J. Payne, Rudgwick, Surrey, third. Mr. Douglas had the best four varieties of fancies, three blooms of each, and here he scored with gorgeous flowers of Edenside, Pasquin, Queen Eleanor, and Lord Steyne; Mr. H. Mathias second; and Mr. C. Blick third; this was a good class.

Premier award for four varieties of white-ground carnations was awarded to Mr. J. Douglas for The Bride, Montrose, Mrs. Percy Ower, and Milly; Mr. C. Blick second; and Mr. Payne third. Four yellow-ground varieties, three blooms of each, made a good class; Mr. Douglas was again first, and scored with Onward, Togo, John Ruskin, and Mr. J. J. Keen; Mr. Blick second; and Mr. Payne third.

In the series of classes of similar character, but for three blooms instead of six, Mr. W. H. Parton scored for a rose self; Mr. J. Fairlie for a white self, with Farthest North; Mr. C. A. Linzee for a maroon with W. H. Parton; and Miss Shiffner, Lewis, for a yellow self with Daffodil; Mr. R. Morton, for a scarlet self, with Miss Willmott; Mr. Morton, for a yellow-ground picotee, with John Ruskin; Mr. H. W. Frostick, Thornton Heath, for a terra-cotta self, with Elizabeth Shiffner; Mr. J. Fairlie, for "any other colour," with Irme, a purple flower; Mr. J. A. Fort, for a fancy, with Pasquin, very fine.

MARTIN SMITH CLASS.

Probably the most important class, and certainly the one that interested the public most, was the competition for the Martin Smith Challenge Cup. Twelve varieties are needed, three blooms of each, in vases, representing selfs, fancies, and yellow-ground picotees. There were three competitors, and once more Mr. R. H. Morton, Woodside Park, N., won the cup, and did so with fine examples of Donald Macdonald, Basuto, Lord Steyne, Bookham White, Linkman, Margaret Lennox, Miss Willmott, Onward, Cardinal, Skirmisher, and Santa Claus; second prize went to Mr. W. H. Parton, Moseley; and third to Mr. J. Fairlie, Acton.

FLOWERS ON CARDS.

Mr. Jas. Douglas, Edenside, Great Bookham, led for a dozen bizarre and flaked varieties — the old-fashioned carnations — with bright flowers of good size; Recorder, Torchlight, Meteor, Master Fred, and J. S. Headerley were his best varieties; there were four entries; Mr. C. Blick, Hayes, second; and Messrs. A .R. Brown, Lim., Birmingham, third.

Mr. Jas. Douglas was a capital first for a dozen selfs, and here he had lovely blooms of Bookham White, Mrs. George Marshall, Bookham Yellow, Cardinal, May Day, Maud Allen, Basuto, Miss Schiffner, Ruby, Robt. Bruce, Mrs. Guy Sebright, and Miss Willmott; Mr. Hayward Mathew second, and Messrs. A. R. Brown third.

Mr. C. Blick was first for fancies, and led with handsome examples of Lord Steyne, Victory, Bombardier, Thomas à Becket, Skirmisher, Capt. Scott, Mohawk, Rosamond, Stella Carol, Linkman, Hercules, and Prince Albert; Mr. H. Mathias second, and Messrs. A. R. Brown, Lim., third; and Mr. Jas. Douglas fourth. Mr. Douglas came to the front again in the class for a dozen white-ground picotees, and here he had Harry Kenyon, Fair Maiden, Fortrose, President, and Mr. G. Chaundy in fine form; Mr. C. Blick second. The premier set of yellow-ground picotees came from Mr. C. Blick, whose Her Majesty, Neil Kenyon, Onward, John Ruskin, and Miss Winifred were capital; Mr. J. Douglas second.

In the second division, for flowers on cards, in boxes, six flowers of the various kinds were required. Mr. H. R. Taylor, Cheam, led for flakes and bizarres with some good flowers; Mr. J. Fairlie, Acton, coming second; and Mr. C. A. Linzee, Alresford, third. For selfs, Mr. Taylor again took the lead, Mr. Linzee second, and Mr. J. A. Fort, Winchester, third. Mr. Taylor scored for fancies, and here he had Nobleman, Lord Steyne, Erle King, Linkman, Hidalgo, and Queen Eleanor in good condition; Mr. Fort second, and Mr. Linzee third. Mr. J. J. Keen, Southampton, Mr. H. R. Taylor, and Mr. Fort took the awards for white-ground picotees; and Messrs. Taylor, Parton, and Linzee were the winners for yellow-grounds.

In the small growers' section, Mr. W. Thornton, East Cowes; Mr. E. M. Painter, Brentford; Mr. E. Walters, Newbury; and Mr. E. W. Folkes, Norbury, were the leading prize-winners.

PREMIER BLOOMS.

The best self in the show was Mrs. George Marshall, shown by Mr. Jas. Douglas; premier fancy, Linkman, from Mr. H. R. Taylor; premier light-edged picotee, Eclipse, shown by Mr. H. R. Taylor; premier white-ground fancy, Daisy Walker, shown by Mr. Jas. Douglas; premier bizarre, Robt. Houlgrave, from Mr. J. Douglas. On cards.—Premier flake, Gordon Lewis, from Mr. Jas. Fairlie; premier show self, Mrs. George Marshall, from Mr. C. A. Linzee; premier fancy, Linkman, from Mr. Jas. Douglas; premier heavy-edged white picotee, John Smith, from Mr. J. J. Keen; premier light-edged white, Melita, from Mr. C. Blick; premier heavy-edged yellow picotee, Her Majesty, from Mr. C. Blick; and premier light-edged yellow picotee, Eclipse, from Mr. H. R. Taylor.

EXHIBITING PLANTS AND CUT FLOWERS.

There is, at the present time, a tendency on the part of exhibitors to break away from the orthodox manner of arranging plants and cut flowers at horticultural exhibitions. Such efforts are to be commended. For many years past it has appeared surprising to me that they could rest content with commonplace and inartistic styles. But, perhaps, they were not content, but had to follow custom owing to circumstances over which they had no control. For my own part, when arranging exhibits in competition from private gardens, I always tried to introduce fresh features so as to make them look more attractive and to gain points for general effect.

The many excellent illustrations of groups, etc., which have appeared in the pages of THE GARDENERS' MAGAZINE have shown clearly the splendid advance that has been made in the art of arrangement on the part of trade exhibitors. This advance, to my mind, is too slow, but, of course, there are many obstacles in the way over which neither the exhibitor nor the show officials have any effective control. The members of up-to-date councils are fully aware of the great importance of presenting the various objects to public notice in a tasteful manner, and do all they can to assist the exhibitors. The character of each exhibit must be taken into account, and the effect should not be marred in order to follow out some fantastic idea. On the contrary, all plants and flowers should be so arranged as to present an appearance at once natural and tasteful. In staging fruits, what a splendid improvement has been made during the past few years. At the leading London and provincial exhibitions, the contributions to the great classes for collections of dessert fruits on decorated tables at once arrest general attention and enhance the beauty of the whole show. Similar efforts should be made at smaller shows, and where, necessarily, smaller prizes have to be given. Even vegetables, especially collections, are now staged in much better style than was the case ten years ago. There is not a wide scope here for the exhibitor, but in the case of flowers, groups of flowering and foliage plants in pots and cut flowers combined with pot plants, there is an unlimited opportunity for the display of taste.

Trade exhibitors often have so many plants or flowers at home which are so good that they wish to present them to public notice that they are tempted to bring too many. Frequently they exhibit all to the detriment of the exhibit through overcrowding. More exhibits should be staged on the ground, or on stages not more than 1ft. high. It is a great mistake to pile up, say, such flowers as delphiniums and phloxes on a stage from 3ft. to 4ft. high. The same remark applies to chrysanthemums with long stems in tall vases. With regard to hardy border flowers, there should be a distinct line between each variety, as well as each kind. This may be accomplished without stiffness of arrangement. Groups and borders of herbaceous flowers, arranged on the ground, after the style of grouping adopted in the case of stove and greenhouse plants, would be effective. In a word, exhibitors of these and like flowers may, with advantage, follow the methods of exhibitors of rock gardens. It is not very expensive to make such displays of the lovely hardy flowers now becoming more and more popular with the general public.

G. B.

NEW PLANTS AND FLOWERS.

CARNATIONS.

Firefly.—An attractive border variety, with large, scented flowers of a fine red-scarlet shade. Good stems and calyx, and apparently a very good grower, but scarcely refined enough for show purposes, though none the less useful on that account. A.M., R.H.S., July 15. Mr. Jas. Douglas, Great Bookham.

Bookham White.—A very fine white border carnation, of good form and size, and robust habit. It was greatly admired when shown at Holland House, and it was included in several stands of exhibition blooms at the Carnation Show last week. A.M., R.H.S., July 15. Mr. J. Douglas.

NEW BORDER CARNATION BOOKHAM WHITE.
Flowers pure white. A.M., R.H.S., July 15. Mr. J. Douglas, Great Bookham.

PAPHINIA CRISTATA.

Though long known in gardens, this dwarf orchid is now rarely found in collections. The flowers are generally produced in short horizontal spikes, generally carrying two blooms. Each flower has a spread of about four inches; the colour is rich wine-red, with white lines, and a white fringed tip to the purplish-red lip. A.M., R.H.S., July 15. Messrs. Charlesworth and Co., Hayward's Heath.

ODONTIODA THWAITESI PURPLE EMPEROR.

A handsome, distinct, and strong-growing form of the hybrid between Odontoglossum Harryanum and Cochlioda vulcanica. The large purple flowers, each with lilac-purple, white-spotted lip, were borne on a closely-branched spike, and there were thirty-five of them on the one inflorescence. A.M., R.H.S., July 15. Mr. E. H. Davidson, Orchid Dene, Twyford.

ODONTIODA COOKSONIÆ VENUSTUM.

A very beautiful orchid, the flowers shapely and well set on a graceful spike. The colour

is brilliant scarlet-red, with a yellow crest and white apex to the lip. A.M., R.H.S., July 15. Sir George Holford (grover, Mr. H. Alexander), Westonbirt, Tetbury.

DENDROBIUM DEAREI McBEAN'S VAR.
A splendid variety of a well-known white-flowered species. The flowers are of larger size than usual, of fine form, and carried in good raceme-like spikes. F.C.C., R.H.S., July 15. Messrs. J. and A. McBean, Cooksbridge.

DELPHINIUM MRS. W. J. SANDERSON.
A beautiful and particularly effective variety, with shapely flowers set closely on a tall and ample spike. The colour is very rich bright blue of a very pure shade; a white centre further increases the effectiveness of this newcomer. A.M., R.H.S., July 15. W. J. Sanderson, Esq., Warkworth, Northumberland.

HARDY CYCLAMEN.

These distinct and pretty hardy plants are quite easy to grow when planted in favourable aspects, and have suitable soil. They may be successfully cultivated and even naturalised in shrubberies and woods. The most perfect place for their cultivation is, perhaps, the rock and Alpine garden, or under trees, where the soil is well drained, for they do not flourish in soil that is continually saturated. In their native homes they are found in various places and soils. The most natural medium is decayed leaves, and, indeed, decayed vegetation generally. When a colony or plantation is to be formed, select a shady spot with a well-drained soil, which, if heavy, must be made lighter with leaf soil, sand, mortar rubbish, or broken sandstone. A situation facing north would be the best in the southern counties. They will flourish under small specimens of Abies excelsa, and also under rhododendrons, and, in fact, any shrub. The lower branches of these should be cut away so that shade is afforded without depriving them of a fair amount of light.

Corms are best planted when dormant. Planting should be done in June and July for autumn and winter-flowering species, and in August and September for those flowering in spring. Plant the bulbs in a good layer of sand and leaf soil, make firm, and cover with either fine leaf soil or cocoanut fibre refuse for protection from drought and from frost. The frost should not be allowed to harm them, at all events, in the first season after planting, when they will eventually become acclimatised.

Cyclamen may be raised from seed, which should be sown, when ripe, in pans of rich, sweet soil. The seeds quickly germinate if the seed is fresh, but very slowly if old. Grow in a cool frame, which, however, should be kept closed in cold, windy weather, in order to allow the plants uninterrupted growth in the early stages, when they have made a second leaf. They should be potted up singly, using small thumbs. Plunge each pot in fine ashes or leaf soil. When this is done they do not dry so readily, and consequently no check is received. During these early stages they must receive continual light shade. The natural growth is very slow, so no disappointment should be felt if the progress is not so rapid as expected. After the second winter the plants will be ready for transferring to the open quarters. C. Coum, deep rose, C. Coum album, white, and C. libanoticum, white with red centre, are very pretty, and most attractive in their season of flowering. C. coum is the smallest of all, the flower-stems rarely exceeding three to four inches in length. They are perfectly hardy when established. C. libanoticum is a native of Asia Minor. C. Atkinsi, C. a. album, and C. a. roseum all produce their flowers in March, and present a charming appearance. C. ibericum is a new form of C. Coum, and is found on the Iberian mountains. C. repandum also flowers in March. C. europæum flowers in August and September, and anyone who has seen a colony growing satisfactorily will not forget the effect. I have seen plants nearly a foot across, completely covered in flowers, and hundreds of them, under tall, spreading conifers. C. neapolitanum and C. pyrenaicum flower in August and September, and are very beautiful.

During the time growth is being made sufficient moisture should be given to ensure both leaves and flowers being fully developed. The seed-pods frequently remain on the plants five or six months. The corms, leaves, and flower-stems must be protected from the ravages of slugs, wireworm, and greenfly. They are liable to attacks from all these pests, and therefore must be watched, and remedies applied at once. Several applications of a weak solution of a nicotine preparation will rid the foliage of aphis, and in the case of wireworm cut a carrot in half and stick the portions in the ground close to the corm, and examine them twice daily, and destroy the wireworms that are caught. Slugs must be trapped by the aid of lettuce leaves, and a small sprinkling of a mixture of soot and lime may be placed around the plants at some distance. W. A. COOK.
Leonardslee Gardens.

THE MORELLO CHERRY IN SCOTTISH GARDENS.

The cool and usually moist conditions pertaining to the northern climate are conducive to the health, growth, and general successful culture of the Morello cherry. As a rule, full crops of large, well-coloured fruits are annually produced. A northern aspect, backed by a wall, against which the branches are trained, is usually made use of, as sunshine, so essential for most other fruits, is of less importance to the Morello. Here the trees thrive and extend apace, and speedily become fruitful if the few necessary items which enter largely into the success or otherwise of their cultivation are timeously attended to. With the exception of liability to attack of red spider in hot, dry seasons, no other kind of insect seldom, if ever, molests the foliage; and this pest is easily kept in check, in fact, exterminated, in its early stages if the spray machine and one of the numerous compounds so frequently advertised in the pages of THE GARDENERS' MAGAZINE are brought into use.

The rooting spaces being towards the north, and consequently less affected by the sun's rays, might at first thought be considered exempt from the evils arising from drought. Such, however, is far from correct, as, with the usually moisture-bearing winds advancing from the opposite direction, the trees might possibly receive but little benefit therefrom; hence timely mulchings of litter or other light material should be applied to conserve as far as possible the moisture which the soil contained. Gumming of the branches is less prevalent with the Morello than with the dessert type of cherry, all the same care should be taken that wounds are not inflicted upon the bark, and that in pruning clean cuts are made. When the severance of large branches becomes necessary, the stumps of those remaining should be smoothed with the knife, and then dressed with some adhesive mixture or coal tar, to prevent the ingress of moisture.

Pruning and Training.

The fan-shaped method of training is best suited for the Morello, hence it follows that the system of pruning pursued should coincide therewith. This is usually carried out in early spring by cutting clean away most of the shoots that have borne fruit, and replacing them with others produced during the preceding summer. Most of the shoots that spring from the front of the branches are removed, while those at the sides, but more particularly at the upper sides, which are most amenable to the training process, and give the best appearance when brought into position, are retained. The spectacle presented very often by a newly-trained tree is not commendable, as far too many shoots are retained upon the branches.

In case of trees of considerable age it may be advantageous to retain a fair amount of the smaller fore-right growths for a season, or until they have produced fruit, when they may be removed to afford space for their successors. In this way the trees may be kept better furnished with fruiting wood, and an improved appearance is likewise maintained at all seasons. With young, vigorous trees nails and shreds, or, in the case of wired walls, tying will be the most readily adaptable mode of securing the branches, the leaders in each case being kept straight and wide-spread according to the wall space desirous of being covered. As time goes on, and the trees enlarge, many of the shoots from the base of the tree upwards may be secured by being tied to the larger branches, which, while giving effect, is a more speedy and less expensive method than by using nails in excess of the actual requirements. The Morello, as compared with other sections of the genus, blossoms late in season, and generally escapes damage from frosts. In this respect the drooping habit of the bloom trusses is also in its favour.

Preserving the Fruit.

Though birds are less troublesome than in the case of sweet cherries, no time must be lost when the fruits show colour in securely netting the trees as a protection against attack, which is often made quite suddenly, and before one is aware, the greater part of the crop may have vanished in this unpleasing fashion. As the season in which this fruit is available generally extends to fully six weeks, from the middle of August to the end of September, one is somewhat amazed that greater use is not made in gardens generally of the bare spaces so often observed in what are considered unfavourable positions, but which, with due preparation of the soil, might be made to produce abundant crops of this useful fruit. It is needless to enter upon any lengthy description of the various uses to which this may be put, as apart from the several forms of preservation, whereby supplies can be prolonged throughout the year, it is always welcomed in its fresh state for kitchen use; and finely-grown, well-ripened fruits are in many families much appreciated for dessert, as summer fruits of other species are waning, or have quite disappeared, from the supply list.

The Choice of Trees.

Wherever possible, the intending planter should visit the nursery of repute, and select the trees required, and see that such are skilfully worked or grafted, and that the union of scion and stock is so well in harmony that no roughness of either wood or bark exists. The branches, too, where diverging, should be in regular order, and evenly balanced. JAMES DAY.

DEUTZIA PARVIFLORA.

Before the introduction of Deutzia parviflora thirty years ago there were only two species of the genus grown to any extent in English gardens, those being the well known forcing plant D. gracilis and the more vigorous D. crenata. With the introduction of D. parviflora, however, there came a change, for its appearance was followed by others, and, with the aid of D. gracilis and some of the newer species, M. Lemoine, of Nancy, was successful in raising a number of hybrids, which are ornamental and useful garden plants.

D. parviflora is a native of Northern China and Amurland, and was originally introduced to the European gardens by way of the St. Petersburg Botanic Garden. From thence it was sent to the Arnold Arboretum, and a description of the plant growing in that establishment was given in the "Garden and Forest," 1888, p. 365. In appearance the species is upright and vigorous, four to five feet in height, with elliptical or lance-shaped leaves, with sharply serrate margins. The white, shapely flowers are produced in both axillary and terminal corymbs towards the end of May, but their effectiveness is sometimes spoiled by late frosts, for, like other shrubs from regions where a cold and rather prolonged winter is experienced, they commence to grow too early here, and although perfectly hardy so far as winter frost is concerned, are liable to injury when the young shoots are tender in spring.

The first hybrid raised between this and the old D. gracilis was named D. Lemoinei, and it was figured and described about 1895. In point of hardiness it is about equal to the parents, and is intermediate in character, the inflorescences being after the style of those of D. parviflora. In addition to the type, there is a form known as D. Lemoinei compacta, which is also a very pretty shrub. D. parviflora and the hybrids may be grown in loamy soil in an outdoor border, or they may be used for forcing. W. DALLIMORE.

NEW BORDER CARNATION FIREFLY.

Flowers rich scarlet. A.M., R.H.S., July 15. Mr. J. Douglas, Great Bookham.

JAPANESE HARDY ORCHIDS.—I.

Japan is rich in hardy orchids; more so than the generality of hardy plant lovers are aware. Many a mountain path and wooded height, and many a lowland valley are rich with hardy orchids, and some of them are very deserving of recognition at the hands of English growers. It is strange to note that, though the orchids of Japan are different from the majority of the British forms, yet in a few cases one may meet with species which are common to both countries. As an instance of this I need only quote Herminium monarchis, Goodyera repens, and Malaxis paludosa, to illustrate my remarks. These are typical "natives" of the island kingdoms of the East and West.

Of the three forms quoted, Herminium monarchis is the "Musk Herminium," which, with its small yellowish-green flowers, and honeyed musk perfume, is sparsely distributed through our own southern and eastern counties. Goodyera repens haunts the pine woods of the highlands, and has been found as far south as the northern counties of England. It is indeed a charming plant, and its spikes of small, creamy-white flowers are delightful. Malaxis paludosa, a true bog orchid, lingering still among the mountain lakes and bog swamps, finding a home amid the sphagnum, is native both of Wales and Southern England. Its rather insignificant appearance, and greenish-yellow flowers, have doubtless helped to preserve it largely from wanton hands. In Japan it is found in the sphagnum swamps on the high mountains around Nikko, but it is somewhat rare. Calypso bulbosa, var. japonica, is an interesting and showy native of the wooded hills of Central and Northern Japan. It is remarkable for its deep green corded leaves and its attractive pinkish-winged blossoms.

Of cypripediums we may briefly note C. Yatameanum, from the tree region of Mount Togakushi, and Hokkaido. It is of creeping habit, produces its leaves in pairs, and the yellowish-green blossoms are heavily marked and spotted with brown. C. Debile, a charming species, with golden, half-drooping blossoms, is deserving of culture, and hails from the woods around Nikko. C. macranthum, of which the best forms grow on the grassy slopes of Fuji-Yama, is an ideal subject, and the huge rosy blossoms are one of the delights of the orchid world. C. japonicum is also very fine, giving large attractive blossoms of decided merit, and showing the white, pink, and purplish colourings in a delightful manner.

Listeras in varied forms are found in the tree belt upon the mountains, and are not without interest. True, they are among the least attractive of orchids, and yet they have a simple charm which is of certain interest. L. Yatabei is a native of Mid-Japan, being most plentiful around Ontake and Nikko. The growths are very slender, carrying twin leaves and greenish, loosely-arranged blossoms. L. cordata and L. Savatieri are found both in Central and South Japan; the former carries green, white-tipped flowers set closely upon the spikes, the latter with its leaves low down on the stem (often lined with silver), and its sparsely-set blossoms of greenish hue. Both blossom in July and August. In L. nipponica we meet with a delightful little gem. The blossoms show a rare combination of bronzy-yellow, green, and pink, coming to beauty during August. It is chiefly found in Central Japan, especially around Yatsugatake and Nikko.

The gymnadenias show more diversity, and are well worthy of attention. These orchids are not very difficult, and, coming from the tree regions, are best accommodated in a well-drained, leafy soil and a shady position. G. Chidori is glorious, carrying a lovely crimson colouring, which pales to pink and white. It is single-leaved, and possesses the fleshy roots characteristic of the genus. The flowering season is June. It is a rarity of its class, and its principal habitat is at Tosa and Idzu. G. conopsea is very deserving of note, and, unlike its confrères, it is found largely in the boggy mountain swamps of Central and Northern Japan. The roots are palmate and tuberous, and the blossoms are produced upon tall, leafy stems (very grass-like in form), and are of a delightful shade of pink, with often twenty or more upon a stem. G. cuculata, a native of Central and Southern Japan, including Mount Fuji, is less attractive. The flowers are small and mauve-purple in colour. Twin leaves are formed at the base of the stem, and leafy bracts upon it. Flowers chiefly in August. G. cyclochila, a gem from the districts around Fuji and Nikko, flowers in July. The blossoms are pink, with a large lip, red-spotted, and are often produced in pairs. A single leaf is carried at the base of the stem, and two smaller ones beneath the blossom; these are rounded, the plant in blossom being very pretty. G. gracilis, mainly confined to southern districts, carries a single leaf and a spike of small purplish blossoms. G. Keiskei is decidedly worth attention. Coming from Central Japan, it exhibits its charms in two distinct forms. The type is a charming pink, and alba, the white form, is undoubtedly a natural variety, and is much rarer. They produce the typical single leaf and flower in June, both forms being of decided merit. G. rupestris, the "rock-loving gymnadenia," is found upon shaded rocks in Central and Northern districts. The flowers are of good size, lilac-pink in hue, lightly spotted with brown. The leaves are grassy in appearance and stem-clasping, and the plant is in beauty during July.

Very quaint are the platantheras, which inhabit the grassy, higher levels of the mountains. These necessarily require a drier and more open situation, and just a surface covering of minor plants. They are, however, not a really attractive group, their interest being greater than their beauty. P. decipiens is the best, and, unlike the majority of platantheras, it haunts the tree belts. It grows a foot or more in height, producing leafy flower-spikes which are rather thickly crowded with rosy-mauve and white blossoms. The flowering-time is May and June. Another woodland form is P. Tinumea, which has tall spikes of green and yellow blossoms. It flowers in July, and the large-ribbed leaves are of aspidistra-like formation. Three typical grassland forms are P. minor, P. Matsudai, and P. Takedai.

P. S. HAYWARD.

(To be continued.)

BUDDLEIA GLOBOSA.

In the southern counties this very distinct flowering shrub grows freely enough in warm, open positions. In the northern midlands and in the northern counties shelter is desirable, and it is, in many instances, planted near walls. Undoubtedly a warm spot is conducive to the proper ripening of the wood and the free flowering of the plant the following year, but many specimens lose great numbers of basal leaves when they are planted in a light, well-drained soil and a hot season comes.

I know of several beautiful specimens which have, during the past few years, degenerated very much owing to over-dryness at the roots and lack of attention in hot weather. The cultivator should not wait for a dry spell to come, but at once see that the soil is sufficiently moist, and top-dress with good loam, as well as feed with liquid manure. Much may be done in a cool and moderately moist period to improve their condition.

GEO. GARNER.

DISEASES OF RASPBERRY AND LOGANBERRY.

During recent years the canes of raspberries and loganberries have been observed to suffer to a considerable extent from the effects produced by microscopic, parasitic fungi, which are stated to be yearly extending their range of activity. The fungi implicated have been known for more than half a century as parasites on wild roses, brambles, and other rosaceous plants, and their rapid extension during recent years does not imply any increased power of parasitism, but is simply due to the increased number of suitable host-plants grown in juxtaposition.

Hendersonia rubi, Westendorp, is responsible for most of the injury caused to raspberries and loganberries. The canes or stems are the parts attacked, infection taking place during the summer, when the young growth is tender. The first indication of the presence of the parasites varies to some extent with the particular variety attacked, but as a rule lurid red or purplish patches of variable size appear on the stem. Such patches continue for some time to increase in size, and during the winter change to a pale grey or dingy white colour, due to the bark having been killed. At this stage the fruit of the fungus, in the form of minute black dots, is thickly scattered over the dead, white patches of bark. Microscopic examination shows that the minute black fruits contain myriads of coloured, four-celled spores. When mature these spores escape into the air, and those that happen to alight on young shoots germinate and enter the tissues, thus ensuring the continuance of the disease in the following season. When several diseased patches are present the canes are killed outright during the winter, whereas when only one or two diseased areas are present, the cane may survive and produce a certain amount of fruit. As the spores of the fungus, however, will be present in such cases, it is sound policy, even at the sacrifice of a certain amount of fruit, to remove and burn all canes, however slightly attacked, as it is only by such means that the disease can be eradicated. Infection mostly takes place at the period of the year when fruit is present, hence spraying cannot be resorted to unless the fruit is sacrificed, when Bordeaux mixture should be used. Even in these circumstances every diseased cane should be cut down the moment it is observed. The practice, common in many places, of allowing the dead canes to remain standing throughout the winter, is to be condemned.

A second fungus, Ascochyta pallor, Berk., sometimes occurs as a parasite on the stems of raspberries, roses, and brambles. It forms whitish dead patches, studded with black dot-like fruit. Treatment should be similar to that suggested against Hendersonia rubi.

—*Board of Agriculture Leaflet.*

STREPTOCARPUSES.

Few flowers have been so much improved during recent years as the streptocarpus, and those who saw the beautiful plants exhibited at the Chelsea Show were able to note how much finer the flowers were than in the case of those seen at exhibitions eight or ten years ago. Taking into account how beautiful the modern streptocarpus is, it is a matter for wonder that plants are not more largely grown in gardens than is the case at present.

There is a great improvement, not only in the flowers, but in the habit of growth, and the formation and symmetrical arrangement of the leaves generally. The flowers range in colour from pure white, through various shades of pink, rose, red, blue, to deep purple. The variety Royal Purple was probably the first of the large-flowered forms, but since its arrival, owing to skilful cross-fertilisation, the present race has quickly sprung up.

The streptocarpuses give the best results when treated as biennials, although the same plants can be grown on for a number of years, but the blooms deteriorate under such conditions. Seeds should be sown early in the year, in well-drained pots or pans filled with a fine sandy compost. It is preferable to water the compost before sowing the seeds, and to allow the pans to stand for several hours. Distribute the seeds very thinly, and just sift the lightest possible covering of the compost over it. Place the pans in a warm house to germinate, cover them with glass, and shade from sunshine. When the seedlings are large enough to handle prick them off into pans filled with a light peaty compost, and grow them on in genial warmth, at all times shading them from the direct rays of the sun.

A little later they may be transferred separately into 60's. For this potting use two parts good fibrous loam and one part flaky leaf-soil, with the addition of sufficient silver sand and crushed charcoal to keep the compost sweet and porous. If the loam is deficient in fibre a little good peat should be added. Press the soil fairly firmly around the roots, and return the plants to the same structure until well established, when they may be removed to a cooler house or frame. Give water sparingly until the roots take possession of the new soil, but at no time must they be kept too wet at the roots. Plants will flower towards the end of the first summer, but it is not well to allow them to keep in bloom too long if good specimens are required the second year. By allowing them to flower the standard of the blooms is ascertained, and any inferior forms can be discarded.

Towards the end of the autumn commence to dry off the plants by gradually withholding water, and allow them a rest of several weeks' duration in the winter. They should be shaken out and repotted at the end of January or early in February. Use a similar compost to that previously recommended, only in a rather coarser condition, and transfer the plants to 48's and 32's, according to their size. The pots must be perfectly clean and well crocked, and may have a few half-inch bones scattered over the drainage. Pot rather firmly, and grow the plants in a temperature of 50 degrees for a start, but a little later they may be gradually raised to 60 degrees. Give them a position near the glass, and keep the roof well washed to admit the maximum amount of light. It is beneficial to spray between the pots, but avoid wetting the foliage. Give water with special care, but later on, when the pots become full of roots, applications of soot water and weak liquid manure will be beneficial.

When the sun gains power shade the plants from bright sunshine, and fumigate the house occasionally to keep down greenfly. If the dead blooms are picked off as they appear, the plants will continue to bloom throughout the summer. Streptocarpuses are sometimes used for furnishing rockeries in a conservatory, and they succeed under such conditions, and associate well with ferns and other foliage plants.

J. Gardner.

THE STATELY CINERARIA.

Since the introduction of the star cineraria, and its rapid rise in popular favour, there is a tendency to scorn or disregard the large-flowering type. Yet this should not be so. In gardening, as in real life, we should have such a store of love as to retain a full affection for our many old friends, while ready to welcome with delight any newcomer. It must certainly be admitted that the star cineraria has many points of beauty which do not belong to the older type; but this does not justify us in casting the latter altogether aside. Each has its beauty in its own place, and in an artistic conservatory both must be found.

The difference in the two types is chiefly in appearance, and therefore also in their arrangement, but the details of culture which follow are common to both. It may be parenthetically remarked that Cineraria stellata is a splendid subject for the supply of cut flowers, lasting often for three weeks in a vase. To have a long supply of these plants, several sowings should be made, commencing towards the end of April, with the latest sowing in July. This will give us several batches, which will naturally link themselves together, by some plants of each outstripping their neighbours.

Gentle heat, combined with an atmosphere abounding, but not overloaded, with moisture, will quickly cause the young seedlings to appear, and before they become crowded it will be advisable to prick them off into pans or boxes. As in the case of all young seedlings, sandy soil, passed through a quarter-inch sieve, and devoid entirely of any stimulant, either natural or artificial, will be found an ideal medium for enabling them to become transformed quickly into plants capable of being easily handled. If in the boxes or pans the young plantlets are set at about two inches apart, the next removal may be into three-inch pots. If a long label be run into the soil and passed along the bottom of the box, the seedlings may be uplifted and the separation made easy and less injurious than when, as it were, cut out. A slight shake will remove the loose soil which is not in direct contact with the roots. While it is always desirable to reduce root disturbance to a minimum, the desire to do this must not be exaggerated by using a large portion of soil which serves no such purpose as root protection, and whose place could well be occupied by some more nourishing mixture.

Immediately after the appearance of the seedlings in the pan a cooler quarter should be chosen for them, and as they become more robust they may be gradually inured to cold frame treatment, with frequent sprayings with the syringe. During their growing season the plants enjoy a shady place such as is provided by a wall with a north aspect, with abundant ventilation, a moist atmosphere, and a uniform state of moisture at the roots. Indeed, from the sowing of the seed to the eventual and regretful consignment to the rubbish-heap, they should not be allowed to flag through dryness, nor wilt, as they often do, through sourness of soil consequent on stagnation of water at the roots.

Useful specimens of cinerarias may be grown in six-inch pots, but for the full development of the beautiful flowers and expansive leaves a further shift into an eight-inch pot is needed. If the soil suitable for the final shift be used, it may be toned down in its manurial parts for the intermediate pottings. I have had the best results from cinerarias which were potted in nut-brown loam full of fibre, and stacked for nearly a year with alternate layers of cow manure. This, with leaf-soil in the proportion of two of loam and one of leaf-soil, with the usual modicum of sharp sand, has given splendid results. Where cow manure is unobtainable, horse droppings will do, and in the case of a heavy loam they would be preferable.

It is often urged as a reason for not growing the cinerarias that they are "dirty" plants, because of their frequent subjection to the attacks of aphides. But considering how easy it is to destroy these by the prosaic yet powerful process of fumigating, the excuse seems puerile. Nor are they so prone to this evil if they are accorded strictly cold treatment and enjoy the frequent play of the syringe. Where there are but a few plants affected, a syringing with some weak wash, or even with soapy water, will remove the pests.

Not until the plants have nicely filled their final pots with roots should they be fed with liquid manure, and it should be given then for three days in succession, so that all the plants may receive benefit. The orthodox method is to water alternately with manure and with clear water. But it may happen that for many times in succession some plants may only be dry on the clear water day, whereas it is less likely that they will be passed over three consecutive times. A dry fertiliser dusted over the surface and hoed in with a piece of stick will afford change of diet, and the benefit will be reflected in the flowers.

It will be necessary to house the plants, or, at any rate, afford them protection, as the prospect of frost becomes imminent. But even at this period the amount of artificial heat should only be sufficient to ward off frost and dispel a surplus of moisture. The open trellis-work staging, standing immediately over the hot-water pipes, such as we see in many plant-houses, is most uncongenial to the cineraria. It results in the modicum of moisture and absence of the direct play of heat on its foliage, afforded by a flat staging, covered by finely-sifted shingle or coal ashes. This, combined with abundant ventilation on all possible occasions, and care in watering, will enable the plants to flower freely and well.

W. F. Rowles.

Coleworts of the first sowing may be planted in dull or showery weather on land previously occupied by potatoes or old strawberries, manure being applied or withheld as may seem necessary. Given a rich soil, coleworts make rapid growth, and turn in earlier than those in unmanured ground. The richer the soil the greater the distance apart at which to plant the London and Rosette varieties, fifteen inches being the maximum. A heavy dressing of freshly-slaked lime should be incorporated with the soil, as a guard against grub and wireworm. The seed beds of the successional sowings should not lack water.—W. Messenger, Woolverstone Park Gardens.

THE ROCK ROSES, OR GUM CISTUSES.

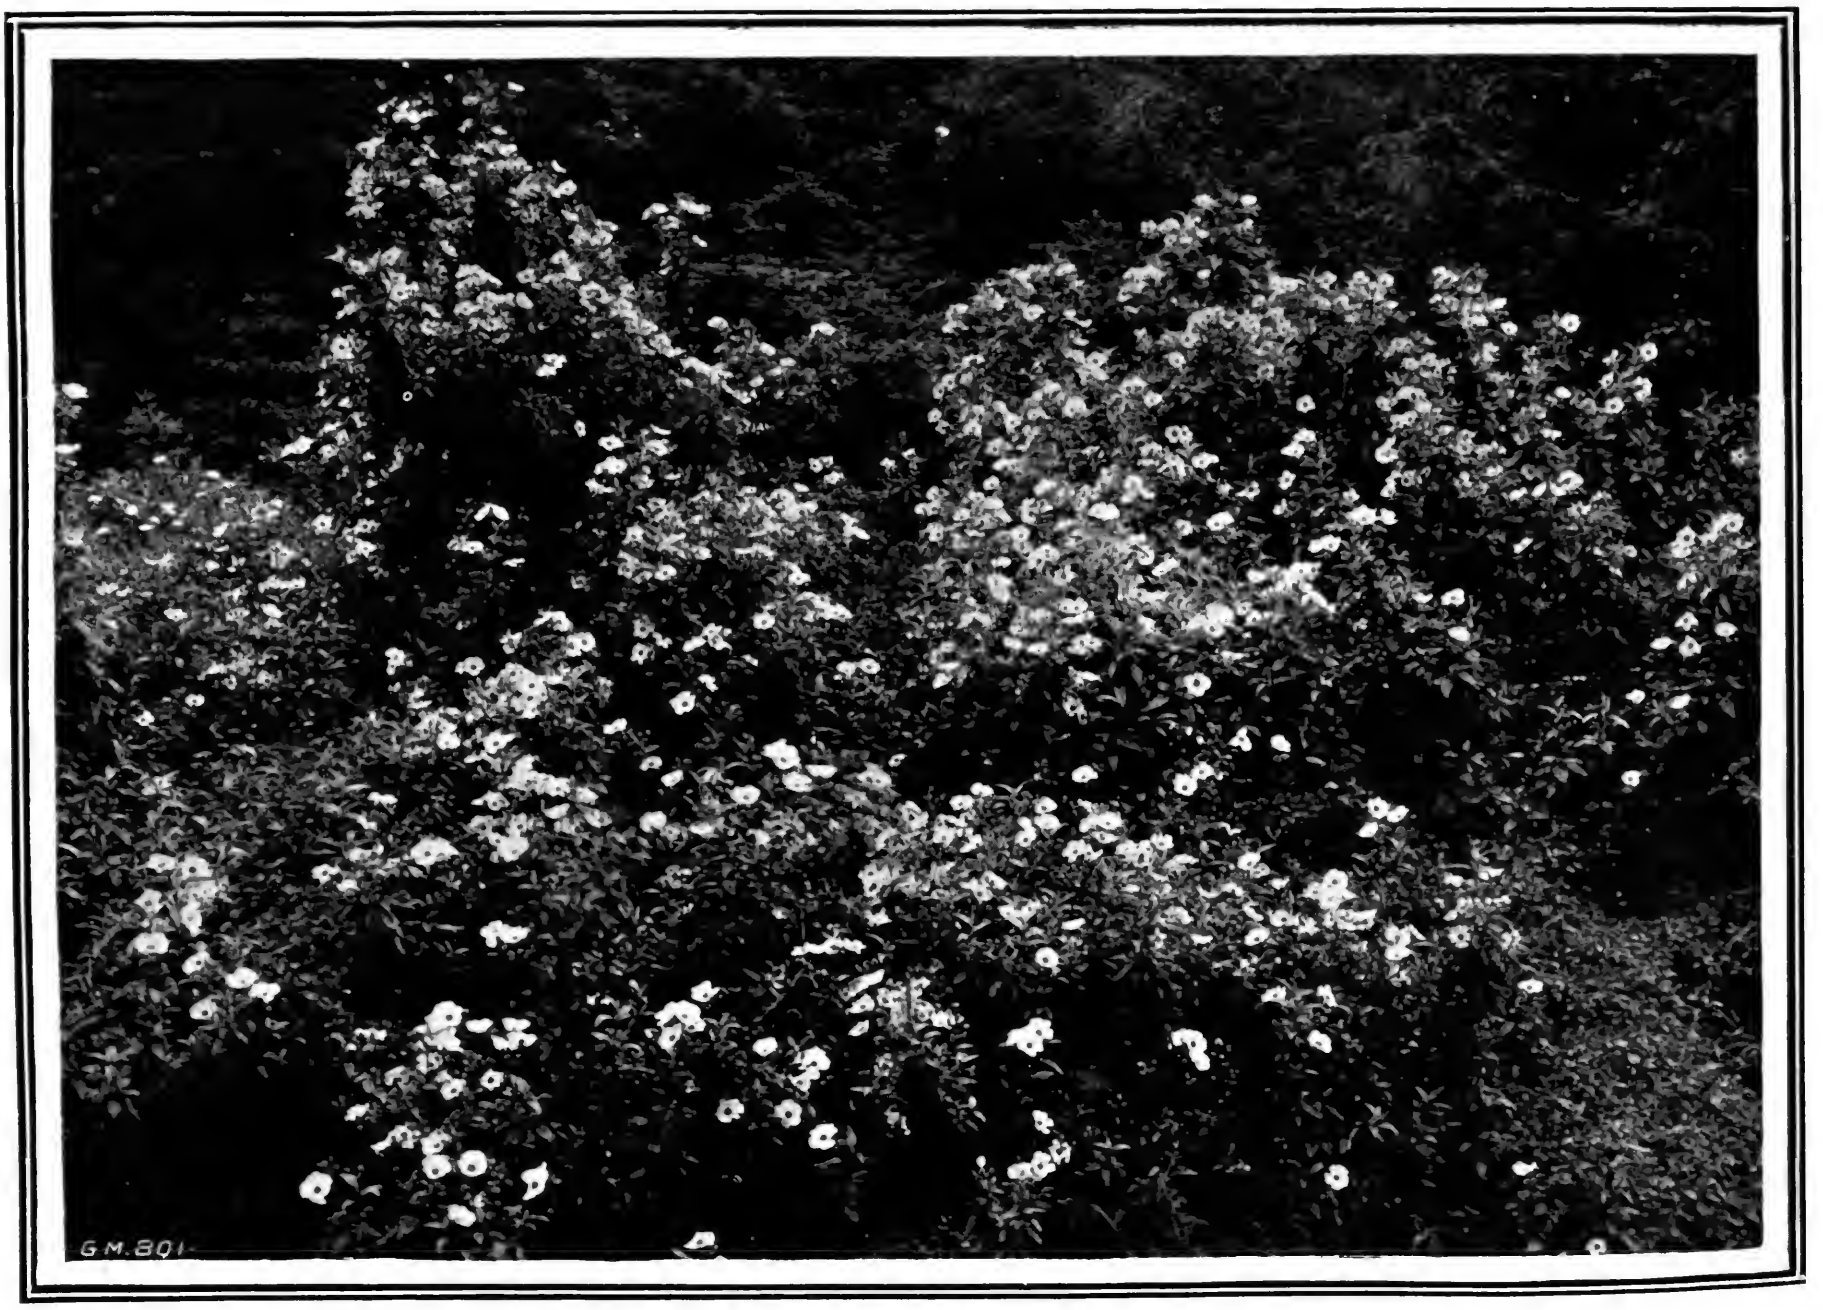
The cistuses, when in full beauty from May to July, form one of our most showy families of shrubs. Being natives of South Europe, particularly in what is known as the Mediterranean region, North Africa, and the Canary Islands, warm and sheltered spots should be chosen for their cultivation. In the favourable climate of the south and west the rock roses, to use a familiar expression, "grow like weeds." The mild winters of the last few years have been very favourable for their growth in most gardens, but occasionally a more severe winter than usual is experienced, killing a good many plants outright, unless protected or growing in warm, sheltered spots.

There are, however, varying degrees of hardiness among the cistuses, for whereas many species were killed outright at Kew during the severe frost of January and February, 1895, C. laurifolius was unharmed. The fact that some of the rock roses are just on the borderline of hardiness should not prevent cultivators planting them, for cuttings may be rooted in a cold frame towards the end of the summer, and these will soon replace losses occasioned by a more than usually severe winter. The flowers only last a day each, but any drawbacks in this direction are more than counterbalanced by the quantities of flowers each plant produces from day to day.

In cold localities it is advisable to plant the rock roses at the foot of sunny south walls. Sunny banks of sandy soil may be effectively clothed with cistus in company with, if thought desirable, the double furze and the more vigorous-growing helianthemums. The top of the rock garden, where the position is the hottest and well drained, and possibly consisting largely of stones, will grow rock roses. Wherever planted, the soil must be well drained, an excess of water at the roots of cistuses in winter being fatal; the position also must be sunny. Few plants repay more fully any little extra trouble in caring for their welfare than do the rock roses or gum cistus, either in the selection of a position for planting, the provision of soil, or protection from severe frosts in winter with mats, bracken, or spruce and yew branches.

Seeds and cuttings form ready means of propagation. The seeds may be sown as soon as ripe, or in spring. Cuttings root freely in a cold frame towards the end of the summer. Light, sandy soil should be used in filling the cutting pots, or, if large numbers of cuttings are to be inserted, a well-drained bed of sandy soil should be made up in the frame. Cistus being most difficult plants to transplant successfully, even in a small state, from the nursery beds to their permanent quarters, they should be cultivated in pots till large enough to plant out permanently. From time to time it becomes necessary to replace old and straggly plants with young stock. A pot of cuttings, at any rate, of the more tender sorts, should be inserted each year lest there should be losses through severe frosts. This will entail very little trouble, and, if not required, they may be discarded in spring.

In Sweet's Cistineæ, published from 1825 to 1830, fifty-two species and varieties are described. The "Kew Hand-list" enumerates twenty-five species and varieties, which may be taken as a guide to the number now in cultivation. Their nearest allies are the helianthemums. The two genera are fairly easy to distinguish at a glance, the cistus in most instances being much more vigorous in growth. Botanically the great difference is in the seed vessels, the helianthemums being three-celled and the cistuses five-celled or more. The yellow-flowered Helianthemum formosum is sometimes grown as Cistus formosus, but, strictly speaking, there is no yellow-flowered cistus.



CISTUS LADANIFERUS.
Flowers white and of large size.

C. albidus.

The specific name refers to the leaves, which are a hoary-white colour, being covered with a dense pubescence. The rose-coloured flowers are about two inches or rather more across, with a yellow centre. It forms a large, compact bush, two feet to five feet high. The leaves are sessile, uniting at the base, and surrounding the stem. A native of Corsica, Southern France, Portugal, and Italy.

C. corbariensis.

This is a natural hybrid, found growing wild in the mountains of Southern France and Spain. The reputed parents are C. populifolius and C. salvifolius. This is a free-growing rock rose, spreading over the

ground freely, and reaching a height of two feet to three feet or more. The ovate or heart-shaped leaves, which taper to a point, are comparatively small, being one inch to two inches long. The flowers are one inch to one and a-half inches across, white, with yellow centre, the buds and edges of the petals tipped with red. It is very free-flowering, being covered daily for some weeks with white flowers, and most effective at a distance. C. corbariensis may be regarded as one of the six hardiest rock roses.

C. crispus.

The flowers of this species are reddish-purple or pale crimson, two and a-half inches across, borne several together in a cyme. It forms a small, shapely bush, two feet or more in height, with narrow lanceolate leaves, which are distinctly pubescent. A native of the Mediterranean region.

outside which, towards the base of the petals, are prominent dark velvety blotches.

C. florentinus.

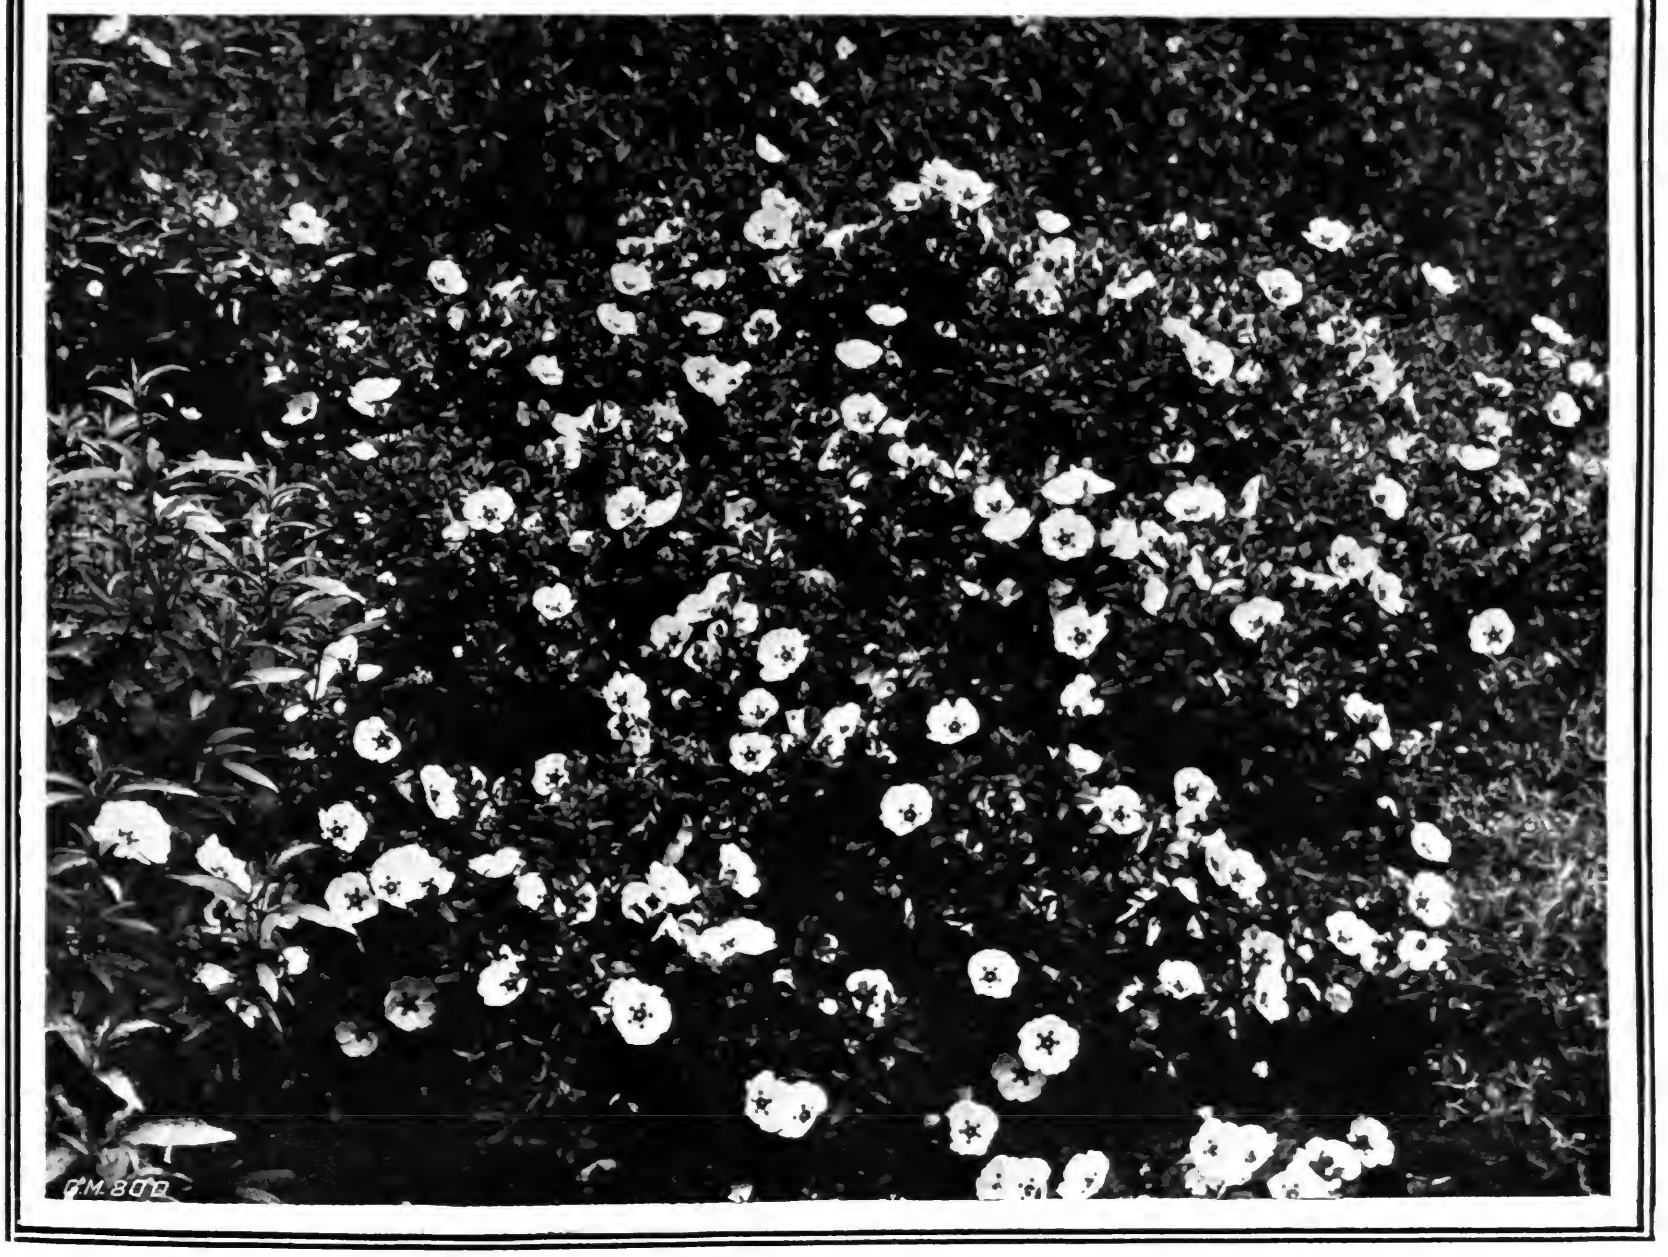
This is one of the most valuable cistuses for the rock garden. Being a low-growing, spreading shrub, it is very suitable for hanging over the ledges or boulders, and is quite at home with its roots between the stones where there is comparatively little soil. The leaves are linear-lanceolate, the flowers white, some two inches across, with a yellow centre. Found growing wild in Spain and the South of France, C. florentinus is generally regarded to be a natural hybrid between C. salvifolius and C. monspeliensis.

C. ladaniferus.

The true gum cistus, as figured in Sweet's Cistineæ, has a large, solitary, white flower without any blotches, and is comparatively

C. laurifolius.

As a hardy evergreen shrub this is the best species of the whole genus for general planting. It stood unharmed the severe winter of 1894-95, so may be safely planted freely in the pleasure grounds. Forming large, shapely bushes, five feet to eight feet or more in height, the laurel-leaved rock rose is an excellent plant for a hedge, being an attractive evergreen when not in flower, while during early summer the bushes produce an abundance of flowers. The leaves are dark green above, at first white beneath, which disappears with age, stalked, ovately-lanceolate, three inches to three and a-half inches long, the flowers are white, three inches to four inches across, six to nine flowers opening in succession, mostly clustered together at the top of a peduncle five inches to six inches long. It is a native of South-Western Europe, and was introduced in 1771.



CISTUS LORETI.

Flowers white with dark spots at base of petals.

C. cyprius.

As a garden plant this is in the forefront, and is cultivated in this country to a larger extent than any other rock rose. It is a hybrid between C. ladaniferus maculatus and C. laurifolius, and has been cultivated in this country for more than a century. Under the name of C. ladaniferus, a figure of C. cyprius is given in the "Botanical Magazine," tab. 112. The flowers of the true C. ladaniferus are always solitary, while those of C. cyprius are borne several together in a cyme. C. cyprius is one of the larger-growing species, four feet to five feet is an average height, but in the west and against walls there are much taller bushes. The leaves are dark glossy-green above, covered beneath with a white tomentum. The flowers exceed three inches in diameter, pure white, with a yellow centre,

rare in gardens. The form usually sold as C. ladaniferus is C. cyprius, perhaps for general purposes a better garden plant, producing a succession of flowers over a longer period, and it is also rather hardier. Growing at the foot of a south wall, however, with its large, solitary, white flowers, the true C. ladaniferus is a glorious rock rose. A variety which also has solitary flowers, but with the dark blotches on the petals, is usually grown as maculatus. Unfortunately this order of things is sometimes reversed, the form with the blotched flowers being sold as C. ladaniferus, and the one with pure white flowers as the variety immaculatus. C. ladaniferus is one of the taller-growing species, with narrow lanceolate leaves, and large, white, solitary flowers three inches or more in diameter. A native of Spain, Portugal, and Southern France.

C. Loreti.

Recently figured in the "Botanical Magazine," this hybrid cistus, though grown for some years at Kew, does not appear to be generally cultivated in gardens. It forms compact bushes three feet to four feet high, and is very floriferous. A most important point about C. Loreti is that while practically all the flowers on the other cistuses shatter soon after noon, they last in good condition on this hybrid most of the afternoon. The leaves are oblong-lanceolate, one to two inches long, dark green above, lighter beneath; flowers white, with dark blotches, one and a-quarter inches across. The parents are C. ladaniferus maculatus and C. monspeliensis. Being one of the hardiest rock roses, and very free flowering, C. Loreti should become very popular.

A. Osborne.

Kew.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

DECIDUOUS CALANTHES.—Plants that have been treated as advised in a previous note will have their growth advanced to the stage when the pseudo-bulbs commence to form. It is in this condition of growth that particular care is needed. It is essential to the future well-being of the plants to see that there is no accumulation of moisture in the centre of the growths; drip from the roof, syringing, or carelessness in watering, will convey moisture to the base of the newly-formed leaves, where it has no possibility of escape except by evaporation; here it is likely to become stagnant, and quickly subjects the advancing pseudo-bulbs to injury. Calanthes have practically filled their pots with roots, and care must be observed that the plants are not permitted to remain for any lengthened period in a dry state. In giving advice as to watering, I always feel that I am treading on dangerous ground. I have above stated that the plants should not be permitted to remain too long in a dry state; some readers may consider I wish to convey that the plants should not be permitted to become dry, or reasonably dry, at the roots between waterings. This is the reverse of my intention. There is always more danger of calanthes being carelessly overwatered than their suffering from want of moisture. Conditions vary, so every cultivator must use discretion; and if he has a keen interest in his plants he will readily discover from personal observation the treatment which is likely to be most beneficial. When the pseudo-bulbs have become well advanced, the plants may be benefited by applications of some safe liquid manure. Give a weak solution at first, and as the plants become matured and produce their flower scapes stronger solutions may be given and more frequently.

INFLUENCE OF LIGHT.—In the early stages of growth, and up to the time now under consideration, the foliage of calanthes is particularly subject to injury from strong light, and has thus far needed strict protection from the sun. From the time the pseudo-bulbs commence to form the light should be gradually increased. This will not only harden the foliage, but will also assist in ripening the pseudo-bulbs as they advance. This is essential, for one often sees large, sappy pseudo-bulbs producing flowers of inferior quality owing to the want of proper ripening. Where ample moisture can be provided during the daytime, I consider it advisable to have a drier atmosphere at night, particularly as the season advances and the growths are reaching maturity. The roof ventilators afford the best means of reducing atmospheric moisture, and with the discreet use of these and the heating apparatus the last thing at night, these conditions can be favourably obtained. The roof ventilators should be closed before damping in the morning.—H. J. CHAPMAN, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

BEGONIA GLOIRE DE LORRAINE.—It is time now that the whole of these plants were shifted into their flowering pots. The most forward batch should be grown in 7in. pots, in which size they will make very large specimens if they are staked out carefully. The soil must be of a rich character, and be pressed moderately firm. A good batch of the later plants should be put into 5in. pots, and the latest batch of all into large 60's. These will be found of much greater value for decorative purposes than the large plants. For dinner-table decorations the smaller size are invaluable during the winter, and, with care, they may be used on several occasions. When they are fairly established they do not need so much artificial heat as is sometimes given them; indeed, they are much more useful, and will last in flower for a much longer period, when grown under cool conditions. A night temperature of 60 degrees is ample during the later stages of growth, and when in flower the temperature may be considerably lowered. This begonia is very suitable for growing in baskets, and it is not too late now to make up baskets if plants are available. They make charming objects for hanging from the roof of the conservatory during the winter months.

SALVIA SPLENDENS.—These are now growing freely in their flowering pots, and in order to keep them clean and healthy, strict attention must be given to watering and syringing. When syringing, make sure that the water reaches the under-side of the leaves, as it is there that red spider always attacks the plants. Should this pest obtain a footing, lose no time in drenching the foliage with an insecticide. Unless the plants are required to flower early, the growth must be again stopped at the end of the present month or early in August. Salvia Pitcheri must also be liberally treated now that roots and growth are active. Some of the weaker growths may be thinned out, and the remaining shoots secured to neat stakes. This lovely blue salvia always attracts attention in the conservatory or greenhouse during the autumn months, when chrysanthemums are so much in evidence.

WINTER-FLOWERING PELARGONIUMS.—These will now be growing in a thoroughly exposed situation out of doors. They require abundance of water, and when well rooted stimulants must be given. Soot water and liquid manure will meet their requirements in this respect. Remove the flower buds as they appear, and stop the growths to encourage a dwarf bushy habit. Pelargoniums which have been flowering in the greenhouse must be brought outside after flowering to ripen their wood. These plants require a period of rest, and with this object in view water at the roots must be gradually withheld. Cuttings may be taken from the plants and inserted around the side of 3½in. pots filled with a light sandy compost. Place the pots in a close, moist pit, and keep shaded till the cuttings are rooted.—E. HARRISS, Lockinge Gardens.

HARDY FRUITS.

STRAWBERRY BEDS.—The drought and heavy crops of fruit have greatly taxed the plants of most varieties, especially on light, shallow land. If these are intended to remain for another year they should receive every encouragement to build up strong, fruitful crowns by the end of the season. Lose no time in having the beds cleared of weeds, runners, and a goodly portion of the old leaves, then give the plants a good syringing with nicotine, or some other insecticide, to dislodge red spider. Fork lightly between the rows to fill up any cracks and to loosen the soil, after which mulch with good manure; and, if required, give the roots a thorough soaking with water. This method I have practised for many years with good results.

FORCED STRAWBERRY PLANTS that were put out on good, deeply-worked land, in which plenty of manure was mixed, should not suffer from an insufficiency of moisture, and should the weather prove dry a few syringings overhead on bright afternoons will benefit them greatly. Attend carefully to all young layered runners, and as soon as ever the pots become filled with roots, set them out at once on a rather firm soil. When planting ram the soil about the roots rather firmly, and give a good watering to settle the soil. Keep the runners from these plants cut away, and stir the soil at intervals with the Dutch hoe. Do not forget to plant plenty of Laxton's Latest, one of the best for late use; the fruits grow to a great size, and are of splendid colour.

PEACHES AND NECTARINES.—These are now making plenty of splendid wood, and very little blister is to be seen. Keep the foliage clean and free from red spider, attend to all the leaders required for filling up wall space, and the young shoots wanted for fruiting next year, securing them carefully in their required positions. Remove with a sharp-edged knife sub-laterals and any shoots not wanted, so that the trees do not become crowded with useless wood. Although the crop here is poor, our trees will nevertheless receive every attention, both as regards training and the care of the roots.

GATHERING FRUITS.—All ripe fruit will need daily attention, and should for most purposes be gathered when perfectly dry. Black currants make the brightest jam when gathered and placed in a small-meshed sieve and washed with clean water. Remove nets as soon as the fruits are all gathered, and if not required, store them in an airy place when perfectly dry, tie a label to each net describing its size, etc., so as to prevent confusion and trouble the next time they are required.—H. MARKHAM, Wrotham Park Gardens.

THE KITCHEN GARDEN.

CAULIFLOWERS.—The latest sowing, to supply heads during October and the early part of November, when cauliflowers are much esteemed, will require a warm, sheltered position to which the young plants should now be transferred, the land should be in good condition to encourage free growth, and water should be afforded abundantly during dry weather, if the water supply is deficient a good mulching will prevent a too rapid evaporation of moisture, and at the same time afford nutriment to the plants. In hot weather examine the rows of plants which are forming heads, and break a few of the inner leaves over the curd. Keep the surface soil well stirred between succession plants, and also draw a little soil about the stems, having previously applied liquid manure and water to the soil if it be dry.

AUTUMN-SOWN ONIONS.—With the object of checking top growth and diverting the strength into the bulbs, the necks of these plants should now be twisted, or bent down with the back of a wooden rake. This will also allow the light and air to reach the bulbs more easily.

SPRING-SOWN ONIONS.—Keep the beds free from weeds, and if the soil is very dry give a thorough soaking of water. If large onions are required, and the plants have been well thinned, afford liquid manure or some approved artificial manure, and thoroughly water in with clear water. Beds which are troubled with mildew should be sprayed with sulphide of potassium, half an ounce to a gallon of water. A lump of soft soap (previously dissolved in hot water) should be added, as it materially assists the action of the sulphide on the affected parts of the plant; a second application may be necessary if the mildew has gained a strong hold.

POTATOES. — When the early varieties become ripe, dig up and sort the tubers, picking out the required number of sets, and storing them in a cool place. If tubers are left in the ground after the skin is firm, they will quickly start into growth in showery weather.

GLOBE ARTICHOKES. — After all the usable heads have been consumed, remove the stalks for the plants' sake, and for neatness. Two or three applications of liquid manure, thoroughly washed in with clear water, greatly tends to throw strength into next year's shoots and stems.

CHICORY, DANDELION, ETC.—These should be grown to a large size, the bed being frequently run alongside and between the rows, and water and liquid manure applied as to encourage growth. — W. MESSENGER, Woolverstone Park Gardens.

"A Storehouse of Practical Information in the most concise form . . . ."

THE ENCYCLOPÆDIA OF GARDENING

14th (Revised) Edition.

By T. W. SANDERS, F.L.S., Editor of "Amateur Gardening."

A Book of 466 pages, which shows at a glance How any Flower, Vegetable, Fruit, Plant, Tree, or Shrub can be grown with ease and success.

"A valuable book of reference in a handy form, conveying in a nutshell all that the Amateur Gardener needs to know about Plants and Flowers of every description."—

SPECIMEN PAGE.

ENCYCLOPÆDIA OF GARDENING.

tion, front of shrubberies. Plant, Nov. to Feb. Propagate by seeds sown ¼ in. deep outdoors in March, or in boxes of light soil in temp. 55° in Feb.; cuttings inserted in sandy soil under bell-glass in Oct.; layering in Oct. C. alnifolia suitable for forcing to flower in winter.

SPECIES CULTIVATED: C. alnifolia (Sweet Pepper Bush), white, Sept., 4 ft., Florida; alnifolia Michauxii, 4 ft.; alnifolia paniculata, 4 ft.; acuminata (White Alder), white, Sept., 10 ft.; arborea, white, Sept., 8 ft., Madeira; canescens, white, Aug., 8 ft., China.

Clianthus (Glory Pea; Parrot's-bill; Sturt's Desert Pea).—Ord. Leguminosæ. Greenhouse climbing shrubs & herbaceous perennials. First introduced 1832.

CULTURE: Compost, two parts loam, one part leaf-mould & silver sand. Position, pots or beds in greenhouse. Pot or plant, March. Prune in April, shortening young shoots to within 2 in. of their base. Water freely March to Sept., moderately afterwards. Syringe foliage daily April to Aug. Temp., Oct. to March 45° to 50°; March to Oct. 55° to 65°. C. puniceus succeeds outdoors against warm walls in Devonshire. Propagate by seeds sown ¼ in. deep in well-drained pot of light soil in temp. 75° in March; cuttings of shoots inserted in sandy soil in temp. 75° to 85° in March or April.

SPECIES CULTIVATED: C. Dampieri, scarlet, April, 3 ft., Australia; puniceus magnificus, crimson, May, 6 ft., New Zealand.

Cliff Brake Fern.—See Pellæa.

Climbing Dahlia (Hidalgoa Wercklei).—See Hidalgoa.

Climbing Fern (Lygodium scandens).—See Lygodium.

Climbing Fumitory (Adlumia cirrhosa).—See Adlumia.

Climbing Groundsel (Senecio mikanoides).—See Senecio.

Climbing Hydrangea (Schizophragma hydrangeoides).—See Schizophragma.

Climbing Snake's-tongue Fern (Lygodium scandens).—See Lygodium.

Clintonia.—Ord. Liliaceæ. Hardy herbaceous perennials. First introduced 1788.

CULTURE: Soil, sandy peat. Position, moist shady border. Plant, Oct. or March. Propagate by division of roots in March or April.

SPECIES CULTIVATED: C. andrewsiana, rose, April, 2 ft., California; borealis, yellow, May, 1 ft., N. America; umbellata (Syn. Smilacina umbellata), white, May, 9 in., N. America; uniflora (Syn. Smilacina uniflora), white, July, 6 in., California.

Clitoria (Butterfly Pea). — Ord. Leguminosæ. Stove evergreen flowering climbers. First introduced 1739.

CULTURE: Compost, equal parts peat, leaf-mould, loam, & silver sand. Position, pots, tubs, or beds in light plant stove. Pot or plant, March. Water freely April to Sept., moderately afterwards. Temp., Oct. to March 55° to 65°; March to Oct. 70° to 80°. Propagate by seeds sown ¼ in. deep in light soil in temp. 75° in March; cuttings of side shoots inserted in sandy peat in temp. 80° at any time.

SPECIES CULTIVATED: C. ternatea, blue, July, 4 ft., E. Indies; ternatea alba, white, May; ternatea cærulea, blue, May; ternatea major, brown, Aug.

Clivia (Caffre Lily).—Ord. Amaryllidaceæ. Greenhouse evergreen flowering plants. Fleshy-rooted. Formerly known by the generic name of Imantophyllum. First introduced 1823.

CULTURE: Compost, two-thirds good loam, one-third decayed manure & sand. Position, sunny, close to glass in greenhouse. Pot, Feb. Water freely March to Sept. 65° to 75°. Propagate by seeds sown in light soil in temp. 75° in March; division of roots at potting time.

EXHIBITIONS AND MEETINGS.

National Sweet Pea Society.

The exhibition of this society, held at the Royal Horticultural Hall, Vincent Square, Westminster, on Thursday, July 17, was a glorious success. Though streak and other troubles may be disappointing growers in some parts of the country, it was amply evident from the splendid flowers on view that there are plenty of people all over the country who can, and do, grow sweet peas grandly. This was not the largest show the society has held, but it would have been as large as any but for the heavy storm in the eastern counties and Kent a few days previously, which compelled many exhibitors to cancel their entries. In point of quality and beauty, and variety of colouring, this show was far ahead of any previously held. The arrangements were excellent; the officers and some hard-working members of the committee were very busy the previous afternoon and evening, marking out and taping off each exhibitor's space, leaving a ticket in each place to show who should occupy it. Class numbers, with pointed hands, showed where classes began and ended, and two large plans of the exhibition were set in prominent positions and showed the position of every class and every trade display. All this meant that the 150 exhibitors had no difficulty in finding their positions if they used their eyes at all, and it also meant that visitors were easily able to find any particular class in which they were interested. The absence of central backgrounds enhanced the beauty and effect of the show, palms down the centre of each table also helped, and the decoration of the music gallery with palms, bamboos, asparagus, and sweet peas, begged and borrowed from all and sundry by the hon. secretary and Mr. Tigwell, further helped to make this exhibition one of the most beautiful ever seen at Vincent Square.

We understand that £26 17s. were taken at the doors; and it must be remembered that the society's members, as well as R.H.S. Fellows, were admitted free.

In the evening, after the close of the exhibition, the committee, officers, judges, stewards, and principal exhibitors dined together at the Hotel Windsor. Mr. Herbert Smith, chairman of committee, presided in the unavoidable absence of Sir Daniel Morris, the President. After the loyal toasts, that of "The Society" was very heartily received and ably responded to by Mr. J. S. Brunton, who briefly reviewed the society's history and work, and compared the flowers of to-day with those of thirteen years ago. Mr. F. W. Harvey gave "The Exhibitors," to which Mr. Edward Cowdy, J.P., "from the wilds of Armagh," responded with typical Irish humour. "The Judges," proposed by Mr. H. Shane, of Luton, was responded to by Mr. Alex. Malcolm, of Duns. Mr. E. H. Christy proposed "The Chairman," which toast, like that of "The Hon. Secretary," proposed by Mr. W. Cuthbertson, was accorded musical honours. Mr. Robt. Sydenham was heartily thanked, on the motion of Mr. H. J. Wright, for his kindly contribution of "Sparkling Muscatel" to the dinner.

GENERAL VIEW OF THE NATIONAL SWEET PEA SOCIETY'S EXHIBITION.

GENERAL DIVISION.

In the Sutton cup class there were five exhibitors, and all showed finely. The cup was won by Mr. E. A. Usher, gardener to Sir Randolf Baker, Bart., M.P., Ranston, Blandford, who had a lovely set of twenty-one bunches all selected from the society's classification list. His best bunches were of Rosabelle, Loyalty, Sunproof Crimson, May Campbell, True Lavender, Barbara, Florence Nightingale, Clara Curtis, Edrom Beauty, and R. F. Felton; the second prize fell to Mr. H. Bircher, gardener to Mrs. W. Jarratt Thorpe, Gransmoor, Hucclecote; and the third was won by Mr. A. Moring, gardener to A. W. Stirling, Esq., Holme Lea, Goring. There was but one exhibitor of eighteen bunches of varieties suitable for garden decoration, and here Sir Randolf Baker was the only exhibitor. He was awarded the second prize only, which is perhaps as good evidence as possible of the high quality prevailing when Mr. Usher has to be content with a second prize for his flowers.

About fifteen competitors fought for the Eckford cup; it was a great fight, and many champions were routed. Mr. F. Peacock, gardener to Mrs. F. E. Hall, Cumberland Cottage, Redbourne, was the winner with a super-excellent set of Sunproof Crimson, Mrs. Hardcastle Sykes, Melba, Hercules, R. F. Felton, Prince George, Thos. Stevenson, White Queen, John Ingman, Edrom Beauty, Queen of Norway, and King Manoel; Mr. Janes, gardener to Lord North, Wroxton Abbey, second; and Mr. T. Stevenson third. An interesting class was the one for a dozen bunches, distinct, to consist of three cream-pink, three lavender, three orange, and three scarlet varieties, arranged in rows of a colour. Here Mr. Usher was forward with Anglian Orange, Edrom Beauty, Thos. Stevenson, Doris Usher, Lady Miller, Anglian Pink, Lavender, George Herbert, R. F. Felton, and True Lavender; Mr. M. Y. Green, Eynsford, was placed third.

For six bunches of new sweet peas, Mr. Thos. Jones, Ruabon, scored with Birdbrook, Marks Tey, Agricola, Mrs. E. Cowdy, Dobbie's Thos. Stevenson, and Lavender George Herbert (Dobbie's); Mr. Edward Cowdy, Loughgall, co. Armagh, second; and Mr. T. Stevenson third. Mr. Usher led for three bunches of cream-pink varieties with Hercules, Doris Usher, and Lady Miller.

OPEN CLASSES.

In the classification class for twenty-four varieties, selected from the society's colour classes in their classification list, Mr. H. D. Tigwell, Harrow View, Greenford, beat Mr. J. Stevenson, Wimborne, but with little to spare.

In an open twelve-bunch class for a dozen bunches, Mr. Edward Keith, gardener to Sir G. O. Trevelyan, Bart., Cambo, Morpeth, was a clear winner, and his bunches of May Campbell, R. F. Felton, and Lilian were very fine; Mrs. E. R. Janes came second; and Mr. H. Tysoe, The Gardens, The Lodge, Bedford, third in a keen competition.

The Chapman silver salver for three bunches of varieties not in commerce, was won by Mr. Robt. Bolton, Warton, Carnforth, with Rosina, a sort of soft Rosabelle; Steeton, a lovely orange-tinted pink, and Peggy Mackereth, which has curiously-shaded, rosy-purple flowers, the opening buds being whitish; Mr. R. Wright, Formby, second; and Mr. A. Moring third.

Amateurs came forward splendidly in competition for the A. W. King Cup, where a dozen bunches were required. Mr. J. B. Lowe, gardener to Captain Geoffrey Lubbock, Greenhill, Warminster, came first of fourteen entrants, and his Melba, Florence Nightingale, Nubian, and Doris Usher were grand bunches; Mr. Julian Lemon, Bransfield, Godstone (gardener, Mr. Cowlard), a close second; and Mr. R. Sandford, Mildenhall, Suffolk, third. Thirty-three competitors staged in the class for six vases of blooms, distinct, five spikes in a bunch, and in this close competition Mr. Thos. Jones, Bryn Penylan, Ruabon, led with wonderful blooms of Clara Curtis, John Ingman, R. F. Felton, Marjorie Linzee, Edrom Beauty, and King Manuel, all four-flowered stems; Mrs. F. E. Hall second.

Five tables of blooms were set up in competition for the splendid Burpee Cup, the space allowed is 8ft. by 3ft., and 4ft. high. Mr. W. Hopkins, gardener to Francis Wellesley, Esq., Westfield, Woking, won the cup with fine flowers, finely arranged; his best were Mrs. W. Cuthbertson, R. F. Felton, Melba, Agricola, Edrom Beauty, Clara Curtis, and Audrey Crier. Mr. W. E. Alsen, Denmead, Hants, was a fine second, and he had among many good things, a fine vase of Chas. Foster; Messrs. Frank E. Smith and Co., High Street, Belfast, third.

DISTRICT CLASSES.

In the Scottish class, Mr. J. Kerr, Westmount, Stewarton, Ayrshire, had the finest six bunches, and his Agricola and Hercules were very fine; Mr. John A. Grigor, Sea Park Gardens, Forres, N.B., came second; and Mr. J. McKinnon, gardener to H. E. the Countess of Aberdeen, Haddo House, Aberdeenshire, came third. In the Irish Class, Mr. Edward Cowdy, Greenhill, Loughgall, Armagh, was a capital first for nine bunches, his Dobbie's Cream, Mrs. Hardcastle Sykes, Orchid, and Helen Williams (cream, edged pink), were lovely; Mr. W. Shuldham Gorey, Ireland, second.

In the Welsh class Mr. Thomas Jones was first, and his flowers were so fine that he had to crowd them into the space provided; Mark's Tey and Nubian were superbly shown; Mr. L. Webb, Welshpool, and Mr. J. Roberts, Griffin Inn, Gosford second and third respectively. In the Northern Counties class Mr. Edward Keith had a glorious first-prize six, his Barbara and Mark's Tey scoring heavily; he was followed in order by Mr. E. A. Allen, Formby, and Dr. Phillips, Malpas.

The prize-winners in the Western Counties class were B. Peyman, Esq. (gardener, Mr. Preedy), Sandford Manor, Sherborne; Mr. E. A. P. Broad, The Lawn, St. Austell; and Mr. R. B. Evans, Wanbrook, near Chard. In the Eastern Counties class Mr. H. Tysoe, Bedford, was first with bright, clean flowers, and was followed by Mr. A. W. Ralph, King Street, Kempston Hoo; and Mr. H. R. Grellet, Hitchin.

Competition was very close in the Midland Counties class, and many exhibitors turned out; Mr. E. R. Janes, Wroxton Abbey, scored a first; Mr. A. W. Glistey, Goring, second; and Mr. J. H. Hardstaff, Hucknall (a miner), third.

Mrs. Kensington (gardener, Mr. Beale), Haverbrack, Uckfield, led finely in the Southern Counties class, staging a grand nine bunches; Mr. Thomas Stevenson second, and Mr. A. L. F. Cook, Iver, third.

AMATEURS AND SMALL GROWERS.

The two Breadmore Challenge Cups, open to single-handed gardeners, were won respectively by Mr. E. Cowdy, Loughgall, and Mr. Davies, gardener to Dr. Phillips, Malpas, both showing capitally.

Mr. Thomas Jones, Ruabon, retained the Haslemere Cup by staging grand flowers of May Campbell, Nubian, Mrs. C. W. Breadmore, Etta Dyke, etc.; Mr. N. Thornton, Scraces, Barming, second; and Mr. A. H. Jennings, Hemel Hempstead, third. In other small amateur classes, Mr. A. T. Steadman and Mr. George Rain were successful.

Mr. W. H. Holloway, Port Hill, Shrewsbury, won the Horace Wright Cup with a grand dozen bunches in a small growers' class that was keenly contested; his Thomas Stevenson, White Queen, Elfrida Pearson, and Mrs. Routzahn were famous; Mr. R. Carlisle, Bicester, second; and Mr. H. Parsons, Nimmer, Chard, third. This is Mr. Holloway's second successive win.

The Walter Voss Cup for six bunches, in a small growers' class, was won by Mr. W. T. James, Kempston Hoo, Bedford, with beautiful bunches of Mrs. W. J. Unwin, Tom Bolton, Thomas Stevenson, Prince George, May Campbell, and Florence Nightingale; Mr. W. H. Holloway second, and Mr. E. J. Gee, Chesham, third.

DECORATIVE CLASSES.

Fifteen or sixteen ladies competed in the class for a table decoration of sweet peas, but there was nothing of outstanding merit in the class; indeed, we think the ladies have done much better on some previous occasions. As is usual in such a class, the awards were sharply criticised by the competitors. The leading awards fell to Miss B. Armstrong, Hitchin; Mrs. W. Fulcher, Chelmsford; Mrs. J. M. Croxford, Brentford; and Mrs. M. Welch, Sutton. Mrs. Ruff, Sharnbrook, led for an epergne of sweet peas, and was followed by Mrs. A. C. Brown, Reigate, and Mrs. F. A. Tisdall, Woodford Green. Mrs. Rumble, Addlestone, and Mrs. A. Bide, Farnham, scored for a vase of sweet peas.

NON-COMPETITIVE.

All round the hall traders staged beautiful displays that were greatly admired by everyone. In point of quality and arrangement they have never done so well at the society's London show, and all deserve heartiest congratulations.

Gold medals were awarded to Mr. Robt. Bolton, whose artistic effort contained lovely bunches of his varieties Agricola, Chas. Foster, Afterglow, Prince George, Princess Mary, and other good things; and to Messrs. Dobbie and Co., Rothesay, whose exhibit contained the latest advances made in varieties of this firm, Melba and King White were fine.

Silver-gilt medals were awarded to Messrs. E. W. King and Co., Coggeshall, who had Anglian Orange and Anglian Cream in good condition; Messrs. S. Bide and Sons, Farnham, who had good specimens of White Queen, Bluebell, and a waved Jeannie Gordon; Mr. W. J. Unwin, Histon, who showed Phyllis, The Abbott, Edith Taylor, and Nettie Jenkins finely; Messrs. Jarman and Co., Chard, who had fine spikes of flowers of Mrs. Townsend and other popular varieties; Messrs. R. H. Bath, Lim., Wisbech, whose Edith Taylor was very fine; and Messrs. Jas. Carter and Co., Raynes Park, for a very effective exhibit.

Silver medals fell to Robert Sydenham Limited, Tenby Street, Birmingham; Messrs. Jones and Son, Shrewsbury; Messrs. George Stark and Son, Great Ryburgh, for a novel arrangement of good blooms; and Mr. Jas. Box, Lindfield, Haywards Heath.

Bronze Medals were granted to Messrs. John K. King and Sons, Coggeshall; Mr. J. D. Webster, Chichester; Messrs. Walter Voss and Co., Milwall, E.; Mr. B. W. Deal, Kelvedon; and Mr. Aldersey, Tilston, Malpas.

Birmingham Horticultural Society.

JULY 18 and 19.

When some two years since the boundaries of the city of Birmingham were so extended as to include Handsworth within the area governed by the municipal authorities, it was felt by those who take an active interest in gardening matters that the horticultural society which had been established in this important suburb some years previously, and had done much excellent work, should have its scope enlarged and its name changed with a view to making it one of the Birmingham institutions. It was at once recognised by those concerned with the affairs of the city that it would be an immense advantage for the Handsworth Horticultural Society to be reorganised, and the sphere of its operations so enlarged as to enable it to become the great centre of horticultural activity. The idea of the change found so much favour that the reorganisation was quickly effected, and the title changed to the Birmingham Horticultural Society. Two years is by no means a lengthy period, but the work that has been accomplished has been more than to fully justify the opinion of those who regarded the society as worthy of being the representative in matters horticultural of the whole municipality. The first of the shows under the new régime was held in the summer of last year, and proved so great a success as to surpass any of the gatherings under the old title, and to stimulate further effort on the part of those responsible for the management. It, indeed, did so much credit to all concerned as to prove to demonstration that they were deserving the most hearty support in performing the pleasant but arduous task they had undertaken. Fortunately, the support was forthcoming, and accordingly great encouragement was given to cultivators of plants, flowers, fruits, and vegetables to contribute liberally of their best. Appreciating the encouragement given, exhibitors were present in larger numbers, and the exhibition far surpassed that of last year in magnitude, cultural excellence, and attractiveness.

There is no occasion for instituting comparisons between this and other of the great provincial horticultural exhibitions held during the summer months; but it is a point of some importance, as evidence of the progress that has been made, to state that it compared favourably with the best of them, and far surpassed the shows previously held at Birmingham. As compared with last year's exhibition, there was a marked advance, the exhibitors numbering 205, and the entries 1,083, against 161 exhibitors and 960 entries last year. Seven huge marquees were provided for the accommodation of the exhibits, and, vast as was the space they afforded, it was not more than sufficient to meet the requirements of exhibitors. The schedule was comprehensive in character, and as, with but few exceptions, the competition was keen throughout, all classes of garden products available for exhibition at this season of the year were well represented. Groups arranged for effect formed a large and highly attractive feature; roses and sweet peas were shown in such large quantities as to suggest that the National Rose

and Sweet Pea Societies were holding provincial shows at Birmingham; carnations were of special merit; and vegetables were shown in enormous quantities.

A deputation from the Royal Horticultural Society, consisting of Sir Harry Veitch, V.M.H., Mr. George Bunyard, V.M.H., Mr. H. B. May, V.M.H., and Mr. J. G. Gaskell, made a number of awards to exhibits of special merit. The Hardy Plant Society also sent a deputation, which consisted of Mr. F. Bouskell, chairman of committee, and Mr. A. J. Macself, the hon. secretary, who made awards to hardy flowers of exceptional merit.

GROUPS.

Groups arranged for effect occupied the greater part of two of the large marquees, and proved highly attractive and of great educational value. In the open class for groups occupying a space not exceeding 300 square feet, Messrs. J. Cypher and Sons, Cheltenham, occupied the premier position with an arrangement that was greatly admired. In addition to the first prize, consisting of £4 and a 10 guinea silver challenge cup, the firm were awarded the Royal Horticultural Society's Gold Medal. The design was similar to that of the groups shown by Messrs. Cypher at some previous exhibitions this season, and described in these pages. Mr. J. T. Macdonald, gardener to Sir George Kenrick, Edgbaston, was a capital second with plants admirably grown and tastefully arranged; and Mr. R. Manning, Dudley, was third with a group possessing great merit. The first and second prize-winners adopted designs similar to that which Messrs. Cypher have used with so much success, and had a central arch surmounted by a finely developed palm and richly-coloured crotons, and finely grown aralias, narrow-leaved crotons, dracænas, and other fine-foliage plants, deftly set in a carpet composed of flowering and fine-foliage plants of dwarf growth. The entries were very numerous in the gardeners' class for square groups, and the whole of the arrangements were of a high order of merit. Mr. A. Cryer, gardener to J. A. Kenrick, Esq., was a splendid first, and, in addition to the schedule prize, was awarded the Royal Horticultural Society's silver cup; Mr. A. Corbett was second, and this prize was supplemented by the R.H.S. Silver-gilt Banksian Medal; Mr. R. Usher, Mr. A. Bastock, and Mr. Perks were third, fourth, and fifth, the last-named being a special award.

SPECIMEN PLANTS.

Specimen stove and greenhouse plants were shown in much finer condition than we have seen them for some years past, and afforded abundant evidence that the production of specimens of the finest of the plants that have their home in the greenhouse and tropical structures has not become a lost art. Messrs. J. Cypher and Sons were at the head of the competitors in the class for twelve flowering and foliage plants, those in bloom comprising Statice profusa, Bougainvillea Sanderiana, Clerodendron Thomsonæ, Allamanda Hendersoni, Ixora Williamsi, and the fragrant Stephanotis floribunda, all of large size, freely-flowered, and perfect in development. Crotons Countess and Warreni were remarkable for size, vigour, and colour. Mr. A. Cryer followed for second place with excellent specimens, that of Bougainvillea being especially noteworthy; Mr. Manning third with well-grown plants. In the gardeners' class for six specimens, Mr. A. Cryer occupied the premier position with good specimens of Clerodendron Thomsonæ, Bougainvillea glabra, and Vinca rosea as the best, the last-named being seldom seen nowadays in such fine form.

To touch otherwise than lightly on the many other classes for plants would require much space, and it must, therefore, suffice to refer briefly to those in which they were of outstanding merit. Mr. T. B. Perks, gardener to J. Bastow, Esq., Handsworth, contributed finely-flowered examples to the class for six gloxinias; and Mr. Corbett, gardener to H. C. Pinsent, Esq., Harborne; and Mr. R. Usher, gardener to J. A. Kenrick, Esq., Harborne, who were second and third, also staged finely-flowered examples. Very highly-developed also were the plants shown in the class for six single tuberous begonias by Mr. G. Corbett and Mr. A. Cryer, who were first and second respectively. These last-named exhibitors were first and second also in the class for ivy-leaved pelargoniums. Both exhibitors had pyramidal specimens, about 4ft. in height, and splendidly flowered, the lightness of training contributing greatly to their charm. In the corresponding class for zonal pelargoniums these exhibitors changed places, but both had large finely-flowered bush specimens. Mr. Cryer was first also for six ferns in a competition that was not particularly strong, too many adiantums being included in the collections to produce a distinct effect.

A MAGNIFICENT DISPLAY OF FLOWERS, FRUIT, AND VEGETABLES.
Exhibited at Birmingham by Messrs. Sutton and Sons, who were awarded two Gold Medals, and a twenty-guinea Silver Challenge Cup.

ROSES AND SWEET PEAS.

Cut flowers were so well shown as to contribute largely to the interest and attractions of the show. Roses were pre-eminent, and the contributions to the class for a collection of cut blooms, to occupy a space of 20ft. by 5ft., produced a wondrously beautiful display. Here Messrs. Gunn and Son, Olton, was first with superb blooms, tastefully arranged as pillars and arches, set in a groundwork of fragrant blooms in vases. The premier award, consisting of a silver challenge cup of the value of 20 guineas, a gold medal, and £10, was supplemented by the award of a R.H.S. silver cup. Mr. J. Mattock, Headington, was a capital second, and received, in addition to the society's prize, the R.H.S. Flora medal.

LEICESTER.—ABBEY PARK FLOWER SHOW, 5th and 6th August next. Open Class. Group of Plants, £20, £15, £10, £6. Liberal prizes for Collections of Fruit. Displays of Roses; Silver Cup, Gold and Silver Medals for non-competitive exhibits. Schedules from JOSEPH BURTON, Supt.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

Messrs. W. and J. Brown, Peterborough, who were third, also had a remarkably attractive display.

Mr. J. Mattock was successful in obtaining premier honours in the class for forty-eight cut blooms, which were of good quality, and included Mrs. Stewart Clarke at its best. Messrs. Perkins and Son, Coventry, were a good second with a collection in which Madame Victor Verdier was so good that it was selected as the best bloom in the show; Mr. W. T. Mattock, Headington, was third. Mr. J. Mattock scored for twelve vases of garden roses with a collection in which Madame Abel Chatenay, Harry Kirk, Lady Hillingdon, Lady Pirrie, and Lady Curzon were conspicuous. Mr. W. T. Mattock followed for second place with good bunches. In the class for eighteen blooms, Mr. W. T. Mattock and Messrs. Perkins and Son were the prizetakers, these fine old roses, A. K. Williams and the Duke of Wellington, being admirably shown in the first prize box. There was a good competition in the class for twelve teas, and Mr. W. T. Mattock and Mr. J. Mattock were the winners of the first and second prizes.

Sweet peas were in strong force, and one of the most important of the classes provided for these fragrant flowers was that for a display occupying a space of 20ft. by 4ft. There was a very keen contest for first place between Messrs. E. W. King and Co., Coggeshall, and Messrs. Herd Brothers, Penrith. Both exhibitors had displays of great merit, but the arrangement from the last-named was a trifle overcrowded, and the premier award was made in favour of Messrs. E. W. King and Co. This consisted of a twenty-guinea silver challenge cup, a special gold medal, and £5. Messrs. Herd Brothers were awarded a gold medal as the second prize, and a R.H.S. silver-gilt Flora medal was deservedly awarded both collections.

In competition for the prizes for twenty-four bunches of sweet peas, Mr. F. Hallett, gardener to Sir R. Grahame, Carlisle, was first with flowers of exceptional quality, and the vase of R. F. Felton in the collection was selected as the best in the exhibition. Miss E. M. Baird, Malvern, followed closely for second place. Mr. Hallett was first also in Messrs. E. Webb and Sons' class for eight varieties, with finely-developed flowers, especially noteworthy being those of Lady Cynthia, Clara Curtis, Thomas Stevenson, and Elsie Herbert. Mr. H. Smart, gardener to T. R. Cresswell, Wolverhampton, was second. Robert Sydenham Limited provided two classes for sweet peas, one for twelve varieties, and the other for six, and in both the competition was especially keen. Mr. Hallett obtained premier honours in the class for twelve, with flowers of superb quality, Helen Grosvenor, Rosabelle, Barbara, Elfrida Pearson, Charles Foster, and Mrs. Andrew Ireland being especially noteworthy. Mr. Blackburn, gardener to Captain W. H. Starkey, Leamington, followed closely for second place. For the six varieties, Mr. T. Batchelor, gardener to H. Mitchell, Esq., Hampton-in-Arden, was a capital first. In Messrs. Holder and Co.'s class for six varieties, Mrs. Carine, Wolverhampton, was first with an excellent collection.

HARDY FLOWERS.

Hardy flowers were strongly represented, and the numerous collections formed a distinct and attractive feature. There were six entries in the class for twelve vases, and at the head of the several exhibitors was Mr. A. Bostock, who had Scabiosa caucasica, Galega officinalis, and its white form, Monarda didyma, and the Madonna lily in fine form; Mr. R. Usher was a close second with a collection in which well-known kinds were admirably represented; and Mr. A. Cryer staged a good set for third place. In a class for a similar number of kinds, in which flowering shrubs, herbaceous plants, and annuals could be shown, Mr. H. E. Potter, Handsworth, had a collection equally remarkable for the high quality of the flowers and the taste with which they were arranged. Mr. Prince, Harborne, and Mr. J. Clifford, Handsworth, followed closely for the second and third places, with interesting and attractive collections.

Carnations were admirably shown in the competitive classes, as well as in the honorary exhibits from trade growers. Very attractive was the collection of perpetual-flowering varieties from Mr. C. Wall, the flowers being large in size, fresh, and bright in colour. In the corresponding class for carnations and picotees, there was a spirited contest, and the premier award was made in favour of Mr. C. Wall, who had blooms of high quality. Very fine, also, were the blooms with which Mr. G. R. Rudd obtained first prize for twelve border carnations. There were some eight or ten entries in the class for twelve vases of violas, and the blooms in the winning sets were so splendidly developed as to be quite beyond praise. Mr. H. Allen, Handsworth, scored with blooms of large size, stout in substance, and richly coloured, and they were set up in bowls in a remarkably natural manner. Of special excellence were Rosslyn, Mrs. Pell, Master Stevens, Mrs. Robinson, and Mosely Perfection, the finest of all the yellow violas for the exhibition stage. Mr. J. Bostock and Mr. H. J. Milner were the other prize-winners. Messrs. J. Pemberton and Sons were successful in securing the first prize for a tasteful arrangement of pansies and violas, with blooms of fine quality.

TABLE DECORATIONS.

There were two classes for table decorations, one for flowers at the discretion of the exhibitors, and arranged in any kind of vases or stands, and the other for sweet peas arranged in rustic stands. There were thirty or more tables in the two classes, and as they were all more or less tastefully decorated, they produced a delightful effect. In the unrestricted competition, Mrs. F. Jenks, Codsall, was first with a beautiful arrangement of Lady Hillingdon rose, and in the other Mrs. H. Reeve was a splendid first with pink sweet peas.

ROCK GARDENS.

For a rock garden occupying 30ft. by 30ft. in the open, there were two excellent entries which, unfortunately, were placed in an out-of-the-way corner of the grounds, practically out of sight. Mr. T. R. Hayes, Keswick, who was awarded first prize, had naturally weather-beaten, water-worn stone, which he arranged in a suitable manner, and furnished with a fine selection of ericas, pigmy conifers, and suitable flowering plants. There was a little lily pool in the foreground, and some good Iris Kaempferi, spiræas, and water rushes. Choice hardy ferns were also freely but cleverly used, the whole making a delightful exhibit.

Messrs. Gunn and Son, Olton, took second prize, their effort being bold and striking. Large boulders were arranged in an imposing manner, and spiræas, campanulas, osmunda, and other ferns were used to provide a great show of colour and foliage. Kniphofias, gladioli, lychnis, and phloxes, though not really appropriate for a rock garden, added much to the brightness of the display.

FRUIT.

Four exhibits were staged in the class for a dinner-table set for six persons and decorated with dessert fruit and flowers. The leading award was allotted to Mr. C. Crooks, gardener to H. Mitchell, Esq., Droitwich, who showed Muscat of Alexandria and Black Hamburgh grapes, good melons, Dymond peaches, and Humbold nectarine in duplicate dishes, all well-grown, nicely finished fruit; rose and white schizanthus formed the floral decoration, which was rather overdone. Mr. G. L. Blackburn, gardener to Captain W. H. Starkey, Leamington, took second place. He had loganberries, strawberries, peaches, nectarines, a melon, and a bunch of grapes, and used Irish Elegance and other roses for decoration. Stephen Sims, Esq., Borrowash, took third prize.

Mr. N. F. Barnes, gardener to His Grace the Duke of Westminster, Eaton Hall, Chester, was worthily awarded first prize for a collection of ten dishes of fruit, the strong points being Madresfield Court and Muscat of Alexandria grapes, beautifully coloured James Grieve apples, and an excellent dish of Williams' Bon Chretien pears. Mr. J. R. Tooley, gardener to Hugh Andrews, Esq., Toddington Manor, was a very good second, but was a bit weak with his peaches and nectarines. Third prize went to Mr. G. L. Blackburn, Leamington, who had Rivers' Black cherry and Waterloo strawberry well shown. Mr. Barnes took the lead for both black and white grapes, putting up shapely, well-finished bunches.

VEGETABLES.

In the open section the principal vegetable class was for a collection of nine dishes, and the winner was Mr. E. Winchester, Rubery. Magnum Bonum cauliflower was very well shown, other good dishes being Centenary peas and Delicacy cucumber. Mr. J. R. Tooley, Toddington Manor, was second, and Mr. E. Deakin, Hay Mills, third. Various classes for vegetables were provided by seedsmen, Messrs. E. Webb and Sons, Wordsley, giving the prizes in an open class for eight kinds, the winner being Mr. J. R. Tooley, followed by Mr. G. F. Hallett, Carlisle. In a class for six kinds in the amateurs' section, the leading award went to Mr. F. Hudman, Hamstead.

Mr. E. Deakin, Hay Mills, won first prize in Messrs. Sutton and Sons' class for six kinds, showing excellent produce. Second and third prizes were secured by Mr. E. Winchester and Mr. A. T. Rainbow, Northfield, respectively. Mr. Deakin again scored in Messrs. Dickson and Robinson's class, and also in Messrs. Yates and Sons' class, six dishes being staged in each case.

MISCELLANEOUS EXHIBITS.

The largest and most important non-competitive display was the splendid stand of choice melons, vegetables, and flowers put up by Messrs. Sutton and Sons, Reading. Sweet peas and annuals were used on arches along the background, and in vases on the table between mounds of Globe beet, tomatoes, carrots, and peas, together with purple egg plants, golden beans, capsicums, and aubergines. The whole exhibit was beautifully arranged, and drew forth high praise from the visitors.

Messrs. T. S. Ware, Lim., Feltham, had an excellent group of begonias, among which several plants of the beautiful pale pink variety Lady Cromer were particularly noticeable. A new deep salmon variety, Gladys Valentine, having flowers well formed and of rich colour, and a new variety with finely-formed flowers of a rich orange-salmon hue, named King George, attracted much attention.

Messrs. E. Webb and Sons, Wordsley, Stourbridge, showed splendid vegetables, and good Ringleader, Epicure, and other melons on a stand tastefully decorated with stocks, larkspurs, sweet peas, and a variety of other flowers. King George pea was very good, and the onions, tomatoes, and mushrooms were of great excellence.

From Messrs. Barr and Sons, Covent Garden, W.C., came a very interesting exhibit of Japanese pigmy trees, many of which were extremely good specimens, numbering seventy and seventy-five years in age. Messrs. Barr also showed a collection of hardy border flowers and a few alpines.

Sweet peas were largely shown, Messrs. Herd Brothers, Penrith, being responsible for a big, bold display of excellent varieties. Mr. Geo. Aitkens, Tarvin, Chester, showed well, and so also did Messrs. E. W. King

and Co., Coggeshall. Mr. W. H. Morter, Cannon Hill Park, Birmingham, put up a big batch of the golden-yellow bedding viola Queen's Park, demonstrating the sturdy free-flowering habit of the variety.

Herbaceous flowers were finely shown by Messrs. F. Smith and Co., Woodbridge. Verbascums Caledonia, Harkness Hybrid, and Chaixi were striking, and some bright pentstemons. Romneya Coulteri, tritomas, and gaillardias were other subjects.

Mr. H. N. Ellison, West Bromwich, showed ferns in his usual good style, the stand including specimens of Platycerium grande, Polypodium sporodocarpum, crested nephrolepis and adiantums in variety.

Mr. John Barnett, Middleton Nurseries, King's Norton, Birmingham, showed roses, such as Mdme. A. Chatenay, The Lyon, Joseph Hill, G. C. Waud, and a few good climbing varieties. Messrs. W. H. Simpson and Sons, Birmingham, had a miscellaneous exhibit, in which begonias, Gilia coronopifolia, Lobelia Sapphire—a new trailing, white-eyed variety, and nemesias played a part, with sweet peas and border flowers in tall mounds at the back.

All the way from Guernsey, Mr. H. Burnett brought up a choice batch of perpetual-flowering carnations. Marmion was excellent, Calypso, the lilac-striped fancy, and Countess of Lathom, crimson, were noticeable. The violas from Messrs. Seagrave and Co., Sheffield, were well-grown flowers of the best varieties. They also showed a collection of fancy pelargoniums in bunches.

Perpetual carnations were tastefully staged on the ground by the Clury Nurseries, Langley, Bucks. The flowers were very fine, and among the varieties staged were Scarlet Glow, Beacon, British Triumph, White Perfection, and some of the best of the delicate pink varieties.

Messrs. Holder and Co., Erdington, Birmingham, made an extensive display of sweet peas, embracing a large number of the best present-day varieties.

Mr. A. F. Dutton, Iver, Bucks, staged a good lot of perpetual carnations in elegant baskets with vases of good border varieties in the foreground. Among the latter were Grownow, a yellow-ground fancy; Mrs. Colby Sharpin, deep salmon apricot; Elizabeth Shiffner, and the crimson Agnes Sorrel.

From Messrs. Bowell's Alpine Gardens, Cheltenham, came a collection of alpines, viola species, dwarf campanulas, mimulus, and dwarf veronicas and statices. Messrs. H. J. Jones, Lim., Lewisham, staged a very fine exhibit of phloxes, embracing the best of both British-raised and Continental varieties.

Late-flowering rambler roses were well shown by Mr. R. J. Barnes, Malvern. Excelsa, the crimson Dorothy, was particularly good, and American Pillar was very fine.

Messrs. Young and Co., Hatherley, Cheltenham, showed perpetual carnations in choice variety, the flowers being fresh, well-developed, and carried on good stems. Hon. John Boscawen, Duchess of Devonshire, Mrs. C. W. Ward, and Mrs. Raphael were among the best vases.

Messrs. Pipers, Bayswater, London, arranged a water garden across the end of one of the tents, with lily pools backed up by bold masses of spiræas and astilbes, with tall bamboos, clumps of Miscanthus sinensis, phormiums, funkias, etc. A rocky ledge at one end was planted with Artemesia pedemontana, Campanula pusilla, and C. pusilla alba, Lysimachia Henryi, and other suitable subjects, and beyond this was a border of herbaceous flowers, among which some good new erigerons, the deep-coloured Delphinium Lamartin, and several fine liliums were used to advantage. Messrs. Pipers also had a collection of clipped box trees in tubs, representing the topiary art to a high state of perfection. A large exhibit of herbaceous flowers, with a few roses and carnations, was effectively staged by Messrs. Hewitt and Co., Solihull. Gladiolus, Œnothera Fraseri, coreopsis, and verbascums showed up well, and there were good bunches of Lythrum virgatum, Aconitum pyrenaicum, Digitalis lanata, and other of the less common flowers of the border.

Mr. Douglas Leigh, Arden Nurseries, Hampton-in-Arden, displayed sweet peas and roses, among the latter being bunches of Mdme. Melanie Soupert, Geo. C. Waud, Rhea Read, Dean Hole, and Avoca.

Mr. F. A. Walton, Villa Road, Handsworth, showed miniature cacti in great variety, and also a collection of choice ferns in small pots. Asplenium nidus, and some of the better-class adiantums were very nice. Messrs. Rich and Co., Bath, showed phloxes, pyrethrums, pentstemons, and other herbaceous flowers, and The Grove Nurseries, Handsworth, put up violas, which showed excellent cultivation. One of the largest and richest-coloured varieties was Master Stevenson, a rich deep purple with lighter top petal.

AWARDS MADE BY THE R.H.S. DEPUTATION.

Gold Medal.—Messrs. Cypher and Sons, Cheltenham, for group of plants; and Messrs. Sutton and Sons, Reading, for vegetables and flowers.

Silver Cups.—The Duke of Westminster (gardener, Mr. Barnes), Eaton Hall, for fruit; Sir G. Kenrick (gardener, Mr. J. V. Macdonald); Mr. J. Arthur Kenrick (gardener, Mr. Cryer), for a group of plants; Messrs. Gunn and Sons, Olton, for roses; Mr. F. R. Hayes, Keswick, for rock and water garden.

Silver-gilt Knightian Medal.—Messrs. E. Webb and Sons, Wordsley, for vegetables.

Silver-gilt Flora Medal.—Messrs. Cypher and Sons, for stove and greenhouse plants; Messrs. E. W. King and Co., Coggeshall, for sweet peas; Messrs. Herd Brothers, Penrith, for sweet peas.

Silver Knightian Medal.—Mr. H. Andrews (gardener, Mr. J. R. Tooley), for a collection of fruit.

Silver Flora Medal.—Mr. H. J. Jones, Lewisham, for phloxes; Messrs. Piper, Bayswater, for water garden and herbaceous flowers; Messrs. J. Mattock and Son, Headington, for roses; Messrs. Fred Smith and Co., Woodbridge, for herbaceous group; Messrs. T. S. Ware, Lim., Feltham, for begonias; the Clury Nurseries, Mr. H. Burnett, Guernsey, and Mr. A. F. Dutton, Iver, for carnations; Messrs. Gunn and Son, for rock gardens and phloxes.

Silver-gilt Banksian Medal.—Mr. W. R. Manning, for group of plants; Mr. H. C. Pinsent (gardener, Mr. Corbett), for group of plants.

Silver Banksian Medal.—Messrs. Hewitt and Co., Solihull, for herbaceous; Mr. Ellison, West Bromwich, for ferns; Mr. T. Howse, for display of produce.

Bronze Banksian Medal. Mr. F. Hudman, for display of produce; Mr. W. W. Emms, Harborne, for collection wild flowers; Mr. Leslie Robinson Lightwood, for collection wild flowers.

SPECIAL MEDAL AWARDS OF THE BIRMINGHAM SOCIETY.

Silver Challenge Cup.—For best exhibit in show, and large gold medal, to Messrs. Sutton and Sons, Reading.

Gold Medal.—To Messrs. E. Webb and Sons, Mr. H. N. Ellison, Messrs. Pipers (2), Messrs. Barr and Sons, Messrs. T. S. Ware, Lim., Messrs. Hewitt and Co., Solihull, Messrs. H. J. Jones, Lim., Messrs. Holder and Co.

Silver-Gilt Medal.—To Mr. A. F. Dutton, Mr. H. Burnett, Messrs. W. H. Simpson and Sons, Messrs. F. Smith and Co., The Clury Nurseries.

Silver Medal.—To Messrs. Young and Co., Mr. Douglas Leigh, Messrs. Seagrave and Co., Mr. R. J. Barnes, Mr. F. A. Walton, Messrs. Bowell's, Miss Thompson.

Silver Medal.—For premier rose, Messrs. Perkins and Sons. Premier carnation, Messrs. A. R. Brown, Lim. Perpetual carnation, Clury Nurseries. Best vase of sweet peas, Sir Richard Grahame.

Southampton.

What is known as the Summer Exhibition of the Royal Southampton Horticultural Society was held on the County Cricket Ground on July 15. The entries were fewer than in past years, especially in the carnation section.

In the first three classes for carnations, i.e., for twelve vases of selfs, fancies, and yellow-ground picotees, four vases self carnations, and four vases of fancies, there was but one entry. Mr. H. Mathias, Medstead, was awarded first in each class with good blooms of Mrs. Leo Hunter, Linkman, Margaret Thurston, and Leslie. For six flakes or bizarres, Mr. J. J. Keen, The Avenue, Southampton, was first with Lord Curzon, Flamingo, Robt. Houlgrave, Premier, Shamrock, and Cleopatra; Mr. H. Mathias second, his Ethel Macrae and Mrs. R. Lord being noticeable. The former was selected as the premier bloom.

For six fancy carnations, Mr. Mathias had the best of three sets, staging good blooms of Lord Steyne, Donald McDonald, Bombardier, Hercules, and J. J. Keen (premier); Mr. Keen second. The best six carnations came from Mr. Mathias, Mrs. G. Marshall (premier), Mrs. R. Percy Smith, and Helen being the best; Mr. H. M. Elford, 22, Markham Road, Bournemouth, was second. Mr. Keen won the premier position for both yellow and white-ground picotees with Viola (premier yellow), Miss Goodfellow, John Smith (premier white), Mrs. Payne, Lavinia, and Radiant; Mr. Mathias second in both classes.

In many amateurs' classes there was but one exhibitor—Mr. J. A. Fort, The College, Winchester, who won first place for four vases of fancies, one vase of blush, of yellow, and buff or terra-cotta selfs, showing desirable blooms of Rhea, Hercules, Mrs. Howard Green, Daffodil, Linkman, and Santa Claus. In the dressed flower section, it was the same, Mr. Fort being the only exhibitor; Sir Walter, Highland Lass, Libra, Exquisite, Margaret Lennox, Queen of Spain, Mrs. Sharp, and Favourite were the best of his flowers.

Perpetual-flowering carnations made rather a better show. For five vases of tree or American varieties, Sir Randolf Baker, Bart., Ranston, Blandford (gardener, Mr. Usher), was first with Scarlet Glow, R. F. Felton, White Wonder, and Mrs. T. W. Ward as the best. W. H. Myers, Esq., Swanmore House, Bishop's Waltham (gardener, Mr. Ellwood), second. These two exhibitors reversed their positions for three varieties, Mr. Myers depending upon Mrs. Dutton, Britannia, and President.

For a dinner-table arrangement three competed, and Mrs. F. G. Bealing, Basset, Southampton, was first with an effective display of pink flowers; Mrs. E. Ladhams, Shirley, Southampton, second, with pink.

Messrs. Sutton and Sons, Reading, offered prizes for six bunches of sweet peas, and here Sir R. Baker had the best of three sets with good blooms of Barbara, King Manoel, Clara Curtis, and Princess Victoria; Mr. F. G. Bealing second, showing Elfrida, R. F. Felton, and Helen Lewis well. For one bunch of Sutton's Queen, these two exhibitors occupied similar positions. In Messrs. Toogood's class for nine bunches, there were three entries; two were disqualified, and the second prize was awarded to Mr. A. Maple, Aldermoor, Shirley. Mr. Bealing won Messrs. Webb and Sons' premier prize for eight bunches, with Elsie Herbert, Mrs. H. Dickson, King Manoel, and Masterpiece, and he led for nine distinct varieties with Thos. Stevenson, Asta Ohn, Mrs. R. Hallam, Etta Dyke, and Maud Holmes in the class provided by Mr. R. Sydenham; Mr. Maple second.

For a collection of four dishes of fruit, Ellen Lady Swaythling, South Stoneham House, Southampton (gardener, Mr. T. Hall), was the only exhibitor; the Madresfield Court grapes, melon, peaches, and nectarines were beyond ordinary quality. The same exhibitor also won for black grapes with Madresfield Court, and also for two bunches of white grapes with Muscat of Alexandria, and

for a dish of peaches with Dymond. The Locksheath Nursery Company had the best nectarines, Humboldt.

Vegetables were a distinct feature. Mr. Myers won the leading position in the classes provided by Messrs. Toogood and Sons, Southampton, six varieties; Messrs. James Carter and Co.'s Challenge Cup for eight dishes; Messrs. Sutton and Sons' for six; and Messrs. Webb and Sons' for the same number. Admiral Sir John Hopkins, Greatbridge House, Romsey (gardener, Mr. H. Mattingley), second in the two former classes, and also in Messrs. Webbs' collection.

Quite the finest trade display was that from Messrs. Sutton and Sons, Reading, who had a huge exhibit of sweet peas of the finest quality, including such varieties as Barbara, Doris Usher, Elfrida Pearson, Dainty Spencer, Mrs. Henry Bell, Edith Taylor, Cynthia, Audrey Crier, and W. P. Wright. Messrs. Toogood and Sons, Southampton, had sweet peas, vegetables, melons, etc., all attractively displayed. Messrs. W. H. Rogers and Son, Southampton, had standard roses, hardy plants, etc., an interesting exhibit. Mr. Fred Longster provided sweet peas in quantity, and of undoubted quality. Mr. C. Fay, Testwood Nurseries, Totton, Southampton, arranged carnations in the finest condition. Mr. A. F. Dutton, Iver, Bucks, also had carnations, such varieties as Winsor, Magra, May Day, Mrs. A. F. Dutton, Beacon, Scarlet Glow, and White Perfection being finely represented. Messrs. Jarman and Co., Chard, depended upon roses mainly for their interesting display. Messrs. B. Ladhams and Son, Shirley Nurseries, Southampton, had hardy plants in quantity and variety, including an interestingly-planted rock garden with the choice subjects this firm is noted for. Mr. E. Wills, The Nurseries, Winchester Road, Southampton, had miscellaneous plants. Messrs. E. Hillier and Son, Winchester, contributed an interesting collection of hardy plants, roses, carnations, and especially growing lilies. Mr. W. F. Gullick, florist, Salisbury, had a huge and attractive exhibit of violas in small bowls, which was much admired.

Bishop's Waltham.

The thirty-ninth annual show was held in Swanmore Park, an ideal spot for such a display, on July 16, and was a success. On the whole the entries were fewer, but the quality was quite up to the high standard attained here in the various sections.

The leading feature is the floral department; £5 is offered for the best decorated table, 6ft. by 3ft., orchids excluded; five competed. The best was an arrangement of Rose Mrs. Alfred Tate in a low bowl centrepiece, with corner vases all daintily filled with buds and blossoms in the right stage of development, associated with trails of Selaginella, and tinted rose foliage; this was from Miss Gertrude Saunders, Crumpherne, Fareham. The second was a low arrangement of Irish Elegance rose, most effectively displayed, by Mrs. Edgar M. Burnett, Holly Lodge, Westwood Road, Southampton. Mrs. A. Bide, Highlands, Farnham, was third with Lyon Rose rather too crowded in the centre.

For a dinner table of orchids with any natural foliage, Miss Saunders was again successful with a low centre silver bowl and corner vases of odontoglossums, cattleyas, Oncidiums, with odontiodas here and there, and suitable greenery; this was a most tastefully executed table, and was universally admired. Miss Taylor, Bemerton Rectory, Salisbury, was second with a rather too crowded centre of oncidiums, but the lælias employed at the corners were quite effective. Mrs. A. Bide was third.

For a similarly sized table of sweet peas Miss F. M. Molyneux, Swanmore Farm, Bishop's Waltham, won with Melba, effectively arranged in two low silver bowls, and four small silver trumpets, with suitable foliage; Mrs. A. Bide second with mauve and pink flowers; Miss Taylor third with a too high centre column of Barbara.

For the best arranged vase, Mrs. Burnett won with Rose Mdme. Melanie Soupert in prime condition, nicely interspersed with young rose shoots; Miss Taylor second with a pretty mixture of hardy flowers. Mrs. Burnett, with a daintily arranged exhibit of Lady Pirrie rose, won for a basket of flowers; Mr. G. Ellwood, Swanmore Park Gardens, second, with a light arangement of bougainvillea, gloriosa, and orchids. Miss Taylor won for a basket of wild flowers, quite prettily arranged; Mr. Ellwood second. Miss G. Saunders had the best vase of carnations, good blooms of R. F. Felton. Miss Taylor, with Barbara, scored for a vase of sweet peas. Bowls of roses were numerous and good. Mrs. Bide, with Lady Pirrie and Lyon, was easily first; and Miss Molyneux, with Lady Hillingdon, second.

Sweet peas were numerous and good. For twelve vases, distinct, J. Lowthian Bell, Esq., Curdridge (gardener, Mr. Regan), was first with a bright, fresh set; Mrs. Macrae, Meonstoke House, Bishop's Waltham (gardener, Mr. H. Childs), second. Mrs. Bashford, Soberton Towers, Bishop's Waltham, led for six bunches. Mr. Lowthian Bell won Mr. R. Sydenham's prize for six varieties. Mrs. Macrae was first in Messrs. Webbs' class. Mr. B. Peppler won Messrs. Toogood's prize for six varieties with good blooms. J. W. Bamforth, Esq., Northbrook House, Bishop's Waltham (gardener, Mr. Fursey), led in Messrs. Sutton's class for six bunches; and in Messrs. S. Bide's class for a similar number.

Roses were a strong feature. For six bunches, distinct, W. H. Myers, Esq., Swanmore House (gardener, Mr. G. Ellwood), secured the leading place with nice blooms of Liberty, Mdme. A. Chatenay, and Kaiserin Augusta Victoria; Miss Bashford second. Mr. Myers also led for six bunches of rambling varieties, and for six of any section in the class arranged by Messrs. Rogers and Son, Southampton.

Fruit was not largely displayed, though the quality was high. For four varieties Mr. Myers was first with melon, peaches, figs, and strawberries; he also won for four dishes grown in the open, with J. Lowthian Bell, Esq., second. Cottagers contributed excellent currants, gooseberries, and raspberries.

Vegetables were a fine display. Mr. Myers was unassailable in the classes provided by Messrs. Toogoods, Suttons, Carters, and Webbs, all for six dishes, and showed splendid produce. Mrs. Macrae was second in all the classes noted.

Mr. E. J. Wootten, Fair Oak, Eastleigh, had an exceedingly fine exhibit of cut carnations most tastefully arranged.

Dundee Horticultural Association.

The association's annual excursion took place on the 12th inst., and Murthly, the Perthshire seat of W. Stuart Fothringham, Esq., was the rendezvous. On arrival by train the party were met by Mr. James Lawrie, head gardener and forester, and subsequently Mr. and Mrs. Fothringham joined the party, mingling freely with all, and contributing in every possible manner to the interest and enjoyment of an afternoon spent in the woods around the historical mansion, for there was no time to explore the gardens, except the flower garden, which lies between the two castles. Here old-fashioned flowers and antiquity are respected in every detail: the delightful fragrance of old-world roses lavishly planted in beds of formal design, and their profusion of flowers were a revelation to all who were not too far carried away with enthusiasm and admiration for the huge specimen timbers and ornamental trees which Murthly is famous for, and everyone, from the genial Laird to the apprentice gardener, is justly proud of.

The picturesque landscape, from the finely-wooded heights of Birnam Hill to the low-lying banks of the Tay, contains so much of interest that a couple of days would be well spent in admiration of the natural beauty and historical association of the place, and the forestry museum, with Mr. Fothringham or Mr. Lawrie as exponent, is in itself a valuable education.

The hour of parting came all too quickly, and the cheers and thanks of the party were tendered to the kindly Laird, his gracious lady, and Mr. Lawrie.

United Horticultural Benefit and Provident Society.

The monthly committee meeting of this society was held at the R.H.S. Hall on Monday, July 14, Mr. J. Harrison Dick in the chair. Four new members were elected. The sick pay for the month on the ordinary side amounted to £40 15s., on the State side to £17 17s. 8d., and maternity claims to £10 10s. Three members were allowed to withdraw double the amount of their interest, i.e., £4 15s. 10d., £1 17s. 4d., and £1 14s. respectively. One member was also allowed to withdraw £10 from his deposit account. The committee also assisted one member from the distress fund. The sum of £26 13s. 7d. was passed for payment to the nominee of a deceased member, and the sum of £16 17s. 8d. standing to the credit of a lapsed member was also passed for payment. A long discussion took place on suggestions from two members respecting alterations of rules, but the matter was adjourned until the next meeting. Mr. J. Harrison Dick brought forward a scheme for advertising the society, which will bring its advantages more closely to the notice of the gardening profession.

NEW MEDAL ROSES AT GLOUCESTER.

As the names of some of the new roses to which awards were made at the National Rose Society's Exhibition at Gloucester, on the 15th inst., were accidentally omitted from the report we published in our issue of the 19th inst., we now give the complete list of awards. This is as follows:

Gold Medal.—To Messrs. S. McGredy and Son, Woodside Nurseries, Portadown, for Colleen (H.T.), Iona Herdman (H.T.), Mrs. Frederick W. Vanderbilt (H.T.), and Florence Forrester (H.T.); to Messrs. Hugh Dickson, Lim., Royal Nurseries, Belfast, for Gorgeous (H.T.), Countess Clanwilliam (H.T.), and Mrs. Archie Gray (H.T.); and to Messrs. Alex. Dickson and Sons, Royal Irish Nurseries, Newtownards, for G. Amedee Hammond (H.T.).

Silver-Gilt Medal.—To Messrs. S. McGredy and Son, for Eileen Smiley (H.T.).

Card of Commendation. — To Messrs. S. McGredy and Son, for Mrs. Franklin Dennison (H.T.); and to the Rev. J. H. Pemberton, Havering, Romford, for Ceres (H.T.).

The medal for the best bloom of a tea-scented variety shown by amateurs was awarded to Mr. J. H. Welch, Londonderry, for a fine bloom of Mrs. Foley Hobbs.

FORTHCOMING ENGAGEMENTS

NEXT WEEK.

TUESDAY, July 29.—Royal Horticultural Society: Committees meet at 12 o'clock; the Tenth Masters Memorial Lecture, at 3 p.m., by Professor R. H. Biffen, M.A., on "Some Factors in the Prevention of Disease in Plants"; Scientific Committee at 4 o'clock.
Gladiolus Show at the Royal Horticultural Hall.
WEDNESDAY, July 30.—Midland Carnation Show, two days.
Worth Horticultural Society.
Co. Clare Summer Show.
Chesterfield Flower Show.
Rolleston Summer Show.
Alderley Edge Flower Show.
THURSDAY, July 31.—Dawlish Summer Show at Luscombe Park.
Burnley Flower Show; four days.
SATURDAY, August 2.—French Horticultural Society of London.

OBITUARY.

MR. ROBERT SYDENHAM.

It is difficult to believe we have "bid the long farewell" to Mr. Robt. Sydenham, and that never again shall we see his sturdy, grey-clad figure, and hear his hearty laugh at sweet pea and daffodil exhibitions, and other horticultural gatherings. Not one of the fifty or more who said good-bye to him, at the close of the dinner following the Great Sweet Pea Show in London on Thursday, July 17, imagined for one moment it was the last good-bye, and that about forty-eight hours later he would pass into the "great beyond." Mr. Robert Sydenham, founder and director of Robert Sydenham Limited, seedsmen and bulb merchants, of Tenby Street, Birmingham, went from London to the Birmingham Show on Friday, July 18; on Saturday, July 19, he was at the offices at Tenby Street, as usual, where about eleven o'clock he was found insensible, death supervening with tragic suddenness.

A tremendous worker and a keen business man to the finger-tips, Mr. Robert Sydenham crowded an enormous amount of work into his sixty-five years of life. He was born at Salisbury in 1848, and after school became apprenticed to a general hardware firm in Birmingham. His great ability, application, and industry soon secured advancement, and he became the firm's representative in the United States and British North America, where he travelled for several years. In 1872 he entered the wholesale jewellery business, and established the firm of Sydenham Brothers. For ten years or so he travelled in the southern and western counties and in South Wales on behalf of this business. He was eminently successful both as traveller and as director, and in later years, after the retirement of one brother and the death of another, the responsibility of this big concern fell upon his shoulders. About 1884 Mr. Sydenham took up gardening as a hobby, and put as much energy and keenness into his hobby as into his business. Ere long he began to purchase seeds and bulbs in some quantity for himself and friends, and eventually commenced a small seed and bulb business as a "side line." So rapidly, however, did the business extend that large premises were built to accommodate it, at Tenby Street, attached to those in which the jewellery business is conducted. Mr. Sydenham was quick to see the possibilities of fibre for bulb growing and the attractiveness of undrained bowls, fancy pots, etc., for the cultivation indoors of spring-flowering bulbs, and he made these an important part of his business. In connection with his bulb business he visited Holland, Ireland, and the Channel Islands frequently, and he fostered the cultivation of daffodils in Anglesea. Sweet peas early caught his fancy, and ever since the celebration of the bicentenary of the introduction of the sweet pea into England he has been steadily advocating the claims of the queen of annual flowers. He gave prizes for sweet peas at most of the leading exhibitions in the country, and was a generous supporter of the National Sweet Pea Society, and in 1912 was president of that body.

Carnations fascinated him, and for many years his flowers, grown in his private garden at Edgbaston, were hard to beat in Birmingham and London. For six successive years he won the Midland Champion Carnation Medal, and he spared no pains or money in securing the best varieties and the highest cultivation. In later years, however, daffodils and sweet peas were his prime favourites, although he loved all flowers, and was never happier than when with his family in his garden. The Midland Daffodil Society was one of Mr. Sydenham's favourite institutions, and one upon which he lavished time and money. The evening previous to the daffodil show he invariably invited a few of the leading growers and raisers to dinner at his private house, and to those who have at any time had the privilege of an invitation, these functions will remain as very pleasant memories. Then there would be luncheon to all exhibitors and helpers in the Botanic Gardens on show day, and, in the evening, dinner at an hotel to all who had taken part, followed by an informal discussion upon some daffodil subject.

Keen business ability did not blunt Mr. Sydenham's generous instincts. His leading employees all have a direct interest in the success of the business. A hard worker himself, he expected full measure from others, but he was none the less a kind and considerate employer. In illness or trouble he became a personal friend, and every bit of extra work or special success received acknowledgment. One of his happiest days was that on which he visited London with Mrs. Sydenham, to purchase blouses and dress lengths for Christmas presents to his girl employees. He dearly loved to get the best of a business deal, but had an open-hearted generosity that was none the less real because so much of it found expression in a quiet and unostentatious manner.

Those who were his keenest competitors in business had a great admiration for Mr. Robt. Sydenham's talents. His methods of advertising were often quaint, but always effective, and he had a wonderful knack of getting his business and himself talked about.

Mr. Sydenham leaves a widow and two married daughters, and to these we tender our sincerest condolence and sympathy, for nowhere will his loss be so greatly felt as at Beech Court, Edgbaston.

The funeral took place on Tuesday, July 22, and the service, conducted chiefly by the Rev. Joseph Jacob, of Whitchurch, was held in the Old Church, Edgbaston. There was a large attendance, and the chief mourners included: Mr. William Sydenham, Mr. Albert Sydenham (the two surviving brothers), the two sons-in-law, and Mr. Herbert Smith. Others present at the service and the interment at Lodge Hill Cemetery, Selly Oak, were: Mr. Pressly, Mr. Price, and Mr. Dean, members of the staff at Tenby Street; Mr. W. H. Parton, who represented the Midland Carnation Society; Mr. C. Lemeslie Adams, Midland Daffodil Society; Mr. Christopher Bourne and Mr. Goodwin, R.H.S. Daffodil Committee; Mr. C. H. Curtis, who represented the National Sweet Pea Society and The Gardeners' Magazine; Mr. F. W. Harvey and Mr. Quick, from "The Garden"; Mr. W. H. Mortar, Superintendent of the Birmingham Parks; Mr. Thos. Humphreys, Superintendent of the Birmingham Botanic Gardens; Mr. Walter Jones and Mr. Spinks, who represented the Birmingham Horticultural Societies; and Mr. Alfred Watkins, who represented the London wholesale seedsmen.

Flowers were sent in quantities as tokens of respect from relatives, friends, and the various societies with which Mr. Sydenham was connected, and it was noticeable that carnations and sweet peas were the chief flowers used, and a wreath of rosemary, "for remembrance," was placed on the coffin.

THE LATE MR. ROBERT SYDENHAM.

Sandringham Gardens. — Mr. Cyril Ward, R.C.A., the author-artist of "Royal Gardens," has, by command of Queen Alexandra, just painted for her Majesty a series of water-colour drawings representing various aspects of the delightful gardens and grounds of Sandringham, which have been exceptionally beautiful during the past spring season.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of THE GARDENERS' MAGAZINE, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the GARDENERS' MAGAZINE, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in THE GARDENERS' MAGAZINE. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

TRACHELIUM CŒRULEUM.—H. C. V., Stone: At an exhibition I recently visited Trachelium cœruleum was used very effectively in one group of miscellaneous plants. It is so graceful and pretty that I should like to cultivate it for the conservatory. Is it propagated from seeds or cuttings?—Trachelium cœruleum is readily raised from seeds sown in gentle heat in early spring, or from seed sown in a frame in autumn as soon as ripe. Transfer the seedlings to small pots, singly, at an early date, and in the case of spring-sown stock, proceed to harden off the plants early, as they are almost hardy, and only need frame or cool greenhouse protection. Cuttings of young shoots may be inserted in early summer, under a handlight or frame, or the old stools may be shaken out and the basal growths separated and potted in autumn or spring. Light loam, leaf-soil, and sand make a suitable compost, and 48-sized pots will be sufficiently large to flower the plants in.

ASPARAGUS SEEDLINGS.—F D., Crowborough: Many thanks for sending the other seedlings. We have inspected them, and still believe that the condition of the soil and lack of moisture are answerable for the yellowing. One or two seedlings have broken roots, but probably this breakage was caused when lifting the plantlets, though it suggests the possibility of harm resulting from wireworms or weevil grubs. Try a few carrot and potato traps for wireworms, and let us know the results.

INSECTS IN MELON HOUSE.—J. A. W., Wimborne: I am enclosing some tiny beetle-like insects found in my melon house. I find they attack the melon leaves, and in some instances they have eaten the edges of leaves. I shall be glad if you can tell me what the insect is, whether it is a real pest, and if so, how to deal with it.—The postal authorities left us little chance of determining what the insect was, as all we found in the cotton wool inside the letter was a few minute squashed bodies, that look like red ants without feelers. Try to find whether the pests have a general home, and if such is found, boiling water will probably put an end to the trouble. Failing this, fumigate the house on two or three successive evenings, and endeavour to trap the insects by means of melon and cucumber leaves laid on the soil, and by means of pieces of wood and slate smeared with treacle.

CULTURE OF GARLIC.—C. C., Dartmouth: After long residence in Spain and Italy, I have acquired a considerable liking for garlic. This may be a very dreadful confession to make, especially as I find it very difficult to obtain garlic, and so must consider it to be unfashionable and little grown. Can you tell me how to grow this somewhat vulgar crop?—Garlic is not much used in this country, though not a few allotment holders in Surrey and Kent grow a row or two, very much as they grow shallots. Obtain cloves, or bulbs, of garlic early in the year, and plant them at the end of February, nine inches apart, in rows a foot apart. The soil should be rich and finely worked, but no fresh manure should be provided for the crop. Use a dibber for planting, and just cover each clove with soil.

AQUATICS FOR SMALL POOL.—E. E., Grimsby: You will very greatly oblige me by naming about half a dozen aquatics that would be suitable for cultivation in a small pool of water in a sheltered and sunny position. The strong-growing water lilies of the Marliacea and tuberous groups are far too large for me.—Among the nymphæas three very pretty and quite small-growing sorts are N. tetragona, N. Helveola, and N. pygmæa. Other aquatics of modest growth and considerable beauty are Aponogeton distachyon, Echinodorus ranunculoides, Menyanthes trifoliata, and Limnanthemum peltatum, known also as Villarsia nymphæoides.

DAMAGED MUSHROOMS.—B. C. K., Bromsgrove: I send you a few mushrooms from a bed that has cropped well, but numbers of the mushrooms appear to be eaten by some pest or other. Can you say what causes the damage?—Woodlice have been at work amongst the crop, and the damage is due to their depredations. Use every possible means to trap and destroy these pests. Small, dirty boards placed round the edge of the bed, dirty side down, form excellent traps that must be frequently examined.

CROSNES.—J. B., St. Leonards: My employer wishes me to grow a vegetable he has enjoyed in France, where it is called Crosnes du Japon. Please tell me what this vegetable is, as I must confess to entire ignorance of it under such a name.—Crosnes are the tubers of Stachys tuberifera, frequently known as the Japanese artichoke. It is easily grown, and crops freely, but as the tubers are small they do not commend themselves to cooks at home. Tubers for planting may be purchased in the spring and planted in rich soil in a sunny position. The tubers are curiously constructed, but each portion carries a bud, and so each tuber may be divided for planting. When the leaves die in the autumn it is time to lift the tubers, though, as in the case of potatoes, there will be tubers fit for cooking before the leafage withers. Store in sand until required. Plant three inches deep and a foot apart, in rows 1ft. 6in. apart, at the end of March or early in April.

NAMES OF PLANTS.

C. J., Saltaire.—1, Alnus glutinosa; 2, Ostrya carpinifolia.

B. E., Llandudno.—1, Thalictrum angustifolium; 2, Lavatera Olbia.

J. S. F., Bromley.—1, Galega officinalis; 2, Gilia densiflora; 3, Hypericum calycinum.

H. W. J., Louth.—1, Sidalcea Listeri; 2, Dianthus deltoidea; 3, Leptosyne maritima; 4, Scrophularia aquatica.

H. A. N., Hampstead.—1, Sagittaria sagittifolia; 2, Butomus umbellatus; 3, Salvia pratensis; 4, Veronica spicata.

M. E. L., Hitchin.—1, Inula glandulosa; 2, Achillea filipendula; 3, Abutilon megapotamicum; 4, Fuchsia gracilis; 5, F. fulgens; 6, Vaccinium Vitis-Idæa.

NOTICE.

READERS experiencing difficulty in obtaining "THE GARDENERS' MAGAZINE" at any bookstall or newsagent should write to the

PUBLISHING MANAGER,
148-9, Aldersgate Street,
London, E.C.,

who will give the matter immediate attention.

MARKETS.

COVENT GARDEN.

Flowers.

Flowers are cheaper, and the demand has slackened somewhat.

VOL. LVI.—No. 3,118. SATURDAY, AUGUST 2, 1913.

THE GARDENERS' MAGAZINE

NOTE OF THE WEEK.

The Future of the Crystal Palace.

The rapidity with which the Bill introduced into Parliament for giving statutory power to local authorities to contribute to the cost of acquiring the Crystal Palace for the nation, is passing through its several stages, should afford immense satisfaction as an additional proof of the strong desire that is being felt for the preservation of this historic building and its beautiful grounds. It is certainly most gratifying to have unquestionable evidence that the public bodies, whose spheres of activity are in the southern parts of the Metropolitan area more or less fully appreciate their responsibilities, and are taking the steps necessary to contribute liberally to the Mansion House Fund. Since the completion within fourteen days of the arduous task undertaken by "The Times" to raise £90,000, the amount estimated by the Lord Mayor as necessary to complete the sum of £230,000 required for the purchase of the Crystal Palace, there has not been any doubt as to the ultimate result. If there has not been any apprehension with regard to the desired amount being forthcoming, the fact has not been lost sight of that not until the public bodies have made their contributions will it be possible for the Lord Mayor to make the purchase. Hence the satisfaction that may be derived from the promptitude with which the borough councils, in whose area the Crystal Palace and grounds are situated, have voted substantial amounts. The claims upon these bodies are necessarily great, but they are not limited exclusively to them, for the acquisition of the Crystal Palace is a national rather than a local question. The visitors have not been drawn from any one part of the Metropolis, or indeed exclusively from the metropolitan area, but they have come from all parts of the country. There is no likelihood of any great change in this respect, and it would be an immense advantage were public bodies throughout the United Kingdom to take some part in the movement. The Bill now before Parliament will afford them ample opportunities for doing so, as it gives power to any metropolitan borough council, and the council of any administrative county, any municipal corporation, and any urban district council in England and Wales to contribute such sums as they may think fit, with the sanction of the Local Government Board; and provision is made for the raising of the money by a rate or otherwise. It is yet too early for those who are engaged in raising the funds necessary for the completion of the purchase to give public expression to definite views with regard to the future of the Crystal Palace. The Lord Mayor has stated that he will, without loss of time, take the steps necessary to form a committee, or similar body, drawn chiefly from the largest subscribers, to consider this all-important question. We know also that under the Bill referred to "Parliamentary powers will be sought hereafter to provide for the public control and maintenance of the property." This question is one of immense interest to those who are in any way concerned with the various aspects of horticulture. The vast edifice which for sixty years has been a conspicuous landmark in approaching London from the south is the outcome of the genius of Sir Joseph Paxton, the greatest gardener of his day, and the grounds which form so delightful a setting, with their magnificent terraces and fountains, were designed by him and laid out under his direction. Of this fact the gardening community have full justification for indulging in a feeling of pride that so great an accomplishment is the exemplification of the taste and skill of one of its own members. Gardeners should also be imbued with a strong sense of satisfaction that Paxton's work has been saved from the builder by the generosity and public spirit of the Earl of Plymouth, who is not only a liberal patron of gardening, but takes a deep interest in the welfare of gardeners, as proved to demonstration by his occupying the position of president of the British Gardeners' Association. Of interest also is the fact that for nearly half a century the Crystal Palace was a great centre of horticultural activity, and exercised an enormous influence for good on the advancement of gardening. For a long series of years there were exhibitions of spring flowers of the most delightful character, summer shows of great excellence, at which all the leading growers of stove and greenhouse plants, orchids, and certain classes of soft-wood plants might be seen in competition. Then in the autumn, there was an exhibition of fruit and dahlias that was so remarkable for its extent and the high quality of the products as to attract members of the gardening community in their thousands. It was possible to see plants, flowers, and fruits that belong to the summer season in a high degree of perfection at the South Kensington and Regent's Park exhibitions, but to enjoy the charms of dahlias and gladioli and the fruits associated with the autumn it was necessary to visit the September exhibition at Sydenham. Many also were the exhibitions held under the auspices of the National Rose Society, and not a few shows have been held by the National Chrysanthemum Society and National Dahlia Society, which continue to make the Crystal Palace their home. With regard to the grounds it is not unreasonable to assume that when the Crystal Palace passes under public control the buildings with which the grounds are now crowded will wholly, or in part, disappear, and that the great exhibitions will be held in the building for which it is so well adapted. This will afford opportunites for demonstrating the best methods of beautifying the grounds with hardy and tender plants during the summer and early autumn months, due

MR. A. E. USHER.

consideration in this matter being given to the prevailing taste at the time. By the adoption of some such method it will be possible to so use the various plants available as to give the arrangements considerable educational value. It will be practicable to proceed still further in the education of visitors in the selection and arrangement of both hardy and tender plants employed in garden decoration. We would, for example, set apart one or more areas in positions convenient of access, and devote them, not to trials, but to the demonstration of the best of the varieties for garden decoration that are in general cultivation. One of these demonstration gardens might be devoted to roses, another to dahlias, another to early-flowering carnations, and so on, the beds to be of moderate size, and each to be filled with one variety. In carrying out a scheme of this kind, there can be no doubt that the special societies would readily render assistance in the selection of varieties, and might probably contribute the plants of such as they may, because of their great merit, be desirous of bringing prominently into notice. It might also be possible to arrange a set of school gardens, which would serve as models for adoption in school areas, and be useful to both teachers and scholars as illustrative of the best methods of cropping, etc. Whatever may be the future of the Crystal Palace, we trust that, as in the past, horticulture will be closely associated with it, and that the educational side of the art will be constantly kept in view by those responsible for its management.

Mr. A. E. Usher, of sweet pea and carnation fame, is particularly fortunate in having as employer such an enthusiastic garden lover as Sir Randolf Baker, Bart., M.P., because Mr. Usher's many successes have only been possible as a result of the keen and generous interest Sir Randolf takes in his garden at Ranston, Blandford, Dorset. Mr. Usher gained most of his experience in the County of Kent, where he was born, and, after becoming foreman at Down House, Blandford, became head gardener at Ranston, a position he has held since September, 1905. His first exhibit was a group of plants and chrysanthemums at Bournemouth in 1906, when he won the first prize and silver cup. In 1906 he commenced sweet pea culture, and won a first prize at Southampton with his first exhibit; the year following he won the Sutton Cup at the National Sweet Pea Society's exhibition, and has repeated that win this year. In 1910 he was in great form with sweet peas, winning the Eckford Cup, Humphery Cup, and ten first prizes at the National Show, and about fifty other first prizes at provincial shows within a fortnight. He holds six of the N.S.P.'s gold medals, two R.H.S. silver cups, and this year secured the coveted gold medal of the Royal Horticultural Society at the Holland House Exhibition. At the International Horticultural Exhibition he won two gold medals and a silver cup for sweet peas and perpetual-flowering carnations. With the latter flower he is as successful as with sweet peas, and grows a considerable number of plants right well. Mr. Usher also grows vegetables excellently, and has a large and pretty garden under his care. Flowering trees and shrubs and Iris Kæmpferi are subjects that receive special attention at Ranston, and the upkeep of the garden shows that Mr. Usher does not put all his energy and enthusiasm into sweet peas and perpetual carnations.

Chelsea Physic Garden.—In our next issue (August 9) we shall give an illustrated account of the famous Physic Garden at Chelsea, wherein Aiton and Miller, Curtis and Forsyth, Anderson and Fortune, and Moore and Lindley did excellent work in the cause of botanical science in bygone days. Within recent years the garden has been greatly improved in various directions, and the changes that have been made with a view to greater efficiency form by no means the least interesting part of the historical sketch of this old garden.

Research Scholarships. — The Board of Agriculture has awarded research scholarships of the value of £150, tenable for one year, to Mr. F. L. Engledow, Mr. G. O. Sherrard, and Mr. T. Trought, genetics; to Mr. E. J. Holmyard, plant nutrition and soil problems; and Mr. R. C. Knight and Mr. S. P. Wilshere, plant physiology.

Irish Potato Crop.—Potatoes in various parts of Ireland have suffered considerably from the unfavourable weather that has been experienced at several periods since the planting season. In the Midlands much damage was caused by the floods on the Shannon. In the district of which Athlone is the centre, two distinct crops of potatoes are grown, one for the supply of the Irish markets with early potatoes, and the other for the production of tubers for planting. The early crop was destroyed by the floods in March and April, and a second crop had to be planted. The floods of June also did much damage. Disease has made its appearance in County Limerick, but as yet no considerable amount of damage has been done. Spraying, owing to the rains, has been less effectual in repressing the disease than usual.

John Innes Horticultural Institution.—On July 18 some of the members of the Royal Horticultural Society's Scientific Committee visited the John Innes Horticultural Institution at Merton, on the invitation of the director, Mr. W. Bateson, F.R.S. The party included Dr. A. B. Rendle, Dr. Voelcker, Messrs. C. E. Shea, W. Cuthbertson, A. W. Sutton, W. Fawcett, W. Hales, A. R. Rolfe, and F. J. Chittenden. The main aim of the institution is investigation into the laws of inheritance, but there are also experiments in progress on certain plant diseases, especially those of peas, and on silver-leaf in plums, etc. The latter clearly corroborate the findings of other experimenters with regard to the fungus Stereum purpureum being the cause of the trouble. Perhaps the chief interest at present attaches to the series of investigations into the inheritance of sex, especially in the tropæolums, reseda, and other plants. But fruit trees (self-fertility and self-sterility) and peas, potatoes, gooseberries, primulas, calceolarias, begonias, capsicums, campanulas, and various other plants are contributing to the investigations afoot. Many complications are being discovered in the modes of inheritance, but most are slowly yielding to the application of the analytical method, upon which Mendel based his far-reaching generalisations.

Mulching Roses.—In conjunction with the July meeting and show of the North of England Horticultural Society at Leeds, there was a discussion on roses and their cultivation. Mr. Percy Clapham, secretary of the Society's Plant and Floral Committee, in the course of the discussion, stated that he considered the large percentage of failures which rose-growers experienced was due in the main to the practice of winter mulching, which he characterised as harmful and unnecessary. Inasmuch as all the varieties of roses cultivated were grafted on to the English brier, which was so hardy that the severest winter and the driest of summers could not kill it, it followed, he said, that the roses worked upon it were hardy too. A number of the members took up the discussion on this point, the consensus of opinion being that circumstances, such as altitude and exposure of position, made all the difference as to the correct methods of treatment. The English brier is, however, by no means the only stock used in the propagation of roses by budding and grafting.

Magnesia as a Fertiliser. — A number of experiments with magnesia salts have been carried out at the Woburn Experimental Farm, with the result that it has been proved that magnesia can with advantage be added to a soil poor in magnesia provided the amount does not exceed that of lime.

Delphiniums from Langport.—From Messrs. Kelway and Son we have had the pleasure of receiving a gathering of flower spikes of delphiniums, which have for many years constituted one of the more important features of the Langport Nurseries. The specimens received are not only immensely attractive, but are of much interest as evidence of the remarkable development which these flowers have undergone within recent years, not only in the size and form of the flowers, but in the increase of the range of colouring.

Extension of Streatham Common.—The extension of Streatham Common, known as "The Rookery," which was purchased some time since at a cost of £3,075, is now open to the public. The extension consists of rather more than three acres of land, and is situate on the southern side of the common. On the wide-spreading lawn are some of the finest specimens of the Cedar of Lebanon within the metropolitan area. The other features are an Old English garden, a White garden, a rock garden, a wild garden, and a woodland walk. The laying out of the extension has been executed from the designs and under the supervision of Major Maud, C.M.G., Chief Officer of the Parks Department of the London County Council.

A New Home for American Blight.—In a paper recently read by Professor G. H. Carpenter at a meeting of the Royal Dublin Society, attention was called to the fact that the woolly aphis, or American blight, has found a new home for the winter. It was stated that the cores of a number of apples imported from America and sold in Dublin contained insects, and reference was made to the fact that by means of the imported fruit the introduction of the pest into fresh districts might be readily brought about.

Dr. M. C. Cooke, the distinguished fungologist, who for a long period occupied a position in the herbarium of the Royal Gardens, Kew, from which he retired some years since, completed his 88th year a few days since. Those who knew Dr. Cooke, or are acquainted with his works on fungi, will be sorry to learn that his eyesight is failing him, and they will readily understand that it will prevent him continuing the researches among the fungi to which he has devoted so many years. In the course of his long and active life Dr. Cooke wrote much on the fungi, especially those injurious to plant life, although he could have received but little encouragement, for not until quite recently has the importance of fungi in the economy of the garden and farm been fully appreciated. His most important work is his "Illustrations of British Fungi," which was published in eight volumes at £24, but the work that is best known to the general public is "Fungi," which was published in the International Scientific Series. Dr. Cooke

who is a native of Norfolk, had a somewhat varied experience in his younger days. He was first a teacher at a Birmingham school, then became a teacher at a National school in Lambeth, and later was apprenticed to the drapery trade, subsequently becoming a lawyer's clerk. He must, however, have devoted much time and attention to the study of fungi after he had commenced the battle of life to have enabled him to obtain the official positions he eventually occupied at the Indian Museum and Kew, and filled them with such remarkable ability.

A Gardening School for Feeble-minded Girls has been formed at Knotty Ash, and is, we understand, making very satisfactory progress. Canon Sylvester states that the school is the only one of its kind in Europe, and that its existence is due to the efforts of the members of the committee of the Liverpool Society for the Care and Training of Young Girls. The school has forty-three scholars, and the object is to develop their minds by encouraging healthy occupation, and this it is thought can be the most satisfactorily accomplished by teaching gardening. So far the results have fully justified this view of the case.

Australian Dried Fruits.—An interesting statement illustrative of the remarkable development which the dried fruits industry has undergone in Australia within recent years was made at the annual conference of the Australian Dried Fruits Association, recently held at Melbourne. According to the statement made the forty delegates represented over 10,000 persons who are dependent upon the production of dried fruits for their livelihood, besides between 3,000 and 4,000 casual labourers. The annual production of dried fruits controlled by the association is about 12,000 tons, of the value of close upon £500,000.

Oxydases in Plant Tissues.—Mr. W. R. C. Atkins contributed to the monthly meeting of the Royal Dublin Society a paper having reference to oxydases in plant tissues. He expressed the opinion that the distribution of oxydases seems to point to their being concerned in the production of cork and sclerenchyma. The guard cells of stomata and the cells abutting on them are particularly rich in epidermal oxydase. The leaf-saps of Iris germanica and Aspidium filix-mas contain powerful reducing substances which inhibit oxydase reactions. Precipitation of the enzymes by alcohol or removal of the reducing substance by dialysis permits of the detection of oxydase. The colours of the perianth of iris are due to the presence of a yellow plastil pigment, or of a purple anthocyan chromogen, which arises by the action of the epidermal peroxydase on a chromogen.

The Scottish Raspberry Crop.—We learn from "The Scotsman" that the gathering of fruit commenced at the raspberry farms at Drumtogle, Auchterarder, on July 21, and has since become general throughout the district. The dry weather has brought the fruit on rapidly, and if it continues the crop will not be a large one. The prices for raspberries at present are £33 per ton. The growers are holding back, because they fear that, with the prospect of a short crop, they might oversell. It was expected that there would be some difficulty in obtaining pickers because of the spell of good trade, but at present a large number are to be seen at the roadsides, and it is now thought that there will not be much difficulty in this connection. About six tons of fruit were sent from Auchterarder Station on the first day of gathering.

NOTES FROM KEW.

Achimenes.

A collection of these charming summer-flowering gesnerads is brought together in the cool portion of the T range, and so attractive are they that it is a matter for regret and surprise that they are not more often met with in gardens. The probable reason is that they are of but little use for the supply of cut flowers. The range in colour among the large-flowered forms of achimenes is now an extensive one, varying from pure white to deep purple, while of the scarlet kinds the old Achimenes coccinea, the first member of the genus to be introduced into this country, still holds its own. A garden form of much the same hue which probably originated from it is Dazzle. In both of these the flowers are smaller than those of the purple ones. Taken altogether, achimenes are of very easy culture, one important point to bear in mind being that they require a liberal amount of good leaf-mould in the potting compost.

Bougainvillea rosa catalina.

It is now four years since this beautiful and distinct bougainvillea was shown at one of the meetings of the Royal Horticultural Society, when the rich colour of its bracts so impressed everyone that it was awarded a first-class certificate. These bracts are totally without the magenta shade, which is so objectionable to many, their colour being of a rich rose-pink. A small plant in the succulent house is now flowering freely.

Oxalis floribunda.

Good use is made of this showy flowering oxalis as an edging to the stages of the succulent house, for the rich green, handsome leafage droops over in a very graceful manner, and also serves admirably as a setting to the bright coloured blossoms. This oxalis might with advantage be more often treated in this way, while for hanging baskets it is also well adapted.

Interesting Begonias.

As most of the tuberous begonias now grown are of garden origin, a selection of some of the original species in the cool end of the T range is very interesting. Conspicuous among them are Begonia Dregei, noteworthy as being one of the parents of Gloire de Lorraine; Begonia Sutherlandi, one of whose progeny is B. Weltoniensis; Begonia Baumanni, a tuberous kind with carmine-rose-coloured flowers, native of Bolivia; Begonia Pearcei, to which we are indebted for the yellow and similar tints among the tuberous-rooted varieties of today; Begonia Davisi, whose dwarf habit has had a great influence among the present race of tuberous-rooted begonias; and the distinct Begonia gracilis grandiflora, a native of Mexico, with rose-coloured blossoms.

Eustoma Russelliana.

This Mexican gentian-wort, more generally known as Lisianthus Russellianus, is now flowering freely in the intermediate portion of the T range, though the blossoms are hardly as richly coloured as when they develop in a lighter and more airy structure. It is, however, a very handsome plant, whose successful culture was in the days long past looked upon as a good test of the cultivator's skill. At Kew there is a white variety (alba) associated with the ordinary form. The new comer is very chaste and beautiful, and affords a direct

SUTTON'S RED SUNFLOWER.

Flowers rich yellow, with brown-red band round the disk. A.M., R.H.S., July 29. Messrs. Sutton and Sons, Reading.

contrast to the type. These eustomas are best treated as biennials, and flowered the year after the seed is sown.

Pavetta caffra.

Each recurring summer this forms a pleasing feature in the cool portion of the T range, yet, for some reason or other, it is rarely, if ever, met with elsewhere. It forms a neat-growing, freely-branched shrub, clothed with smooth, obovate leaves, while the flowers, which are borne in great profusion in compact, rounded heads, are white with long prominent stamens. Being a native of Caffraria, this pavetta needs rather more heat than those from the more southern part of Africa. In the days of the old Chiswick shows this pavetta used to figure among the specimen plants then exhibited.

Dædalacanthus Watti.

This is a near relative of the popular Dædalacanthus nervosus, which is more generally known in gardens as Eranthemum pulchellum. From the older kind D. Watti differs from its being dwarfer in habit, while the flowers, which are about an inch across, are of a deep bluish-purple colour. It also flowers much earlier, as is well shown in the case of a group of plants in the intermediate portion of the T range. Where glass structures have to be kept gay at all seasons, both these species of Dædalacanthus are exceedingly useful for the purpose. D. Watti is also known as D. parvus.

Lindenia rivalis.

This strange flower, somewhat like an exaggerated bouvardia, is in bloom in the stove portion of the T range. It forms an evergreen shrub, is a native of Mexico, and the white blossoms are borne in few-flowered corymbs. They are star-like, about 1½ inches across, and with a corolla tube six inches long, the latter giving to plants in bloom a singular appearance.

Costus speciosus.

This member of the Ginger-wort family is common in India, but it is not often met with in cultivation here. From a stout root-stock are produced erect, leafy shoots to the height of a yard or more. They are terminated by a cone-like head of bracts, from whence the flowers are produced. In the case of C. speciosus they are of a satiny white tint, while in another species —C. igneus—which blooms later in the season, they are of a brilliant orange hue. Costus speciosus is now in flower in the T range.

Combretum purpureum.

Though long in cultivation, and at one time far more generally met with than it is now, this combretum always arrests the attention of visitors to Kew when in flower. It is trained to the roof of the stove portion of the T range. The oblong, lanceolate leaves are of a dark, shining green, and the flowers are borne in panicles, and are of a pleasing shade of light scarlet. This combretum is also known as Poivrea coccinea; indeed, this is the name under which it occurs in the "Dictionary of Gardening," but at Kew the older name of Combretum is retained.

The Victoria Lily House.

The gigantic water lily, from whence this structure derives its name, is not yet in bloom, but in the same tank two of the blue-flowered tropical species of nymphæa are blooming freely. They are the Australian Nymphæa gigantea and Nymphæa stellata, which is a native of tropical Africa and Asia, and of which several varieties are in cultivation. K.

PARTIAL STERILISATION OF SOILS

Within a quite recent period we have received several inquiries about the most advanced methods of partially sterilisation of soils used in crop production under glass for the purpose of suppressing insect and fungoid contained therein. The most recent information available on this important subject is that contained in a lengthy report by Dr. E. J. Russell and Mr. F. R. Pethridge which was published in the issue of the "Journal of the Board of Agriculture" for January last. Both Dr. Russell and Mr. Pethridge have devoted much attention to the investigation of soil sterilisation, and the results of their researches cannot be too widely known. We publish the portion of the report relating to the methods of procedure in the partial sterilisation of soil by heat and chemicals, and refer those of our readers to the issue of the publication containing the report for particulars of the results obtained in dealing with the various crops included in the researches.

Partial Sterilisation.

There are two general methods of partial sterilisation. The soil may be heated to about 200 degrees F. by steam or dry heat, or it may be treated with chemical antiseptics. Up to the present time heat has been found to give the better results, because it not only kills the various detrimental and disease organisms, but it also brings about a certain amount of decomposition, thus lightening the subsequent work of the food-making bacteria, while in some instances it improves the physical condition of the soil. Chemical treatment is cheaper and more convenient in practice, but, on the other hand, is less effective, even when thoroughly done; it is also difficult to effect thoroughly, since some of the antiseptics cannot readily be distributed uniformly in the soil, even by watering, because they are absorbed by the top layer of soil from their solutions or emulsions.

None of these difficulties are insuperable, and it would be premature to offer any opinion as to which method will finally prove better for the grower. The more effective must in the end be the more profitable, but there is nothing to show that chemical treatment will always be less effective than heat, and, in fact, the difference between them has been distinctly reduced by the use of new antiseptics.

Partial Sterilisation by Heat.

Two methods of partial sterilisation by heat are in use. In one the soil is heated directly by means of a coke fire; in the other it is subjected to the action of steam. The choice is largely dictated by convenience and engineering detail, there being no sufficient evidence of any difference in effectiveness when the soil is equally heated in both cases.

In the direct heat sterilisers the soil is heated for a number of hours, and is then removed to make way for another charge; the process is practically continuous, and can be worked with but little labour. There are several advantages in working with moist rather than dry soil; the danger of overheating is minimised, and the heat travels more rapidly and uniformly throughout the mass, since moist soil is a better conductor than dry soil.

Several methods have been adopted for heating by steam. Perhaps the best known consists in blowing steam into the soil through a gridiron-shaped instrument 4 or 5ft. by 3 or 4ft., made in 1in. piping perforated with holes one-eighth of an inch in diameter. This instrument is placed in a wooden frame without top or bottom, and capable of holding a load or more of soil. Soil is then filled in, and the whole is covered with sacks. Connection with the boiler is made by a 2in. hose pipe, and steam is blown in for about 20 to 30 minutes. When high pressure (80lb.) is available a larger amount of soil can be treated at once; when only low pressure can be used, the soil should not be too wet to begin with, or much condensation may occur. Considerable economy can be effected by performing the operation in the house itself, and moving the tackle along the borders as each piece is treated.*

Another implement used in precisely the same manner is shaped like a harrow; this is also made of gas piping, but is fitted with nine or more tines of smaller piping, perforated with holes, out of which the steam issues.

An appliance adopted in America is on the principle of a warming-pan. A galvanised iron vessel, 10ft. by 6ft. by 6in. is connected with the boiler, and then passed down an inch or two into the soil which has already been prepared for the plants. Steam is now blown into the vessel for 40 minutes at a pressure of 100lb.; none escapes into the soil, but there is considerable passage of heat. The process is sometimes done by contract, and is estimated to cost about a shilling for 33 sq. ft. We have not seen the process at work, and do not know that it is in use in this country.

In the gridiron or harrow method it is hardly necessary to use a thermometer; the temperature cannot rise above 212 degrees F., and will not usually be much below if the steam is at the pressures already mentioned. The soil, after removal from the sterilising frame, may be thrown into a heap, and cools so slowly that the sterilising process still continues. The heap, however, should not remain out of doors for long without protection; every shower of rain washes away valuable plant food, and every wind may bring plant disease germs and other undesirable organisms to repopulate the soil. Among the advantages of sterilising inside the house is the avoidance of these sources of injury. We have not yet sufficient data to determine the cost, but we have seen houses done at a cost of 4d. to 6d. per sq. yard.

It is not yet possible to say whether soils may profitably be sterilised very long before they are wanted. In commercial cucumber houses, for example, there would be obvious advantages in carrying out the sterilisation during the slack months from October onwards; but as the borders are not made up till February, the risk of infection is increased if the treatment is carried out too early. In course of time a copious development of mould often takes place in heated soils carrying no crops, but we have no evidence that it is detrimental to plant growth. This, however, is essentially a matter where convenience counts; even if a loss does go on in the stored soil, it may be advantageous to sterilise early when work is slack.

Seeds sown during winter and early spring in this heated soil do not germinate as quickly as in untreated soil, and the seedlings are apt to be rather stunted and dark green in colour. Tomatoes also show a purple colouration in the stems and the backs of the leaves. Fig. 2 shows a box of cucumber seedlings in heated soil side by side with another lot sown the same day in the same soil, which, however, had not been heated. Bad seed is more affected than good seed. Young plants raised in heated soil also suffer a longer check after pricking out. The roots, however, grow more quickly than the tops; stunted plants in heated soil which, in the "sixties" pots, appeared to be distinctly poorer than those in untreated soil, have not infrequently been found to possess much better roots when knocked out. The extent to which these effects show depends on the sesaon, the light, the soil, etc., and we have not yet learnt how to control them; sometimes they pass so quickly that they are hardly observable. In any case, they need not cause anxiety, for the retardation ceases soon after the second leaves are out, and a great increase in growth sets in, soon carrying the plants well ahead of those on untreated soils.

(To be continued.)

* An ingenious modification consists in making the implement like a comb with three prongs, the ends being blocked up and the piping perforated as before. This can be hauled out of the borders more readily than the gridiron.

MOSSY SAXIFRAGES.

The saxifrage or rockfoil family is far and away the most valuable genus of plants that we have for use in the rock garden. There are so many different and beautiful kinds, and they vary in habit to such an extent that such extreme species like the diminutive S. cæsia, with its tiny rosettes of leaves and corresponding sprays of flowers, and the Californian giant S. peltata, would appear at first sight to have little in common. This beautiful family of plants embraces subjects suitable for all positions, from a hot, sunny ledge or rocky crevice to a cool shady bank. Others delight to have their roots among stones in water, and several species make delightful bog plants.

As a whole, the rockfoils are easy to grow, and only need to be planted in suitable situations according to the requirements of the different sections. A good general guide for planting is, sun for those species with hard, encrusted, and leathery leaves, although there are a few exceptions; and shade or half-shade for those of the mossy or soft-leaved section. Many of the latter form lovely carpets or mounds of deep emerald green foliage, very beautiful in winter, and covered in spring and early summer with masses of pure white or rosy-pink flowers.

During the past few years the hybridist has been busy amongst the saxifrages of the mossy section as well as the others. Many fine varieties have been raised of various degrees of excellence, but some of the taller hybrids which have been brought out are of a rather weedy character, with flowers of a washed-out appearance in the matter of colour. The charm of the mossy saxifrages lies in their neat and tufted appearance, with flowers in proportion, on stems that hold themselves erect. It is evidently the influence of S. granulata which has tended to develop the taller and less graceful habit which we see in many of the newer productions. For general use, easy cultivation, and good habit, the following species, with their varieties, are the best of this section:

SAXIFRAGA MUSCOIDES ATRO-PURPUREA.
A vigorous-growing and free-blooming form, having bright red flowers.

S. cæspitosa.

This species is found growing over the whole of the Northern and almost Arctic regions, and naturally varies to a great extent. Many names have been applied to the different forms, among which may be mentioned S. decipiens and S. sponhemica, but, although the extreme forms may be quite distinct, they are linked up by a chain of intermediates that makes it difficult or even impossible to draw a line between the various so-called species or varieties. Attempts have been made to evolve order out of the chaos, with little or no success, the distinctions being more or less of a geographical character that are of no avail when the plants are growing side by side. It is therefore simplest to keep to Linnæus's name of S. cæspitosa for all these indistinguishable forms.

One of the most marked varieties is S. c. var. hirta, with very hairy foliage. Many beautiful kinds have been produced by hybridisation in recent years, several with charming red flowers. The red colour in these newer forms of S. cæspitosa, which has white flowers, is due to the influence of S. muscoides var. atropurpurea, a charming little plant with bright red flowers. One of the first was Guildford Seedling, a very dwarf carpeting plant with bright crimson flowers. S. Clibrani is of rather stronger habit with red flowers; as also is S. Bathonensis, which grows nearly 1ft. high, with much-branched stems and large brilliant red flowers. One of the best is S. sanguinea superba, which is of neat habit, and bears flowers of a rich ruby-scarlet that do not fade so quickly as some of the other kinds.

S. exarata.

This distinct and beautiful species is a native of the Alps and Pyrenees, and forms a close compact carpet of bright green foliage completely covered with a mantle of white flowers in summer. Only two or three inches high, the thin wiry stems are rigid and freely-branched, and produce such a quantity of flowers that they overlap and quite obscure the foliage.

S. globulifera.

A free-blooming and handsome species, which has its home in the Western Mediterranean region. It is somewhat similar in general character to C. Camposi and S. Wallacei, and, as in the case of these two fine forms, has white flowers, these being produced during the months of May and June.

S. hypnoides.

The "Dovedale Moss," with its emerald green carpet, is a well-known plant in gardens. During the winter months it is one of the chief attractions in the rock garden, clothing otherwise bare places with a

permanent mat of beautiful green. In spring and early summer the white flowers appear in great profusion. It is a very rapid grower, and small tufts planted some distance apart soon meet and make a fitting background for spring-flowering bulbs. Named varieties of the Dovedale Moss are numerous, one of the closest and most compact being gemmifera, while variegata has foliage prettily variegated with white and green.

S. muscoides.

This is a dwarf, dense, carpeting kind, with yellowish flowers in the type, forming a moss-like turf only an inch or less in height. S. m. atropurpurea, with bright red flowers, is the original source of all the fine red hybrids that we now have. S. m. moschata is a stronger-growing kind, with white flowers. All are extremely useful subjects for the many situations in the rock garden.

S. trifurcata.

This elegant plant comes from Northern Spain, and makes a carpet of rosettes with three-parted leaves that are of a stiffer character than most in this section. The pure white flowers are borne on stems two or three inches high in graceful sprays. The variety ceratophylla, which is known as the "Stag's-horn Rockfoil," has more deeply parted leaves of a still more rigid character than in the type. Like the others, it is a quick grower, and easily increased by division.

S. Wallacei.

One of the best of this section, with distinct foliage of a light green colour, and large white flowers that are sweetly scented. For spring bedding or for borders it is a very attractive plant, producing its flowers freely, and lasting for a long time in perfect condition. S. Wallacei is of garden origin, but was considered for some time to be synonymous with S. Camposi, a Spanish plant with much less hairy stems and leaves. Like all the others this plant grows well in light, rich, and well-drained soil.

W. Irving.

Kew.

TABLE DECORATIONS.

The competition in classes for table decoration generally arouses considerable interest among competitors and the public, a certain amount of criticism, and also, I fear, some dissatisfaction with the awards at times. This appeared to be so at the National Sweet Pea Society's Show at Vincent Square.

As an observer—and some might say not quite a novice—I was much interested in the comments on the tables, and the awards. Taking an impartial view of the matter, I do not see that the judges could have done otherwise than they did in placing the awards. Frankly, there was not a pretty table among them. Some were rather overdressed, some rather underdressed; it may be the new style is affected by the tables. There was also not quite that continuity of design carried out to make them effective. Others were a bit too formal in arrangement, and went too far, while some did not go far enough.

If some set of rules were drawn up on judging table decorations, and those rules observed by the judges, some better idea of what should be done by competitors might be an assistance, such as arrangement, continuity of design, more or less, without being too formal, colour schemes, and also blending of colours. A single variety of sweet pea does not always lend itself to effectiveness; also some varieties are better night colours than day, and vice versa.

To illustrate the value of flowers for table decorations, a class for luncheon tables, also one for dinner tables, might be provided, showing what would be effective under natural light, and also under artificial light. This would make an interesting competition. I have seen this done at some shows with very good effect. A rule should be made as to how many are to dine at a table, and the number laid for. The competitor would then know what space he has to work on, and how to place the epergnes or glasses he would require. Had such an arrangement been carried out on the tables under notice, a far better idea of the decorations would have been given. In many private establishments gardeners have to make an arrangement that will allow of the guests being seen, and for general conversation to be carried on while dinner is in progress. With all respect to the fair sex, I do not agree with ladies only judging them. Neither do I hold with single judging or one judge, as is frequently the case. I do not think the judges at the sweet pea show were ladies. Exhibitors at the various shows will agree with me that there is room for improvement in the way decorated tables are arranged and judged, and that some clearly defined rules should be observed on the subject.

Paul T. More.

SAXIFRAGA GLOBULIFERA.

A free-growing species bearing a profusion of white flowers.

Aspidistra Leaves Splitting.—One is frequently consulted as to the cause of the splitting which at times occurs in aspidistra leaves, and often puzzles the owner thereof. This trouble, I am convinced, is largely owing to the rhizome, or underground stem, being buried too deeply when the plants are potted. Stagnant moisture at the roots is also liable to affect the leaves in the same way.—T.

CHRYSANTHEMUMS.

To the cultivator who grows these plants mainly for exhibition, the month of August is a very important one, as the plants are then at a very interesting stage of growth. The expert grower can tell with some degree of accuracy what the quality of the blooms will be when developed. He knows exactly the worth of certain buds and how to treat them. The inexperienced grower does not.

How to Take Early Crown Buds.

The earliest-formed crown buds possess more florets than do those taken, say, two weeks later. The petals are, moreover, shorter and not as highly coloured as those on the later buds. But we must "take" those early buds if they form simply because buds formed on later shoots of the same late-flowering sorts would be useless for exhibition, not having sufficient substance even if they opened in time for the shows.

There is one variety, not a late-flowering one, Mary Poulton, the buds of which develop into the best blooms if they are "taken" late in August. The buds often form very early in August, and when they do the cultivator must not hesitate to nip them out and rely on buds from later-grown shoots. These better buds will be available in about three weeks from the time that the earliest crowns show. The petals are so numerous in the early-formed buds that they have not room to develop, and the colour is very poor. But buds taken about August 25 develop freely and form deep flowers, the colour being an exquisite shell-pink.

The keen cultivator will give constant attendance to his plants, and remove, while quite small, all side shoots; then when the bud shows there will only be about three shoots to pinch off. But the bud must be allowed to grow quite clear of the nearest young shoots before these side growths are nipped off. If the weather be hot at the time the buds are "taken," a daily syringing will greatly assist them to swell up freely, and improve the substance of the bud-stem as well.

The great bulk of the buds will show about August 15, and the grower must then have patience in "taking" them. Instead of removing all the buds he can handle in one day, be content with pinching out about two shoots on each branch each day. This method will take nearly a week to complete the work of bud-taking, but the fine results warrant it being followed, as the buds grow more kindly, as it were; they are not checked, and, in due time, develop into grand blooms, and the main leaves on the branches also swell to a considerable size, thus benefiting the buds, and proving very acceptable where it is intended to show blooms in vases.

Feeding.

This is sometimes discontinued for a long time during the period of bud-taking, but I do not think it at all necessary nor advisable to stop all feeding. The stimulating foods given may be applied less frequently, and in a slightly weaker state for ten days or so, but that is all that is required.

The incurved and single-flowered sections will not be ready for bud-taking before the last week in August and the first half of September. If the buds are secured during the time named, ninety per cent. will develop satisfactorily. Where buds of these plants show before August 15, the cultivator should not hesitate to remove them and rely on buds formed on later-grown shoots. The incurved blooms are more refined, perhaps not quite as broad, as when earlier buds are selected, but they will be deeper, and be more richly coloured.

Retarding Buds.

Some cultivators place the plants in a sunless position in order to retard the buds. It is a mistake to do this, as the wood just below the buds soon becomes soft, and no amount of after care will repair the damage.

GEO. GARNER.

STANDARD FUCHSIAS.

For the moment it is not to the elegant standard specimens of florists' fuchsias that reference is made. These are of great value and importance in the flower garden; indeed, their usefulness in modern schemes of summer bedding can scarcely be over-estimated. But there is another type of fuchsia which is gaining favour with those who love to have something rather out of the common, and have facilities for growing such things. Fuchsia triphylla, with its dark foliage and bright orange-coloured flowers, has become fairly well known during recent years because the leading exhibitors of decorative groups have grown and used it skilfully. Of stronger growth and with larger flowers are the hybrids from this species, many of which have been raised on the Continent. The leafage is attractive, and the long-tubed drooping flowers are very bright and generally of some shade of red, dull orange, or salmon. Two of the best are Thalia and Coralle, the latter having lighter foliage than the former. Both flower freely, and make pleasing standards after two or three years' growth. Messrs. H. B. May and Sons exhibited numbers of beautiful specimens at a recent meeting at Vincent Square, with heads from two feet to two and a-half feet across. Our illustration represents the head of one specimen of Thalia, which has deep red flowers, borne in terminal clusters. It must be confessed that these hybrids possess one weakness when compared with the usual type of greenhouse fuchsia because they produce flowers only at the ends of the branches, and do not form lateral growths to continue the display. Nevertheless, they are very graceful and beautiful, and would provide a striking and novel feature for conservatory, corridor, or hall decoration in the summer.

STANDARD SPECIMEN OF FUCHSIA THALIA.

One of a fine group shown at a R.H.S. meeting by Messrs. H. B. May and Sons, Edmonton.

The two attractive fuchsias, F. Coralle and F. Thalia are among the best of a set of distinct hybrids sent here from the Continent a few years ago. In their production F. triphylla has undoubtedly played an important part, while traces of F. corymbiflora and F. fulgens are apparently present. These two varieties, and especially Thalia, seem in many places to be used for bedding out during the summer, and pretty and distinct they are for this purpose. They are seen more in the shape of standards than in any other way, and so grown it is very pretty and effective, as was well exemplified at the meeting of the Royal Horticultural Society, when delightful specimens of the two varieties, of which one is illustrated herewith, were shown.

T.

SPRING FLOWERS.

In all well-managed gardens thoughts are being very seriously turned to the question of spring gardening for 1914. Very soon the bulbs must be purchased, but before this is done designs must be considered, successes reconsidered, and failures kept in mind, so that their lessons may not be lost. The numbers and kinds of the various bulbs needed should be worked out quite early because it is bad policy to leave the ordering of bulbs until the bulb merchant is inundated with orders. Viola cuttings and arabis cuttings root very freely at this season of the year, and there are many other early-flowering subjects which strike freely or part up readily in early August; indeed, in many cases the pressure of summer work and fruit picking is so great that much of the preparation for next spring has to be left until now. The transplanting of wallflowers, myosotis, etc., is a pressing matter, and if carried out at once the plants develop sturdily from now onward until the summer flowers have to be removed, and the beds prepared for their spring occupants. Hoeing regularly and watering as occasion demands are matters of prime importance, because these ensure a first-class root system, without which double daisies, aubrietias, wallflowers, forget-me-nots, violas, and other beautiful spring flowers cannot possibly do themselves justice, and bring that pleasure which we so eagerly anticipate as the winter slowly passes.

The massing of spring flowers is immensely effective, as shown in the accompanying illustration, when wallflowers, forget-me-nots, and double arabis are grouped around an ancient well-head, near an old time house, at King John's Farm, Chorley Wood. Such a scene brings to mind the fragrance of springtime, and is a reminder of the fact that to secure such a picture in the garden early preparation is necessary.

SPRING FLOWERS AROUND AN OLD WELL-HEAD,
In the Well Garden at King John's Farm, Chorley Wood.

Spiræa Anthony Waterer. — This charming little crimson-flowered form of Spiræa japonica, or S. callosa, as it is more generally called in gardens, well repays a little trouble taken with it. In a general way it produces its rich tinted blossoms in great profusion, and if left alone the floral display is then to a great extent ended. In order to extend the flowering season the old blossoms should be cut off as soon as they fade, and if the plants are given a dose or two of liquid manure secondary shoots are pushed out, which will keep up a succession of bloom till the end of the season. Like the other members of the genus it must not be allowed to become too dry at the roots during the season of growth.—W. T.

OUTDOOR STRAWBERRIES.

Maintenance of a Continuous Supply.

The most suitable season for planting strawberries is at hand, and intending planters, before doing so, would do well to consider for what purpose they intend to plant, and act accordingly. In an ordinary way the managers of private gardens can best serve their own and their employers' interests by growing sufficient plants in quantity and variety to meet the demands for fruit, for the purpose of preserving and maintaining a supply for dessert, over as long a period as is practicable. This method is not, however, by any means always followed, even where it would suit the producers' best interests to do so, for even in such cases it is not an uncommon occurrence to see inconveniences caused by superabundance and deficiency in the supply, owing to errors made either in the selection of varieties or in too much space being devoted to a favourite variety, such, for instance, as Royal Sovereign, to the sacrifice of others.

Though the strawberry will succeed in any ordinary garden soil, the ideal one is a fairly heavy deep loam. Light soils can nevertheless be improved by the addition of those of a heavier character, and clayey ones by the aid of light soil, such as charred refuse from the rubbish yard. In any case it is desirable to work the soil deeply, apply a heavy dressing of decayed farmyard manure, or give suitable manurial aid in some other available form. Our usual method is to plant upon deeply-dug land, in succession to early crops of peas that have occupied quarters which have been

bastard trenched and heavily dressed with farmyard manure, and depend upon, for further supplies of nourishment, diluted liquid manure derived from stables. Ground of this description, after being dug, should be prepared for the strawberries by having a few inches of its surface finely broken and levelled. For the main crops, quarters fully exposed to the sun are to be preferred, south borders being best for the earliest crops, and north borders the most suitable for late crops. By so arranging the varieties according to their seasons we secure the best possible results.

The best plants are those obtained from young plantations that were formed the previous season, the strongest runners being selected and layered in 2½in. or 3in. pots as early in the season as they can be procured, and grown on without neglect by keeping them carefully supplied with water, and suppressing their extending growths. When well rooted they should be severed from their parents, and be placed in a semi-shaded position for a few days to enable them to recover from the check before being planted out. In layering it is important to ascertain that the plants from which it is desired to obtain runners are fertile, for, though sterile strawberry plants are not often met with, cases of the kind do happen. I well remember Vicomtesse Hericart de Thury causing disappointment in this way, and for reasons of this kind it is advisable, especially for those dealing with unfavourable soils, to occasionally change their stock of plants by securing fresh ones from a reliable source.

In planting strong-growing varieties, possessed of long leaf stalks, such as Louis Gauthier, Royal Sovereign, and Progress, they should be arranged in rows three feet apart, and in the rows two feet asunder. Compact growers of the type of Givon's Late Prolific, Loxford Hall Seedling, or Laxton's Latest may be placed closer together. Wait for a showery time in which to plant, but avoid doing so when the soil is very wet. See that the balls of soil are moist when the plants are turned out of their pots, and embed them quite firmly and sufficiently deep for the surface of the ball of soil to be slightly covered when the planting has been completed.

Subsequent treatment will chiefly consist in watering if it is necessary, and care should be taken in attending to this to prevent the balls of soil containing the roots becoming dry. Also pay attention to keeping the plants free from runners, and the surface soil frequently stirred with the hoe. Once the roots have taken freely to the soil, a good watering with diluted liquid manure should be given. This will both strengthen the plants and cause their crowns to develop. Plants so treated will produce splendid crops of fruit the first season, and the fruit will be larger in size and earlier than that produced in beds of some age, though the crops produced by plants the second year after planting will be heavier, and will also afford supplies of ripe fruit in succession to that of young plants of the same variety.

We have given most of the leading varieties a fair trial, and can recommend the following, as early kinds: Vicomtesse Hericart de Thury and Royal Sovereign; for main crops, President, Sir Joseph Paxton, The Bedford, Countess, Fillbasket, Reward, and Laxton's Profit; of late varieties Givon's Late Prolific, Laxton's Latest, Eleanor, Waterloo, and President Loubet; as a white fruiting variety, Louis Gauthier; for preserving purposes, Vicomtesse Hericart de Thury is unsurpassed, and as a perpetual St. Antoine de Padoue can be strongly recommended.

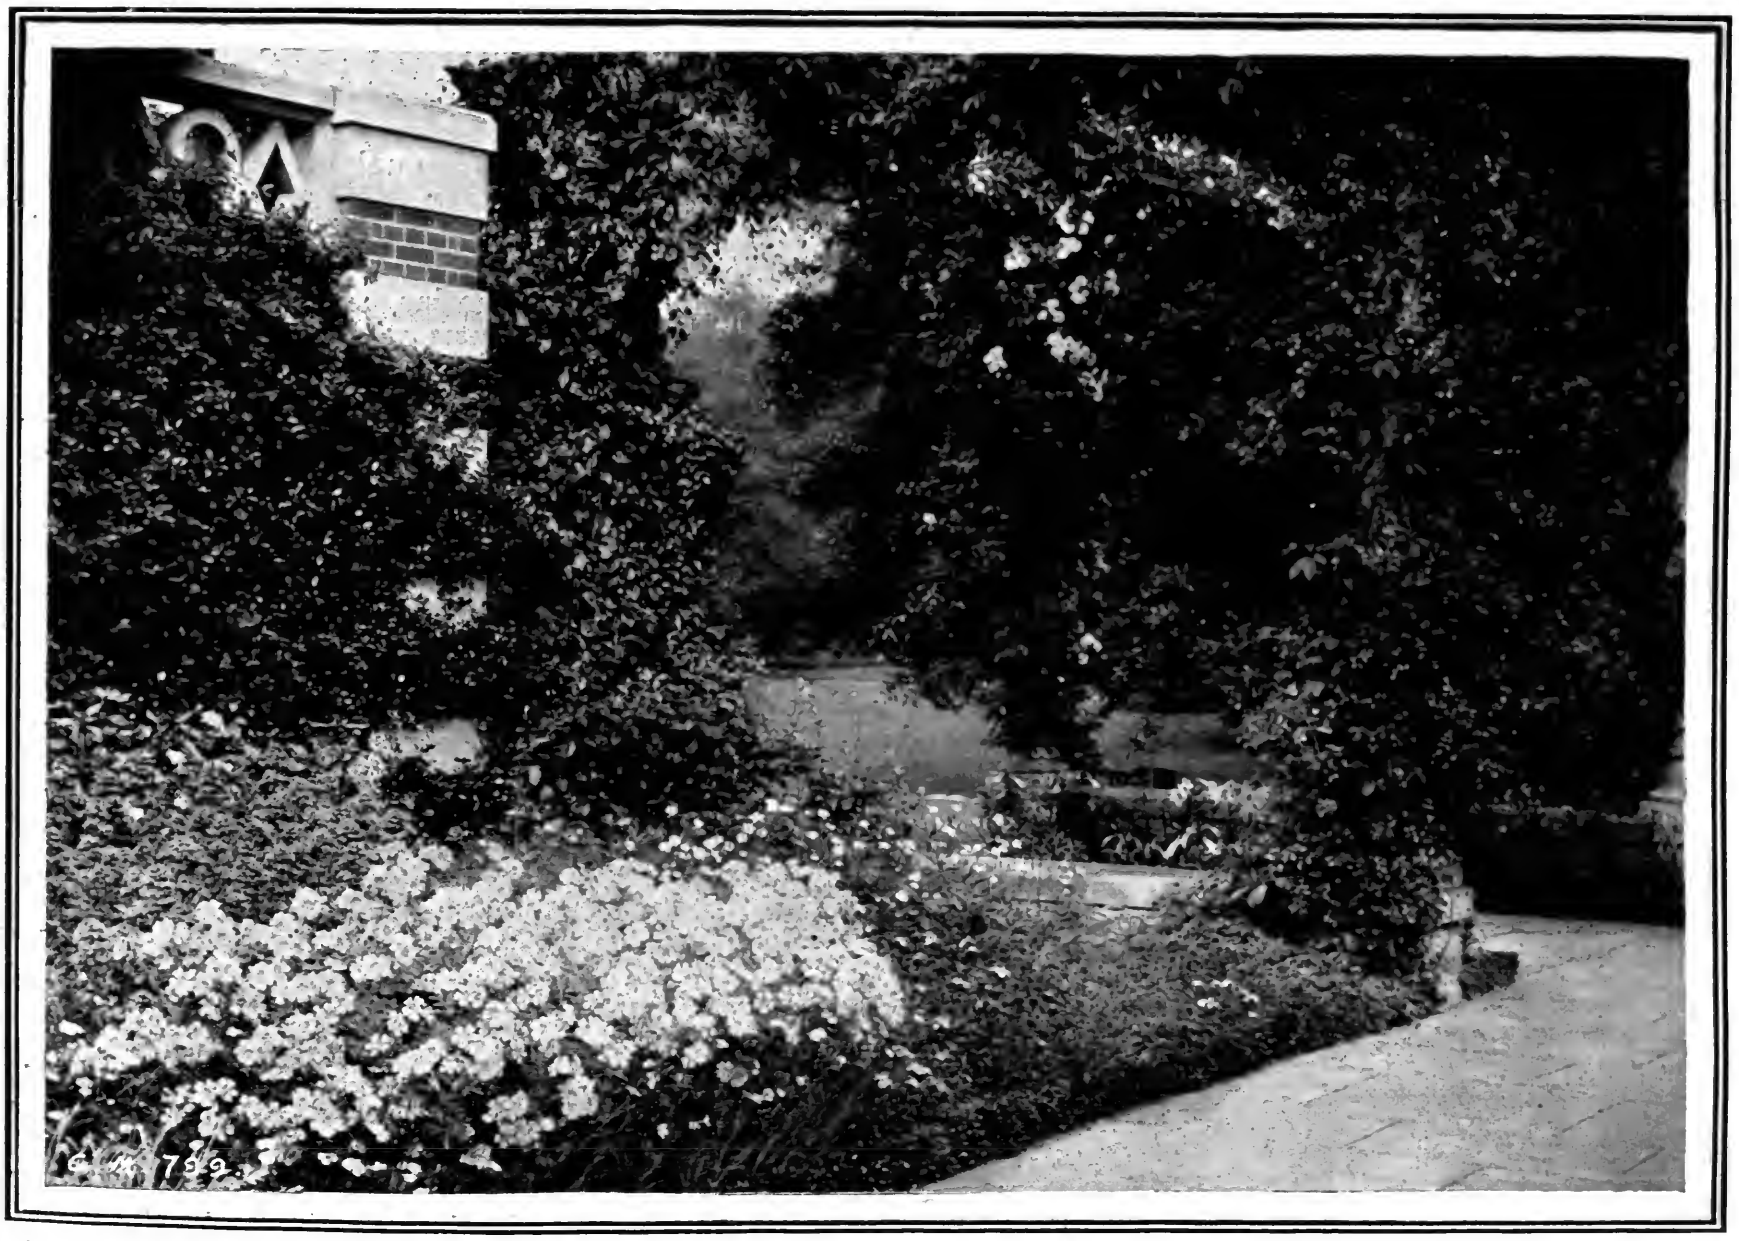
THOS. COOMBER.

The Hendre Gardens.

GERANIUM IBERICUM.

In the pursuit of novelties it sometimes happens that meritorious plants are overlooked because they are commonplace or old-fashioned, or perhaps there is a suspicion of coarseness about them that makes their presence undesirable among choicer plants. It is probably for the first of these reasons that Geranium ibericum is so seldom included in hardy flower borders. Yet, despite its old-world character, it is a subject that at once attracts attention in June in the border. The flowers are of a fine shade of blue, large in size, and are produced in the freest possible manner, and when boldly grouped in quantity it forms a conspicuous object throughout the month of June. It is a deciduous perennial of the most persistent character, and, like Geranium armenum, G. Endressi, and G. grandiflorum, it succeeds in practically any kind of soil, and is a subject to commend for arid ground and semi-shade. Once fully established it calls for little attention beyond a mulching of farmyard manure at the annual overhauling of the borders. This species, with the others named, are readily increased by division at any time during the resting period. THOMAS SMITH.

Coombe Court Gardens.



GERANIUM IBERICUM.

An effective group below terrace wall in Coombe Court Gardens.

The Bergamot or Oswego Tea.—This is a grand border flower, especially if the soil is rather damp. The bright scarlet flowers render it very showy, and the delicious fragrance of the entire plant makes close inspection particularly agreeable.—W. T.

JAPANESE HARDY ORCHIDS.—II.

Goodyeras, with their creeping, stem-rooting growths, are fairly easy, and should be given a peaty soil intermixed with broken stone. G. repens I have noted, but there are others of intense interest. G. bifida is well scattered among the mountain tree belts. It is evergreen, with rich green leaves, one at every joint of stem. The flowers are whitish, with a mauve shading, and are closely set upon the stem. G. macrantha is July flowering, with large leaves of purplish-green hue. The blossoms are large, white and bronze, and the plant is of sturdier growth than the other goodyeras under notice. G. pendula, a southern beauty from Tosa, Kii, etc., is both interesting and pretty. The blossoms, scarlet lightly touched with yellow, are closely set along the recurving stem. The flowering-time in August, and the leaves are narrow and ribbon-like. C. Schlectendaliana, from Central and Southern Japan, is August-flowering. In this plant the leaves are broad and prettily variegated with silver, and the blue and white blossoms are effectively arranged upon fine tall stems. G. velutina, which favours the same haunts, and blossoms at the same time as the preceding, has flowers of a distinct, bronzy hue. The foliage is a very dark green, lined with orange down the centres. The stems are tall, but the flowers are not so regular as in schlectendaliana.

Arethusa japonica is pretty well known, and its simple scarlet blossoms always attract notice. It flowers in June and July, and inhabits the high mountain swamps around Nikko and Iwashiro. Near to the last-named is Pogonia japonica, which comes from the high sphagnum swamps of Central Japan. The flowers are crimson, and produced singly on grassy stems during July.

Orchis aristata is a fine grassland orchid from central and northern districts. The foliage is long and narrow, and the pretty soft-pink flowers are carried in numbers upon tall stems. It is at its best in July. Then one must note Pergamena uniflora, with its oval-shaped leafage, and pink and white blossoms with green wings. It is an exquisite little orchid, and grows in the woods of Central and South Japan, coming into beauty in June and July. Myrmechis japonica, from the tree and shrub regions of Nikko and Ontake, has small leaves upon creeping, Tradescantia-like stems, surmounted by small white blossoms.

In Epipactis latifolia, var. papillosa, we meet the Japanese form of a typical British orchid. It is a lover of moist, shady nooks, and is chiefly confined to the tree belt of Fuji-Yama, Nikko, and the Hokkaido. The blossoms are green and bronze, produced upon tall, well-foliaged spikes. Ephippianthus Schmidti, a white-flowered orchid from the Ontake, Hayachine, and Iidé mountains, flowers in August, and is notable for its pale green leaves with red undersides. Two little-known and rather unattractive orchids are Perystylis viridis and Microstylis monophyllus. Both are shade lovers, the former producing glaucous-green, leafy stems and green and bronzy-purple blossoms, while the latter has one large stem-clasping leaf, and a slender spike of minute greyish flowers. Both are practically confined to central and northern districts. Bletias are so well known to most readers that there is little need to go into their charms. They are common alike to China and Japan, the type being a favourite with growers of hardy orchids. The varieties alba (white), rosea (pink), and albo-marginata (with white-margined foliage), are even better than the typical B. hyacinthina.

Other orchids are in evidence, many of them being lowland forms, and some not hardy in English gardens. It may be possible to refer to some of these at a later date, but space forbids their inclusion in these notes. P. S. Hayward.

FINSBURY PARK.

The words of the Rev. D. R. Williamson were recalled to my mind when visiting that splendid lung of our great city, Finsbury Park, just recently. In speaking of a storm that had passed over his garden, he said, "Nature, so long our sympathetic friend, and gentle inspirer, becomes our enemy. A gale of wind passes over the land, and a thousand and one cherished beauties are wiped out of existence, and swept to desolation by the remorseless blasts. Such a visitation tends to paralyze, but not to demoralise, and we are consoled by the fact that embryonic life and potential loveliness remains hidden in the army of buds that have escaped destruction."

And Nature, in one of her impetuous moods, wrought much mischief in gardens in North London and elsewhere on Wednesday, July 9. A hailstorm of unusual severity was experienced, and Finsbury Park fared badly; the hail lacerated and tore the colonies of cannas, but, being of strong growth, they will speedily recover. The sepals were torn from the fuchsia blossoms; the graceful, but fragile, clarkias could not withstand the onslaught; while the glory of the Paul Crampel geraniums was destroyed for the nonce. The flat-leaved succulents, such as echeverias and sempervivums are pock-marked, more or less deep indentations being noted over the entire surface of the exposed leaves. A splendid batch of chrysanthemums, 3,000 in number, did not escape, the more tender foliage being rent in twain. The storm also left its mark upon the spacious and finely-kept roads and paths, and the material that went to make up a smooth and even surface was conveyed with wonderful rapidity to a low level, and, in some instances, into the public thoroughfare.

This is only one of the penalties those are called upon to pay who reside in hilly districts, or where the ground is of a very undulating character, but I found Mr. F. Wright, the superintendent, in an equally philosophical frame of mind, as was the Scotch enthusiast, and while he deeply regrets the onslaught on his work, he looks forward with confidence to all traces of damage being obliterated in two or three weeks. He also derives consolation from the fact that matters would have been infinitely more serious had it occurred a month later.

It is worthy of note that a big improvement has been effected by Mr. Wright in the flower garden proper, and no less than thirty-six beds have been removed, while a number of the remainder have been enlarged, in order to allow for the effective display of plants of large growth.

This treatment has allowed a fine setting of turf, which, from an artistic standpoint, is a necessity, and, incidentally, Mr. Wright has designs upon another portion of the park devoted to flower beds and borders, and if his ideas materialise a less cramped arrangement will obtain.

What is known as the wild garden lacks breadth, and one instinctively feels, in passing through this feature of the park, that it requires pushing out, and if the opportunity presents itself, it will, I believe, receive attention. It was a pity, too, that a spacious rockery should be built up and arranged under the dense shade of wide-spreading plane trees, which, as a matter of course, render the successful cultivation of alpines an impossibility. But perhaps the trees were quite small when the rockery was constructed, and, if so, they should have been allocated sites at a respectable distance therefrom.

On the other hand, I raise my hat to the gardener who conceived and planted the glorious masses of rhododendrons. Away down in the valley notice boards announce "The American Garden," and I have yet to see a more beautiful spot. The rhododendron dell at Kew is happily placed and arranged, but it must take second place to the Finsbury example, with its thousands of towering specimens, backed by trees of fine growth. Overhead, birds in variety warble their sweet melodies, and one might well imagine himself to be far removed from the great city.

Surely such an exquisite spot must be highly appreciated by the people of Finsbury and neighbourhood! I understand that a certain amount of damage has been inflicted upon the shrubs by children of tender age, and that it has been found necessary to prevent them entering the garden unless accompanied by a responsible person.

One finds plenty to admire in the floral arrangement. Roses and violas in combination, standard Paul Crampel geraniums with Veronica Andersoni variegata in similar form; acers and marguerites, with May's Pink pelargonium create a light and graceful effect, while clarkias strike a distinct note in company with fibrous begonias. Glorious masses of ten-week stocks scatter fragrance for some distance around, and in their neighbourhood clambering masses of Traveller's Joy (Clematis vitalba) completely hide all traces of huge hollies, etc. A picturesque spot! Finely-flowered heliotropes are freely represented, but space will not permit of further detail as to bedding arrangements, and it must suffice to say that there is abundant evidence on every hand of artistic perception and loving care.

Touching upon out of door games, there is a big demand for accommodation, which means much time, labour, and thought, all of which are freely bestowed.

It may be added that the natural soil at Finsbury is a very unkind character. A barren kind of clay, but this, as far as possible, and as means will allow, is being remedied. Finsbury Park is not likely to suffer under its present management. Walter H. Aggett.

Perennial Delphiniums from Seeds. — Where these charming blue-flowered perennials are needed in quantity they can be readily raised from seed. If saved from a good collection, many fine flowers will result therefrom, even if they are not quite up to the standard of the named varieties.—S. W.

Late Vineries, which contain winter varieties that have been extra well thinned for keeping through the damp months of November and December, will be greatly improved if they receive Muscat treatment, especially during a continuance of fine weather. These varieties do best when kept extra warm at night, and very freely ventilated throughout the day. By keeping the berries dry and warm towards morning, and allowing the temperature to rise gradually, scalding is reduced to a minimum. A very little warmth in the pipes will produce the desired effect at this season; it prevents condensation of moisture, and also increases the size and colour of the berries, which double the amount of heat will not do later on.—F. Jordan, Warter Priory Gardens.

NEW ROSES THIRTEEN YEARS AGO.

The year 1900 witnessed the introduction of many new roses, though not of the prodigious number that is now the annual output. Of these many have almost, if not wholly, sunk into oblivion, except, maybe, in the gardens of some amateurs, who have kept and propagated from them. Others are still with us, and freely grown, while a few have become world-known. Probably a deficiency in the number of petals may be instanced as characterising those roses of 1900, new colour having been chiefly in the fashion. Madame Ravary, for example, still so popular, disappoints many growers on account of the blossoms showing the centres so quickly; indeed, under a hot sun, this variety will open from quite a moderate bud in the morning, spread out wide during afternoon, and be far past its best by evening. Specimens grown against a west wall, not trained to it, but a foot or two away, have the best chance to preserve the beautiful golden-yellow colour, and delay petal shedding. The raiser's description of this hybrid tea was an eminently fair one: "Golden-yellow, conical buds, flowers when open golden-yellow, large and nearly full, hardy, and a free bloomer." The fact that the gold, in many localities and soils, is almost apricot rather than amber, should, however, be admitted. Madame Ravary does not usually show the strong growth that should characterise a hybrid tea, and would be more likely to be taken for a tea rose, unless liberally fed.

A truly beautiful and useful rose of that year, one, too, that should be more generally grown, was the hybrid tea, Admiral Dewey, described as "an almost white sport from Caroline Testout, distinct, and good." This is still in commerce, and one of the truest modern catalogue descriptions runs thus: "Ivory-white, tinted flesh, very large and good." Another new rose of 1900 was Gladys Harkness, described as "H.T., deep salmon-pink, reflex of petals silvery-pink; growth vigorous, and of erect branching habit, flowering profusely; blooms large and well built."

The same year witnessed the coming of those two noted singles, raised by an Irish firm, Irish Beauty and Irish Glory, which were then priced at seven shillings and sixpence. Since then Irish Elegance has ousted the older relatives from favour, to some extent, on account of its wonderful colour blend of apricot and bronzy-orange, flamed with scarlet. Corallina attracted considerable attention as a rich-hued tea, then regarded as somewhat uncommon, and this rose of William Paul and Son's still merits the praise. Deep rosy-crimson, large petals; beautiful in the bud state; a strong-growing variety, which, combined with its free-blooming qualities, renders it one of the most charming crimson roses in cultivation for massing and cutting. It should be realised by gardeners that the largest, and most intensely solid roses, are less sought after for table decoration. Corallina is a perfect variety to grow in quantity for vase furnishing.

A deep velvety-crimson hybrid tea, with nearly black buds, shown and appreciated at that time, was Dr. Cazeneuve. A hybrid perpetual very well spoken of was Edith Turner; an exceedingly pale blush, early blooming, and very fragrant, with a vigorous habit of growth.

Léonie Lamesch still holds its own as a dwarf polyantha, of orange-red or tomato-vermillion; Eugénie Lamesch, "orange-yellow, passing to clear yellow, ranunculus-shaped, and produced in compact clusters," was brought out as its companion.

Two more introductions in 1900 were the hybrid Bourbon rose, known as J. B. M. Camm, and Rugosa atropurpurea. The latter, besides having all the characteristics of the hardy Japanese family of the rugosas, was faithfully word-sketched as: "Almost blackish-crimson, the blooms passing, as they open, to maroon-crimson, shaded with vivid colouring, and thence to vivid purple." A hedge of this makes an almost unique feature for any garden, and branches are of great decorative service indoors. The former was a splendid exhibition rose, being "opaque salmon-pink; double, thick-petalled; the blooms are of first size, circular, and high-pointed, shaped somewhat like those of H.P. Duchess de Caylus."

Four of Alexander Dickson and Son's novelties for that year were Rosslyn, H.P., a delicate rosy-flesh sport from the well-known variety, Susanne Marie Rodocanachi; Lady Clanmorris, a creamy-white H.T., with delicate salmon centre; Lady Mary Corry, a deep golden-yellow tea rose; and Liberty, brilliant velvety-crimson. Richmond is commonly called the improved Liberty, but for decorative purposes, out of doors or in, it is to be questioned if the older rose is not vastly the better, as being much more prolific and graceful. Rosslyn is scarcely ever met with, but the H.T. and the T., among these four, continue deservedly prominent.

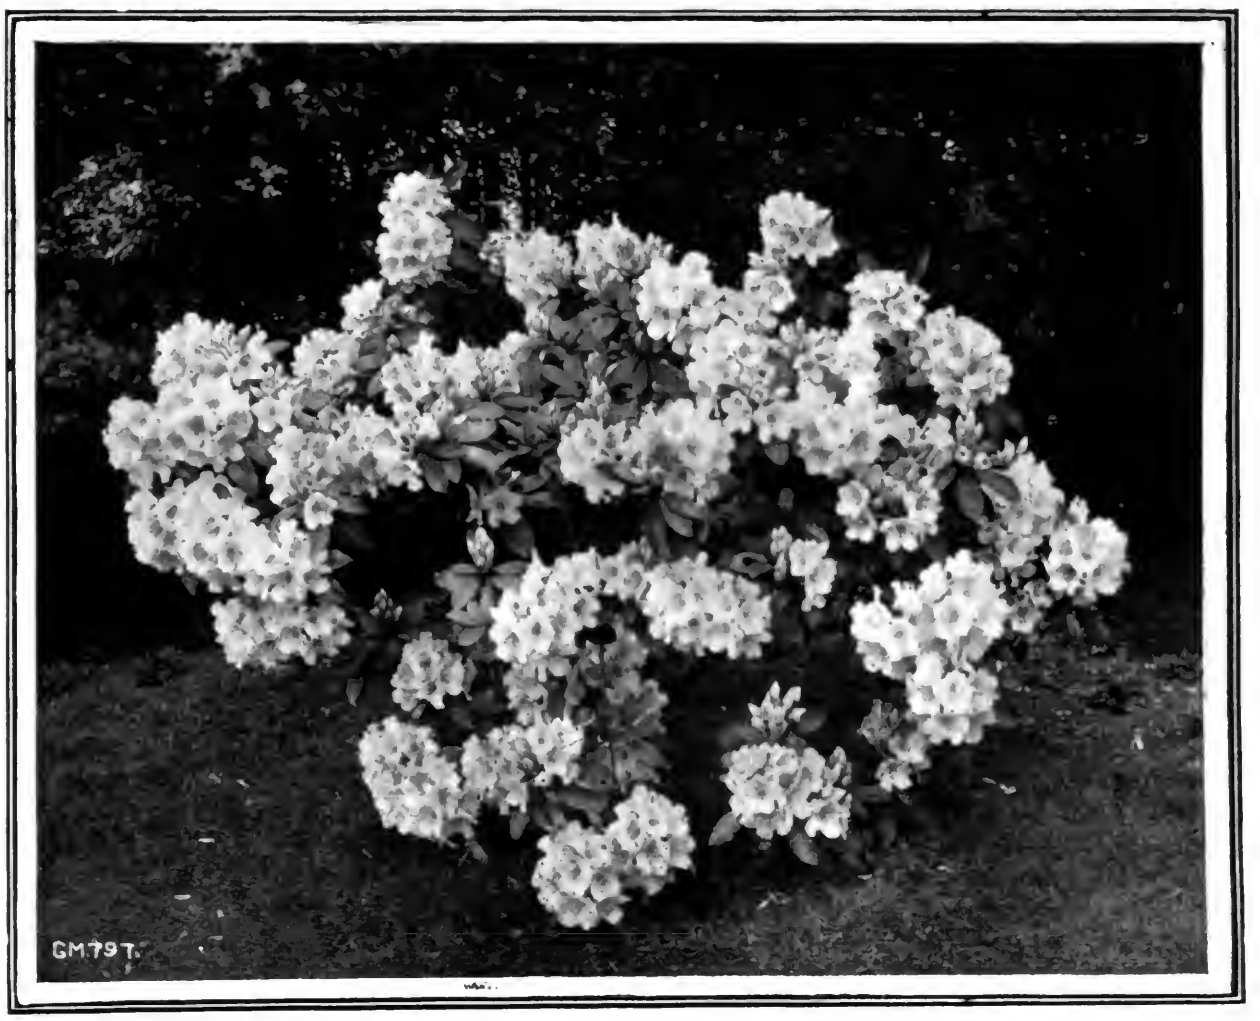
Two teas of remarkable shadings, brought into notice in 1900, were Souvenir de William Robinson, a welcomed and unique colour blend to-day also, and the nearly-forgotten Madame Louis Poncet, that was "nasturtium-red, base of petals coppery-rose, large, full, of good shape, fine for massing." It seems strange that this is not yet among our most popular roses if it was entitled to such high praise.

Other roses of that important year were Ma Tulipe, H.T.; flowers, deep crimson, semi-double, with large stiff petals like a tulip, fine for cutting, growth very vigorous; and the H.T. Monsieur Bunel, rosy-peach, yellow, and bright rose.

Roses, like statesmen and actors, have their reign, conferring benefits of profit and giving pleasure; roses, too, may possess the renown of poets and novelists, live for centuries; but success and fame with flowers, as with persons, can only be the reward of truly fine qualities. M. H.

RHODODENDRON PINK PEARL.

Probably no hardy rhododendron has achieved so large a measure of popularity as Pink Pearl. It is a variety which caught the public fancy immediately the raisers presented it to public notice, and everyone fell under the fascination of its large flowers, ample trusses, and exquisite pink colouring. Small wonder, then, that it is so largely grown, and such a general favourite, both at home, on the Continent, and in America. Numerous illustrations of this rhododendron have appeared in these columns, and now another is given representing a specimen in the gardens of Ken View, Highgate, the residence of F. W. Platt, Esq. Mr. C. Turner, the gardener, tells us that this plant carried one hundred and eighteen trusses of bloom this year, and was a lovely picture that will long be remembered.



RHODODENDRON PINK PEARL,
In the gardens at Ken View, Highgate.

Æschynanthus Lobbianus. — This is one of the earliest members of the genus, and a very pretty subject for a hanging basket in the stove. The long, slender shoots, which hang down for a considerable distance, are clothed with small, ovate, deep green leaves. The flowers, which are freely borne from the axils thereof, are tubular in shape and deep scarlet in colour. In this species the flowers protrude from a comparatively large thimble-shaped calyx. These æschynanthuses, which are, for the most part, natives of the islands of the Malayan Archipelago, occur principally as epiphytes, so that they do not require a large mass of soil around the roots. Fibrous loam, peat, and sphagnum moss, with a little sand, will suit them well.—S. W.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

INSECT PESTS.—Orchid houses in many private places are often surrounded by, or in close proximity to, herbaceous borders, where the plants are sometimes teeming with thrips and other insect pests. Or it may be that deciduous trees are near, and their leaves are frequently infested by black thrips. These pests are frequently blown on to the roof, and find their way through the laps of the glass as well as the ventilators, while in showery weather they are washed into the rain-water tanks, whence they are dipped into the water-can and thus conveyed to the surface of the compost in which the plants are growing. If growers doubt this, let them examine the surface of the water in the tanks after summer rains, and it will be found literally covered with insect life. It is no easy matter to keep plants free from thrips when the surronndings provide fresh importations daily. More than ordinary care is needed to prevent injury to the foliage by pests that quickly cause permanent disfigurement. The only method is to vaporise and spray at regular intervals. It may be considered an unnecessary expense, but prevention is better than cure, and, as we have more favourable means at our disposal for effectually holding insect pests in check than was the case a few years ago, I question if it is much more expensive, and I am certain it is more effective and pleasant than used to be the case, when we had to sit with bellows in hand and handkerchiefs round our mouths watching the baskets containing the tobacco paper so as to prevent the least flame.

PREPARATIONS FOR REPOTTING.—I saw recently a note of good advice in The Gardeners' Magazine, under "Answers to Correspondents," where an amateur was advised not to disturb his odontoglossums until the hot weather had passed. The time is rapidly drawing on when the general repotting of cool-house orchids may be safely attended to. In the meantime it is desirable to have all material ready for use. Sphagnum moss, for instance, should be gathered and picked. I am afraid many growers overlook the fact that sphagnum moss is at the present season of the year absolutely infested with slugs in all stages of development from the egg state. Little attention is paid to washing or otherwise cleansing the moss after it is picked free from weeds, etc. If some attention is given to washing the moss by placing it in a pail or tub for a time, many of the slugs, and eggs especially, will be destroyed or at least removed from the moss. The peat and other material used for odontoglossums should also be prepared for use.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

GENERAL WORK.—With the commencement of August the work in the houses generally will be scarcely so pressing as during the past few months, and time should be found for a general rearrangement of the stove. Where possible the glass sides should be washed down. Leggy and otherwise undesirable plants should be discarded. Pay attention to sponging and cleaning, and give plants that will be useful for house or table decoration through the autumn and winter months sufficient room for full and symmetrical development. Many plants propagated through the spring and summer months may require potting on, although at this season over-potting should be guarded against. Winter-flowering begonias and other plants flowering at the same season should be carefully staked and tied out, and should not by any means be crowded together.

DRACÆNAS.—The fine red-foliaged forms will now be growing less fast, and will require more careful attention to watering; let there be no doubt about the plant requiring water when it is given, otherwise decay of the young fleshy roots will probably follow, with the consequent loss of the lower leaves. D. Sanderiana we find a most useful subject for house decoration, either used alone or in conjunction with other foliage or flowering plants. Rooted easily from cuttings in the spring, we put them three in a pot. Any still in large 60's or 54's may be transferred to 48's or 32's; larger plants will scarcely require to be potted, but will benefit from an occasional application of artificial manure.

ABUTILON SAVITZI rooted early in summer may be shifted into 48's; given a good position and plenty of room, they will provide useful material for the autumn. Older plants may have their tops removed for insertion as cuttings, before being discarded; root the cuttings singly in small pots, and if they are potted when nicely rooted will provide a useful batch for late winter and spring use.

STEPHANOTIS FLORIBUNDA.—With us this plant, on the stove roof, has flowered with remarkable freedom. Old, useless, and superfluous growths should now be removed, the remaining growths being sponged, cleaned, and tied in so as to nicely cover the trellis.

CALADIUMS.—The earlier plants will now have passed their best; do not hurriedly dry them off, but give them a nice light position where they may be thoroughly matured, allowing them to die down naturally. A little liquid manure will assist in the development of good, sound tubers.—H. Prime, Hatfield House Gardens.

THE FLOWER GARDEN.

HELIOTROPES AND FUCHSIAS.—Among the various subjects used in summer bedding as specimen and dot plants, heliotropes and fuchsias find much favour. Some advocate lifting the plants at the end of the season, and storing them away for the winter in a cool house, and utilising them again the following season, but I cannot see any advantage in such a practice, unless, of course, one is dealing with very large specimens, which have taken a few years to develop. I find that young plants are more vigorous, and flower over a longer period, and, since it is possible by inserting cuttings at the present time and keeping the plants growing on through the winter, to have specimens in the form of pyramids six feet in height, or standards with three to four-feet stems, carrying good heads, by the end of May, one wonders why the method is not adopted to a greater extent. While they are being grown through the winter in small pots they take up but little space. When securing the cuttings choose strong young growths which do not shown signs of flowering; insert these in large 60-size pots, containing a light compost, placing four cuttings in each pot. Place in a close pit with brisk heat, to root.

HERBACEOUS BORDERS.—As many of the early summer flowering occupants of herbaceous borders have passed out of bloom, the removal of dead and unsightly growths will be necessary. Late summer and autumn-flowering subjects continue to grow apace, and the taller kinds must be well supported and secured against rough winds and heavy rains, usually prevalent later on in the season. Dahlias and chrysanthemums are making rapid growth, and the shoots must be kept tied in. When flowers with more substance and size are desired, disbudding must be resorted to, and frequent applications of either artificial or liquid manure become necessary; the former must be well watered in during the absence of showers.

HEDGE CLIPPING.—This operation in most gardens accounts for a great deal of labour at this time of the year; it also exacts some skill and experience to carry it out well, as hedges on terraces, or in the vicinity of formal gardens are often substitutes for balustrades and walls, and in such cases it depends entirely on their trueness of form whether they fulfil their part of a scheme satisfactorily. A hedge which has once been allowed to grow out of shape is most difficult to deal with, and for that reason it is very important that proper attention should be bestowed on them each season. Most hedges by this time have so far completed their growth that, if clipped now, they should not require any further attention in that direction. One often observes much mutilation wrought through using shears when the work ought to have been executed with a knife or secateurs; this applies to hedges composed of subjects having large leaves, such as laurels, rhododendrons, and some varieties of hollies, etc.; these when clipped with shears present a pitiful sight, aggravated by the sliced edges turning brown and rusty.—T. B. Field, Wych Cross Place Gardens.

FRUITS UNDER GLASS.

WORK IN VINERIES.—Vines now cleared of fruit must be copiously syringed rather late on fine evenings, adding a little soft soap and sulphur occasionally if red spider has been troublesome. Where inside borders have been allowed to get rather dry during the ripening of the grapes, the borders must be well watered to restore them to better condition. Clear water only should be given to young and vigorous vines, whilst older vines which make weaker wood and but few laterals should receive more generous treatmnt and diluted liquid manure may be given freely, and ventilation both day and night must be on a liberal scale.

SUCCESSION HOUSES, which contain ripe grapes must be kept cool and airy, and in some cases, possibly, lightly shaded for a few hours on bright days where black grapes are losing colour. On the other hand, white grapes cannot have too much light, providing they do not burn. In bright weather, to keep the houses cool, damp the borders and paths frequently, but in dull damp weather a much drier treatment becomes necessary. Much, however, depends upon the way in which the borders have been watered.

MUSCATS now ripe or nearly so must have the benefit of plenty of light by drawing aside the leaves, but not so as to allow full sun to strike on the bunches. The berries are subject to cracking, and, if the roots are inside, the borders should be kept fairly moist. Bright sun-heat should now suffice, except in dull or wet weather, when a little steady fire-heat will be necessary to keep up a nice fresh, warm atmosphere. Later Muscats should be encouraged with warm, weak liquid manure and an occasional dusting of the border with some artificial manure, as at this stage they are gross feeders. In favourable weather give plenty of air, but at all times avoid sudden changes of temperature.

YOUNG VINES planted this spring should now be making rapid progress, and the growths should be allowed to extend as long as there is space to occupy. Late-planted ones should be encouraged to make as much growth as possible, as even when late planted they will have a decided advantage over others planted next spring, and good progress can yet be looked for if careful attention is paid to syringing and other little details.

STRAWBERRIES, as recommended in a previous calendar, should now be in their fruiting pots, and, as soon as they have made fresh roots, they should be placed on a good ash base, fully exposed to the sun, where they can be examined easily at watering time. Keep all runners picked off as they appear, and the pots clear of weeds, and pay careful attention to watering.—F. Jordan, Warter Priory Gardens.

SANDY SHOW (BEDFORDSHIRE).
45th Year.
THURSDAY, AUGUST 28th, 1913.
Largest One-day Show in the Midlands.
PRIZES VALUE £1,000,
including £90 for Plants and £55 for Cut Flowers.
Entries close August 21st, 1913.
Schedules, Entry Forms, etc., may be obtained from
A. F. LOVE,
Dead Stock Secretary,
Sandy, Beds.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

The meeting held at Westminster on Tuesday, July 29, was a rather better one than that of July 15, but the attendance was poor. Hardy flowers, gladioli, phloxes, and orchids were the most important features. Novelties were fairly numerous.

PHLOXES.

Phloxes were a good feature, and there was a fine display of these handsome, fragrant flowers. The exhibit consisted of pot-grown plants, so that a good idea of the height and habit of growth was obtained. A few varieties of outstanding merit were M. Grayham, Flambeau, Widar, rosy-lilac with large white eye; Meteore, G. A. Strohlein, Europe, white, pink-eyed; E. Campbell, Mrs. J. Harkness, and The Dove. This group, containing about a hundred and fifty plants in fifty varieties, was from Mr. H. J. Jones, Ryecroft Nursery, Lewisham. Mr. Jas. Box, Lindfield, Sussex, was a large and enterprising exhibitor, contributing a big bank of phloxes that included most of the finest and newest sorts, Gen. T. Hentz and Caran d'Ache being particularly good. In the middle was a grand vase or stand of Gladiolus Halley, a lovely large-flowered, pinkish-salmon variety of great merit. Sweet peas at either end completed the exhibit. Messrs. W. Wells and Co., Merstham, put up a fine lot of phloxes, and made up very bold sets of spikes of Arthur Rana, pink; Selma, rosy-centred; Elizabeth Campbell, and Antoine Mercie.

OTHER HARDY FLOWERS.

Messrs. T. S. Ware, Lim., Feltham, put up a capital display of hardy flowers, wherein phloxes were an outstanding feature; Campanula grandiflora, Stokesia cyanea alba, Sidalcea Rosy Gem, and Montbretia roseus were other striking plants. The Guildford Hardy Plant Co. and Mr. G. Reuthe, Keston, were also exhibitors of hardy flowers. Mr. C. Turner, Slough, contributed vases of shrubby spiræas, notably of S. Anthony Waterer, S. callosa, S. c. alba, S. Billardi, and S. rosea superba. Romneya Coulteri, Astilbe rubella, A. Juno, Crinum Powelli album, the fine Stokesia cyanea præcox, Rubus fruticosa fl. pl., and Phlox Goliath were a few of the outstanding features in a considerable display of hardy flowers contributed by Mr. Maurice Prichard, Christchurch. Astilbes of the Arendsi group were exhibited by Messrs. Bakers, Codsall, Wolverhampton; the leading varieties were Venus, Gunther, Pink Pearl, Ceres, very beautiful; Salmon Queen, not very effective; Vesta, Rose Perle, and Siegfried. It will be seen that the raising of astilbes proceeds apace. Among the alpines shown by Messrs. Fells and Son, Hitchin, we noticed Campanula pusilla alba, Œnothera riparia, Primula involucrata, and Verbena ternera Mahonetti, a curiously white-edged flower. Messrs. J. Cheal and Sons, Crawley, contributed a very bright selection of hardy border flowers in season. Mr. G. Reuthe, Keston, had some uncommon things, and Mr. G. W. Miller, Wisbech, filled a corner with pyrethrums, etc.

Masses of Spiræa gigantea, S. venusta, S. gigantea elegans, and S. g. delicata formed large flanking groups for a well-furnished water-lily pool, arranged by Mr. Amos Perry, Enfield. Senecio macrophylla, with its huge spikes of golden flowers, made a fine background for the water-lilies, while in the foreground were Lilium Humboldti magnificum, L. canadense, and the dark L. martagon dalmaticum. Hybrid astilbes, Achillea ptarmica The Pearl, and some hardy ferns completed the display. The double Sagittaria japonica plena, a striking aquatic with large, very double white flowers, was well shown by Messrs. Phillips and Taylor, Bracknell. In a little pool Nymphæa Froebelli was very brilliant. Around the pool were selections of phloxes, heleniums, astilbes, campanulas, etc.

INDOOR PLANTS.

Messrs. J. Veitch and Sons, Chelsea, put up some lovely gloxinias raised from seeds sown in January last; an almost scarlet self and a series of pink and blue spotted varieties claimed special attention. The same firm showed a large group of the graceful, hardy, pale blue Thalictrum dipterocarpum, with spikes five feet high. Messrs. W. Cutbush and Son, in addition to caladiums, coleus, cordelia, and other stove and greenhouse plants, set up large vases of Chrysanthemum maximum Kenneth, an elegantly-fringed variety, and the large-flowered C. m. The Speaker. Ferns in great variety came from Messrs. H. B. May and Sons, Edmonton, their Nephrolepis Willmottæ being especially good.

Three enormous specimen hydrangeas, in big tubs, smothered with large heads of bloom, were submitted by Mr. L. R. Russell, Richmond, and they were greatly admired; each stood eight feet high. The same exhibitor filled a long table with alocasias, marantas, dracænas, crotons, aralias, and other ornamental-leaved stove plants.

ROSES AND SOME NOVELTIES.

Some charming roses were staged by Messrs. Wm. Paul and Son, Waltham Cross; the creamy-pink Ophelia, raised by the exhibitors, was the central feature, and is a lovely hybrid tea variety. Very fine carnations from Mr. J. Douglas, Great Bookham, included lovely vases of Mrs. George Marshall, Furthest North, Mrs. Elliott Douglas, Linkman, Rosy Morn (A.M.), a handsome deep old-rose colour; The Bride, and Annie Laurie.

A beautiful rose named Annie Crawford, raised by Dr. Campbell Hall, and exhibited by Mr. W. R. Hammond, Burgess Hill, was greatly admired, and gained an A.M. It is very much the colour of Caroline Testout, but a little rosier, and the flowers are of wonderful size, splendid form, and grand substance; it should prove an exhibition flower of the highest order.

Spiræa (sorbaria) arborea grandis (A.M.), a lovely spiræa with big branching plumes of milk-white flowers and pinnate leaves, was very beautiful as shown by Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree. Messrs. Dobbie and Co. gained an A.M. for True Lavender sweet pea and for the noble King White sweet pea, the latter probably the finest white variety that has yet appeared. Clematis tangutica obtusiuscula, from West Hansu, China, has small, yellow flowers; it was shown by Mr. F. C. Stern, Highdown, Goring-by-Sea, and collected by Mr. G. Fenwick Owen. An A.M. was awarded.

Mr. Jas. Hudson, gardener to Leopold de Rothschild, Esq., Gunnersbury House, Alton, showed Nymphæa colossea, a giant cream-white variety of great beauty (A.M.), and N. Escarboncle, also raised by Marliac, an intense crimson-red variety of fine size (A.M.).

Very striking were the red sunflowers (A.M.) staged by Messrs. Sutton and Sons, Reading. This is the result of crossing Helianthus lenticularis coronatus with the annual garden kind. The original hybrid was raised in California, and has now been selected to come about 75 per cent. true from seed. The colour is rich red-brown over yellow, with golden tips to the ray florets; under sunlight it is very bright red.

ORCHIDS.

A few examples of Lælio-cattleya Nyssa, Cattleya gigas Sanderiana, Miltonia Bleuana, the beautiful Cœlogyne Mooreana, Oncidium Papilio, with its butterfly flowers, the rare Phalanthera ionantha, and Oncidium Sanderi, a new species with bright yellow flowers, spotted and barred with red—all came from Messrs. Sander and Sons, St. Albans. The beautiful Disa grandiflora was very well shown by Messrs. Jas. Veitch and Sons, Chelsea; all the plants were strong, home-raised seedlings, and represented a first-rate type.

Miltonia Roezli, Oncidioda Charlesworthi, the lovely Odontoglossum armainvilliersense xanthotes, the giant Paphinia cristata, and the fragrant Houlletia Wallisi were included in a group of orchids from Messrs. Charlesworth and Co., Hayward's Heath, who also staged Angræcum Eichlerianum with nineteen white and ivory-coloured flowers. Mr. Black, gardener to R. G. Thwaites, Esq., Streatham, brought varietal forms of Odontioda Thwaitesi, Cattleya Caduces, and C. Goosensiana.

De Barri Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks, secured an Award of Merit for Odontoglossum Queen Alexandra var. Theodora, a fine form of the hybrid between O. Harryanum and O. triumphans, its flowers yellow and red-brown, with a white rose-marked lip.

The neat little Habenaria rhodocheila, with pale orange-coloured flowers, was well shown by Mr. White, grower to Sir Trevor Lawrence, Bart., Burford Lodge, Reigate; this is not an easy species to grow, and the two dozen plants staged received a cultural commendation; Maxillaria fractiflexa, with curiously curled whitish petals and long yellow-green sepals, was also shown from the Burford Lodge collection, together with Dendrobium polyphlebium, a pretty, dwarf species. Messrs. Hassall and Co.'s contribution included Odontoglossum percultum, good forms of Cattleya Dowiana, C. Thurgoodiana, and the golden Acineta Barkeri. Pantia Ralli, Esq., Ashtead Park, sent Miltonia Charlesworthi, Mrs. Ralli (A.M.), with rosy sepals and petals, pale rose-pink tip, and deep crimson basal disk, as well as a crimson blotch at the base of each lateral sepal. Sir Jeremiah Colman, Bart., sent good examples of Miltonia vexillaria radiata and M. v. Queen Alexandra.

FRUIT AND VEGETABLES.

Mr. A. W. Metcalf, gardener to Lady Wernher, Luton Hoo, gained a Silver Knightian medal for a fine lot of Hero of Lockinge and Countess melons, and six handsome clusters of Muscat of Alexandria grapes.

Mr. J. Hudson brought a finely-cropped Bourjasotte Grise fig tree from Gunnersbury House Gardens, and gained a cultural commendation therefor. Mr. F. Herbert Chapman, Rye, brought up a series of crossbred marrows; he is aiming at getting the custard-marrow flavour into modest-sized, elongated fruits that may be cooked whole.

CERTIFICATE AND AWARDS OF MERIT.

First-Class Certificate.—To Gladiolus Electra, from Messrs. P. Hopman and Sons, Hillegon, Holland.

Award of Merit.—To Carnation Rosy Morn, from Mr. J. Douglas, Great Bookham; Sutton's Red Sunflower, from Messrs. Sutton and Sons, Reading; to Rose Annie Crawford, from Mr. W. R. Hammond, Burgess Hill; to Sweet Peas True Lavender and King White, from Messrs. Dobbie and Co., Rothesay; to Dendromecon rigidum, from Sir Trevor Lawrence, Bart., Burford Lodge, Dorking; to Gloxinia Veitch's Strain, from Messrs. Jas. Veitch and Sons, Chelsea; to Nymphæa Colossea and N. Escarboncle, from Leopold de Rothschild, Esq. (gardener, Mr. J. Hudson), Gunnersbury House, Acton; to Spiræa (Sorbaria) arborea grandis, from the Hon. Vicary Gibbs (gardener, Mr. E. Beckett), Aldenham House, Elstree; to Clematis tangutica obtusiuscula, from Mr. F. C. Stern, Goring-on-Sea; to Gladiolus Prince of Wales, from Mr. V. Van Lauten, Hillegom; to Gladiolus Frank Peddleton, from Messrs. Voss, Sassenheim; to Gladiolus King of the Blues, from Mr. K. Velthuys, Hillegom; to Gladiolus Pink Perfection, from Messrs. P. Hopman and Sons, Hillegom; to Gladiolus Incontestible, from Messrs. Alkemande and Co., Noordwijk; to

Gladioli Liebesfeuer and Loveliness, from Messrs. de Ruyter, Noordwijk (the gladioli awards were made by a joint committee of the R.H.S. and the National Gladiolus Society); to Miltonia Charlesworthi var. Mrs. Ralli, from Pantia Ralli, Esq., Ashtead Park, Leatherhead; to Odontoglossum Queen Alexandra var. Theodora, from De Barri Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks; to Dwarf Beans Sunrise and Perpetual (tried at Wisley), from Messrs. Jas. Carter and Co., Raynes Park.

MEDALS.

Silver-Gilt Banksian.—To Mr. Amos Perry, Enfield, for nymphæas and spiræas.

Silver Flora.—To Mr. H. J. Jones, Lewisham, for phloxes; to Messrs. H. B. May and Sons, Edmonton, for ferns; to Mr. M. Prichard, Christchurch, for hardy flowers; to Mr. L. R. Russell, Richmond, for stove and greenhouse plants; to Messrs. Jas. Veitch and Sons, Chelsea, for gloxinias and thalictrums.

Silver Knightian.—To Mr. Metcalfe, gardener to Lady Wernher, Luton Hoo, for fruit.

Silver Banksian.—To Mr. Jas. Box, Lindfield, for hardy flowers; to Messrs. W. Cutbush and Son, Highgate, for foliage plants, etc.; to Mr. Jas. Douglas, Great Bookham, for carnations; to Mr. G. W. Miller, Wisbech, for hardy flowers; to Messrs. W. Wells and Co., Merstham, for phloxes; to Messrs. Phillips and Taylor, Bracknell, for aquatics, etc.; to Messrs. T. S. Ware, Feltham, for hardy flowers; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Sander and Sons, St. Albans, for orchids.

Bronze Flora.—To Messrs. Bakers, Wolverhampton, for astilbes; to Messrs. Sutton and Sons, Reading, for red Sunflowers; to Mr. Chas. Turner, Slough, for spiræas.

Bronze Banksian.—To Messrs. Carter Page and Co., London Wall, for violas, etc.; to Messrs. Wm. Paul and Son, Waltham Cross, for roses; to Messrs. Hassall and Co., Southgate, for orchids; to Messrs. Jas. Veitch and Sons, Chelsea, for disas; and to Mr. R. E. Thwaites, Streatham, for orchids.

SCIENTIFIC COMMITTEE, July 15.

Present: E. A. Bowles, Esq. (in the chair); Sir J. T. Llewelyn, Dr. Bateson, Messrs. Fraser, Fawcett, Gordon, Hales, Bennett-Poë, Cuthbertson, Sutton, and Chittenden (hon. sec.).

PROLIFERATION IN ROSE.—Mr. Bennett-Poë showed a rose having a fasciated and branched shoot bearing several buds developed from its centre. It is worth noting that the branch bearing the flower showed no sign of fasciation.

LITHIASIS IN PEAR.—Mr. W. A. Voss sent a small pear (Doyenné Boussoch) from a tree of about 25 years of age, showing peculiar developments of "stone-cells" breaking through the epidermis here and there. Only one or two fruits on the tree, which was bearing a heavy crop, were affected, and these were from the end of a branch. The trouble is one not commonly met with in England, and has been attributed by German investigators to lack of sufficient water supply.

ALDER DISEASED.—Mr. J. O'Brien sent fruits of Alnus glutinosa, gathered near Le Touquet from a tree bearing many similar ones, in which some of the carpels had grown out in a peculiar fashion, becoming fleshy and somewhat curled, standing out like leafy projections from the cones. The development of these peculiar growths is due to the attack of the fungus Ascomyces alnitorquus.

LIPARIS LACERATA.—Mr. J. B. O'Brien showed an inflorescence of Liparis lacerata (Ridley, "Journ. Linn. Soc., XXII., 1886, p. 284. Malay Peninsula, Perak, etc., Dist. Tenasserim, Borneo). A small example is in Burbidge's drawings of Borneo plants in the Natural History Museum. It has been little known until it flowered with the Hon. N. Charles Rothschild, from a plant sent to him by a collector in Borneo. The present specimen flowering with Sir Marcus Samuel is from the same source. Some of the flowers had dropped, but the spike was about nine inches in length.

POPLAR DISEASED.—The Ven. Archdeacon Meredith sent leaves of a poplar with large golden-yellow areas upon them, occupying in some cases half the leaf surface—Ascomyces aureus, a fungus nearly allied to the one producing leaf-curl in peaches, etc. One or two of the leaves showed on their upper surfaces the silvery appearance characteristic of the attack of Stereum purpureum as seen in plums.

ROBINIA PSEUDACACIA MONOPHYLLA.—Mr. E. A. Bowles showed flowers of the variety of Robinia pseudacacia called monophylla, characterised by the very large terminal leaflet and pair of small ones below it, which he had obtained in a garden in Italy. All the flowers he had examined had two or three carpels, but seed was being produced.

PROGENY OF GREEN WALLFLOWER.—Mr. Chittenden referred to the wallflower cross, the F_1 generation of which was shown to the committee last season. The original cross was between a "green-flowered" form and the normal form, and in the first generation all the flowers produced in many plants were normal. The self-fertilised seedlings from these plants had in some cases flowered this season, but in insufficient numbers to give any reliable statistics. The results, so far, showed, however, that segregation was occurring, several of the plants producing the "green" abortive flowers, and others the normal flowers. The plants are being grown on.

National Gladiolus Society.

This society held its second summer show in connection with the R.H.S. Meeting on July 29. The arrangements were better than last year, but there is still room for improvement in the matter of the names and addresses of exhibitors. The gladioli were very fine, and made a considerable and effective and interesting display; indeed, the exhibition brought together justified the existence of the society. There were nineteen classes, and the prizes throughout were medals or cups.

The President, Sir Francis Burdett, Bart., presents a handsome silver cup for the best collection of twenty gladioli, three spikes of each; Messrs. Jas. Kelway and Son, Langport; Messrs. de Ruyter and Hogenwoning, Noordwijk; and Messrs. G. Zeestraten and Sons, Oegstgeest, Holland, were the three exhibitors. The prize was not awarded on this occasion, but the exhibits were pointed by the judges, and the exhibitors will have to compete again a fortnight hence, and the highest total of points will win the cup.

A combined committee of this society and members of the R.H.S. Floral Committee made numerous awards to gladioli, as referred to in another column.

The National Gladiolus Society exhibited a large collection of gladioli from the trial grounds at the Locksheath Nurseries, Southampton, setting up several bunches of each variety. Particularly attractive were Golden King, Willy Wigman, Faust, Electra, Lily Lehmann, General Kuroki, and Cotteral. Messrs. Jas. Carter and Co., Raynes Park, were large exhibitors of beautiful gladioli, and they associated their spikes with gypsophila. Their Lemoinei varieties were capital, and so were their spikes of the large-flowered America, Anthonia, Niagara, Electra, and Halley.

First prize for a group of late-flowering gladioli was won by Messrs. Van Waveren and Sons, Leeuwenstein Nurseries, Hillegom, who staged many seedlings. Mr. H. Barlow, Narford Road, Clapton, came second with a handsome collection. Mr. K. Velthuys, Hillegom, won first prize for two dozen late gladioli, three spikes of each, and showed Sulphur King, Halley, Albino, Lily Lehmann, and Sieger finely; Messrs. J. Kelway and Son, second with a fine collection.

Mr. C. Van Lauten led for two spikes of a new seedling gladiolus with Glory of Noordwijk, pale cream-yellow; Mr. P. Van Demsen, second with the scarlet Brilliant Star. The premier yellow gladiolus was Nugget, very beautiful, from Messrs. Freylink and Lonen; Mr. C. Van Lauten second with the same variety. The premier scarlet was Liebesfeuer, from Messrs. Freylink and Lonen; the premier pink, Pink Perfection, shown by Messrs. P. Hopman and Sons, Hillegom; the premier salmon, Prince of Wales, bright salmon, from Mr. Van Lauten; the premier white, Europe, from Mr. K. Velthuys, Hillegom; the premier blue, Badenia, from Messrs. G. Zeestraten and Sons, Oegstgeest.

For G. primulinum hybrids Messrs. Zeestraten and Sons beat Messrs. J. Kelway and Son, with brighter-hued flowers; while for one G. primulinum hybrid, Mr. G. Churcher led with a pretty salmon-scarlet variety. Mr. Churcher was also first for late varieties in an amateurs' class. Mr. Velthuys had the best vase of Panama (pink), and Messrs. Zeestraten and Sons the best vase of Niagara (cream and rose).

Cardiff Horticultural Society.

JULY 23 and 24.

The celebration of the twenty-fifth exhibition of this society was made the occasion of a special effort on the part of the executive to make the display a conspicuously good one, and great was the success achieved. Plants were numerous and finely developed. Cut roses were so good as to form an excellent feature, while sweet peas were of exceptional merit. Table decorative classes were perhaps less interesting than usual owing to the exclusion of orchids. Fruit and vegetables were remarkably well shown. A special tent was set apart for trade exhibits, and this step was amply justified. The executive, under the guidance of Mr. Maurice Bailey, the experienced secretary, managed the details with much success.

PLANTS.

The leading class in the plant section was for a group of miscellaneous flowering and fine foliage kinds, arranged for effect in a space of 150 square feet. There were three entries, and the first prize was won by Messrs. J. Cypher and Sons, Cheltenham, for one of their characteristic displays. A bridge of cork in the centre supporting a tall palm, and splendidly-grown crotons, the base set in a carpet of smaller plants, was highly attractive. The whole exhibit was rich and harmonious without an indication of overcrowding or an excess of colour. Mr. D. McIntyre, gardener to Lady Hill, Rookwood, was a good second. Fuchsias were capitally shown, and pyramids eight feet high and well flowered came from Lady Hill, and easily secured the premier award. Tuberous begonias were remarkable for the quality of their flowers. Mr. H. J. Pilcher, Penarth, won for four with double-flowered varieties of excellent quality. Gloxinias were best shown by J. Lewis, Esq., Cathedral Road, Cardiff, who had a remarkably good set.

CUT FLOWERS.

This section of the show was perhaps the most attractive of all. Five entered in the rose class for twelve varieties, three blooms of each, and Mr. J. Mattock, Headington, Oxon, just beat The King's Acre Nursery Co., Hereford, with a set of clean, high quality flowers. Mrs. A. Coxhead, Mrs. W. H. Rowe, British Queen, Mildred Grant, J. B. Clark, Mrs. Theodore Roosevelt, and W. Shean were the most conspicuous. Mr. Stephen Treseder, Ely Nurseries, Cardiff, won for twenty-four distinct varieties, with handsome examples of Helen Keller, Komgem Carola, and Lyon; The King's Acre Nursery Co. second. The last-named exhibitors were the most successful for eighteen tea or nisette varieties. Mrs. Myles Kennedy and White Maman Cochet were conspicuous in an even set of clean blooms. The second award went to Mr. S. Treseder. Gloire de Chedane Guinoisseau secured for The King's Acre Nursery Co. the premier award for

twelve blooms of any one variety other than tea or noisette. This firm also obtained the premier award for twelve blooms of any one tea or noisette variety with Mrs. E. Mawley. Mr. J. Mattock second with Mrs. Foley Hobbs.

There was keen competition in the class for groups of roses to occupy a space nine feet by four feet six inches with rose foliage only. Mr. J. Mattock won with ease for a tasteful arrangement of ramblers at the back, columns of H.T. varieties at the front, rising from a base of mixed varieties neatly edged, the whole showing much taste. Especially fine was Rayon d'Or, G. C. Waud, Lady Hillingdon, Lady Pirrie, Ethel Malcolm, Simplicity, Dorothy Perkins, Philadelphia Rambler, and White Dorothy. Mr. John Crossling, Penarth Nurseries, was second with a group containing a splendid column of Victor Hugo and Mdme. Jean Dupuy. Mr. W. Treseder, Cardiff, third. Amateurs staged really fine blooms in the classes provided for them.

Carnations were a strong feature, and for a collection of border varieties and picotees, arranged in a space of six feet by three feet, there were three entries, and Mr. H. Lakeman, Thornton Heath, just beat Mr. C. Wall, Bath, for first place, staging Cecilia, Thomas a'Beckett, Lieutenant Shackleton, and Togo in superb condition. In the second prize exhibit Linkman and Hercules were extremely fine. Mr. A. Brown, Wychall Nurseries, Birmingham, third, with an excellent collection. Mr. C. Wall won for a group of tree, American, or Malmaison varieties with an excellent display of Mrs. C. W. Ward, Carola, and T. F. Felton. Mr. Woodfield, gardener to the Duchess of Somerset, Bath, was second. There was a strong entry for twelve border carnations and picotees. Mr. Thomas Methones won with shapely flowers of leading varieties,

Hardy flowers were an especial feature. The sum of £6 was offered as the leading prize for a collection of distinct varieties, arranged in a space five feet by four feet. Five entered, and the most successful of the exhibitors were Messrs. A. and C. Bell, The Nurseries, Frome, who had a fine display of choice subjects tastefully arranged. Mr. W. Treseder, Cardiff, second; Messrs. Rich and Co., Bath, third. For twelve bunches of flowers of hardy herbaceous plants distinct, arranged on the ground in a space twelve feet by four feet, the piece of plate offered as the first prize was awarded to Mr. R. F. West, Llandaff; everlasting peas, gladioli, gaillardias, and astilbes were prominent in the collection. Mr. D. Burns, 27, Strathcona Street, Cardiff, was a capital second. Sweet peas were, as they usually are here, well shown. In the open class for eighteen vases distinct, Mr. J. B. Lowe, gardener to Captain G. Lubbock, Warminster, was first with remarkable flowers, well staged, of such varieties as Hercules, Prince George, Thomas Stevenson, T. F. Felton, Marks Tey, Melba, and Elfrida Pearson. Mr. Usher, gardener to Sir Randolf Baker, Ranston, Blandford, was a close second, King Manoel, Princess Victoria, and Melba being his outstanding varieties. Messrs. Artindale and Sons, Sheffield, provided by Robert Sydenham Limited for twelve bunches. Mr. H. Wheeler, gardener to Mrs. Jenner, Wenvoe Castle, Glamorgan, was first with an extremely fine set of blooms. Barbara, Edith Taylor, Maud Holmes, and Elsie Herbert were conspicuously fine. Mr. F. W. Ganaway, Rumney, second. Robert Sydenham Limited also provided the prizes in the class for six bunches. Six entered, and the winning flowers came from Alan Gibbs, Esq., Dinas Powis, an even set of high-class blooms of popular varieties. Mr. C. W. J. Williams, Dinas Powis, won Mr. H. Eckford's first prize for twelve bunches distinct with excellent blooms; Mr. J. Franks, gardener to J. Waddell, Esq., Raneston, Caermarthen, second.

FLORAL DECORATIONS—OPEN.

In the class for a dinner-table eight feet by four feet, laid for dessert, orchids excluded, there were three competitors, and the premier award was made in favour of Mr. W. Treseder, Cardiff, for a light and effective arrangement of May Day carnations, with francoa, lily of the valley, and selaginella trails. The fruit employed was black grapes, peaches, nectarines, melon, and cherries.; Messrs. Sydney Case, Lim., Cardiff, was second. Mr. Treseder also won for one bouquet for the hand with a happy combination of pink carnations, lily of the valley, and suitable foliage, as Asparagus plumosus and Caladinm argyrites; Mr. P. Thomas, Albany Road, Cardiff, second. Mr. Treseder also won for one bouquet of roses with Lady Hillingdon and Liberty, and for bridal bouquets with and without orchids.

Amateurs competed strongly for the prizes for table decoration. Mr. J. T. Curtis, gardener to Sir W. Howell Davies, M.P., Bristol, was first with Rose Irish Elegance. Miss Gwilliam, Dinas Powis, won a piece of plate given as first prize for a floral dinner table decoration, four feet by three feet six inches. Mr. Gerhold, Penarth, had the best bowl of roses.

FRUIT.

Fruit was a strong feature. For two bunches white grapes Mr. H. Gerrins, gardener to E. H. Elsworth, Esq., Llandargh Castle, was first with extremely fine examples of Muscat of Alexandria. Mr. Dobbs secured the first place for any other white with Mrs. Pearson. For two bunches of Black Hamburgh six entered, and Mr. A. H. Cassam, gardener to R. T. England, Esq., Rumney, was first with finely-finished clusters. Mr. W. Rooper, gardener to Captain W. B. Marling, Lydney, Glos., with grandly-finished bunches of Madresfield Court, won for any other black grape. Melons were a strong class, and Mr. J. Pickett and Mr. C. Robinson, gardener to T. M. Franklin, Esq., Cambridge, won for green and flesh varieties, the latter showing that grand old variety Hero of Lockinge. G. L. Clark, Esq., had the best dish of nectarines in a strong competition, and Captain Marling won for peaches with a fine dish of Princess of Wales.

VEGETABLES.

For nine distinct kinds Mr. Searle, gardener to the Marquis of Northampton, Castle Ashby, was first with excellent examples of Webb's King George pea, Colonist potato, Monster White Tripoli onion, Express runner bean, Regina tomato, and Globe beet. Mr. Searle also won Messrs. J. Carter and Co.'s premier prize for six dishes with commendable produce, also Messrs. Webbs' leading prize for six kinds with similar varieties to those in his open class exhibit. Mr. W. T. Shacksea, gardener to Mrs. Rees Jones, Porthkerry Park, obtained the premier position in Messrs. Wheeler and Sons' class for six varieties.

NON-COMPETITIVE.

Trade exhibits were numerous and interesting. The King's Acre Nursery Co., Hereford, arranged a wonderful exhibit of fruit trees in pots and a fine selection of cut roses. Messrs. Sutton and Sons, Reading, had sweet peas in quantity, variety, and quality, with vegetables and melons. Messrs. Dicksons, Chester, had herbaceous plants, shrubs, etc. Messrs. Artindale, Sheffield, staged an extensive and interesting collection of violas.

Mr. Farmer, gardener to the Marquis of Bute, Cardiff Castle, arranged at the entrance of the plant tent a very fine group of flowering and fine foliage plants that was universally admired. Messrs. Isaac House and Son, Bristol, had herbaceous flowers of the best varieties and forms, as well as sweet peas. Mr. Dutton, Iver, Bucks, displayed carnations in his usual form. Messrs. Young and Co., Cheltenham, had carnations in variety and of high quality. Messrs. H. B. May and Sons, The Nurseries, Upper Edmonton, displayed ferns in endless variety. A deputation from the R.H.S., consisting of the president, Lord Grenfell, Gurney Fowler, Esq., Sir Daniel Morris, the Rev. W. Wilks, and Mr. J. Hudson, attended, and awarded cups and medals as below.

Gold Medal.—To Messrs. Sutton and Sons, for sweet peas, and to The King's Acre Nursery Co., for fruit trees.

Silver Flora Medal.—To Mr. J. Mattock, for roses.

Standard Silver Cup.—To Lady Hill, for group of plants; to Messrs. J. Cypher and Sons, for gronp of plants; to the Marquis of Bute, for group of plants; and to Messrs. I. House and Son, for hardy flowers.

Silver-Gilt Flora Medal.—To Lady Hill, for fuchsias.

Silver Flora Medal.—To Messrs. Artindale, for violas.

Silver Banksian Medal.—To E. H. Elsworthy, for Muscat of Alexandria grapes.

Silver Knightian Medal.—To the Marquis of Northampton, for collection of vegetables.

Haywards Heath.

The Haywards Heath Horticultural Society celebrated its twenty-fifth birthday on July 23, when it held a fine and extensive exhibition in the pleasant and well-wooded Victoria Park. Three large tents were well filled—indeed, there was no small amount of crowding, and a fourth tent would have been none too much room to allow ample space for the cut flower classes. We venture to make a suggestion respecting the groups of miscellaneous plants, each 8ft. by 4ft., arranged on the ground; these would look far better, and add immensely to the appearance of the show, if set on tables of equal size, and raised about 2½ft. from the ground.

The hardy flowers formed the great feature of the show, as the classes for them were numerous, the exhibits good, and the competition keen. Sweet peas were good, but roses were quite poor. Vegetables were excellent, and so were fruits.

The society is fortunate in having many friends who have given eight silver cups for competition. It is fortunate in its committee and officers, and also in having the Vicar the Rev. T. G. Wyatt, as the moving spirit in all enterprises. The Church of St. Wilfrid, where he ministers, is said to be exactly in the middle of the county of Sussex, and it is the reverend gentleman's ambitious dream that the Haywards Heath exhibition shall become the great county show. He is himself one of the original members of the society, was for years its treasurer, and is one of the most successful cultivators of herbaceous border plants. On this occasion he most hospitably entertained the officers and committee, judges, and exhibitors, at luncheon to celebrate this 25th anniversary. The president, Colonel Stephenson R. Clarke, C.B., has a fine garden at Borde Hill, and he is enlisting the interest of county families in the Haywards Heath Society, so that the possibility of the Vicar's dream coming true is not a remote one, especially when the climate and railway facilities of the place are considered.

CUT FLOWERS.

Hardy flowers were grandly shown, and there were numerous classes for them. In the chief class the Rev. T. G. Wyatt, St. Wilfrid's Parsonage (gardener, Mr. J. E. Shirley), won the challenge cup presented by Sir J. E. Kleinwort, for the third time, and consequently his gardener receives a gold medal to celebrate the third successive win. In the collection there were capital bunches of Watsonia Ardernei, Phlox Lindfield Beauty, Gladiolus Pink Beauty, P. Frau Ant. Buchner, Lilium Henryi, L. umbellatum, L. tigrinum, and Chelone barbata. Mr. H. Manton, gardener to W. A. Sturdy, Esq., Paxhill Park, Lindfield, a close second; and Mr. Longridge, gardener to L. E. Smith, Esq., Ashfold, Handcross, third.

Mr. H. Cherrimas, gardener to H. Lloyd, Esq., Tyllwyd, won first place for six bunches of hardy flowers with Galega officinalis, Eryngium alpinum, Erigeron speciosum, Lychnis chalcedonica, a phlox, and a form of Chrysanthemum maximum; Mr. G. Mortimer, gardener to Mrs. Wrightson, Ockenden

second; and Mr. G. Clarke, Haywards Heath, third.

A very curious and interesting class was one for twelve specimen blooms or spikes of hardy flowers, each in a separate vase. Here Mr. J. E. Shirley won first place with an interesting collection, and Mr. H. Cherriman came second. Such a class is worth encouragement where there are many amateurs and single-handed gardeners.

A capital class was the one for six bunches of climbing roses, and here there were six competitors. First prize was well won by Mr. G. Mortimer, gardener to Mrs. Wrightson, Ockenden, with grand bunches of Crimson Rambler, Lady Gay, Felicite Perpetue, Dorothy Perkins, Hiawatha, and Blush Rambler; second prize fell to Mr. W. F. Elvy, gardener to R. Foster, Esq., Summer Hill; and third to Mr. A. Jewell, gardener to H. Ramsbotham, Esq., Warren House, Crowborough, who had a fine bunch of Gardenia.

Mr. Cherriman was first, Mr. H. Rowland, Cuckfield, second, and Mr. F. H. Arsell, Haywards Heath, third, for six bunches of hardy flowers in a keen competition among single-handed gardeners.

In a close competition, Mr. F. C. Beale, gardener to Mrs. A. E. Kensington, Haverbrack, Uckfield, annexed the premier award for eighteen bunches of sweet peas, with a beautiful set of Barbara, Rosabelle, Mrs. Cuthbertson, Audrey Crier, Mauve Queen, R. F. Felton, Thos. Stevenson, Dobbie's Cream, Edith Taylor, and Orange Perfection; Mr. W. F. Elvy second; and Mr. E. Fairbrother, gardener to Lieut.-Colonel Dudley Sampson, J.P., Buxshalls, Lindfield, third. Mr. J. Perrett, gardener to J. Goddard, Esp., Tilegate Forest Cottage, scored for nine bunches of sweet peas, followed in order by Mr. G. Mortimer and Mr. J. W. Mitchell, gardener to Claude Askew, Esq., Botches.

In other classes, Mr. J. C. Reeve, gardener to Capt. H. Acton Blake, Pucks Croft, led for dahlias; and Mr. G. Smith, gardener to F. W. Thoroughgood, Esq., Clevelands, for carnations. Roses were poor, and the only really good box was one of twelve from Mr. G. T. Davis, Burgess Hill, who was a great distance ahead of all his competitors.

One tent was devoted largely to table decorations arranged by ladies, and judged by ladies. Miss Constance Coles, Furze Hill, Haywards Heath, was placed first for a table with a quaint combination of berberis foliage and berries and Dorothy Perkins roses; Miss Cumberlege, Walstead Place, Lindfield, second, with Hiawatha and Blush Rambler roses; and Miss C. L. Roberts, The Deal House, Haywards Heath, third, with galega and Lady Gay roses.

GROUPS AND PLANTS.

Out of six competitors in the class for a group 8ft. by 4ft., Mr. G. Smith, Cleveland Gardens, was placed first; Clarkia Firefly, begonias, and schizanthuses were Mr. Smith's strong plants, and he used maidenhair ferns as a groundwork, and Caladium argyrites for an edging. Mr. H. Lazell, gardener to H. M. Knight, Esq., Beech Hurst, second, with a good display that was a wee bit flat; Mr. A. E. Mayor, Haywards Heath, third. Six coleuses made a good class, and Mr. R. Halfield, gardener to E. Holmwood, Esq., Meads, was placed first, with Mr. G. Smith second, and Mr. Robbins third. Mr. Smith had the best caladiums.

FRUITS AND VEGETABLES.

The fine cup presented by W. A. Sturdy, Esq., for eight dishes of fruit, set out on a table decorated with flowers and small plants, was won by Mr. H. Manton, who had fine dishes of Madresfield Court and Muscat of Alexandria grapes, Bellegarde peaches, Lord Napier nectarines, Royal Jubilee melon, cherries, gooseberries, and raspberries, and blush carnations for decoration; Mr. W. H. Robbins, gardener to Mrs. Rodgers, Great Walstead, second.

Two competitors came forward in the parish class for a decorative exhibit of fruits, flowers, and vegetables, and first prize was awarded to Lindfield Parish, which was far ahead for the quality of its grapes, peaches, cherries, figs, and other fruits; Haywards Heath had to take second place.

Mr. G. Grubb, gardener to L. B. Scheisinger, Esq., Bedales, Lindfield, had the best white grapes, but both he and Mr. J. Perrett staged very green bunches. Mr. Grubb beat Mr. Lazell for black grapes, and did so with good clusters of Madresfield Court. Mr. Grubb was first for a melon with a fine Emerald Gem; he was also first for tomatoes with a very fine dish. Gooseberries, currants, cherries, and raspberries were shown largely and well, and there was a fair display of apples, and some plums and strawberries.

In the vegetable classes there was a keen competition. For Messrs. Sutton and Sons' prizes for eight dishes, Mr. G. Langridge was a capital first, showing splendid celery, carrots, and Prizewinner runner beans; Mr. H. Manton second, and Mr. J. Perrett third. Mr. Langridge secured the most points for vegetables, and consequently won the handsome cup presented by Mrs. Stephenson Clarke. Mr. Langridge and Mr. J. C. Reeves scored for Messrs. J. Cheal and Sons' prizes, but in the local class Mr. W. H. Robbins beat Mr. Reeves for eight dishes. Mr. J. Collingham, gardener to Mrs. R. E. Wyatt, Sheencroft, won first place for eight dishes of vegetables in the single-handed gardeners' class, and Mr. C. T. Harris, Lindfield, came second.

Mr. T. Umpleby, Haywards Heath; Mr. W. Braden, Rusper, Horsham; and Mr. J. White, Haywards Heath, were leading winners in other vegetable classes. It must be said that cottagers, amateurs, and single-handed gardeners are thoroughly well encouraged at this show, and they sent capital produce.

NON-COMPETITIVE DISPLAYS.

Mr. J. Box, Lindfield, was a great exhibitor, staging a splendid lot of sweet peas in large bunches and stands, and a large and effective collection of roses; but even finer than these was the large exhibit of hardy flowers at the end of one big tent. The design was a herbaceous border with central pool of water lilies, phloxes, gladioli, spiræas, senecios, astilbes, salvias, etc. A gold medal was deservedly awarded.

Mr. Riley Scott, Horsham, put up a very pleasing display of violas, roses, carnations, and border flowers, and secured a gold medal. A similar award fell to Messrs. Charlesworth and Co., Haywards Heath, for a beautiful collection of miltonias, odontiodas, hybrid odontoglossums, oncidiodas, and the autumn-flowering Epidendrum vitellinum majus.

Colonel Stephenson Clarke, C.B., Borde Hill, Cuckfield, submitted a very interesting collection of flowering shrubs and choice hardy flowers, including buddleias and Destontainea spinosa.

Mr. Frank Woollard, Lewes Road, Brighton, was represented by a goodly collection of rambling and other roses; and Messrs. J. Cheal and Sons, Crawley, put up hardy flowers and roses in fine condition.

Dumfries Sweet Pea Show.

This show, organised by the managers of the "Courier and Herald," was held in Dumfries Drill Hall, on July 26, and proved a very successful one. There was a large display of sweet peas and roses, and in the limited number of other classes there was some capital produce.

In the sweet pea classes there was a strong contest for twelve vases, distinct, open to all. Mr. J. Smellie, Pansy Gardens, Busby, won with a splendid lot, large, clean, and in perfect condition. Mr. J. M'Gill, Kirkconnel Gardens, Newabbey, made a good second; Mr. J. Shaw, Dilston Gardens, Northumberland, third. Mr. R. A. Grigor, Dalswinton, was first for a display of sweet peas, with Mr. M'Gill second, in the gardeners' classes. Mr. Shaw won with twelve vases, six vases, three vases, one vase lavender, one vase scarlet, and one vase pink. Mr. J. Henderson, Elmbank, was awarded the first for a basket of sweet peas. Dinner table decorations were good, Miss M'Kie, Maxwelltown, winning, with Mrs. R. G. Mann, Dumfries, second. Mrs. Henderson, Elmbank, had the best basket in the amateurs' classes. For six vases in the amateurs' classes Mr. W. Edgar was first. Other first prizes in the sweet pea classes were taken by Mr. W. Howie, Mr. J. Henderson, Mr. R. A. Grigor, Mr. J. Carruthers, Mr. J. Shaw, Mr. G. L. Moffat, and Mr. T. James.

The rose classes were excellent as a whole, and Messrs. T. Smith and Sons, Stranraer, took the leading prizes in the open classes. Mr. F. France, Knockbrex, was the leading winner in the gardeners' classes, and he also carried off the first for twelve H.P.'s and twelve H.T.'s in the open classes. Mr. A. W. Appleton, Fairham Hall; Mr. J. Henderson, and Mr. R. A. Grigor were also successful in the rose classes.

The other sections were more limited in numbers, and space will not permit of detailed notice. Among the winners of first prizes were Mr. J. Douglas, St. Mary's; Mr. B. Rutherford, Glenlair; Mr. C. Murray, Cowhill; Mr. France, Mr. J. Shaw, Mr. G. L. Moffat, Mr. T. James, Mr. F. Thomson, and Mr. W. Wilson.

Trade awards were made as follows: Silver cup to Messrs. Dobbie and Co. Edinburgh; gold medal to Messrs. Fairbairn and Sons, Carlisle; silver medal to Messrs. T. Kennedy and Co., Dumfries.

Horticultural Club's Excursion.

On Thursday, July 24, at the kind invitation of its President, Sir Frank Crisp, Bart., some sixty-five of the members of this club and their friends, including a large number of ladies, spent a most delightful day amongst the wonders of Friar Park, and amid the manifold charms of our beautiful River Thames. This latter feature was involved in the programme, saloon carriages for the party being provided at Paddington, whence they proceeded to Marlow. Alighting here and walking down to the riverside, they found a steam launch provided by Sir Frank Crisp, which conveyed the party up the river to Henley. Alighting here at the host's boathouse, they partook of a capital lunch, the tables being beautifully decorated with Dorothy Perkins and other flowers in great abundance. Sir Frank, as usual, did his utmost to nip in the bud Sir Harry Veitch's flowers of speech anent the host's hospitality, but, of course, host though he was, he could do but little in such connection on such an occasion.

The luncheon finished, motors conveyed the guests from the river to Friar Park, where a delightful afternoon was spent among the subterranean and superterranean marvels, grotesque and beautiful, which pervade that wonderland of combined humour and natural beauty, which is constituted both by the mansion itself and the domain surrounding it. Types of old gardens, faithfully reproduced by study of old records, quaint collections of plants, according to their colour of foliage or flower, their scent or peculiar

NOTICE.

READERS experiencing difficulty in obtaining "THE GARDENERS' MAGAZINE" at any bookstall or newsagent should write to the

PUBLISHING MANAGER,
148-9, Aldersgate Street,
London, E.C.,

who will give the matter immediate attention.

habit, or their connection with mythical or sub-mythical legends, both weird and fantastic, were successively traversed and described en route by Sir Frank. A new Japanese garden was passed through, and compared with the photograph of its actual original in Japan. Grim-looking caves near the lake side led down to subterannean streams, electrically lit on weird lines to display all sorts of weird effects in otherwise dim recesses, and so on and on in an apparently endless succession, only to lead to emergence through another cave into the daylight amid continued wonders. The conservatories, filled with the choicest and queerest of plants, were passed through, and in this fashion the hours rapidly fled until the motors arrived to reconvey the party to the boathouse to partake of tea prior to embarking in the launch for the trip to Reading, whither the saloon carriages had been sent for the home journey. After the tea, Mr. Chas. T. Druery read his rhythmic and jocular description of Friar Park, which was well received, and copies of which were distributed to the party generally as a souvenir. The weather fortunately, despite its threatening and unpleasant character on the preceding day, was allowed by all to be absolutely ideal, so that everything contributed to the utmost to render the outing a memorable one, and to enhance the gratitude of the club, its members and guests, to Sir Frank and Lady Crisp for their hospitality and kindness. They were also grateful to the Clerk of the Weather for his forbearance, and last, but by no means least, to Sir Harry Veitch and the hon. secretary, Mr. R. Hooper Pearson, for the admirable arrangements made by them in connection with the journey itself.

East Anglian Horticultural Club.

The recent monthly meeting of this club was largely attended. Mr. A. Reeves, manager at Messrs. Daniels Bros.' nursery, Norwich, read a paper entitled "Roses, and the best kinds to grow." With his large, practical experience, Mr. Reeves was able to make the paper most interesting with his personal observation points. The varieties most strongly recommended were those of recent introduction. A discussion followed.

The exhibition tables were filled with flowers, fruits, and vegetables. Sweet peas and roses were a great feature. In the former Mr. F. Welby, gardener to F. A. Bainbridge, Esq., Hethersett, took all the first prizes. His blooms were superb, and many were the spikes carrying five flowers. In fruit the most attractive exhibits were two dishes of twelve strawberries brought up by Mr. S. Hunt, gardener to Mrs. Willis, Norwich; and Mr. T. Notley, gardener to E. G. Buxton, Esq., Catton. The variety in each case was Laxton's Latest. Mr. Notley's dish was the heaviest, weighing over two pounds net, but Mr. Hunt's were the best in condition, his dish scaled 24 ounces.

Strawberries as Annuals.—It is a well-known fact that many cultivators now treat strawberry plants as annuals. Very good results follow, fine crops of fruit being gathered. But I cannot help being impressed with the fact also, that the system entails much work that might be avoided, and a serious loss of fruit. The strawberry plant is at its best the second year from planting, and I feel sure that if growers would treat them as biennials and not as annuals, the general results would be more satisfactory. There is often much waste of space where strawberries are grown. A distance of two feet, sometimes two feet six inches, is allowed between the plants. If it is intended to grow the plants for two years, and then renew the bed, rows two feet apart and plants sixteen inches asunder in them will answer very well. Perhaps other growers will give their opinions on the subject.—G. B.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of The Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

GAURA LINDHEIMERI.—W. S., Chelmsford: I shall be obliged if you will let me know the name of enclosed specimen, together with a few hints as to its cultivation.—The plant is Gaura Lindheimeri, and, as it comes from the Southern United States, it needs a sunny, well-drained position. In some gardens it does not maintain its perennial character, often failing to stand through the winter. It can, however, be readily cultivated as an annual, and if seeds are sown both indoors and out in the spring a succession of plants is obtained. Thinning and transplanting must follow in due course, and then there will be spikes of elegant white and rose flowers from June to October. Gaura Lindheimeri looks best when massed. Although it loves sunshine and light soil, it also needs abundance of moisture.

RAISING SOLDANELLAS FROM SEEDS.—J. E. B., Gloucester: Please tell me the best way to proceed in the matter of raising soldanellas from seeds.—The seeds should be sown as soon as ripe in the autumn in well-drained pans of sandy peat, and placed in a shaded cold frame. The seedlings must be kept in a cold frame during the winter, and planted out in spring. Sow thinly and evenly, and take great care that the soil is kept comfortably moist at all times.

CALIFORNIAN FIRE CRACKERS.—M. E. J., Torquay: During my business trips to California I have on many occasions seen a bright red flower, that is carried in clusters on a long, thin stem. Out there it is known as the Californian Fire Cracker, but no one seems to know the plant here under that name. Your help in discovering the correct name of this plant—a bulbous one, I believe—would be greatly appreciated.—The botanical name of the Californian Fire Cracker is Brevoortia Ida-Maia. Another popular title is that of Crimson Satin Flower. We may add that Brevoortia Ida-Maia should do very well at Torquay in a sunny border. In many gardens it might be grown successfully if planted in a narrow, warm border on the sunny side of a greenhouse wall. September is the best time to plant, and the best method of dealing with the corms is to place them three or four inches apart in groups. The scarlet, tubular flowers are very attractive, but the stems are so slender that a few twiggy sticks will be necessary to support them.

BICOLOR TRUMPET DAFFODILS.—N. N., Effingham: Will you be good enough to let me know the names of a dozen first-rate bicolor trumpet daffodils of moderate price?—A good dozen varieties of moderate price are: Apricot, Empress, Glory of Noordwijk, Grandee, Horsfieldi, J. B. M. Camm, Mdme. Plemp, Mrs. Walter Ware, Oriana, Prince of the Netherlands, Princeps, and Victoria. Finer and more expensive are: Duke of Bedford, Weardale Perfection, Seraphine, Cygnet, Calpurnia, May Queen, Mrs. Earle, Pharaoh, etc.

MILDEW ON ONIONS.—G. N., Grays: I am sending some onions, and ask you to kindly say what has caused the leaves to die off in such an alarming fashion. Several beds of onions in this neighbourhood have suffered badly. If you can suggest a remedy and preventive I shall be very greatly obliged.—The onions are suffering from a very bad attack of onion mildew (Perenospora Schleideni), a fungus parasite that sometimes spreads at a rapid rate and does a vast amount of harm to the onion crop. The specimens sent are entirely infested with the mildew, and if the leafage is allowed to remain on the ground and rot, the resting spores will be set free subsequently, and, as these retain their vitality for two years, the disease may break out again in the following seasons. Collect and burn all the infested leaves, and spray the rest with potassium sulphide, half an ounce to a gallon of water. It is too late, however, to expect much good to result from spraying if the greater part of the crop is as badly diseased as the specimens sent. Do not grow onions on the present site of the bed until three years hence; indeed, it is a first-rate plan to avoid using the same site more frequently than once in three years. Preventive measures include dusting the seedling plants with powdered quicklime and sulphur, using two parts of lime to one of sulphur, applying the mixture when the onions are damp. Frequent sprayings with the potassium sulphide solution is also useful to guard against an outbreak.

FAILURE WITH RASPBERRIES.—T. H., Surrey: The raspberries are suffering from lack of food, and apparently have been neglected for several years. Cut out the canes that ought to have fruited and on which the flowers set so imperfectly; at the same time remove the small, weak canes of this year's growth, and secure the strongest canes to the wires, so that they will not be damaged by storms. Spread half-decayed cow manure three inches thick over the area occupied by the roots. At the same time it will be desirable to thoroughly trench and manure a plot of ground ready for planting new canes obtained from a reliable source in the autumn. These canes would have to be cut down next spring, and the new canes arising would fruit in 1915, and then enable you to clear out the old plantations.

TIMBER AND TIMBER TREES.—W. A. C., Merioneth: Please give me the title and price of a book treating upon trees such as oak, elm, beech, ash, etc., and describing the wood and its quality, the value of the leaves, etc; such a book as would be useful to a horticulturist.—Two books that will prove very useful to you in this connection are "Trees of Commerce" and "Practical Forestry," 3s. 6d. each, published by Wm. Rider and Son, Lim.

SHANKED GRAPES.—G. S., York: I shall be glad if you can tell me what is wrong with our vines. We have Alicante, and a white grape I do not know the name of, but numbers of the berries fail, like those enclosed, every year, and sometimes half of the berries have to be cut out. The vines are in a lean-to house facing south, and have every attention as regards air and firing. Fire heat is not used after the end of May unless the weather is wet and cold.—The grapes are badly shanked, and this trouble may be due to one or more of several causes. Quite frequently the roots of the vines are in an unsatisfactory state owing to imperfect drainage or an improperly-made border. Whether this is the case you can determine by examination, and if it is, the matter can be put right as soon as the crop is removed and the vine leaves change colour. Another cause of shanking is overcropping, the vines being taxed beyond their capacity. In your district fire heat should not be withheld entirely at such an early date, especially as your grapes are late varieties.

NAMES OF PLANTS.

H. T., Halifax.—Vaccinium Vitis-Idæa.

W. S., Chelmsford.—Gaura Lindheimeri.

A. H., Pinner.—Probably Ononis arvensis.

J. H., Norfolk.—Probably Blanche Double de Courbet.

W. O. H., Cambo.—1, Justicia carnea; 2, Hibiscus Cooperi.

T. H., Slough.—A species of ononis; stem and leaves should have been sent.

W. P., Wilts.—1, Lobelia elatior; 2, insufficient for identification; 3, Veronica spicata; 4, Spiræa filipendula fl. pl.; 5, Campanula lactiflora.

C. S., Macclesfield.—It is impossible to accurately name roses after they have been through the post, and, indeed, at any time it is difficult to name florists' flowers unless there is a collection at hand for purposes of comparison. Viscountess Enfield is a hybrid tea rose raised by Pernet-Ducher, and its colour is coppery old rose. Send flower and growth to the nurseryman who supplied the plants.

NOTES OF OBSERVATION.

Salvia nemorosa.—This member of the sage family, which is also known as Salvia virgata, is a thoroughly good border perennial. It forms a bushy specimen about a yard in height, the spikes of bright bluish purple flowers being borne for a couple of months or so. Even when they drop the persistent reddish-brown calyx is very noticeable.—T.

Philesia buxifolia.—In the shape and colour of the flowers this may best be described as a miniature lapageria, to which indeed it is nearly allied. It is, however, not at all of a climbing habit of growth, but forms a dense bushy specimen, rarely a yard in height, and frequently much less. It is hardy only in particularly favoured parts of the country, and in most districts requires the protection of a greenhouse. Many years ago an interesting hybrid was raised in Messrs. Veitch's nursery at Chelsea, by fertilising a flower of Lapageria rosea with the pollen of Philesia buxifolia. It is known as Philageria Veitchi, but has proved under all conditions to be a difficult plant to cultivate. The generic name of Philageria is derived from its parents, and was one of the first instances of a rule which is now so generally followed.—W. T.

Campanula Vidali.—This is one of the most distinct members of the large bell-flower family, and, unlike most of them, it needs the protection of a greenhouse for its successful culture. It forms a quite woody stem, six or eight inches in height, from the upper part of which numerous spreading branches are produced. The upper half or thereabouts of these branches is occupied by the flowers, which are nearly a couple of inches in length, and of a thick wax-like texture. The shape of the bloom is somewhat singular, being a kind of bell with a contraction around the middle. The colour is white, while at the base of the interior is an orange ring. This campanula can be struck from cuttings, but seeds also ripen readily, and young plants obtained in this way are the more satisfactory. A group of well-flowered examples forms a striking feature in the greenhouse towards the latter part of the summer.—K.

NOTE OF THE WEEK.

Orchards Under Glass.

The incidence of the present season has once more brought into prominence the immense value of glass as an aid in the production of the choicest kinds of hardy fruits for home use, and impressed upon the more observant of those who are immediately concerned with the all-important question of fruit culture, the fact that this value has not as yet received full recognition. We have now on trees growing in the open quarters, and against walls, excellent crops of both culinary and dessert apples, but cherries have been decidedly thin on the trees, especially where growing in the open quarters, and peaches and nectarines are considerably short of a full crop. Pears and plums, which are of so much importance in the economy of the garden, so closely approach a complete failure that the fruit will be very small in quantity, as compared with the area occupied by the trees from which it is gathered. In contrast to this depressing barrenness, we have in orchard houses that are under the charge of experienced cultivators, fruit trees of all kinds, carrying crops, remarkable alike for their bulk and high quality. Such crops, in fact, as would fully justify the suggestion that in all gardens of any considerable area, the orchard house should be regarded as equal in importance to the vinery, and the several other structures that are usually provided for the production of early crops of fruit. That peaches and nectarines, and cherries and plums may be obtained in goodly quantities, and of high quality, from trees in the open there can be no doubt, but under the most favourable conditions they cannot be depended upon to crop with the same degree of regularity as those having the shelter of glass for some part, or the whole, of the period between the development of the flowers and the ripening of the fruit. The uncertainty incidental to fruit culture in the open, even when the most careful attention is paid to the trees as they pass through their several stages of development is, perhaps, one of the strongest arguments that could be used in favour of an extension of orchard house culture. Whether this be the case or not, it will be admitted that a failure, more or less complete, of any one of the principal fruit crops is a serious matter, depriving, as it does, the owner of some part of the advantages resulting from the possession of a garden, and it gives rise to much anxiety on the part of those who are responsible for the maintenance of the supplies required by the household. Not only does the orchard house possess utility of a high order as a means whereby a considerable break in the supplies of such fruits as are suitable for cultivation within it, may be avoided, but it is of much value for the aid that it gives in prolonging the supplies of the several kinds over the longest possible period. Those who have walls suitable for fruit trees should continue to make the best use of them, and in not a few instances that will be the most satisfactorily accomplished by clothing their area with kinds that are the least susceptible to injury from spring frosts and easterly winds. Then, with a view to make the arrangements complete for the production of supplies of the choice kinds, one or more orchard houses should be provided, their number and size being determined by individual requirements. In the case of gardens enclosed within good walls, the orchard house may be regarded as in some degree supplementary to them; but where, as in thousands of instances, the garden has no sheltering wall, the orchard house is a necessity. In entering on the cultivation of fruit trees in pots, which unquestionably are the most suitable for the orchard house, it is important to clearly understand that strength and simplicity, combined with facilities for giving abundant ventilation when necessary are essential points. The dimensions in building the structures required for their accommodation may be varied according to the space available, and the requirements of the household, and, as well known, splendid results can be obtained with both large and small houses. In many cases several small houses are preferable to one of large size, as the several kinds can be grown separately, and their period of ripening be so adjusted as to ensure a continuous supply. Where but one house is decided upon, it should be of rather large dimensions, as it will give a more liberal return in proportion to the time devoted to it than will one of comparatively small size. A house having a length of fifty feet, and a width of twenty feet, can be recommended for gardens wherein there is but one structure of its kind, and it should have a height of ten or eleven feet at the apex, and of about six feet at the sides. Houses with a length of about thirty feet, and a width of about twelve feet, will be found most useful where several of moderate dimensions are preferred. It is a point of some importance to understand that nearly all the choice hardy fruits will crop freely when grown in the same house. There is no difficulty in obtaining full crops of pears from trees that are grown wholly in the orchard house; but these fruits require fuller exposure

ALDERMAN J. BESTER,
President of the Chesterton Horticultural Society.

to atmospheric conditions for the development of a high flavour than the structure affords. As a consequence, it is preferable to keep the trees under glass until they have flowered, and set their crop, and as soon afterwards as the weather will permit, they should be placed outside, and their fruit protected from the birds. The most simple and least troublesome method is to place them under a light framework of wood or iron, that has been covered with wire netting, having a fine mesh. Apples may be dealt with in much the same manner, but the fruits with which the orchard house should be chiefly occupied are the cherries, peaches, nectarines, and dessert plums. For the maintenance of a regular supply of peaches and nectarines, that will in each season extend over a period of between two and three months, the orchard house is practically a necessity, and, with its aid, the crop of cherries and plums become more regular, and the fruit is available for a longer season. The fruits of these two kinds are usually of finer appearance and more richly flavoured than are those produced by trees grown wholly in the open, the difference in the cherries being very great. This improvement is due to the greater length of time the fruits have for the completion of the ripening process, and the more favourable conditions that attain. Both plums and cherries are injured to some extent by wet and damp weather when ripe, and the latter are such great favourites with the fruit-eating birds that it is not possible to allow them to long remain on the trees when they are growing in the open. When in the orchard house the fruits may be allowed to hang several weeks after they attain maturity, with the assurance that the flavour will be improved thereby. Fruit trees in pots require more time and attention to maintain them in a healthy and productive condition than do trees planted in the borders. But much of the advantage of the orchard house would be lost were the trees grown under conditions that afford them unrestricted root run. The trees would soon attain to so large a size that there would be room but for a few only, and the crop, however large it may be, would be only available for a short period. Whereas when the trees are grown in pots, a comparatively large selection of varieties of each of the several kinds can be grown, and if the selection is made with due regard to the period of ripening, there will be no difficulty in obtaining a successional supply for about three months. The additional attention required by pot trees is chiefly due to their requiring frequent supplies of water, but this is not so onerous as to justify anyone hesitating to engage in orchard house culture, because of the apprehension that they will fail to receive an ample return for the thought and time devoted to the work.

Alderman John Bester is a prominent figure in horticultural circles in the Cambridge district, and, indeed, is one of the best-known and most highly-respected of public men in Cambridge itself. Although born in 1847, Alderman Bester is as active in mind and body as many men a score of years his junior. He was apprenticed to Mr. J. J. Chater, of the Gonville Nurseries, Cambridge, who was a florist as well as nurseryman and seedsman. In 1868 Alderman Bester commenced business at Grantchester, where Mr. Widnall was for so many years a noted dahlia grower. He moved to Chesterton, a suburb of Cambridge, in 1875, and took up rose growing as a leading feature of his business. Here he put up a large number of greenhouses for the cultivation of flowering plants, as there was a large demand for these for window-box and other kinds of decorations in the various colleges of the University. Alderman Bester was the pioneer of cucumber culture under glass in the Cambridge district, and was invariably successful as an extensive cultivator of pelargoniums in 48-sized pots. Alderman Bester has always taken a keen interest in horticultural matters; he is president of the Chesterton Horticultural Society, and has been a member of the committee of the Cambridge Horticultural Society for forty years. In public affairs he is greatly interested, and since his retirement from business eleven years ago he has devoted the greater part of his time to public work. In 1880 he became a member of the Chesterton Local Board, and was chairman of that body from 1886 to 1894, and chairman of the Urban District Council during the three following years, and, as such, was a Justice of the Peace. He continued to be a member of the Chesterton Urban District Council until, in 1912, that suburb was added to Cambridge, and he was elected an Alderman of the borough. In addition to the work all this entailed Alderman Bester has been a Guardian of the Poor since 1894, has been chairman of the Board of Guardians, and is now chairman of the Assessment Committee. Alderman Bester is a striking exemplification of the fact that the busiest men are those who have the most time to spare. He has great business and administrative ability, and the added gift of a charming personality.

August Bank Holiday was spent out of doors by many hundreds of thousands of people, for the day was fine, though not over-warm in some districts. In all large towns and cities the public parks and open spaces were crowded with holiday-makers, who showed a fine appreciation of the floral displays and the trees and shrubs. In the Metropolitan district everyone at liberty seemed to be out of doors. There were 200,000 visitors at Hampton Court, over 107,000 at Kew Gardens, 40,000 at the Crystal Palace, 35,000 at Alexandra Palace, 16,000 at the Oval, 80,000 at the Earl's Court Exhibition, 32,437 at the Zoological Gardens, 25,000 at Hendon to see the aviators at work, 8,000 at Windsor Castle, and enormous crowds on the River Thames. Hampstead Heath and Epping Forest also had their full quota of visitors, but the London museums had fewer visitors than usual.

Distressing Accident to Holiday Horticulturists.—On Saturday, August 2, thirty-four employees of Mr. G. Hamilton, Park Lane Nurseries, Waltham Cross, paid a visit to Cambridge, by motor omnibus, for their annual outing. On the return journey, the party had reached Great Amwell, about 10 p.m., when the omnibus overturned. Thirteen members of the party were injured, some of them seriously; one was killed immediately, another died while being taken to Hertford Hospital, and a third died in hospital on Sunday.

R.H.S. on Seed Testing Stations.—The Parliamentary Committee of the Royal Horticultural Society have had under consideration the question of establishing a National Seed Testing Station, and as the result of their deliberations they have drawn up the following resolution: "Understanding that a recent deputation to the Board of Agriculture and Horticulture recommended that a National Seed Testing Station should be established where seeds could be tested if desired, your committee, whilst not wishing to object to the testing of seeds, desires to point out that any such station, if created, must provide a full and sufficient guarantee both to buyer and seller as to the identity of the bulk sold with the sample submitted for test." This resolution came before the president and council at the council meeting held on July 29, when it was unanimously adopted.

The Winter Garden at Avery Hill.—The Parks and Open Spaces Committee of the London County Council recently recommended the expenditure of £2,750 upon the winter garden at Avery Hill, so that this structure, closed because of its dangerous roof since January, 1912, might be opened again to the public. There was a strong objection in the Council to the expenditure of so much money on the ground that the garden was a great luxury, and scarcely came within the scope of the work the Council was called upon to administer. The recommendation was, however, agreed to. Avery Hill, with its mansion, winter garden, and eighty-three acres of land, was purchased by the London County Council for £25,000; the winter garden alone costing the previous owner £22,000 to build.

Castle Ashby, Northampton, the seat of the Marquis of Northampton, and famous for its splendid park and fine gardens, has been let to Baron Alfred de Rothschild.

Wimbledon Common Extension.—In connection with the extension of Wimbledon Common £12,000 has been subscribed by private residents in the district, and £14,000 by the local authorities of Wimbledon, Merton, the Maldens, and Coombe. An effort is now being made to obtain a grant of £5,000 towards the fund from the Surrey County Council, and an influential deputation recently waited upon the General Purposes Committee with that end in view. This committee reported that new conditions had arisen since the Council declined, three years ago, to make a grant, but they did not recommend any contribution. Eventually, on the motion of Mr. Tyrrell Giles and Sir Joseph Lawrence, the question was referred back for further report and consideration, a final decision to be arrived at in November next.

"Fairy Flies and their Hosts" is the subject of a lecture to be delivered before the Royal Horticultural Society, at Westminster, on Tuesday, August 12, at 3 p.m., by Mr. F. Enock, F.L.S.

Longevity of Gardeners.—Discussing the future of the race at a Conference on Infant Mortality, Mr. John Burns said that "it was no accident that clergymen and gardeners had, on the whole, the longest and most healthy lives. It was due in each case to the fact that both clergymen and gardeners lived the most perfect mental, moral, and physical lives. It was not for them to dispossess the clergyman and the gardener of these things, but to see how the lives of most of the population might be approximated to theirs. It could not, of course, be done all at once, but things which were done all at once were not worth doing."

Presentation to the Perry Brothers.—A week ago the employees at Mr. Amos Perry's Hardy Plant Farm, Enfield, had their second annual outing, and paid a visit to Yarmouth. The party was somewhat cosmopolitan, as it included French, German, Danish, and Polish representatives, as well as British. The excellent arrangements for the day were made by Perry's Excursion Club, founded a year ago. After dinner at Yarmouth, Mr. Redman, the firm's shipping agent, and Mr. Logan, the foreman, tendered thanks to the Messrs. Perry for their generosity on this occasion and at Christmas last, and took advantage of this opportunity to

present Mr. Amos Perry with a silver cigarette case, and Mr. William Perry with a case of pipes, as tokens of gratitude and appreciation.

The Gardeners' Company is one of the two City Companies to which women apprentices are admitted, and at the present time the company has six apprentices, of which three are women. These latter are Miss Ursula Joyce, Miss Beatrice Shead, and Miss Joyce Ebblewhite, and they complete their indentures in 1914, 1916, and 1919 respectively, when they will be admitted to the Freedom of the Company by servitude. The first woman apprentice to the Company was Martha Squires, but she did not become free of the Company owing to her not having completed her indentures. It is, however, on record that in 1657 Lydia Hinch, the widow of a Past Master, was allowed to take over three apprentices who had been bound to her late husband, in order to complete their indentures, and thus obtain the Freedom.

Should Women Become Members of the B.G.A.?—At the meeting of the Watford branch of the British Gardeners' Association, to be held on August 20, Mr. Fulton, head gardener at Grims Dyke, will open a discussion entitled "Should Women Gardeners be Admitted to Membership of the British Gardeners' Association?" The annual outing of the members of this branch will take place on August 13, when a visit will be paid to St. Albans. Mr. S. Hartley, The Lodge, Glenthorne, Harrow Weald, is the Watford branch secretary.

AUTUMN ROSE PROSPECTS.

The prospects of a good autumn crop of rose blossom are indeed "rosey" in the majority of gardens that have come under my special notice of late. If these are realised, we shall have had by no means a bad season on the whole, although the early outlook was particularly gloomy. All through the southern counties we appear to have been favoured with genial showers that came at a very opportune moment, when the spell of dry easterly winds had quite parched and cracked the soil in many places.

With the present improvements, especially among the hybrid tea and dwarf polyantha sections, I do not think we need fear many unsatisfactory autumnal displays. Quite a number of the best-known varieties at the present day are most pleasing in their reliability, and, so far as garden decoration and cut flowers are concerned, are quite up to their best during the autumnal months, when the majority of the older hybrid perpetuals and damasks are almost flowerless. Mrs. John Laing, Fisher Holmes, Ulrich Brunner, Auguste Rigotard, Baroness Rothschild, General Jacqueminot, Madame Victor Verdier, Mrs. R. G. Sharman Crawford, Tom Wood, and Victor Hugo are grand late bloomers of the hybrid perpetual section; while none can surpass Frau Karl Druschki, a much more recent introduction than those previously named.

Taken as a class, the hybrid teas are superb autumnal bloomers, and only to name a dozen seems somewhat unfair. Still, as some slight help to intending planters, I may perhaps mention some that have been the most reliable with me: Betty, Caroline Testout, Duchess of Wellington, Edu Meyer, Gustave Regis, La Tosca, Lady Battersea, Madame Abel Chatenay, Madame Ravary, Richmond, Viscountess Folkestone, and Etoile de France. A select dozen from the teas and noisettes may be found in Corallina, G. Nabonnand, Peace, Lady Roberts, Madame Antoine Mari, Madame Jean Dupuy, Marie Van Houtte, Molly Sharman Crawford, Mrs. R. B. Cant, Souv. de Pierre Notting, Reve d'Or, and William Allen Richardson, the last two being climbers.

To secure the very best results from the late bloomers they should not suffer from want of attention. Consistent hoeing and clearing of growths, also the prompt removal of all expanded blossoms, together with the help of a little quick-acting artificial or liquid manure must not be omitted. We have, in fact, to supply food and encouragement to this later growth, even more than to that first appearing, and not lose sight of the fact that the roots have more or less exhausted the soil, unless it was extra rich; hence the need for help in the way of manures. Should the soil be very dry, copious waterings are needed.

Nor must we forget that it is towards late summer and autumn, with the greater variations of day and night temperatures, that our most insidious autumnal foe—mildew—so persistently attacks the younger foliage, and, although, I fear, getting rather monotonous, I must once more remind readers of the great efficacy of a prompt use of the syringe. I believe the hoe is most useful in checking autumnal mildew.

ROSARIAN.

NYMPHÆA COLOSSEA.

Flowers very large; soft rose-pink. A.M., R.H.S., July 29. Leopold de Rothschild, Esq., Gunnersbury House, Acton.

JUNE-FLOWERING LILIES.

As is only to be expected from a genus comprising seventy species and a large number of varieties, the flowering season of lilies extends over a period of five months, from the end of May to October, in the open air. Included in the list of the June-flowering section are some of our best garden lilies, notably L. candidum, L. croceum, L. umbellatum, and L. martagon var. album.

L. martagon.

Popularly referred to as the Turk's Cap Lily, this is the first lily introduced to the British Isles. Having become naturalised in a few places, it is looked upon by some as a British plant, though the first bulbs were introduced from Central or Southern Europe more than three centuries ago. L. martagon thrives and increases in the ordinary soil of the herbaceous and shrubbery border, continuing to grow and flower freely for years if left undisturbed. Replanting if necessary, and the planting of fresh bulbs, should be done in September, or as soon after as possible. The growths of this lily are tall and slender, some 4ft. to 5ft. high, with whorls of leaves, and numerous purple, spotted flowers. These are 1½ inches across, drooping, with reflexed petals.

Seedlings of the martagon lily are easy to raise, and they show a fairly wide variation in the purple colouring, some being much deeper than others. Distinct varieties of this lily are album, white; dalmaticum, a vigorous form with wine-coloured flowers; and Cattanese or Catani, light purple. It is difficult to express in words the beauty of L. martagon var. album, with its crowded spikes of dainty, wax-like, pure white flowers. A group of this lily should find a place in every herbaceous border.

L. pyrenaicum.

This lily, from the Pyrenees, is commonly alluded to as the Yellow Turk's Cap Lily. It is the first of all the liliums to flower in the open border, commencing towards the end of May, and continuing till nearly the end of June. L. pyrenaicum is a loam-loving lily, and is one of the easiest of the whole family to cultivate, thriving in most soils and positions. Effective groups or clumps may be planted in the herbaceous and mixed borders, while it is also a lily suitable to plant liberally in the shrubbery border and semi-wild parts of the pleasure grounds.

The bulbs are large, and produce strong stems up to 4ft. in height, thickly clothed with narrow leaves, surmounted by eight to twelve or more drooping flowers. The individual blooms are 1in. to 1½in. across, with very much reflexed petals, yellow, freely spotted with brown, and merging to green towards the base. This lily is strongly scented, giving a delicious fragrance in the garden, but it is not particularly pleasant to smell an individual bloom.

L. rubellum.

This is without doubt one of the dainties members of the lily family. It is the earliest of the Japanese lilies to bloom outside in this country, opening the first blooms towards the end of May, closely following those of L. pyrenaicum. A considerable number of bulbs of this lily are annually imported from Japan, but for several reasons few of them grow well after planting. L. rubellum, however, produces seeds freely, and the bulbs raised from seeds are far more satisfactory than those imported. Sow the seeds as soon as they are ripe in boxes of light, sandy soil, placing them in a cold frame. Seedlings flower in three years from sowing, occasionally earlier. The bulbs make the best display when from four to seven years' old. After this they appear to deteriorate, so that it is desirable to maintain a stock of plants by raising seedlings at suitable intervals.

Lilium rubellum grows about 2ft. high, and bears from two to six rose-pink tubular flowers on each stem. The bulbs thrive in light sandy loam, with which should be freely mixed flaky leaf-mould and peat.

L. pomponium.

A native of the Maritime Alps, this lily has been cultivated in this country for at least 250 years. The stems are 2 to 3ft. high, thickly clothed with leaves, and developing in June six to twenty flowers on a stem. These are pendent, with reflexed petals, rich scarlet in colour, quite wax-like in appearance. This lily thrives better in the ordinary soil of the herbaceous or shrubbery border than in beds of peat-loving shrubs.

L. croceum.

This is popularly referred to as the Orange Lily, and is nowhere better grown than in the country cottage gardens. A native of South Europe, this lily delights in a fairly heavy loam, and will thrive in most garden soils. The average height is about 4ft. to 5ft., a single stem frequently carrying thirty flowers. These are upright, 3in. to 4in. across, rich orange in colour, with small dark chocolate spots. This is a stem-rooting lily, and should be planted at least four inches deep. The first flowers open about the middle of June.

L. dauricum.

L. davuricum and L. umbellatum are the names by which one of our most easily-grown, June-flowering lilies is known. The original form of L. dauricum is a native of Siberia, but for garden decoration it is much inferior to the Dutch and Japanese varieties usually sold as L. umbellatum, referring presumably to the upright umbel-like heads of flowers. Whether these are improved varieties of L. dauricum obtained by raising seedlings, and selecting the best, or the result of a cross between L. dauricum and some other lily, possibly L. elegans, cannot be definitely stated. It does well in ordinary garden soil, is very free-flowering, and the bulbs increase fairly quickly. The sturdy stems grow 2ft. or more in height, bearing four to eight, or more, large upright flowers, varying in the different varieties from orange to velvety-crimson.

A half-dozen of the best forms are erectum, Incomparable, Sappho, aurantiacum, Cloth of Gold, Tottenhami. A stem-rooting lily, the bulbs should be covered with at least four inches of soil.

L. Hansoni.

This is one of the very few Japanese lilies which will grow freely in most garden soils, doing quite well in the herbaceous border, or in association with rhododendrons. It is one of the first lilies to push up young growths in spring, and these, unless growing in a sheltered spot, should be protected from spring frosts with yew or spruce branches. L. Hansoni belongs to the martagon group of lilies with whorls of leaves, and numerous drooping flowers. The stems reach a height of 3½ to 5ft., with about ten flowers. With us it has proved a very easy lily to propagate by scales. Plant the bulbs six inches deep, as they are large and stem-rooting. The individual flowers are 2½ inches across, yellow, spotted dark brown, the petals recurving.

Kew A. Osborne.

(To be continued.)

GREENHOUSE FLOWERS AT KEW.

The greenhouse in the Royal Gardens is very gay with choice flowering plants, for, beside the usual summer-flowering occupants of that structure, there are many others not so generally met with. Among these last may be included the following: Clerodendron fallax, of which there is a fine and brilliantly coloured group. Another member of the genus there represented is C. fragrans flore plena, whose double whitish blossoms are very sweetly scented, but the leaves have an unpleasant odour if bruised or roughly agitated. Yet a third clerodendron there in bloom is the comparatively new C. ugandense, remarkable among the other members of the family from the fact that the blossoms are of different shades of blue. Primula Kewensis, though well known, is rarely seen in such quantity and in such good condition at this season of the year, while there is also a number of the Canary Island, Statice brassicæfolia one of the best of the shrubby statices for flowering in comparatively small pots.

Impatiens Holsti, too, is well represented, as also is that pretty continuous flowering gesnerad, Isoloma hirsuta, whose vermilion coloured flowers are clothed with brownish hairs. Calceolaria Veitchi, which aroused so much interest last year at the International Horticultural Exhibition, is also bearing its creamy-white flowers, and a valuable greenhouse plant it is. One species of Chironia, namely C. ixifera, is now well known throughout the country, but there are two other species in the greenhouse. They are both very pretty, though scarcely likely to attain the popularity of the last-named. These two species are Chironia laxa, of loose growth with small starry flowers of a deeper tint than those of C. ixifera, and C. floribunda, a rounder flower, about half an inch in diameter. Chironia floribunda is said to have been introduced in 1843, but it is very rarely met with.

K.

Wye Agricultural College.—A meeting of the Governors was held recently, Lord Ashcombe presiding. The Principal (Mr. M. J. R. Dunstan) reported 149 students in residence, the total number of students for the session being 187. An anonymous donor has given £500 to the college for the extension of the research department, and the Development Commission are recommending a grant of £6,000 for the completion of the new college buildings. The Governors also decided upon the erection of the buildings at the Fruit Research Station at Malling, the land for which (22 acres) has been purchased by the Kent County Council. The election of Mr. C. W. Mason to a Carnegie Research Scholarship was also reported.

THE CHELSEA PHYSIC GARDEN.

The student of horticulture and the student of botany find a common interest in the history of the Chelsea Physic Garden, because the names of Philip Miller and Aiton, Forsyth and Curtis, Anderson and Fortune, Moore and Lindley, are reminders of the excellent work done in both sciences by those who filled positions here in the days of long ago. But the name that shines brightest in this history is that of Sir Hans Sloane, whose interest and generosity made the existence of such a garden possible.

Once upon a time the Society of Apothecaries had a physic garden at Westminster, but apparently it had no river frontage, and so the members cast about for a suitable riverside spot where the society might build a barge-house, and so bring itself into line with the City Companies of that day, most of whom possessed state barges wherewith to join in the Royal and Lord Mayor's processions on the Thames. They found a desirable place at Chelsea, and leased it from Mr. Charles Cheyne, in 1673, for a term of sixty-one years, at an annual rental of £5. The site occupied nearly four acres, it was walled in during 1674, and here many of the society's plants were transferred from Westminster. Seventy-one persons formed the committee of management in 1679, and appointed John Watts as gardener with "the allowance of one or two labourers"; and the garden survived. In 1683 four cedars of Lebanon, the first grown in this country, were planted, and the last of these, then in a very bad state, was removed in 1904. Evelyn visited the garden on August 7, 1685, to see Mr. Watts; the heating arrangements interested him, and in his diary he states, "What was very ingenious was the subterranean heate, conveyed by a stove under the conservatory, which was all vaulted with bricks, so as he has the doores and windows open in the hardest frosts, secluding only the snow."

CHELSEA PHYSIC GARDEN.

Bed of plants arranged in natural orders with water garden in the distance.

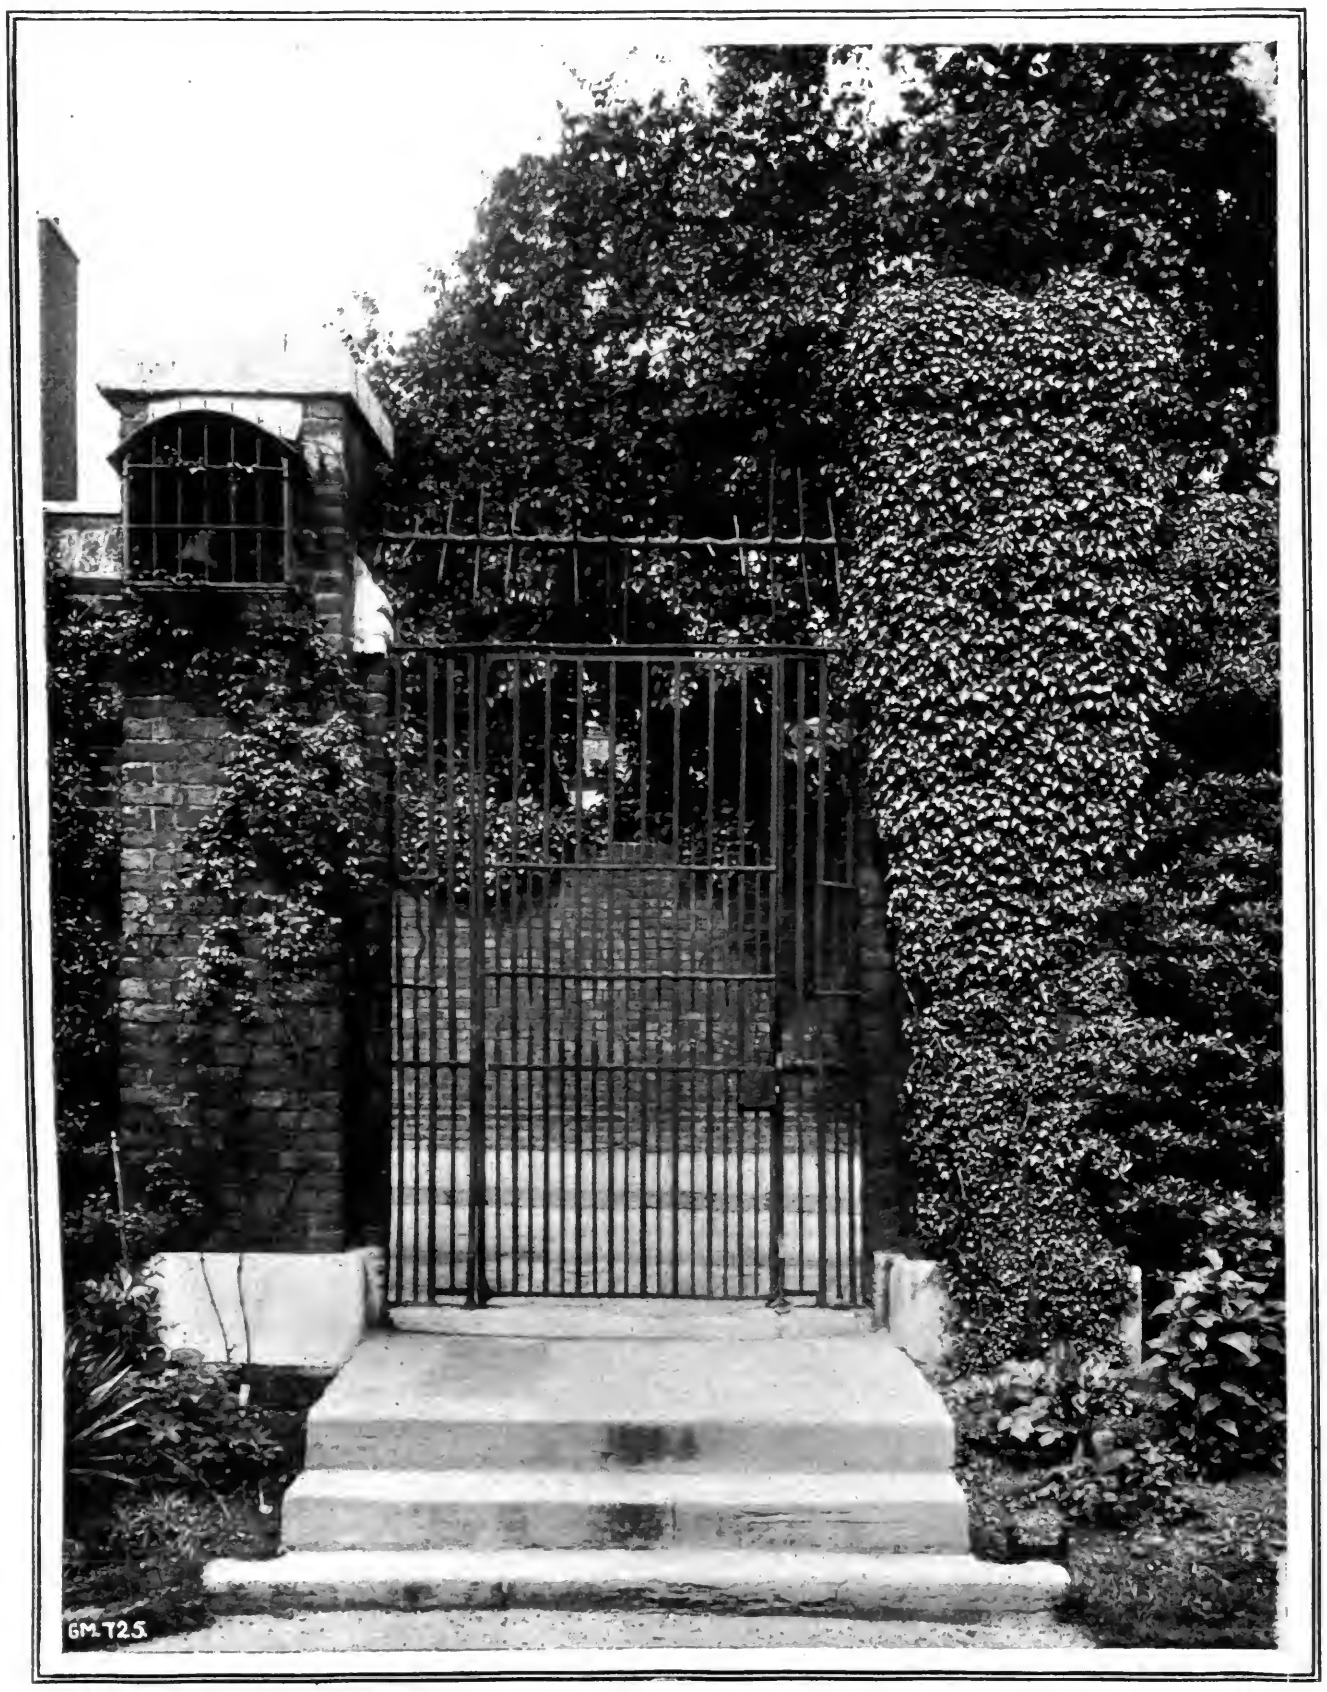
Samuel Doody followed Watts in the charge of the garden, but evil times followed his death in 1706. It appears that the garden had so far been leased to certain members who subscribed among them sufficient for its maintenance. In 1714 the maintenance of the garden came under the Society of Apothecaries in its corporate capacity, this society having imposed definite fees upon its members the year previously. Even thus little interest was taken in the garden until John Petiver became Demonstrator of Plants, instituted botanical excursions in and around London, collected specimens, and came into closer connection with the affairs of the garden.

In 1712 Dr. Hans Sloane purchased the Manor of Chelsea. Two years after, and again in 1718, the Society of Apothecaries conferred with him concerning the garden. In 1722 the Lord of the Manor, who was then President of the Royal College of Physicians, and had become Sir Hans Sloane, conveyed the garden by deed to the society "to the end that the said garden might at all times thereafter be continued as a physick garden, and for the better encouraging and enabling the said Society to support the charge thereof, for the manifestation of the power, wisdom, and glory of God in the works of the creation, and that their Apprentices and others might better distinguish good and useful plants from those that bore resemblance to them, and yet were hurtful, and other the like good purposes."

Philip Miller was appointed head gardener in 1722; he had considerable botanical attainments, and under his care the garden became famous, while his "Dictionary" shows that many plants were grown and flowered here for the first time under cultivation. Ten years later £2,000 were spent on glasshouses, and in 1733 the members of the society, "being sensible how necessary that Branch of Science is to the faithful discharging the Duty of their Profession, With grateful Hearts and general Consent, Ordered this Statue to be erected, In the year of our Lord, 1733, That their Successors and Posterity may never forget their Common Benefactor." This statue to Sir Hans Sloane, by Michael Rysbrach, is in marble; it was finished in 1737, and was moved from a niche in front of the greenhouse to the central position it now occupies in 1748. In passing, it may be stated that Sir Hans Sloane died in 1753 at the age of 93.

"At his death the Nation purchased for £20,000 his library and collections, and obtained Montague House for their reception. George II. added the old Royal Library in 1757, and the joint collections were opened in 1759 as the British Museum."

The excellent order and condition of the garden maintained by Philip Miller involved considerable expense, and the burden of the upkeep becoming too heavy for the Society of Apothecaries, efforts were made to induce either the Royal Society or the Royal College of Physicians to accept control, but without success; indeed, the society was not relieved of its responsibility until 1899. During the latter part of Wm. Anderson's term of office the garden fell into a very bad state, but there was a brisk revival in 1835 when Dr. Lindley became Director. Improvements were continued under Robert Fortune, who was curator during 1846-1848, and his successor, Thomas Moore, helped to make the Physic Garden and himself famous. The latter held office from 1848 to 1887, but from 1862 onwards sufficient funds were not forthcoming to keep things in order, and so during the later years of his tenure the garden became neglected and almost forgotten.



CHELSEA PHYSIC GARDEN.
Entrance gate and old bell, in Swan Walk.

For a moment it may be as well to refer to a few items which may serve to impress upon the minds of garden lovers how great is their indebtedness to the Chelsea Physic Garden, and those at various times connected with it. Philip Miller was a great gardener, and served his day and generation admirably. His "Dictionary of Gardening" and his "Gardeners' Kalendar" were the forerunners of much descriptive and informative literature. Aiton, the first head gardener at Kew, was trained by Miller. Nathaniel Bagshaw Ward, an examiner in botany at the garden, and a moving spirit in the affairs of the society, invented Wardian Cases, which made it possible for Robert Fortune to introduce the tea plant to India, and Markham to bring cinchona from South America to Kew and thence to India. Robert Fortune, previously collector in China for Kew was curator for two years, and left to enter service with the East India Company. Systematic Botany owes a great deal to the Chelsea Physic Garden, which became the stronghold, in this country, of the Linnean method of classification. Wm. Curtis was demonstrator at Chelsea from 1773 to 1777, and left to found a garden and school of his own at Lambeth, whence he issued the "Botanical Magazine" with its beautiful illustrations. Dr. Lindley's work in botany and horticulture is still well known, and his books are found in every horticultural library. He and Thos. Moore gave us "The Treasury of Botany," and the latter was the author of "Index Filicum."

To return. The Society of Apothecaries considered the garden "no longer suitable for the purposes of a botanic garden, owing to the deleterious effects of London smoke, and the impoverished condition of the soil," and desired to relinquish their trust. A Treasury Committee was appointed to consider the matter, and the members, Sir H. Longley, Sir W. T. Thiselton-Dyer, and Mr. Spring Rice, satisfied themselves that the garden was still well fitted for botanical purposes, and that its advantages were likely to be highly appreciated by the students of the Royal College of Science and of the various polytechnics. This meant the salvation of the Chelsea Physic Garden for the benefit of London students. A scheme was formed whereby the trustees of the London Parochial Charities were created trustees of the garden, with the care of the property and funds. The London Parochial Charities contribute £800 a year, the Treasury £150 a year, and the University of London £10 a year. This income is subject to an annual charge of £135 for the redemption in 30 years of the sum of £4,050 advanced by the trustees, and also to a charge for interest upon the outstanding portion of this advance, consequently the garden has to be managed with extreme care. The Committee of Management appointed under the scheme referred to took charge in 1899, and in July of that year appointed Mr. Wm. Hales, then at Kew, as Curator, and Prof. J. B. Farmer as Scientific Adviser. The committee includes members appointed by the trustees, the Treasury, the Lord President of the Council, the Royal Society, the Royal College of Physicians, the Pharmaceutical Society, and the Senate of the University of London.

Mr. Hales found the garden in a state of great neglect. On the advice of Professor Farmer, it was decided that over £4,000 should be expended upon new buildings and repairs and alterations, but fortunately, the sale of a narrow strip of land fronting on the Royal Hospital Road to the Vestry of Chelsea, for £2,000, enabled the trustees to erect a new lecture room and laboratory, a residence for the Curator, new houses and pits, and still leave a modest sum for equipment. Courses of advanced lectures in botany are delivered here under the auspices of the University of London, and the laboratory is used chiefly by students from the Royal College of Science, so that, as a teaching institute, the Chelsea Physic Garden is now filling a large and useful place. In addition to classes and lectures and the use made of the garden by individual students, specimens for teaching and examinations are supplied all through the year to the principal examining and teaching authorities in the Metropolis, and a large part of Mr. Hales' duties consists in cultivating and despatching suitable specimens, and often the specimens sent away run to several hundreds in a day.

The Chelsea Physic Garden is first and foremost a place for the student. Its size, about three and a-quarter acres, and the admirable arrangement of plants in their natural orders, makes it an easy matter for anyone to quickly find the material for their studies. None the less, however, the garden presents many features of interest to the gardener, for probably nowhere else has such a varied collection of plants been brought together in so small a space, and many of the plants are uncommon, and include all those that possess quaint forms and show peculiar methods of adaptation

to environment. The students at Chelsea are always looking for "the reason why" plants behave in certain ways, and as Mr. Hales is a close observer, as well as a botanist and a clever horticulturist, his store of information is liberally drawn upon.

Mr. Hales has worked wonders in the condition of the garden. He has made alterations which have increased the usefulness of the place by one-third. The garden is planned for educational purposes but it is beautiful none the less, and contains many things that appeal directly to the gardener. Here is one of the finest examples of the willow-plate pattern tree, Kolreuteria paniculata, and yonder a splendid Romneya Coulteri that is only protected by a little heap of coal breeze during winter. Against the wall is one of the original plants of Wistaria sinensis, a rare old veteran. Styrax officinalis also does well on the old wall, and the natural hybrid Pyrus intermedia is a good specimen in the open. Rhamnus frangula, the lack Dogwood, is quite a tree, and as happy as if right out in the country, and the Burnett rose does as well here as in Scotland.

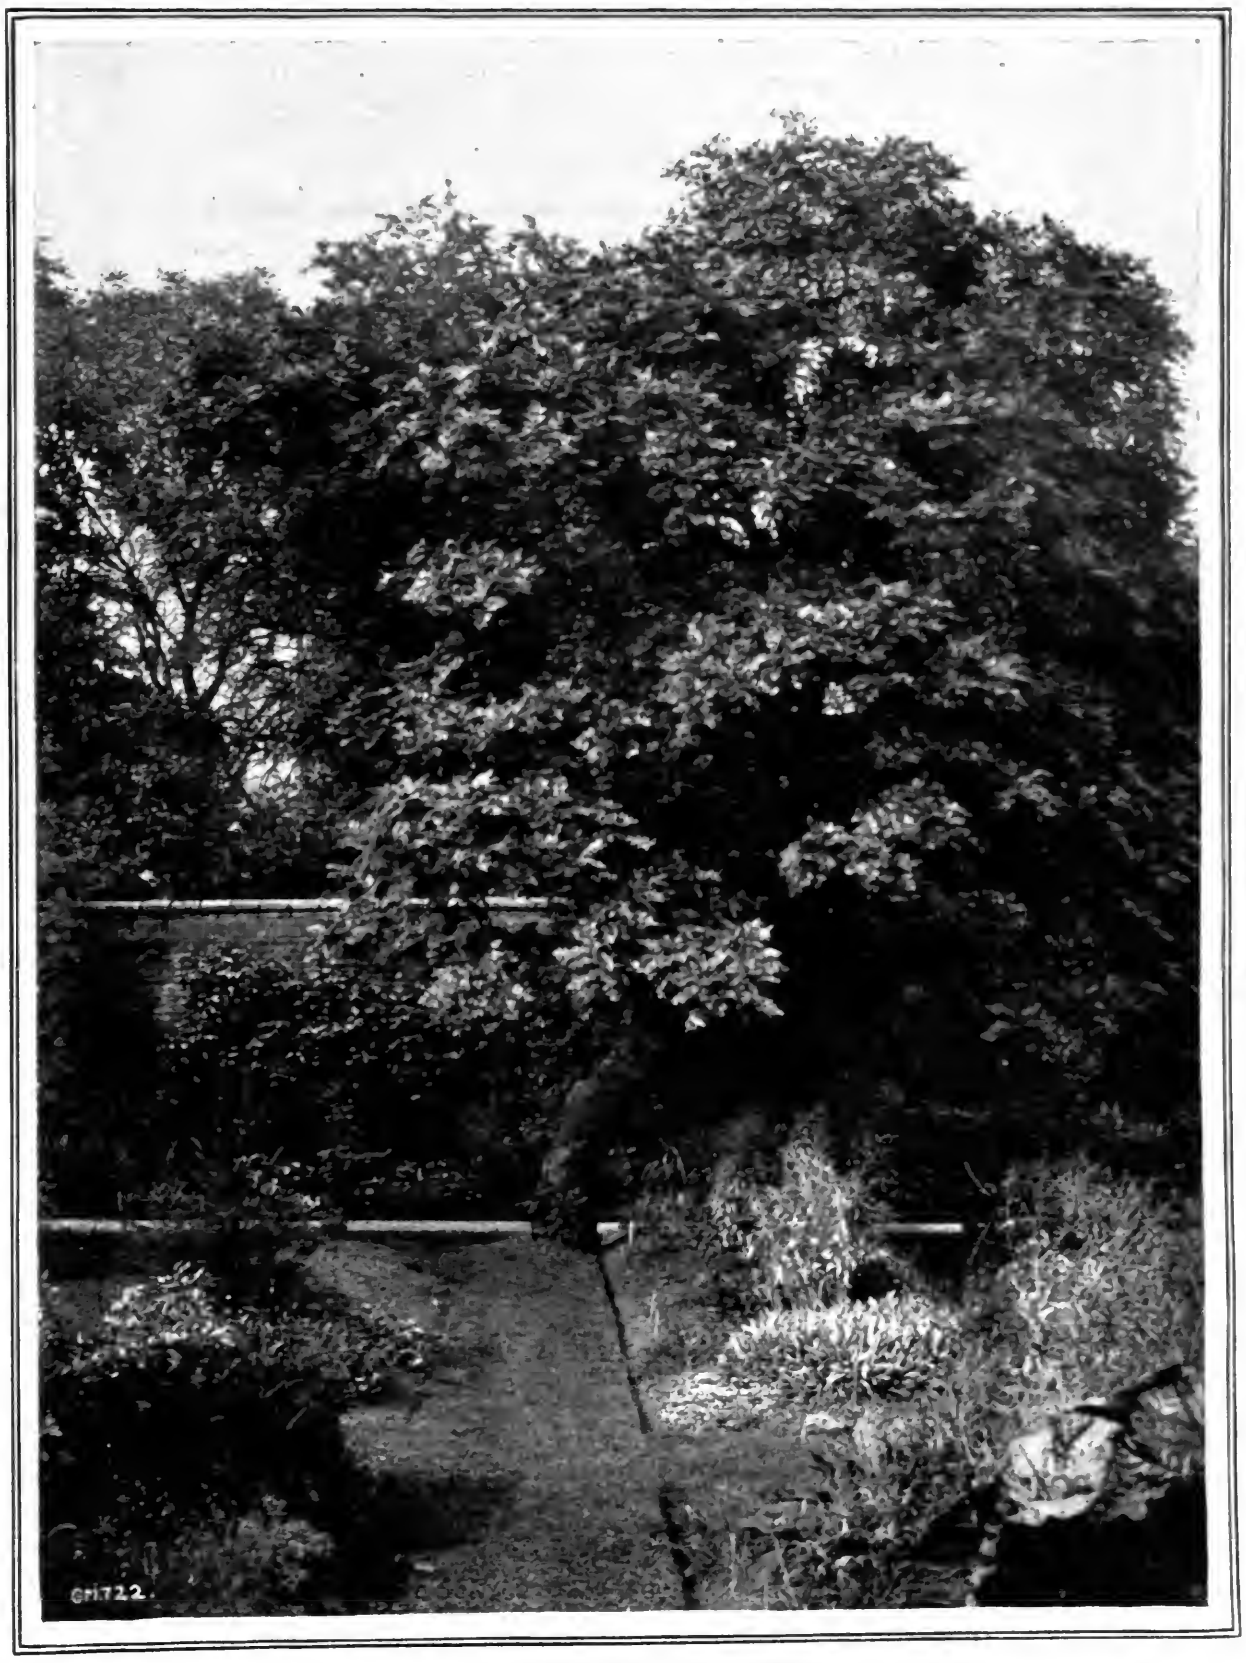
Round by the water garden the Bog Myrtle is as fragrant as in the moist places of a Devon Moorland. Gunnera manicata unfurls its giant leaves in defiance of London smoke, while irises and primulas do well near the water's edge. Farther along a big silver-variegated elm is a conspicuous feature, and under the trees near by the fibrous-rooted Aconitum lycoctonum grows freely, and produces numerous spikes of purple flowers, proclaiming to all and sundry what a good plant it is for shady places where little else will grow.

The cool fernery is a newly-built house, and in it Mr. Hales has arranged the hardy ferns in low rockwork, and already they are growing splendidly, Osmunda palustris gracile and the Lady ferns being particularly handsome. Ferns have to be raised by the thousands for students, or, more correctly, prothalli have to be grown extensively for their use, and so in this fernery there are hosts of these green beginnings of fern life that will never produce frondage. Outside are the beds of bulbous plants. Most irises do well, but montbretias do not so, yet Pancratium maritimum, a Mediterannean species, annually yields its pretty, fragrant and white flowers. A very fine specimen of the Black Walnut (Juglans nigra) attracts attention, and the Loquat is conspicuous on south and west walls. At every step and turn something of more than passing interest appears. Almost in the centre of the garden two big plants of a hybrid rheum produce great handsome leaves, and they are very old inhabitants of the garden. Boehmeria nivea turns the white undersides of its leaves to the breeze as if to remind one that its fibre is now used in the construction of gas mantles. Not far off the dainty Dryas octopetala gives one a surprise.

In the stoves and greenhouses every plant, like a certain advertisement, "tells a story," provided Mr. Hales acts as interpreter. The marvel is that Mr. Hales grows such a huge variety of plants so successfully under glass. There are orchids and succulents, popular fuchsias and pelargoniums, economic plants in great numbers and Encephalartos Hildebrandti, type of a very ancient vegetation. A fine plant of the elegant Restio subverticillata reminds one that there is probably only a better one in the far-off Edinburgh Botanic Gardens. Climbers in the corridor are very handsome, especially Solanum Weidlandi and Bignonia venusta. You turn from Torreya californica, that takes a couple of years to germinate, to the graceful and rare Pentapterygium repens, from the fragrant Drimys Winteri to the odorous Camphor tree, and overhead you notice that Semele androgyna is fruiting.

With five men and a lad Mr. Hales manages the work of the garden, attends to the constant demand for specimens, distributes and receives seeds to and from other botanical gardens, and "pickles" specimens for study during the winter and spring. He has a great love for this old garden, an old garden which his ability and energy have redeemed from possible extinction, and he has amply justified the findings of the committee which, in 1899, considered there was a need for such a garden, and that it could be made extremely useful. No earnest student is denied admission to the Chelsea Physic Garden, and none such should fail to pay the garden a visit. Let me say that the garden is on the Chelsea Embankment, right across the Thames from Battersea Park. It is close to the Royal Hospital, and may be entered from the Royal Hospital Road, though I think the best entrance is the one in Swan Walk, where you may pull the encaged bell that did duty when Philip Miller was in charge.

CHAS. H. CURTIS.



CHELSEA PHYSIC GARDEN.

A fine old specimen of Kolreuteria paniculata—the willow-plate pattern tree.

WALLFLOWERS FOR SPRING BEDDING.

The real value of wallflowers as spring bedding plants is being appreciated more and more every year. One cannot wonder at this being the case, as few kinds of plants will thrive in as many different positions. The least favourable positions in a garden are often left unadorned in springtime owing to the difficulty in getting plants to grow and flower satisfactorily in them. Wallflowers will do well in cold, draughty borders, in partially-shaded ones, and in the sunniest bed in the garden. The wallflower is worthy of every care being bestowed on its cultivation in a young state. Unless they are well-grown in their early stages it is not possible for them to prove satisfactory in the flowering quarters. During the past few weeks I have seen many thousands of plants spoiling in their seed-beds. They are nine inches or more in height, but owing to their crowded condition nearly all the lower leaves have perished already, and the stems are weakly and without side shoots. Such specimens will not fill up much space in spring-time. When nine inches high they ought to be as broad, and bushy plants can only be obtained by early transplanting at least once prior to putting them in the beds.

The soil in the nursery bed must be moderately rich, made so by using well-rotted manure and fairly deep digging. But before any wallflowers are planted in it the soil should be made firm by treading while in a moderately dry state. Put out the plants seven inches apart each way, and firm the soil round the roots, give water at once, and in the absence of rain, frequently afterwards. Instead of weakening, such plants will get stronger every week, and be in prime condition for planting in the flower garden in October, or even as late as March. M. L.

EARLY VINERIES.

Treatment after Gathering the Grapes.

The gathering of the fruit in early vineries is usually completed soon after it becomes ripe, and for this reason the subsequent requirements of the vines, thus relieved, is necessarily very different to that accorded late vines after cropping. When the fruit of late grapes is gathered the vines have invariably fully matured their growth, their leaves have fulfilled their functions, and they are in a fit state for being pruned. It is a very different thing, however, with early vines, which, when their fruit is gathered, have their growth only partially matured, and their leaves with much of their natural faculties still undischarged.

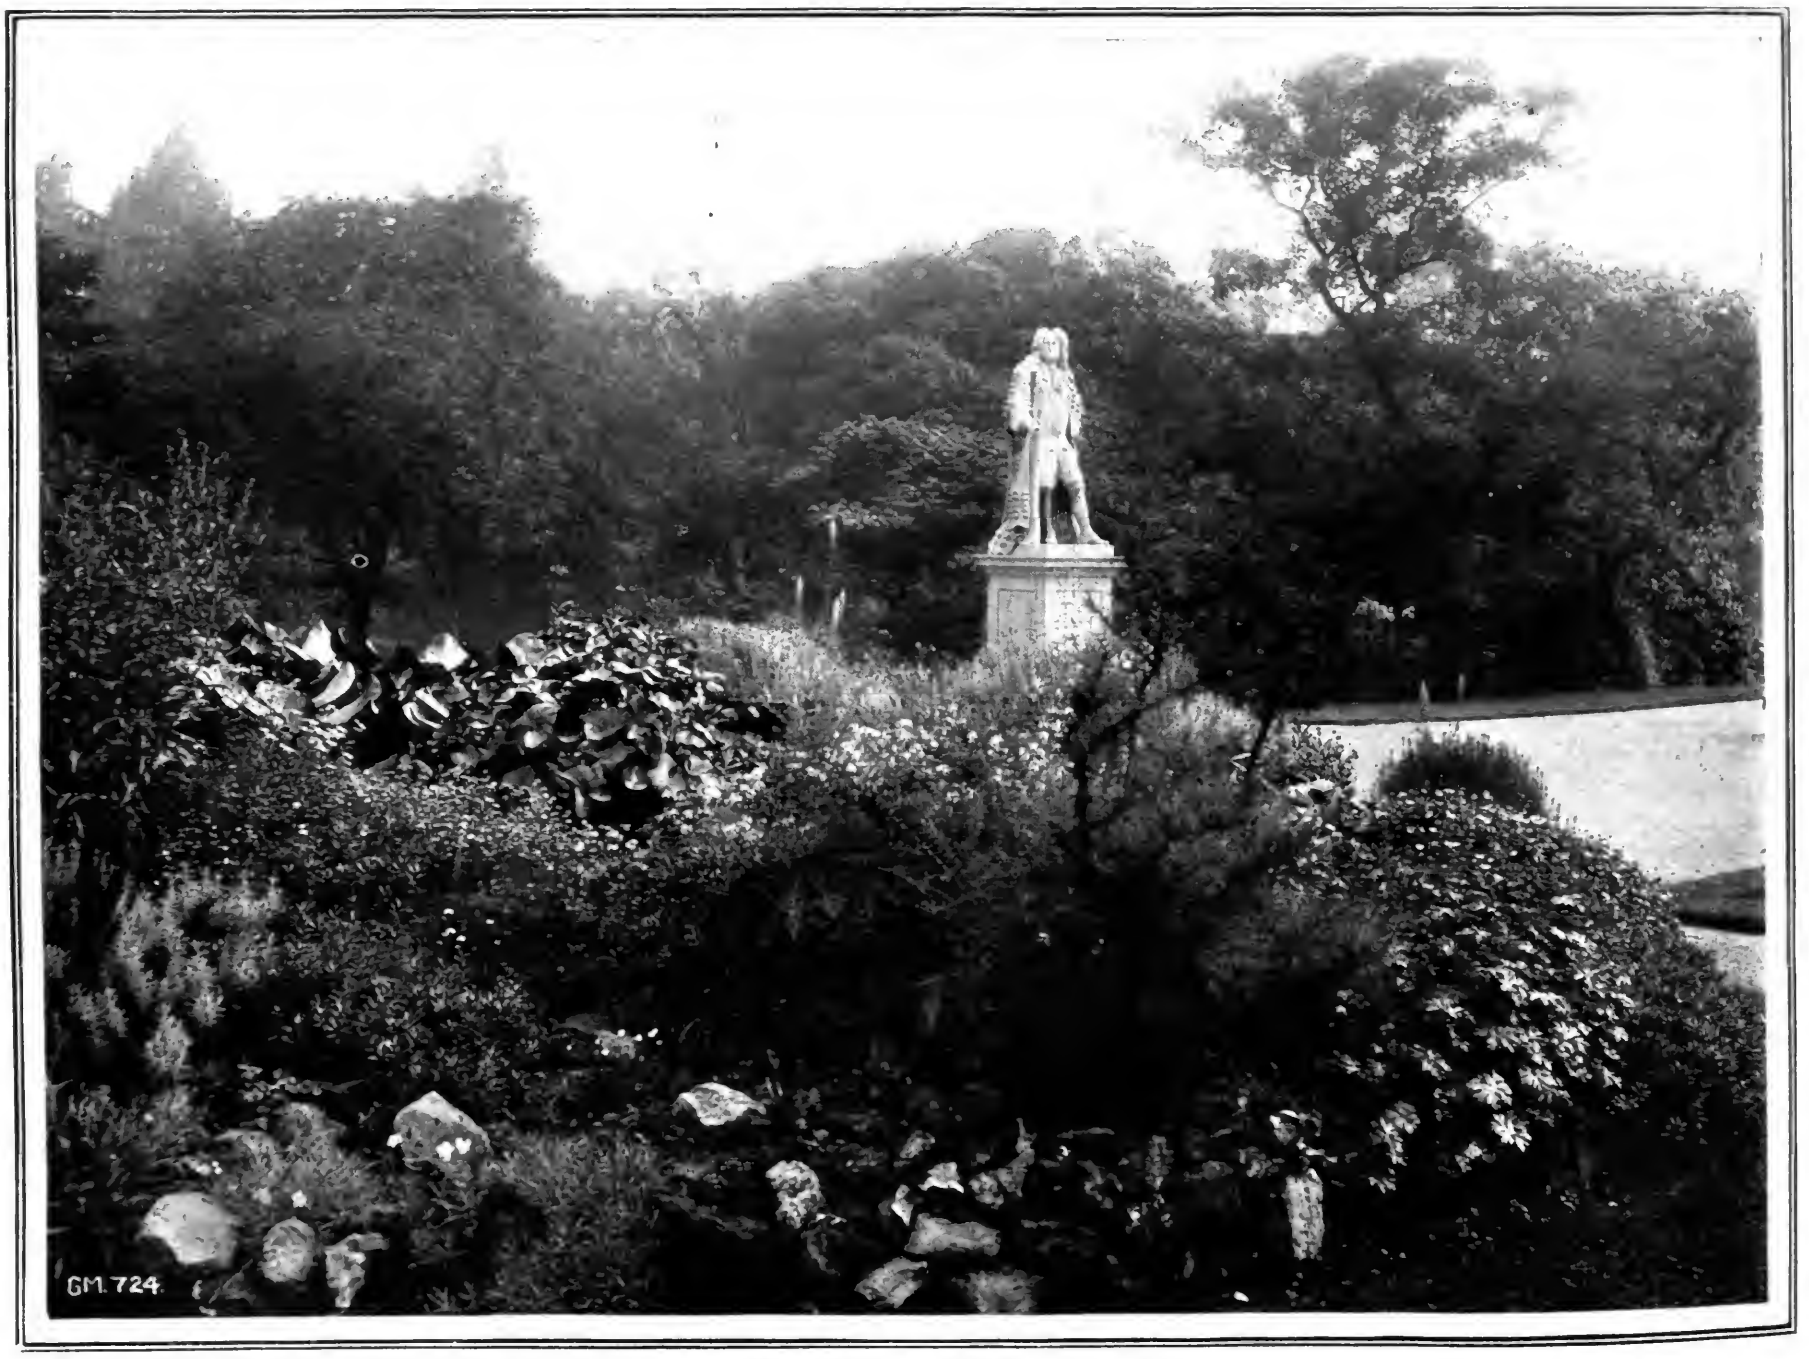
Serious mistakes may be unwittingly made, especially by the inexperienced, by leaving the vines with insufficient attention to ensure the wood being properly ripened, and consequently prepared to produce the next season's crops of fruit. So slight is the margin between success and failure in this and like matters, that even professionals sometimes fail.

Vines that have been carefully managed, when cleared of their crops of fruit will have their trellises well furnished with lateral growths, carrying an adequate quantity of clean strong leaves, well exposed to the light. It is not an uncommon occurrence, however, for them to be found with crowded laterals, or with sublaterals running wild, and thus seriously wasting the vine's energies. In cases of this kind the laterals should be discreetly thinned, the weakest of the superfluous ones being removed, and the sublaterals cut back to their basal leaves, while all growths subsequently made should be regularly stopped or disbudded. This will effectually concentrate the vine's energies upon plumping up the buds, and ripening their wood, and by this means improve, to a considerable degree, the prospect of the next year's crop. To this end also it is decidedly important that the leaves be kept clean until they naturally fall, and to ensure this the syringe, or garden engine, and, if necessary, an efficient insecticide, shoud be freely brought into use, and, moreover, the house must be carefully ventilated. As soon as the fruit has been gathered the circulation of air through it should be gradually increased until the vine wood is thoroughly browned and hardened, when the ventilators should be left open. The object in view in paying such careful attention to these details of management is to ensure the wood being fully matured, and buds well plumped up.

The borders need care, and when water is required enough should be given to wet the soil throughout. It is easy to be deceived about this, particularly as borders vary so much in their formation. I recollect a case in point, which happened in my early gardening days—viz., a house of Black Hamburgh vines was year after year unsatisfactory, the wood and leaves being weak, and the bunches and berries small, while they ultimately dwindled, and were uprooted. The border was an outside one, raised above the ground level, and supported by walls. The reason of failure was starvation, for the border was found to be quite dry throughout. It had received no artificial watering, as those in charge had been deceived in thinking the rainfall sufficient for the requirements of the vines. Had Kirk's patent soil tester been in existence at that date, and been made intelligent use of, the mischief would have been prevented.

To assist the buds to become prominent the sublaterals should be removed as soon as the principal leaves commence to mature, and once the leaves fall the vines should be pruned. This, the practice of pruning, if spur-pruning is followed, is a comparatively simple matter, though mistakes are sometimes made in pruning back to a weak basal bud. This should be avoided by pruning to selected bold buds which have been supported by a fully-developed leaf. Thos. Coomber.

The Hendre Gardens.



CHELSEA PHYSIC GARDEN.
Rysbrach's statue of Sir Hans Sloane.

Hypericum calycinum. — This, which is sometimes popularly known as the Rose of Sharon, though that name is occasionally applied to Hibiscus syriacus, is, common though it be, a charming little under-shrub. A desirable feature is the fact that it is one of the best of low-growing shrubs for growing under the shade of trees. Even under these conditions its comparatively large golden-yellow flowers are borne in great profusion.—S. W.

NEW PLANTS AND FLOWERS.

MILTONIA CHARLESWORTHI MRS. RALLI.

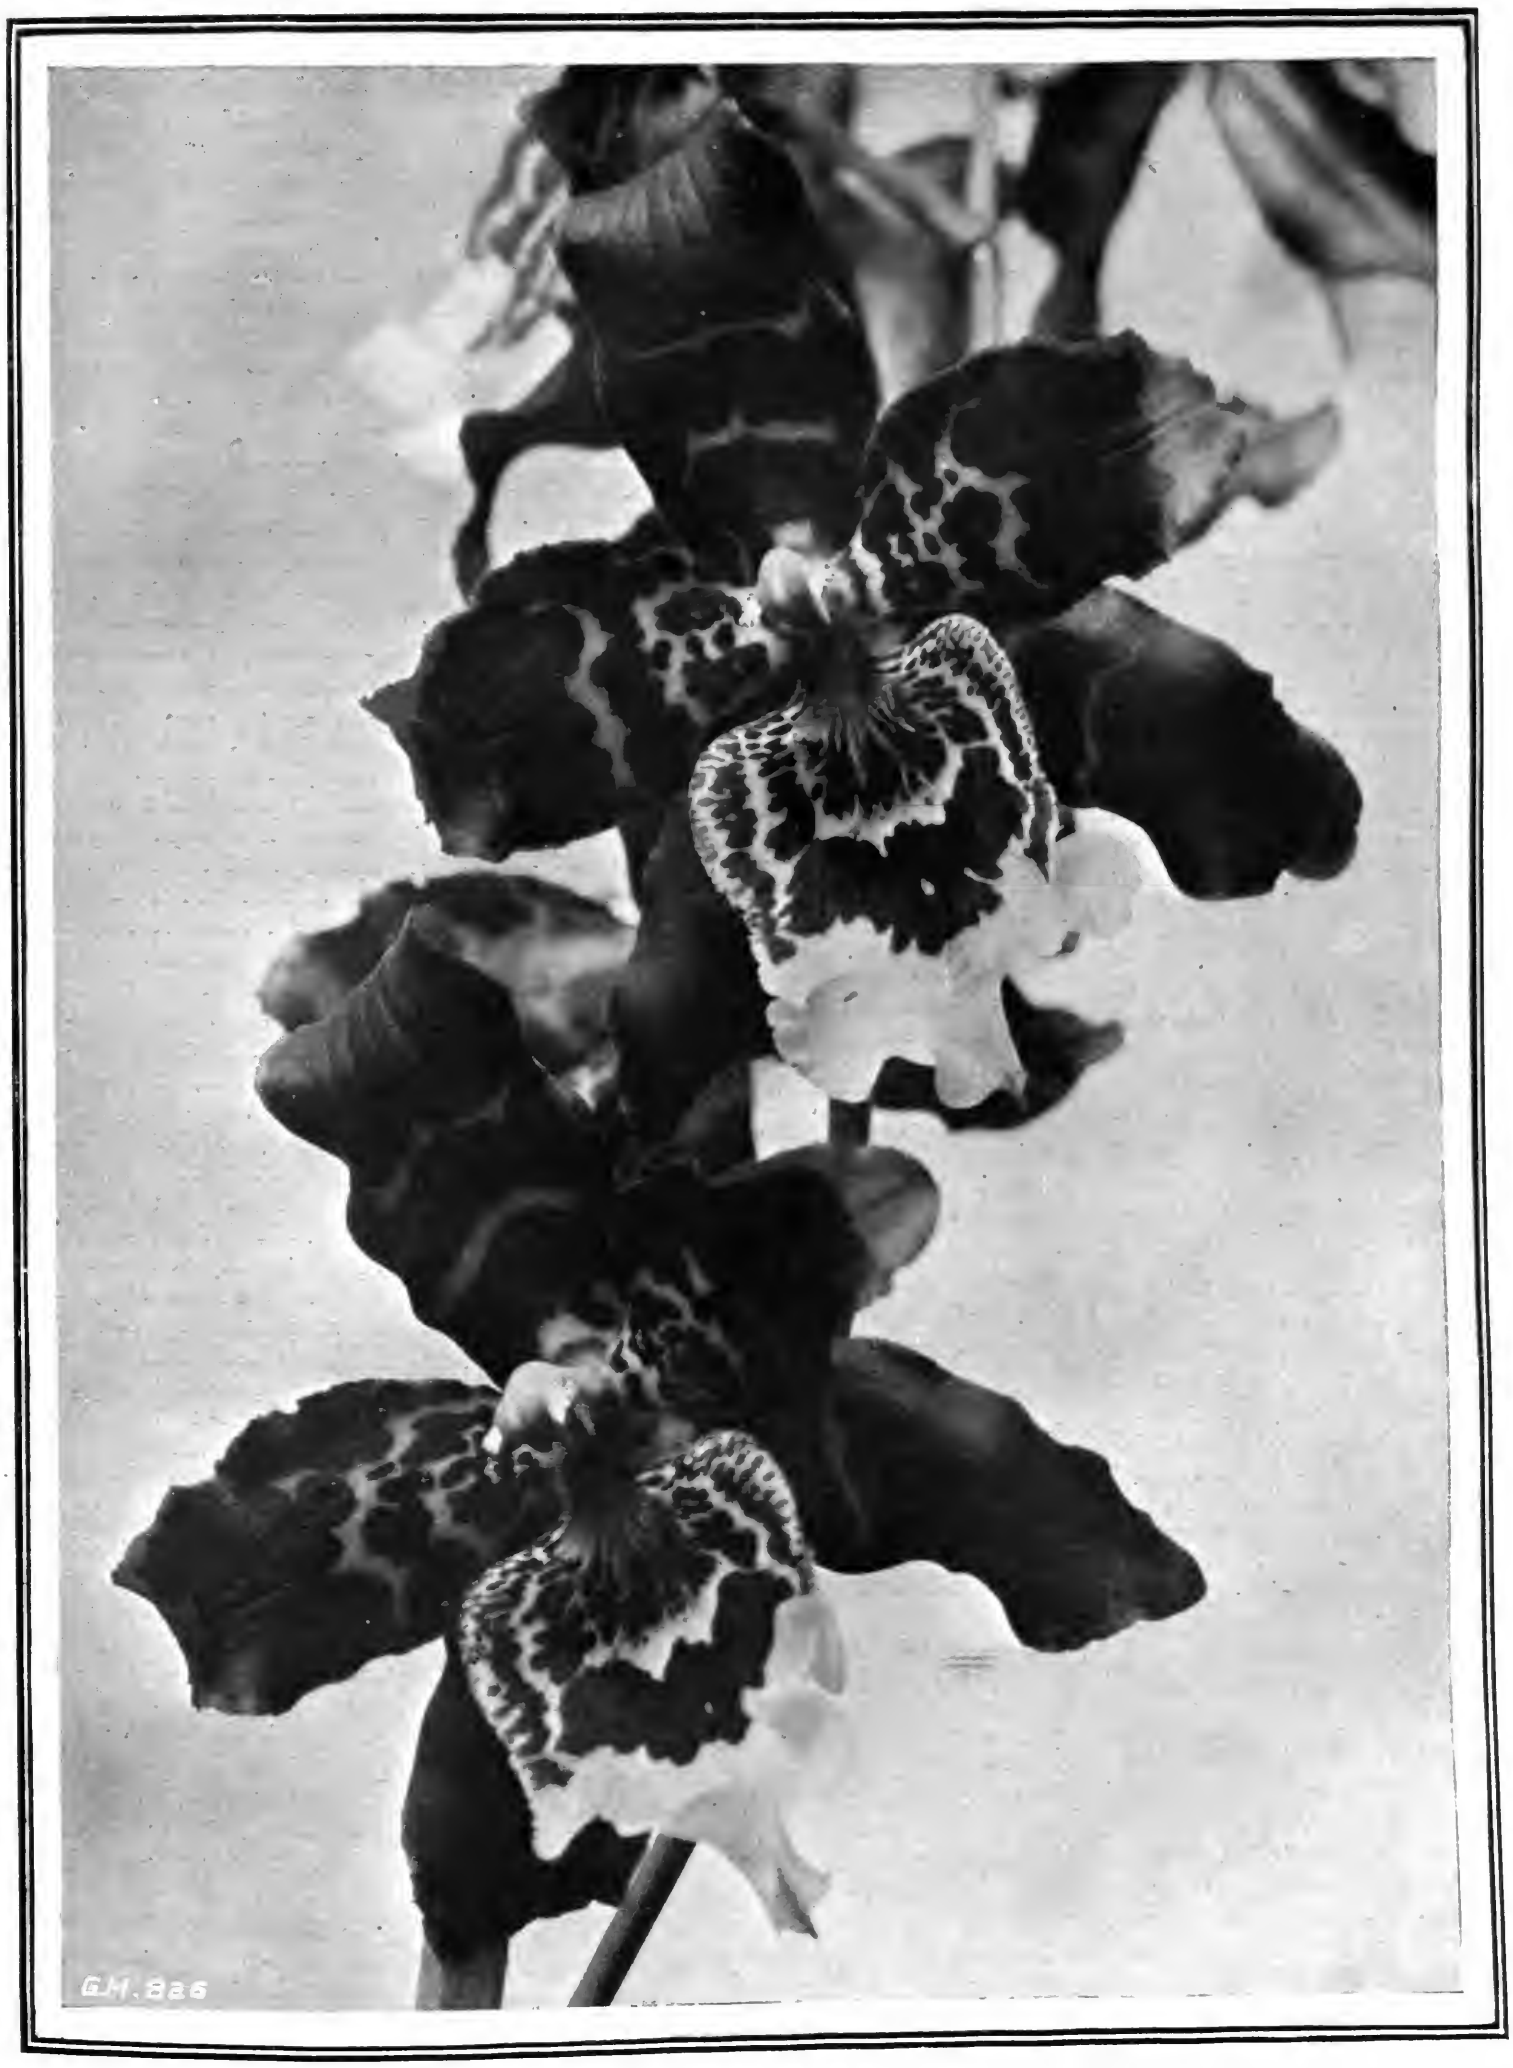
A much smaller flower than the type, recently described. It has a pale rose-pink lip, and rosy sepals and petals. There is a small crimson blotch at the base of each lateral sepal, and a large deep maroon-crimson mark at the base of the lip. A.M., R.H.S., July 29. Pantia Ralli, Esq., Ashtead Park, Leatherhead.

ODONTOGLOSSUM QUEEN ALEXANDRIA VAR. THEODORA.

A showy form of the hybrid between O. Harryanum and O. triumphans. The influence of O. Harryanum is well marked, but the flowers open well, and are of good size. The yellow sepals and petals are heavily marked with bright red-brown, and the white lip has rose-coloured markings. A.M., R.H.S., July 29. De Barri Crawshay, Esq. (gardener, Mr. Stables), Rosefield, Sevenoaks.

SPIRÆA (SORBARIA) ARBOREA GRANDIS.

A strong-growing, shrubby species that is very like S. Aitchesoni. The leaves contain eight or nine pairs of lance-shaped, serrate-margined leaflets. The small flowers are creamy-white, packed closely together in branched triangular panicles, often measuring 1½ft. long by 1¼ft. broad. A very handsome plant. A.M., R.H.S., July 29. Hon. Vicary Gibbs (gardener, Mr. E. Beckett, V.M.H.), Aldenham House, Elstree.



ODONTOGLOSSUM QUEEN ALEXANDRIA VAR. THEODORA.

Flowers yellow, heavily marked with bright red-brown; lip white with rosy markings. A.M., R.H.S., July 29. De Barri Crawshay, Esq., Rosefield, Sevenoaks.

NYMPHÆA COLOSSEA.

A large-flowering and strong-growing variety, raised by M. Marliac, and sent out in 1901. It is very suitable for deep water, i.e., five to seven feet deep. Full-sized

blooms are ten inches across, and have a large number of broad petals. The colour is a soft rose-pink shade. Flowers are freely produced both early and late in the season, and they are sweetly scented. A.M., R.H.S., July 29. Leopold de Rothschild, Esq. (gardener, Mr. Jas. Hudson, V.M.H.), Gunnersbury House, Acton.

NYMPHÆA ESCARBONCLE.

This comparatively recent introduction was also raised by M. Marliac. It has flowers of good size, and particularly brilliant colouring, the shade being very bright crimson-red. It is one of the finest of richly-coloured water lilies. A.M., R.H.S. Leopold de Rothschild, Esq., Gunnersbury House, Acton.

ROSE ANNIE CRAWFORD.

A splendid hybrid perpetual rose raised by Dr. J. Campbell Hall, of Rowantree House, Monaghan, Ireland. The parents are Mrs. J. Laing and Capt. Hayward. In size, substance, form, and breadth of petal this is an altogether fine rose, and one that exhibitors will welcome. It is of better form than Mrs. J. Laing, and the colour is soft, clear pink, but of a rosier shade than seen in Mrs. Laing and similar roses. Fortunately this newcomer is sweetly scented. A.M., R.H.S., July 29. Mr. W. R. Hammond, Burgess Hill.

CARNATION ROSY MORN.

A strong and free growing border variety with large full blooms of a pleasing and soft old rose colour. A.M., R.H.S., July 29. Mr. Jas. Douglas, Great Bookham.

GLOXINIA, VEITCH'S STRAIN.

A particularly fine strain of these popular flowers, including selfs, bicolors, and spotted forms, in a variety of colours. In shape, size, and erectness the flowers are first-rate. A.M., R.H.S., July 29. Messrs. Jas. Veitch and Sons, Chelsea.

CLEMATIS TANGUTICA OBTUSIUSCULA.

An interesting form with very elegant foliage and small yellow flowers, that do not appear to open out fully. Seeds were collected in 1911, in the Chow district of West Kansu, China, by Mr. Fenwick Owen. A.M., R.H.S., July 29. F. C. Stern, Esq., Goring-on-Sea.

RED SUNFLOWER.

An interesting and striking annual obtained by crossing Helianthus annuus with the red-zoned H. lenticularis coronatus found in Colorado by Prof. Cockerell. Messrs. Sutton and Sons have been selecting the strain very carefully, and expect shortly to secure over 90 per cent. of "red" sunflowers true from seeds. The flowers have a blackish centre or disk, and the handsomest have a narrow yellow zone round the disk, then a wide band of bright red-brown, while the tips of the broad ray florets are bright yellow. Under bright sunshine the red colouring shows up most effectively. The leaves are purplish-green, and the stems of the richest hued forms are dark red-purple. A.M., R.H.S., July 29. Messrs. Sutton and Sons, Reading.

SWEET PEAS.

King White.—A fine white waved sweet pea that is destined to become very popular because of its purity, substance, and waviness. It is the best wavy white variety, and was raised, we believe, by Mr. Alex. Malcolm, of Duns. A.M., R.H.S., July 29. Messrs. Dobbie and Co., Edinburgh.

True Lavender.—A light and bright lavender-coloured variety. The shade of colour is most pleasing, and the flowers are nicely waved. A.M., R.H.S., July 29. Messrs Dobbie and Co., Edinburgh.

GLADIOLI.

Electra. — A very fine, large-flowered Childsi variety, with bold scarlet flowers borne in a stately spike. The lower inner segment has a cream-coloured base. F.C.C., R.H.S. and N.G.S., July 29. Messrs. P. Hopman and Sons, Hillegom, Holland.

Prince of Wales.—A strong-growing, open-flowered form, with rich orange-salmon coloured flowers. A beautiful gladiolus. A.M., R.H.S. and N.G.S., July 29. Mr. C. van Zanten, Hillegom.

Pink Perfection.—A refined flower of soft clear pink colour, the larger segments lightly flaked with deeper pink towards the margins. A.M., R.H.S., July 29. Messrs. P. Hopman and Sons.

King of the Blues.—This is the bluest of the blue gladioli, and the shade is velvety violet-purple. A striking flower. A.M., R.H.S. and N.G.S., July 29. Mr. K. Velthuys, Hillegom.

Liebesfeuer.—This is a large-flowered variety of rich coral-red colouring, with a faint line of purple down the centre of the lower segments. A.M., R.H.S. and N.G.S., July 29. Messrs. de Ruyter, Noordwijk, Holland.

Frank Paddleton.—Evidently a Childsi variety. The bold flowers are rich pink with a crimson blotch on each of the mid-lower segments. The individual flowers seem to be very short-lived. A.M., R.H.S. and N.G.S., July 29. Mr. P. Vos, Sassenheim, Holland.

Incontestable.—A white variety, with a blotch of scarlet on the lower segments. A.M., R.H.S. and N.G.S., July 29. Messrs. Alkemande and Co., Noordwijk, Holland.

Loveliness.—This variety produces a splendid spike, and the shapely flowers last well. The colour is light cream-yellow, with buff shading and some purple markings. A.M., R.H.S. and N.G.S., July 29. Messrs. de Ruyter, Noordwijk.

VARIATION AND ENVIRONMENT.

This subject, touched upon in the interesting article by Mr. C. T. Druery, F.L.S., on page 492, will well bear a little discussion. The science of plant biology is hedged about by difficulties of a particularly stubborn nature, and it seems to me that a long time must elapse before the sum of positive knowledge concerning the variability of species will be materially increased. Many shades of opinion are held by clever thinkers, and nothing short of an extended series of very careful experiments and correctly-guided observations can ever put the clue into our hands by which we may thread the labyrinth. At present, certain earnest workers are trying hard to construct something solid from the hazy nebula of theory, but so intricate is the problem they have set themselves that some of the most potent terms are probably still to be discovered. The student of plant variability is working almost in the dark; such glimmers of light as are borne in upon his labours are at best feeble and flickering, and may at times be positively deceiving.

We often hear it advanced as a fundamental proposition that in plants there is an inherent tendency to vary. Now, I believe that the direct opposite is the case. No varietal difference ever occurs as the result of an innate directive force specially applied to that end; on the contrary, I think that all natural tendencies in plant-growth combine to preserve the constancy and stability of a species. When a "break" occurs, it is always attributable to some influence operating from without, but so subtle in its action that investigations have hitherto been fruitless. A few wild species in their native habitat seem more inclined to vary than others—that is to say, their natural tendency to immutability is more easily broken down; but, on the whole, it is easy to perceive that a variety is an accident caused by some extraneous force acting on an individual specimen.

I can, of course, only hazard a very tentative suggestion as to what the modifying agent may be; indeed, I suspect that there are several causes, which sometimes act singly, and sometimes in unison. We are aided somewhat in our pursuit of the variety-forming influences when we reflect that they have been operating upon all forms of life for untold ages, ever since the first specks of neucleated protoplasm came into a lifeless world. They are, therefore, not new factors, but belong to all time.

It is pretty certain, too, that varieties sprang into existence in far greater numbers during the very early stages of evolution, when living structures were all of a comparatively simple kind. If this view be correct, we may advance the theory that the simpler the structure the more likely is it to vary, because it is acted upon more readily by the disturbing agent. Thus one would expect ferns to depart from the normal type more frequently than flowering plants, and, on the same principle, mosses and lichens should vary to a greater extent than ferns. As regards the unstable character of native ferns, as compared with wild species of flowering plants, Mr. Druery's data seem fairly conclusive; what have the students of mosses to say?

Coming to the main point, I would discard the idea that environment of itself is capable of changing in a permanent manner the form of a plant. Such modifications as may be observed in a water-loving plant transferred to drier soil are but signs of physical distress, and I cannot think that unfavourable symptoms of this sort can ever be tolerated as a constant physiological characteristic. It speaks peace where there is no peace.

The variety-forming influence often selects one specimen from amongst many growing under the same general conditions. This does not point to environment as a cause. The change takes place in the very being of the plant, showing that the agent has penetrated to the depths of its vital essentials. It seems to me that we can only account for the phenomenon by supposing that a chemical disturbance and rearrangement takes place in the protoplasm of the seed-germ or spore, and that morphological changes ensue as a natural consequence. I do not infer that an alteration in outward appearance is the sole result. In fact, I think that the modification of external members is but the visible sign of a vastly more important economic deviation within. As Darwin truly states, "the nature of the bond of correlation is very frequently quite obscure." I would go further and say that the internal constitutional change, correlative with altered form in a variety, is always a sealed book. That is, we have no direct means of ascertaining the new constitutional characteristics which are, in all cases, bound up in a varietal departure from type. Yet this hidden correlative really decides whether the fresh-comer shall oust its parent, whether it shall exist side by side with the old form, or whether it shall suffer extinction.

Although the production of natural varieties is apparently haphazard, it is no doubt governed by an inexorable law. I have thought that the chemical action of light may play a part. We know that light exercises a peculiar influence upon vegetable cells, and, perhaps, in certain circumstances it may chemically affect an individualised germ-cell, thus modifying embryonic form and subsequent growth. J. E. SIMMS.

Elkington Hall Gardens.

Achimenes tubiflora.—This achimenes is also known as Gesnera tubiflora, and widely removed from the various garden forms of achimenes, which have small scaly rhizomes, whereas this forms a solid tuber after the manner of some of the gesneras. It is a very pretty flowering plant for the greenhouse, pushing up a stout, erect stem, eighteen inches to two feet in height, the upper portion of which bears several large flowers. Individually these are long tubed, about one and a-half inches across the expanded mouth, and of the purest white. A group of ten or a dozen flowering examples, associated with some low-growing subject, forms an exceedingly pretty feature.—W. T.

FLOWERS AT JESMONDENE.

While paying a visit recently to Jesmondene, Bournemouth, the beautiful residence of Dr. Ramsay, I noticed several features which were quite out of the common. On the upper terrace, in front of the mansion, there is a large lily pond, made four feet deep, then half-filled with leaf-soil and loam, the former predominating. In this compost the lilies are growing most luxuriantly; I never saw leaves more healthy nor blooms larger and purer in colour. The edge of this pond is furnished with various kinds of grasses and reeds in a rockery constructed to appear as natural as possible.

Growing against the walls of the house are three grand camellia bushes. A wistaria had been trained up the wall in a recess between two windows, and then outwards to form a verandah, with Dorothy Perkins roses trained up the supporting front pillars. The able gardener, Mr. Webb, said the wistaria was lovely when in full bloom, and I can quite understand how beautiful it would look, as it is a very large specimen.

Other features in this part of the garden were roses, jasmine, and honeysuckles, the latter being very large, untrained bushes full of blossom.

Elsewhere two long rows of apple and pear trees were trained as cordons; many were bearing heavy crops, and all were in grand health. I could not help thinking how advisable it is to grow these fruits as cordons, and feel sure that, in the near future, many thousands of them will be met with in gardens. The next form to find favour will be bushes with branches trained outwards several feet apart at the top, to resemble so many cordons. These branches should bear fruit their whole length.

A handsome greenhouse, dry-glazed on iron framework, with the glass squares fitting flush and not overlapping, contained a number of beautiful lilies and begonias, also a few orchids in one compartment.

G. B.

FLOWERING CANNAS.

We are so accustomed to see these treated as greenhouse or out-of-door plants during the summer months, that the possibility of growing them in any other way is rarely thought of. Some specimens in the tropical Water Lily House well serve to illustrate the development that they assume with increased heat and moisture. The plants are grown in large pots, and just stood around the edge of the tank, so that the roots have ample access to water. In this way they attain unusual dimensions, the foliage and the flowers being equally fine. K.

SPIRÆA (SORBARIA) ARBOREA GRANDIS.

A shrubby spiræa belonging to the Sorbaria group, and closely allied to S. Aitchesoni; flowers small, creamy-white, borne in large, branching panicles. A.M., R.H.S., July 29. Hon. Vicary Gibbs, Aldenham House, Elstree, Herts.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

THE HEATING APPARATUS.—The present time affords an opportunity of attending to any repairs, or replacing any defects in either the boiler or hot-water pipes. The outside conditions are such that, with a little discretion in damping and making use of the heat derived from the sun's rays, by closing the houses early, the plants will not suffer if the fires are out for a few nights while necessary repairs are being attended to. It is generally found desirable to flush the boilers at least once a year, to remove as much of the sediment as possible from the boilers and pipings. There are very few places where the water used for heating purposes is supplied from the rain water tanks; wherever the water holds any form of mineral there is settlement, which, if not removed, will cause rust and decay. All valves should be oiled and put in working order, the flues and chimneys swept, and the fire-bars overhauled and replaced with new ones where required. It is a good plan to have a water ash pit, sufficiently deep to contain the ashes and sufficient water to cover them. This not only prevents clinkering, but it also is a great saving in fire-bars; we find that where water ash pits are provided the bars, as a rule, last out three of those where the hot, dry ashes are directly under the bars.

DECIDUOUS DENDROBIUMS. — The early-flowering deciduous dendrobiums will have completed their season's growth in some cases, and as they mature, the plants should be removed to a position where there is less moisture in the atmosphere and where they may have the benefit of the available light, only sufficient shade being necessary to prevent actual scorching of the foliage. Root moisture should also be diminished, sufficient to keep the pseudo-bulbs plump is all that is necessary. This treatment will prevent secondary growths appearing, which are undesirable at this season of the year, but frequently occur in very early-flowering plants. Referring to secondary growths on deciduous dendrobiums, I would again point out that it is the usual thing in its native habitat for Dendrobium Wardianum to produce them. The late Mr. Boxall, who was one of the first, and certainly one of the most successful, collectors of this species, told me that he could rarely find a plant that had not produced a young shoot of considerable length, and in the dormant season most of the older leaves had fallen from these growths, but as soon as the favourable season for activity returned, these growths immediately restarted, and developed their pseudo-bulbs in due course.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

RETARDED BULBS FOR AUTUMN AND WINTER FLOWERING.—For autumn and winter flowering retarded bulbs of various kinds of liliums are indispensable. L. speciosum rubrum and L. speciosum album are two of the most useful for this purpose. These, together with L. longiflorum, potted at intervals of two or three weeks, will provide a continuous display all through the late autumn and winter months. The bulbs may be grown in a high temperature if this should be necessary to hasten them into bloom. When well rooted a top-dressing of loam and well-decayed cow manure will prove of great benefit to the plants. Liliums are very prone to attacks of aphis in all stages of their growth, but this can be prevented by light fumigations of a nicotine compound or spraying the foliage with an insecticide. Lily of the valley is always useful, and in order to have a continuous supply of these beautiful flowers during the autumn and winter, retarded crowns must be used. If a supply is required all through the season it is necessary to have a quantity sent at fortnightly intervals. They should be potted immediately on arrival, using about ten or twelve crowns for a 5in. pot. Thoroughly soak them with water and put them in a cool temperature for a few days preparatory to placing them into heat. They should not be exposed to the light until the flower spikes are developing, or the stalks will not be so long as is usually desired. Retarded clumps of spiræas are most useful subjects for winter decoration, and are very easily grown.

ROMAN HYACINTHS.—A batch of these may now be potted, using 5in. pots, and for cut flowers alone a quantity may be planted in boxes or pans. Early varieties of narcissi may also be potted for Christmas decorations. When potted plunge them in ashes in a cold frame.

VIOLETS.—Keep these free from runners and weeds, and frequently use the hoe between the plants. If the weather continues to be dry for a lengthened period they must be thoroughly soaked with water at regular intervals. A dusting of well-seasoned soot prior to watering will be of considerable benefit to the plants, and will help to keep them free from red spider. It will soon be time to take the plants up and put them in frames, and the compost should be made ready for preparing the beds. Chopped loam and leaf-soil collected straight from the woods, in equal parts, makes an excellent rooting medium for the violet.

CHRYSANTHEMUMS.—The large-flowering kinds are now developing their flower buds, and if there is room on the surface of the pots for a little top-dressing material now is the time to apply it. The plants now are in need of abundance of water at the roots, and at least once a day they should receive some kind of stimulant. Earwigs are often very destructive to the buds, and these must be diligently sought after. Portions of bean stalks placed among the plants are excellent traps. These stalks should be examined every morning, and the insects blown into a pail of hot water. The decorative kinds are growing freely, and must be regularly attended to in the matter of tying and staking. — E. Harriss, Lockinge Park Gardens.

HARDY FRUITS.

PEARS.—The removal of all useless soft growths will require attention, taking care not to shorten them back too severely. Keep the leaders well trained and secured to the woll or trellis; well feed any tree that is bearing a good crop of fruit, and insert buds of good varieties on young, healthy shoots that have been trained for that purpose. It is always well when grafting espalier trees to lay in a few shoots for budding should the grafts fail to take. Some of the small early pears may, when ripe, be gathered and eaten straight from the trees, but the larger kinds, such as Williams' Bon Chrètien, Clapp's Favourite, etc., are better when gathered a little under-ripe and stored for a few days in a cool, well ventilated fruit room. By gathering a few at intervals the season may be greatly prolonged.

PLUMS.—Aphis has again made its appearance on the leaves, and should be dislodged without delay; if the pests have become established, use a little quassia extract and follow with clean soft water.

APPLES.—Some of the very early varieties will now be ripe and fit for dessert. Jackson Seedling, Red Juneating, Beauty of Bath, and Irish Peach are amongst those to ripen early, and they will prove very useful where early dessert apples are appreciated. Devonshire Quarrenden crops well here, both on standards and espaliers.

RASPBERRIES.—By this date most of the fruits will have been gathered, and the old canes should be cut out at once to make room for the young ones that will crop next year. Cut the old canes low down, and when removing them from amongst the new ones take every care not to break the leaves. Train in only just the number of canes required. If the soil between the rows has become hard, slightly loosen the surface with a fork and follow on with a good mulching of decayed manure, and give water if needed. Raspberries are surface-rooting, and need ample nourishment.

GRAFTS.—Look carefully over trees that were grafted in the spring, and if the grafts have taken and are growing apace, see that they are made secure against wind. Shorten them back a little if making too much headway. Remove ties and any new shoots springing from the stock. Insert buds of apples, pears, peaches, plums, cherries, etc., now that the wood parts freely from the bark, and let each bud be neatly bound round with damp, soft raffia. Buds may be placed on old trees where fresh shoots are wanted, but sometimes two years elapses before they commence to grow away freely.—H. Markham, Wrotham Park Gardens.

THE KITCHEN GARDEN.

TOMATOES.—To supply fruits early in the spring seeds should now be sown, or cuttings taken and struck in heat. The latter method is often adopted, as plants raised from cuttings are less vigorous in growth, require less space than seedlings, and generally produce fruits earlier. Three-inch pots are suitable for striking the cuttings, and these should be filled with a compost of loam, leaf-mould, and sand, with a good dusting of bone flour added. The seeds may be sown in a similar kind of mixture, thinly and evenly; place in gentle heat, and cover the pans with a piece of glass, and give shade until germination takes place, after which the young plants should be removed to a light, airy position to ensure short, sturdy growth. The young seedlings should be pricked out into pans or into 3-inch pots. Plants for furnishing the winter supply of fruits should now receive their final potting. The most suitable pot is the 9-inch; the soil should be moderately rich, and be made very firm. The plants should be stood out in a sunny position, and by the end of September they will be well set with fruits. They should be kept to one stem, and each one provided with a strong stake. Precautions must be taken to prevent the plants being damaged by wind.

CELERY.—Early and late planted celery will require attention; the plants will require copious waterings during dry weather, weak liquid manure being used alternately with clear water. The surface soil should be frequently stirred with a short hand-hoe, care being taken not to damage the roots by going deeply. The earliest plants may receive the first earthing up, but it should be a slight one. For blanching purposes collars of brown paper are preferable to soil, as water can be supplied more readily to the roots, and the growths are much cleaner; but in either case the plants must not be compressed too severely, otherwise the heads will become deformed. If any leaves are infested with the celery maggot, squeeze the grub-affected parts between the thumb and finger; frequent dustings with soot will act as a deterrent. Before beginning the blanching process remove all side growths and split leaves.

SCARLET RUNNERS.—To ensure healthy growth and heavy crops, it is most necessary to feed liberally and water copiously, applying water in dribblets does more harm than good. Immediately the growths have reached the top of the stalks, they should be stopped. During hot weather a syringing overhead early in the evening will ensure a free set. Do not allow any of the pods to ripen, but set apart a row for seed purposes.—W. Messenger, Woolverstone Park Gardens.

PARTIAL STERILISATION OF SOILS.

(Continued from page 578.)

Partial Sterilisation by Chemical Methods.—The Use of Antiseptics.

In out earlier experiments we confined ourselves to two antiseptics that happened to be very convenient for our owu purpose. The experimeuts have since been extended to iuclude a number of other antiseptics belonging to six different classes, so as to ascertain how wide a choice would be open to the horticulturist. The groups tested were:—1. Volatile hydrocarbons: toluol, light solvent naphtha, benzene, petrol, etc.; 2. Heavy hydrocarbons and their derivatives: naphthalene, etc.; 3. Tar acids: carbolic acid, cresylic acid or cresol, etc.; 4. Tar bases: pyridene and the higher bases, lutidene, collidene; 5. Formaldehyde; 6. Inorganic antiseptics: calcium sulphide.

The substances in the first group, the volatile hydrocarbons, gave good results in our glasshouse, but proved very troublesome when we came to use theu in commercial nurseries. There was great difficulty in applying them to the soil: a hand injector proved too laborious, and spraying too wasteful; further, they had little action in wet soil by reason of their insoluble nature. Another objection of a wholly different kind, but no less serious, was the trouble about carriage, railway companies declining to carry them except in special packages conforming to the Railway Clearing House specification and at a minimum charge of 5s. Where road or water transport was available the charges were less, but the material was a long time iu reaching its destination. These difficulties may be overcome in time, but for the present they put out of the range of practice all the volatile hydrocarbons, and the other volatile substances, such as carbon disulphide and ether.

The second group, the heavy hydrocarbous, is very large, and includes heavy solvent naphtha, uaphthalene and its reduction products, with other of the waste products obtained in the isolation and refining of naphthalene, besides certain other substances obtained when some of these waste products have been subjected to special treatment whereby their purely hydrocarbon character is lost (we do not set up a rigid chemical definition of this group). Of these products, naphthalene is a solid, and is therefore easily transported and applied; on the other hand, it does not dissolve in water, and hence does not readily spread about in a cold soil. It is, however, fairly volatile, and will quickly change into vapour aud do its work at the higher temperature of a cucumber house. The other products are liquids, but, being non-inflammable, require only ordinary drums for transport, and are carried at ordinary rates; some mix or emulsify so readily with water that they can be watered into the soil with the greatest ease, but others will not emulsify until they have been mixed with some other substance. The advantage of being able to water in the disinfectant is so great that only the soluble or easily emulsifiable substances are likely to prove of practical value. Even these, however, are not as easily distributed in the soil as might be supposed; many of them are abstracted by the soil from their solutions or emulsions, so that they fail to travel into it to any great distance. Thus, when they are watered in, ouly the top two or three inches of the soil actually get much antiseptic, and the water that penetrates to greater depths may coutain an insufficient amount of the antiseptic to serve any useful purpose. This effect is most marked in heavy soils, and in those containing much organic matter derived from turf or stable manure.

The tar acids, which form our third group, are already used in glasshouses as disiufectants. At least four occur in the well-knowu "straw-coloured carbolic"—phenol and the three cresols—but we have no information as to whether auy one of the four is more useful thau the rest. The acids are effective, but they do not dissolve or emulsify to a sufficient extent in cold water, although they dissolve more easily if soft soap is added, and are completely soluble in warm water. They also are abstracted from their emulsions by soil, so that they do not readily penetrate to a great depth.

The tar bases have the advautage of supplying some plant food as well as partially sterilising the soil, and their nitrogen rapidly becomes available for the plant. They have a very powerful odour, which may, indeed, prove too much for the horticulturist, but they can be converted into less odorous solid salts, with which, however, we have not experimented.

Formaldehyde has the advantage of being volatile, so that it spreads readily in the soil without being absorbed locally like some of the substances mentioned above. It has proved the most effective antiseptic we have tried. In the pure state it is a gas at ordinary temperatures, but it readily condenses, and is sold as a 40 per cent. solution in water. Sometimes the solution is called Formalin, but this name is the property of a particular German firm, aud their brand has to be supplied whenever formalin is asked for; "40 per cent. Formaldehyde," however, is not a proprietary article, and can be manufactured and sold by anyone. It has an irritating smell, but does no injury to the meu if properly used.

Of the inorganic autiseptics we have as yet only used calcium sulphide. This proved very effective, aud, moreover, it changes after its work is done into useful calcium carbonate. It is not at present obtainable on a large scale. It used to constitute the old-fashioned gas-lime, the so-called "Blue Billy," but only small amounts are found in the gas-liue commonly sold at the present day, owing to recent changes in the method of gas purification.

The group is, however, very large, and contains mauy other substances, some of which, such as sulphur aud boracic acid, have been recently tried by other investigators with results said to be satisfactory. Liue in sufficient doses has been found very good. Bleaching powder also appears to be promising.

Some objections may be found to all the substances in these groups. The first group is readily distributed in the soil, but is highly inconvenient in practice with out present methods; the second and third groups are very convenient to handle, but are apt to distribute badly in the soil owing to local absorption; the fourth group has a bad odour, but otherwise answers well; formaldehyde at the present moment is expensive (7d. per lb.), although there seems no reason why its price should remain high if it were made on a larger scale. We have not yet met with the ideal combination of qualities in any one substance, and the grower's choice must be determined by three considerations —effectiveness, convenience, and price.

The effectiveness of an antiseptic varies with the conditious uuder which it is used, so that it is impossible to set out a number of substances in any rigid order of merit. Only a rough grouping iuto classes can be attempted, and it must be realised that a different method of application would cause a certain amount of readjustment in the classification. During the present season's work the antiseptics have come out in the following groups:—

1st Group, most effective.—Formaldehyde, pyridene, the higher bases, collidene, lutidene, etc.

2nd Group, less effective.—Benzene, calcium sulphide, carbolic acid, cresylic acids (i.e., cresols), light solvent naphtha, heavy solvent naphtha, petrol, toluol.

3rd Group, still less effective.—Naphthalene and certain derivatives obtained during its preparation, nitrobenzene.

The order within the groups is alphabetical only. These groups are based on the effects observed on our tomato plants and the fruit picked up to the middle of July, but later on certain other effects appeared which would cause some of the third group to be moved up into the second, and vice versa. On the whole, however, the early effects and the early fruit are the more important, and we therefore prefer to leave the list as it stands.

None of these substances are as effective as heat, but several are much superior to toluol, the best agent we knew last year. This fact encourages the hope that we may yet find even more useful substances than those in our present first group.

The relative convenience of working with these various substances can only be ascertained by large-scale experiments in commercial glasshouses. Three kinds of application are involved: applications of volatile substances, of solutions or emulsions, and of solids, but there seems no reason why any of these should prove beyond the power of the horticulturist.

The question of price is naturally one about which no general statement can be made. Some of the above substances are by-products and not much in demand; at the moment their price may be low, but it is liable to increase once the demand increases. Others are definitely manufactured and put on the market, but usually for some special purpose requiring more or less costly treatment unnecessary for horticultural use. How little the current price of a substance likely to be used in agriculture or horticulture is an index of its future price is shown by the history of superphosphate; prior to the time of the first artificial manure factory superphosphate was simply a chemical curiosity unobtainable on the market in any quantity. For this reason we have taken no account of current prices in making our choice of antiseptics for trial, but have included any substance that seemed likely to be producible cheaply. Many waste products are cheap, but they are very variable in composition and no uniformity is guaranteed; our experience is that for the present purpose they cannot be recommended until they have been examined carefully and the behaviour of their separate constituents is known. In practice this necessitates a certain amount of manufacturing and standardisation, which becomes a factor in determining the final price. Only actual trial avails to determine what is and what is not a useful antiseptic; remarkable actions go on in the soil, rendering innocuous substances which a priori might be supposed to be very injurious.

Pot Vines intended for forcing next spring should now be ripening, aud will require increased ventilation and less moisture; watering must be gradually reduced as ripening proceeds. Liberal feeding and good syringing ought to be supplied until the foliage changes colour, in order to keep the leaves clean and healthy, without which good buds cannot be expected.—F. Jordan.

The Double-flowered Bramble. — The dressed garden is scarcely the place for this, but in the wilder parts it forms a very pleasing feature when in bloom. Even on dry banks, where but few flowering shrubs will hold their own, it will both grow and flower well. The blossoms, which are closely packed with petals, are not unlike double pink daisies. There is also a double white variety, but the pink is the more pleasing.—W.

SANDY SHOW (BEDFORDSHIRE).
45th Year.
THURSDAY, AUGUST 28th, 1913.
Largest One-day Show in the Midlands.
PRIZES VALUE £1,000,
including £90 for Plants and £55 for Cut Flowers.
Entries close August 21st, 1913.
Schedules, Entry Forms, etc., may be obtained from
A. F. LOVE,
Dead Stock Secretary,
Sandy, Beds.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Leicester Flower Show.

AUGUST 5 and 6.

For upwards of a quarter of a century the annual flower shows in the Abbey Park, Leicester, have been famous for their extent, and the high quality of the products in both competitive and non-competitive classes, but in no year has the fame been more thoroughly deserved than on this occasion. The seven or eight huge tents were filled to their utmost capacity, and the plants, flowers, fruits, and vegetables were staged in a manner that did honour to the exhibitors, and afforded an immense amount of gratification to the tens of thousands of visitors. The Leicester exhibitions are held under the auspices of the Parks Committee of the Corporation of the town, of which Mr. Councillor Collier is the chairman, and this important body may be heartily congratulated on the splendid results of their well-directed efforts for the popularisation of horticulture in and around this great centre of industrial activity. Mr. J. Burton, the Parks Superintendent, is the superintendent of the show, and Mr. J. Staynes is the hon. secretary, and both officials stand high in the estimation of both exhibitors and judges, for the whole of the details are so well carried out that a hitch is practically impossible.

ROSES.

Cut flowers were shown in such immense quantities as to require four huge marquees for their display, and the quality was so high as to surpass that of any previous show held in the Abbey Park within the past twenty years. Roses were more numerous than for many years past, and the blooms were so finely developed in the matter of size and form, and so bright and fresh in colour, as to prove so enormously attractive to the visitors as to render it extremely difficult to approach very closely the long lines of boxes of blooms. This year the attractions of the rose tents were greatly enhanced by the addition to the schedule of two classes for collections in which lightness, beauty, and quality were to be the tests of merit. The competition was very keen in these as in the other classes, and the several collections formed a feature of the most delightful character, and should have proved of great educational value.

There was a very strong competition in the open class for twenty-four blooms, distinct, the entries being numerous and the blooms large in size, high in finish, and of superb colour. The post of honour was occupied by Messrs. Hugh Dickson, Lim., Belfast, with a magnificent collection, in which the blooms of the following varieties were of quite exceptional merit; Archie Gray, Mrs. Myles Kennedy, Charles J. Grahame, Blushing Bride, a beautiful blush-coloured flower; His Majesty, glowing rose-red; Avoca, brilliant in colour; Gorgeous, a well-formed flower, suffused rose on a yellow ground; George Dickson, large in size and glowing in its rich crimson shade; Gloire de Chedane Guinoisseau, Duchess of Abercorn, and Mrs. Willie Dickson, the last a lovely flower, the colour blush with deep pink centre. Mr. W. H. Frettingham, Beeston, Notts, was a capital second with a fine stand, in which were splendidly developed blooms of George Dickson, Gloire de Chedane Guinoisseau, Horace Vernet, Mabel Drew, Frau Karl Druschki, A. K. Williams, and Gustave Piganeau. Messrs. R. Harkness and Co., Hitchin, were a good third with excellent blooms, that of Lyon being the finest bloom of the variety we have yet seen on the exhibition stage. There was a keen contest also in the open class for twelve tea roses, and the premier award was made in favour of Mr. H. Drew, Longworth, Berks, who had, among others, finely developed blooms of Maman Cochet, Medea, Countess de Nadaillac, Alexander Hill Gray, and Madame Constance Soupert. Messrs. Hugh Dickson, Lim., followed closely for second place with an even and fresh box of blooms; and Mr. W. H. Frettingham, Beeston, was third with blooms possessing much merit. There were eight entries in the class for twelve blooms of any one variety, and the quality was high throughout. In the result Messrs. Hugh Dickson, Lim., were first with splendidly developed blooms of the pink Coronation; Mr. W. H. Frettingham followed closely with A. K. Williams, remarkable for brilliancy of colour; and Mr. W. Bentley, Leicester, was third with a fine set of blooms of Mrs. A. E. Coxhead.

There were three entries in the open class for collections of roses, occupying a space of six by three feet, and Mr. John Barron, Cadby, Leicester, was first with an arrangement remarkable for the good quality of the flowers, and for the taste evinced in the arrangement. There were pillars of Hiawatha, Dorothy Perkins, White Dorothy, and Excelsa, a fine basket of the Lyon, and vases of various teas and hybrid teas. Messrs. Hugh Dickson, Lim., were a close second; and Mr. F. W. Frettingham third with a fine collection of blooms, but the arrangement was weak in the essential feature of lightness.

Amateur rosarians assembled in strong force, and the roses in the section open to them were as a whole superior to those seen at Leicester on any previous occasion.

The new class for collections of roses open to amateurs and gardeners of gentlemen was well filled, and the competing collections contributed a delightful feature. The Rev. J. H. Pemberton, Havering, Romford, occupied the post of honour with a charming arrangement, which consisted exclusively of decorative varieties, and these were shown at their best. Mr. Pemberton had for the background three tall bamboo stands filled with ramblers, the varieties being Dorothy Perkins, White Dorothy, and Jean Girin, the last-named one of the very finest of the Wichuriaiana varieties of recent introduction. The flowers are similar in colour to Dorothy Perkins, but are of finer form and arranged in fine pyramidal trusses about twelve inches in height. In front were small baskets of the rich yellow Rayon d'Or, Gustave Regis, the Lyon, and other favourite decorative roses. Mr. F. Dennison, Leamington, was second with a fine display of flowers of high quality, but as they were arranged in large bunches in vases they were somewhat wanting in lightness. Mr. Telford, gardener to A. Turner, Esq., Swithland, Leicester, was third.

Very keen was the contest for first place in the class for eighteen blooms, and the premier award was made in favour of the Rev. J. H. Pemberton, whose blooms were somewhat above the average in size, bright in colour, and highly finished. Very fine were the examples of Gustave Piganeau, Ulrich Brunner, Earl of Warwick, Mrs. Theodore Roosevelt, Mrs. A. E. Coxhead, Her Majesty, Leslie Holland, and Mrs. R. D. Maclure, a beautiful salmon-tinted pink flower. Mr. F. Dennison was a capital second, with an even set of blooms with the soft yellow Mabel Drew as one of the best. Mr. H. Lowe, Beeston, followed for third place. The amateurs' class for twelve blooms, distinct, was a good one, and the Rev. J. H. Pemberton and Mr. F. Dennison were again first and second, both staging remarkably well. Earl of Warwick and Mrs. Foley Hobbs were highly meritorious in the first prize set, and in the second prize box Avoca and G. C. Waud were especially noteworthy. Mr. R. Clarke, Beeston, staged a fine box of blooms for third place, Her Majesty being the most conspicuous.

The prizes for six tea-scented varieties brought out a good competition, and the blooms, for which Mr. W. Upton was awarded the first prize, were of superb quality. The varieties were Madame Jules Gravereaux, Madame Leon Constantine, Mrs. E. Mawley, Souv. de Pierre Notting, White Maman Cochet, and Maman Cochet. The entries were numerous in the class for six blooms of any one variety, and the several awards were made to Mr. F. Dennison, Mr. G. Speight, Market Harborough, and Mr. J. Vine. The varieties in the first and second prize boxes were Alfred Colomb and Mrs. Theodore Roosevelt. In competition for the prizes for four varieties, three blooms of each, the Rev. J. H. Pemberton was first with superbly-developed examples of Mrs. A. E. Coxhead, Earl of Warwick, King George, and Mrs. John Laing. Mr. G. Speight and Mr. R. Clarke, who were second and third also staged well.

In the contest for the awards in the class for eighteen blooms, Mr. M. Whittle was first with blooms of good quality, but wanting in highly-coloured varieties. Mr. G. Speight and Mr. W. Upton, who were second and third respectively, also staged fine sets. The exhibitor last-named was a splendid first in the class for twelve blooms, distinct, and was closely followed for the second and third places by Mr. M. Whittle and Mr. G. Speight. The last-named was first for six varieties, and also for six blooms of teas. Mr. Upton scored in the class for six blooms of any one variety, with splendidly-developed examples of William Shean, and Mr. M. Whittle had in his second-prize box good blooms of Madame Jules Gravereaux.

MISCELLANEOUS CUT FLOWERS.

Carnations and picotees were shown in large numbers, and good style. For six blooms of show carnations, Mr. J. Gumley and Mr. F. G. Duffey were first and second with well-finished blooms. In the corresponding class for picotees, the prizewinners were Mr. R. A. Paterson, Mr. F. G. Duffey, and Mr. R. Hextall, in the order of their names. The yellow-ground carnations made an attractive display, and the prizes for six blooms were awarded to Mr. F. G. Duffey, Mr. J. Gumley, and Mr. J. Rudkin. Very attractive also were the selfs, the entries being numerous, and the blooms of high quality.

There were ten or twelve entries in the class for vases of carnations and picotees, and Mr. F. G. Duffey was a splendid first, his blooms being in a remarkably high state of development. Mr. C. H. Mayer was a capital second. Not a flower was named, and whatever value the flowers staged may have had from the educational point of view was lost.

Carnations and picotees were splendidly shown by the trade growers of these flowers, and, as they were all arranged in small vases with buds and foliage, they presented a highly attractive appearance. There was a very keen contest in the class for twelve show flowers, and the premier award was made in favour of Mr. C. H. Herbert, Acocks Green, whose blooms were as near perfection as one can hope to see them at the beginning of August. The varieties were R. Houlgrave, J. S. Hedderley, George Melville, Arline, Meteor, Gordon Lewes, W. Skirving, Firefly, Arthur, Peter Pan, and Little Dick. Messrs. A. R. Brown, Lim., King's Norton, were an exceedingly close second with flowers of superb quality. Mr. R. G. Rudd was third with good blooms. Self flowers were very largely shown in twelves, and here the last-named was a splendid first, the blooms large and highly-finished. Messrs. A. R. Brown, Lim., were second with flowers in a high state of development, and Mr. C. H. Herbert a close third. Yellow-ground carnations were so largely shown as to afford

unquestionable evidence of their popularity with growers, and the long array of flowers lightly poised above the foliage produced a fine effect. Mr. R. G. Rudd was successful in obtaining premier honours with superbly-developed blooms of Alice B. Stewart, Melton Prior, Lord Steyne, Hercules, Margaret Thurston, Forester, Pasquin, and other of the leading varieties. Messrs. A. R. Brown, Lim., were an exceptionally close second with large, finely-finished blooms. Conspicuous among other varieties was My Fancy, a distinct flower, flaked brilliant orange on a grey-mauve ground. It is the most distinct flower of its class, and most desirable for the variety it affords.

In the corresponding class for twelve blooms of picotees, Messrs. A. R. Brown, Lim., scored with highly finished blooms; Mr. C. H. Herbert was a close second, and Mr. R. G. Rudd was a good third. The classes for single varieties of the several sections, shown in vases, three blooms of each, were all well filled, and the effect produced was remarkably good.

Stocks shown in single spikes were of quite special merit, and the numerous exhibits formed a fragrant and interesting feature. Mr. A. Russell was a capital first for six spikes, and Mr. R. A. Paterson was second, the spikes rather larger, but the individual flowers not so highly developed as in the first prize set.

Violas were largely shown and tastefully staged, and formed a very pleasing feature. Mr. W. Barsby obtained premier honours for twelve varieties with superbly developed flowers; and Messrs. W. Pemberton and Son, Walsall, followed for second place with flowers of high quality.

Hardy flowers were plentiful and of high quality, although not quite equal as a whole to those we have seen on one or two previous occasions at the Abbey Park Show. The finest collections were those shown in the open class, and the post of honour in this was occupied by Mr. Weston, who had phloxes, heleniums, pentstemons, gaillardias, and other well-known subjects in fine condition; Mr. Clanachan had a good collection for the second place. There was also a good competition in the class open to amateurs and professional gardeners for hardy flowers in collections arranged on a space of six by three feet, and the premier award was made in favour of Mr. C. H. Mayer, who had fine bunches of carnations, gaillardias, heleniums, phloxes, pentstemons, and marguerites; Mr. J. H. Hill, Syston, was second.

SWEET PEAS.

Of these fragrant and beautiful flowers there was a very large display, the flowers contributed to the competitive classes being sufficient to fill one of the largest of the several tents. The most important of the classes was that for twelve vases, distinct varieties, in which the prizes were given by Robert Sydenham Limited, and in this the post of honour was worthily occupied by Mr. E. R. Jones, gardener to Lord North, Banbury, with flowers strong in stem, stout in substance, and finely coloured. The varieties included such high-class forms as Thomas Stevenson, Clara Curtis, Elfrida Pearson, and John Ingman, which are invariably met with in all the winning collections. Mr. E. N. Sears was successful in obtaining the second award with a fine collection. Mr. W. Weston, gardener to Colonel C. F. Oliver, was third with flowers of high quality; and Mr. C. Illiston Barkby and Mr. J. Butler, gardener to A. Robinson, Esq., Rothley Grange, who were fourth and fifth, staged flowers evincing cultural skill. In the class for nine varieties, in which also Robert Sydenham Limited provided the prizes, the competitors were many and the flowers of a high order of merit. Mr. A. B. Wykes was first with superbly developed flowers borne on medium-sized stems, and presenting a very graceful appearance. Th other prizes were awarded to Mr. Morris, Mr. E. F. Greasley, and Mr. H. Hudson in the order of their names. Mr. J. Whittle was successful in obtaining premier honours in the class provided by Messrs. Harrison and Sons for nine varieties, and also in that in which the prizes were given by Mr. Unwin.

PLANTS.

The most important of the classes for these was that for groups of plants arranged for effect on a space of 160 superficial feet. The entries were numerous as usual, and the whole of the arrangements were such as to do credit to the taste of the competitors. As the arrangements were similar to those which have been fully referred to in the reports of other great exhibitions that have been recently held, it is not necessary to do more than briefly mention the names of the principal competitors. As usual, the first prize, which was of the value of £20, was awarded to Messrs. J. Cypher and Sons, Cheltenham; Mr. J. Manning, Dudley, was successful in winning the second prize of £15, and the third prize of £10 was won by Mr. Holmes, of Chesterfield.

There were numerous classes for plants of various kinds, but space will not admit of reference being made to other than a few of the more noteworthy. The premier award for a specimen plant in bloom was won by Messrs. J. Cypher and Sons, who had a magnificent example of the brilliantly-coloured Ixora Duffi. In competition for the prize for twelve miscellaneous plants, Messrs. J. Cypher and Sons were first with splendidly flowered examples of cattleyas, lælio-cattleyas and ixoras, and richly coloured crotons. Mr. A. Holmes, Chesterfield, was a capital second with a collection in which flowering and finely foliaged plants were well balanced.

The contributions to the class for eight miscellaneous plants, shown by amateurs not employing a gardener regularly, were so numerous as to form a distinct, attractive, and interesting feature. Mr. J. R. Shelton was first with high-class examples of cultural skill, the tuberous begonias and fuchsias being especially noteworthy. Mr. A. Grace, who was second, had in his collection a well-bloomed example of Stephanotis floribunda. Tuberous begonias were finely shown, and in the open class for four specimens Messrs. James Wright and Sons, Leicester, were first with superbly flowered examples; Mr. A. Grace and Mr. C. Ward were second and third respectively with excellent examples of cultural skill. Messrs. J. Wright and Sons were also first in the class for six with medium-sized plants remarkable for flower development. The same firm were also first for four zonal pelargoniums with splendidly flowered bush specimens of well-known varieties.

FRUIT AND VEGETABLES.

These two essentials of an exhibition of the first class were staged in splendid style, and the interest that is shown in them in the district of which Leicester is the centre was evidenced by the crowded state of the tents throughout the whole of the period the exhibition was open to the public. The decorated dessert tables constituted the most important feature in the fruit tent, and in the class for a table with nine dishes of fruit, Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, won, staging fine dishes of Black Hamburgh and Madresfield Court grapes, Dymond peach, Elruge nectarine, and Brown Turkey fig. The decorations were tasteful, and consisted of pink Malmaison carnations and sprays of Francoa ramosa. Mr. R. Sims, Borrowash, was second for fruit, and Mr. A. Wagg occupied a similar position in competition for the decorations. The contest was especially keen in the class for a table containing six dishes of fruit, and in the result Mr. J. H. Goodacre scored for fruit, and Mr. E. R. Jones for decorations. Mr. Goodacre had splendidly-finished fruits of the Nectarine peach and Lord Napier nectarine, and the decorations by Mr. Jones consisted of carnations with suitable foliage. Mr. A. Wagg, gardener to W. E. Dennison, Esq., Ossington Hall, Newark, was second for fruit. The first prize dish of peaches was that of Noblesse, shown by Mr. J. H. Goodacre, and the best dish of nectarines was that of Lord Napier, from Mr. T. Simms. Mr. J. H. Goodacre was first for four varieties of grapes, two bunches of each, the most noteworthy clusters being those of Black Hamburgh.

The vegetables were not less remarkable for their high quality than for their numbers, and the competition for the honours for collections was of much interest. Mr. J. Hudson, Leicester, well retained his high reputation by taking the premier award in the class for nine kinds, and in the two classes for six kinds the prizes in which were offered by Messrs. Sutton and Sons and Messrs. E. Webb and Sons. Mr. N. Buxton and Mr. A. Hartshorn also exhibited well in these classes. Mr. G. Hartham, Thurmaston, won in Messrs. Harrison and Sons' class for nine kinds.

NON-COMPETITIVE COLLECTIONS.

These formed an important part of this great exhibition, and contributed in no small degree to its interest and attractiveness.

Gold Medal. — To Messrs. E. Webb and Son, Wordsley, Stourbridge, for a very beautiful display of vegetables, melons, and flowers; to Mr. F. Ridout, Langley, Bucks, for a fine collection of perpetual carnations; to Mr. C. Warren, Abbey Nurseries, Leicester, for a large and fine collection of cut roses, etc.; to Messrs. H. B. May and Sons, Edmonton, for a comprehensive and interesting collection of choice ferns; and to Mr. John Hudson, for an exceptionally fine collection of vegetables.

Silver Cup.—To Messrs. Harrison and Sons, Leicester, for a large collection of flowers and vegetables.

Silver Medal. — To Mr. G. Underwood, Aylestone Park, Leicester, for violas and sweet peas in great variety; to Mr. H. M. Ellison, West Bromwich, for a remarkably fine collection of ferns; to Mr. A. F. Dutton, Iver, Bucks, for a charming collection of perpetual carnations; to Mr. J. Williams, Aylestone, Leicester, for rock and alpine plants; and to Messrs. J. Wright and Sons for cut flowers.

Royal Lancashire Agricultural Society.

The horticultural section of this society's show opened at Burnley on July 31, and continued up to August Bank Holiday. The opening day proved a record in attendance, and, judged by the crowded state of the marquees, the floral display proved a powerful attraction. The entries were about the average, but sweet peas more than held their own in quantity and quality.

For a group of miscellaneous plants occupying a space not exceeding 300 square feet, Messrs. J. Cypher and Sons, Cheltenham, were found in their accustomed premier position, with a combination worthy of their great name as group builders; a fine plant of Areca lutescens occupied the central position, with palms, crotons, ferns, and caladiums around, setting off to advantage lælias, odontoglossums, ixoras, and other flowering plants in the best possible manner. Other exhibitors were placed as named—Mr. W. Holmes, Chesterfield; Messrs. R. Simpson and Son, Selby; and Mr. W. J. Garner, Altrincham. For twelve stove or greenhouse plants, not less than seven in bloom, the Messrs. Cypher were again to the fore with three fine kentias, Crotons Warreni, Sunset, and Countess, Statice profusa and intermedia, Bougainvillea Sanderiana, Stephanotis floribunda, and Clerodendron Balfouri (three); Mr. R. Simpson second.

For twelve stove or greenhouse plants in pots not exceeding ten inches, the leading award went again to the Cheltenham firm for a fine lot, Ixora Pilgrimi, Statice intermedia, and Clerodendron Balfouri being noteworthy. The Messrs. Cypher were also to the fore for six orchids with Odontoglossum percultum, O. Hallio-crispum, Lælio-cattleya callisto-glossa, Cattleya aurea (six flowers), and Disa grandiflora; Mr. J. Wilson, gardener to J. Butterworth, Esq., Burnley, was second; and Mr. G. Wilson, Morton Bourne, third.

In the class for a table arrangement for effect, 100 square feet allowed, Mr. W. J. Garner held the leading position, Mr. J. Saul, Preston, and Mr. T. M. Petch, Bridlington, being placed as named. The class for a dinner-table decoration, orchids and the trade excluded, brought a strong competition, the prize-takers being Mrs. John Nixon, Mr. H. B. Vernon, Mrs. A. J. Blair, and Mr. F. Perkins. In the open class ten entries were brought forward, the awards going to Mr. W. J. Garner, Mrs. J. Nixon, Mr. H. B. Vernon, Bowden; and Mr. T. M. Petch, Bridlington. For a table of sweet peas the successful exhibitors were Mr. F. Perkins, Mrs. J. Nixon, and Miss F. Newsham, Ormskirk.

For a collection of sweet peas, eighteen distinct varieties, Mr. W. Bond, gardener to J. R. Herron, Esq., Freshfield, won with fine strong spikes, including a new and distinct variety named Royal Purple; Mr. R. H. Jones was second; and Mr. G. F. Hallett, gardener to Sir R. Graham, Bart., Carlisle, third. For twelve distinct varieties, Mr. F. J. Harrison, Ulverston, led with a good lot, Messrs. G. F. Hallett, and Mr. J. George, gardener to T. Henshaw, Roby, being second and third.

In the class for twelve varieties, trade excluded, the Rev. A. R. Tomlinson, Carnforth, and Mr. E. M. Allen were the prize-winners; and in another class for twelve vases, Mr. T. F. Portnell, Carnforth, led with an excellent lot, followed by Mr. C. E. Taylor, Over Kellet, and Mr. F. J. Harrison. For twelve bunches, prizes presented by Messrs. Dickson, Brown, and Tait, the first and second awards went to Mr. E. Birch, gardener to J. S. Proctor, Esq., Altrincham; and Mrs. S. S. Rigg, Bowdon. For six bunches, prizes by Mr. R. Bolton, the winners were Messrs. C. E. Taylor, J. Whittaker, gardener to G. H. Garnett-Orme, Esq., Skipton, and Mr. S. F. Curtis, Lancaster.

For a collection of tree carnations, arranged on a space ten feet by five feet, Messrs. Young and Co., Hatherley, won with a pleasing lot, and especially fine were the Hon. J. W. Boscawen, and a new variety Miss Hardcastle, a large intense bright scarlet; Mr. A. J. Dutton, Iver, was a good second. For a collection of hardy perennials, space fifteen feet by five feet, Mr. E. Gibson, Bedale, proved the victor; Messrs. Harkness and Sons, Bedale, second; and Mr. J. Saul third.

The class for twenty-four cut roses found Messrs. Alex, Dickson and Sons, Newtownards, first with a very fine box, George Dickson, Mildred Grant, H. V. Machin being extra good; Mr. F. J. Harrison second. For twelve varieties the Messrs. Dickson again scored, followed by Mr. Harrison and Mr. J. Bury. For twelve roses (trade excluded) Mr. C. Garnett, Lancaster, led the way with a good box, followed by Mr. F. J. Harrison and Mr. J. W. Barker; for six varieties the winners were Messrs. C. Garnett, F. J. Harrison and A. E. Troop.

A slight falling off was noticeable in the fruit section. For twelve dishes, not less than nine kinds, Mr. J. Hathaway, gardener to J. Brennand, Esq., Thirsk, was well ahead with fine Black Hamburgh, Foster Seedling, and Madresfeld Court grapes, Dymond and Bellegarde peaches, Humboldt nectarine, Royal Sovereign melon, Utility strawberry, apples, and pears; second, Mr. G. Wilson, who staged Brown Turkey figs in good order. For two bunches of Black Hamburgh grapes Mr. G. Marr, gardener to R. A. Tatton, Esq., led with excellent berries for any other black Mr. Marr led with good specimens of Muscat Hamburgh; and for two bunches of white Muscats, Mr. G. Wilson led; while for any other white Mr. J. E. Newman won with good Foster's Seedling.

For nine distinct kinds of vegetables, prizes presented by Messrs. Sutton and Sons, Mr. E. Beckett, gardener to the Hon. Vicary Gibbs, was in his usual high-class form; Mr. J. George was second with a good lot. For six kinds (trade excluded), Mr. Beckett was again to the fore, with Mr. J. W. Barker second. For a collection of six kinds, prizes by Messrs. E. Webb and Sons, Mr. J. E. Battersby, Blackburn, was the winner; for eight varieties, prizes by Messrs. Clibrans, Mr. Battersby was again the victor.

NON-COMPETITIVE.

As usual, some fine displays were set up, and were quite worthy of the awards bestowed upon them.

Large Gold Medal.—Messrs. Dickson and Robinson, for culinary peas, onions, and tomatoes, backed up with sweet peas and gaillardias.

Gold medal.—Messrs. E. W. King and Co., Coggeshall, for sweet peas; Messrs. Dickson, Brown, and Tait, for a display of gladiolus; Mr. R. Bolton, Carnforth, for sweet peas; Messrs. Alex. Dickson and Sons, Newtownards, for a bank of cut roses; Lancashire County Council, for fruit trees in pots, vegetables in variety, small fruits, sweet peas, etc.

Silver Medal.—Mr. S. Broadhead, for a rockery well planned and planted; Messrs. S. R. Compton and Sons, for violas and pansies; Mr. E. A. le G. Starkie, for stove and greenhouse plants; Messrs. Calwell and Sons, for herbaceous cut flowers, roses, and sweet peas; Mr. H. N. Ellison, West Bromwich, for choice ferns.

Bronze Medal.—Mrs. Hodgkins and Mr. W. Edwards.

PAVILION DISPLAYS.

Messrs. Sutton and Sons had beds of marguerites, verbenas, etc., on each side of their entrance, with groups of gloxinias and begonias, and a large array of melons and sweet peas. Messrs. Dickson and Robinson showed dwarf roses in pots, carnations, liliums, and phloxes. Messrs. Dickson, Brown, and Tait had a large assortment of nephrolepis, cut liliums, and carnations. Messrs. Dicksons, Chester, sent cut liliums, gladiolus, annuals, and perennials. Messrs. Dobbies, Chester, presented cut flowers.

Midland Carnation and Picotee Society.

For twenty-three consecutive years this society of keen and enthusiastic florists has held annual shows of carnations and picotees, latterly adding a few classes for sweet peas. It cannot be said that the shows have grown amazingly from year to year, but nevertheless it is something upon which the Midland florists may be congratulated that they still maintain a very worthy show, and that the display of carnations put before the judges in the Botanical Gardens, Edgbaston, Birmingham, on Wednesday, July 30, both in the open and amateur classes, was of a quality that has probably never been exceeded in the history of the society. Years ago what are now known as "undressed" classes, i.e., for flowers shown in vases with long stems and foliage, were unknown.

At a meeting of the committee held on Wednesday afternoon, July 30, a resolution was proposed by Mr. W. H. Parton, that a vote of condolence and sympathy be extended to the widow and relatives of the late Mr. Robt. Sydenham on the irretrievable loss they had sustained by Mr. Sydenham's death. The resolution was seconded by Mr. A. W. Jones, another ardent amateur who was present at the inauguration meeting of the society twenty-three years ago, and who was able to testify to the fact that it was due to Mr. Sydenham's enthusiasm and generosity that the society was started and carried on for so many years.

DRESSED FLOWERS.

There were six entries in the class for twelve blooms of selfs, distinct varieties, Mr. H. Mathias, Medstead, Hants, taking the lead with a good, even set of flowers of capital size and rich quality. Titan, pure white, Mrs. Marshall, crimson, Daffodil, and the popular Elizabeth Shiffner were among the varieties staged. Messrs. A. R. Brown, Lim., King's Norton, took second place with W. H. Parton, a dark variety of great quality, Cardinal, a splendid petalled scarlet, Royal Velvet, a good purple, and Titan among their best blooms; Mr. C. H. Herbert, Acock's Green, was third. Mr. Mathias scored again for twelve fancies, showing beautifully grown flowers of Lord Steyne, Bombardier, Linkman, and other yellow-grounds; Mr. A. W. Jones, Yardley, took second place with clean and shapely blooms of Thos. à Beckett, Queen Eleanor, Forester, etc.; Mr. C. H. Herbert was again third among eight strong entries. For twelve yellow-ground picotees, Mr. Mathias was again to the front, his flowers being of beautiful quality, but, we thought, a trifle overdressed; Exquisite, a nice clean-petalled bloom with a finely defined wire edge, was a strong point, and both Exquisite and Dago received premier awards, the latter being a most beautiful, heavy-edged variety, which received also a first-class certificate. Messrs. A. R. Brown, Lim., who were second, just erred in the opposite direction to Mr. Mathias, for some of their blooms might have been a little better dressed. However, they had some excellent flowers. Third prize was secured by Mr. C. F. Thurston, Wolverhampton.

The class for twelve white-ground picotees had only four entries, Mr. C. H. Herbert coming first; his Gannymede, which received premier award for a heavy-edged white, was a well-built flower, broad in petal, and very uniform in its rich crimson edge. Other good varieties were Thomas William, Fortrose, and Mrs. Gorton. Mr. Thurston was second with neat flowers of Clementine, Fortrose, Clytie, and Winston Churchill. Third prize went to Messrs. A. R. Brown, Lim. Five collections were staged of twelve flakes or bizarres, but it must be admitted that in this section no headway has been made of late years, and no better, if indeed as good, flowers are seen now than those of twenty to thirty years ago. Mr. C. F. Thurston, who took the leading award, showed well-dressed flowers of Ophelia (premier bizarre), Robt. Houlgrave, Cleopatra, and J. S. Hedderley. Mr. C. H. Herbert was placed second with Master Fred, Admiral Curzon, Robt. Houlgrave, and Torchlight among his varieties. Third prize went to Messrs. A. R. Brown, Lim., with the same varieties appearing on their stand.

UNDRESSED FLOWERS.

The classes for undressed flowers in vases were well supported, and some capital flowers were staged. It was apparent almost throughout the show that the tweezers had played some part in modelling even the so-called "undressed" flowers, and in some cases the "touching-up" was really too evident. It is best to be sincere, and an understanding should be definitely arrived at as to whether the flowers should be shown as grown, or whether the only prohibition is to be the paper collar. It might be best to simply provide classes for flowers in vases, without calling them "undressed." The best six triplets in the class for selfs came from Mr. H. Mathias, who showed grand flowers of Elizabeth Shiffner, Mrs. G. Marshall, Daffodil, Wyatt, Titan, and Sunproof Scarlet. Messrs. A. R. Brown's second prize lot were Mrs. Marshall, Britannia, Wyatt, Mrs. Henwood, Cardinal, and Alba; Mr. C. H. Herbert was third. Messrs. A. R. Brown, Lim., led the way for six vases of fancies, the varieties being Becky Sharpe, Forester, Skirmisher, Lord Steyne, John Ridd, and Linkman, a very nice set; second and third prizes were taken by Mr. H. Mathias and Mr. A. W. Jones. Mr. Mathias scored in a similar class for yellow-ground picotees, followed by Messrs. A. R. Brown, Lim., and Mr. A. W. Jones in the order named. For white-ground picotees the chief award went to Messrs. A. R. Brown, Lim., who had Janet, Lavinia, Myra, and Mrs. Cooper among their half-dozen vases. Mr. H. Mathias was a good second, and Mr. C. H. Herbert third.

AMATEURS' DIVISION.

The quality in the amateurs' division was excellent throughout, and may be said to have come well up to the high standard we are accustomed to see at Birmingham.

Mr. Robt. Morton, of London, rendered a good account of himself, his flowers being answerable for a number of prizes.

In the section for dressed flowers Mr. Morton took first prize for six selfs, on cards, his flowers being big, substantial blooms of Daffodil, Rosy Morn, Etna, Attraction, Elizabeth Shiffner, and Miss Willmott; Mr. W. H. Parton, Moseley, came second; and Mr. F. Bayliss, Walsall, was third; there were eleven entries in the class. Mr. A. H. Birchley, Selly Oak, took the lead for six fancy varieties. He had a nice flower of Linkman, ever a serviceable and telling variety, and John Ridd, Sam Weller, and Queen Eleanor were also well shown; Mr. F. Bayliss was placed second, and showed Rhea, a distinct flower with crushed strawberry flakes and shading on an orange-buff ground; Mr. R. Morton was third. Mr. Morton led the way for six yellow-ground picotees, showing Margaret Lennox, John Ruskin, Onward, Togo, Gloria, and Mrs. J. J. Keen; Mr. G. D. Ford, Acocks Green, second; and Mr. H. Skeels, Walsall, third.

The Rev. G. A. Gottwaltz, Droitwich, had the best half-dozen white-ground picotees, his varieties being Pride of Leyton, Lottie, Dorothy, Agnes Helen, Lady Sybil, and Thomas William. Mr. F. W. Goodfellow, Walsall, took second place, and Mr. G. D. Ford third. For six bizarres, Mr. E. J. Price, Bourneville, was the leading winner, followed by Mr. R. Bruce Waite, Harborne.

In the vase classes Mr. R. Morton won first prize for three vases of selfs, in triplets; he showed Rosy Morn, Etna, and Miss E. Shiffner; Mr. E. J. Price was second, and Mr. W. H. Parton third. There were nine entries in the class, and all were good. For fancies, the winner was Mr. G. D. Ford, Acocks Green; Linkman, Pasquin, and Sweetheart being his varieties. Second prize was taken by Mr. R. Morton, and third by Mr. W. H. Birchley. Mr. Morton scored another success with three triplets of yellow-ground picotees, beating six other competitors; and in the white-ground class the Rev. Gottwaltz led the way with an even sit of clean, refined flowers.

SWEET PEAS.

The lower portion of the conservatory, facing the orchestra, was devoted to a fine display of sweet peas, for which special prizes were offered by Robert Sydenham, Limited, Birmingham. A strong entry for twelve vases, distinct varieties, found Mr. T. Jones, Ruabon, first with remarkably fine flowers of great size and substance, the stems being of wonderful strength, and all the colours pure and clean; Mr. John Haycock, Gyfelia, Wrexham, was second; third prize went to Mr. L. Webb, Welshpool; and fourth to Mr. T. Batchelor, Hampton-in-Arden.

In another class limited to a six-mile radius of Birmingham, Mr. P. E. Fowler, Bournville, led the way with flowers that did the exhibitor great credit. The other prize winners were Mr. J. Dorell, Acocks Green; Mr. A. Taylor, Olton; and Mr. J. Sceaney, Harborne. Ten table decorations of sweet peas made an attractive show, and provided by no means an easy task for the judges. The winner was eventually found in Miss E. Jenks, Codsall; Mr. E. Deakin, Haymills, coming second, and Mr. C. H. Herbert, Acocks Green, third.

PREMIER AWARDS.

Dressed flowers.—Bizarre, Ophelia, shown by Mr. C. F. Thurston; flake, Gordon Lewis, from Mr. C. F. Thurston; heavy-edged white-ground picotee, Ganymede, shown by Mr. C. H. Herbert; light-edged white-ground picotee, Fair Maiden, shown by Mr. E. J. Price; heavy-edged yellow-ground picotee, Dago, shown by Mr. H. Mathias; light-edged yellow-ground picotee, Exquisite, shown by Mr. H. Mathias; yellow-ground fancy, Linkman, shown by Mr. A. W. Jones; self, Titan, shown by Mr. F. W. Goodfellow.

Undressed flowers.—Self, Furthest North, shown by Mr. W. H. Parton; fancy, Linkman, shown by Mr. F. W. Goodfellow; yellow-ground picotee, John Ruskin, shown by Mr. R. Morton; white-ground picotee, Fair Maiden, shown by Mr. E. J. Price.

POINTS MEDALS.

First division.—Silver medal, Mr. H. Mathias, with 172 points; bronze medal, Messrs. A. R. Brown, Lim., with 150 points.

Second division.—Silver medal, Mr. R. Morton, with 89 points; bronze medal, Mr. G. D. Ford, with 56 points.

Third division.—The W. Waters Butler silver medal, Mr. A. Goody, with 68 points; bronze medal, Mr. F. E. Holland, with 50 points.

Novices' section.—The Carnation Brown medal, Mr. T. M. Tranter, with 52 points.

NON-COMPETITIVE EXHIBITS.

Messrs. W. H. Simpson and Co., Birmingham, had two attractive exhibits, one devoted to sweet peas, and the other, which crossed the hall in front of the orchestra, including a number of attractive perennials and biennials, as well as sweet peas. The scarlet Gilia coronopifolia made a striking centrepiece in this stand. Messrs. Gunn and Sons, Olton, put up a very fine show of garden roses with late-flowering ramblers on arches, and baskets and boxes of the latest hybrid teas on the front tables. The whole exhibit attracted a great deal of attention from the visitors, who, we were pleased to note, were in greater number than has been the case for a few years past.

Chester Paxton Society.

By the kind invitation of Mr. E. Peter Jones, J.P., one of the vice-presidents of the society, some thirty odd members had the privilege last week of seeing over the gardens and pleasure grounds at Greenbank, Chester. Under the supervision of the head gardener, Mr. Wm. Dodd, some extensive alterations and additions have recently been carried out, including a new rose garden, a new rockery, and new additions to the herbaceous borders. These additions reflect very great credit on Mr. Dodd's abilities, and on the occasion of this visit he was complimented by his brother gardeners, who greatly appreciated the kindness of Mr. Peter Jones in granting them the privilege of inspecting his gardens. Mr. Jones also very kindly provided tea for the company, which was much appreciated, and before dispersing Mr. J. D. Siddall proposed, and Mr. N. F. Barnes seconded, a hearty vote of thanks to Mr. Jones for his kindness. The latter, in reply, said it had given him great pleasure to see so many horticulturists present, and he expressed a hope that they would come again.

Arabis albida.—The double form of this arabis is indispensable for spring bedding purposes; whether used as a groundwork to bright and deep-coloured tulips, or as an edging to large beds and borders, it is very beautiful, and when well grown its flowers are most useful for cutting. It has a great advantage over the single form in possessing more substance in the flowers, and being more showy. The variegated form is also very useful for those who appreciate the variation of colouring in the foliage. The present time is an opportune one for propagating young plants for putting out in the autumn; my experience is that they root much more freely now than when inserted earlier in the season, and, as they grow very quickly, they have ample time to make good progress for planting in October. Old plants which were laid in when cleared from the beds at the end of May are giving plenty of cuttings; these should be taken off at the heel, and inserted in light, sandy soil, either in a cold frame or on a north border, where, if kept moist, they will soon root. Allow from four to six inches each way between the cuttings, as they will then have room to develop, and can remain without being disturbed until required for planting out.—T. B. Field, Wych Cross Place Gardens.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of The Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of the Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in The Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

VENIDIUM CALENDULACEUM.—M. H. L., Newport: A friend in South Africa has sent me a packet of seeds of a plant named Venidium calendulaceum. Please tell me whether this is a hardy subject, and say when the seeds should be sown.—Venidium calendulaceum is a South African composite with yellow, dark-centred flowers, which closely resemble the blooms of the common marigold; the lyrate leaves, however, are distinct, green above and white beneath. The plant is only half-hardy, but might be hardy in a sheltered position in the Isle of Wight. The species is perennial, and from 6 to 12 inches high, but is best treated as an annual. Sow a few of the seeds at once in a pan of sandy soil, prick off the seedlings into small pots in due course, and keep them in a frame or greenhouse during the winter, planting them in a sunny position in spring. In March sow the rest of the seeds in gentle heat, and otherwise treat as for a half-hardy annual.

INSECTS ON GOOSEBERRY SHOOTS.—C., Bath: Will you kindly say what is the matter with enclosed gooseberry shoots? Apparently there are different kinds of insects on No. 1 and No. 2.—No. 1 specimen shows a rather bad aphis infestation. In an attack of this kind the aphis appear in the points of growth, cause the leaves to curl up, and so produce a very severe check that often results in a shrivelling of the stem. This season has been a particularly bad one for growers, because insect pests have seemed to be particularly prevalent and insistent, and the weather has not favoured the use of insecticides. We have found, in the case of aphis attacks on gooseberries in a garden, that frequent hosings, the water being used with considerable force, a capital method of dislodging the pest and encouraging growth. A few forcible washings of this kind, followed by spraying with a nicotine or quassia mixture, will generally clear the bushes. In the case of a large plantation spraying with nicotine or quassia insecticides must be regularly practised directly the berries have been gathered. No.

NOTICE.

READERS experiencing difficulty in obtaining "THE GARDENERS' MAGAZINE" at any bookstall or newsagent should write to the

PUBLISHING MANAGER,
148-9, Aldersgate Street,
London, E.C.,

who will give the matter immediate attention.

2 specimen is infested with gooseberry red-spider, a pest that flourishes in dry weather. It may be stated at once that well-fed bushes that have not lacked moisture do not suffer to the same extent as bushes on poor, dry soil. Here, again, bushes in gardens may be kept clean, if frequently washed with clear water during dry periods, and given manurial assistance that will permit free growth. Where there is an infestation the bushes must be sprayed at intervals with a kerosine emulsion until the pest has been cleared out. Dissolve ½lb. of soft soap in a gallon of boiling water, and while still boiling add two gallons of kerosine and churn together forcibly, so that a proper emulsion is obtained. Use one part of this mixture to from 30 to 50 parts of water, starting with a weaker solution, and using a stronger one a little later if the leaves are tough.

FOLIAGE PLANTS FOR CUTTING.—K. K., Barberton: I am a regular reader of The Gardeners' Magazine, and noticed in your issue of May 10, you recommended a Lichfield correspondent to grow thalictrums for cutting to use as foliage with flowers. I have a few seeds of a thalictrum I gathered at Rimer's Creek; the plant is just like a maidenhair fern growing near it on the banks of a stream. With us the thalictrum grows 4ft. high, but it is not a common plant; I thought you might like to try it, and possibly send some seeds to your correspondent. We have awful news to-day (July 5) from Johannesburg; train stopped, lines torn up, no newspapers come through, and station destroyed. Thank goodness we are 300 miles away, and the trouble will not disturb us much, but it will upset business, for in this district, free from frosts, garden produce is extensively grown for the winter supplies at Johannesburg. Plant collecting is my hobby, and I have lived here sixteen years.—We are very much obliged to our correspondent for his interest in this matter and regret that, as we do not keep the letters containing only questions to be answered in this column, we cannot forward seeds to our Lichfield correspondent. We will sow the seeds, and if plants develop, endeavour to find the name of the species for you. We may add that we do not know any South African thalictrums.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well-marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

A. G., Morpeth.—Not recognised.

L. N. C., Preston.—1, Mentha Requieni; 2, Typha angustifolia.

G. W. S., Orpington.—1, Verbascum nigrum; 2, Diascea Barberæ; 3, Phacelia campanularia.

TRADE NOTES.

ROBERT SYDENHAM LIMITED.

It will be a matter of great satisfaction to the readers of The Gardeners' Magazine to learn that the firm of Robert Sydenham Limited, Tenby Street, Birmingham, will continue to conduct the business founded and built up by the late Mr. Robert Sydenham, and that the staff of enthusiastic workers who so loyally supported their beloved chief will remain with the firm. We understand that, in accordance with the deceased principal's expressed wish, Mr. Herbert Smith, who for a number of years was Mr. Sydenham's secretary, now becomes managing director, and our readers will, we are confident, join with us in wishing Mr. Smith and his comrades a continuance of the success that has marked the firm's career.

FORTHCOMING ENGAGEMENTS.

NEXT WEEK.

MONDAY, August 11.—United Horticultural Benefit and Provident Society, Committee Meeting.

TUESDAY, August 12.—Royal Horticultural Society; Committees meet at 12 o'clock; Lecture at 3 p.m. on "Fairy Flies and their Hosts," by Mr. Frederick Enock, F.L.S.; Scientific Committee at 4 o'clock.

WEDNESDAY, August 13.—Carlisle Horticultural Association; two days.

National Sweet Pea Society's Provincial Show at Carlisle; two days.

THURSDAY, August 14.—Taunton Dene Summer Show.

SATURDAY, August 16.—Horsley Horticultural Society.

The following dates of exhibitions have been recently announced:—

Horsley Horticultural and Cottage Garden Society, August 16.

Aynho Horticultural Society, August 19.

Brighton Summer Show, August 19 and 20, in the Dome and Corn Exchange, and on the Western Lawn.

Kiddington Horticultural Society, August 21.

Ashton-under-Lyne Horticultural Association, September 6.

Maidenhead Chrysanthemum Show, October 30, at the Drill Hall.

Bath Chrysanthemum Show, November 5 and 6, at the Roman Promenade.

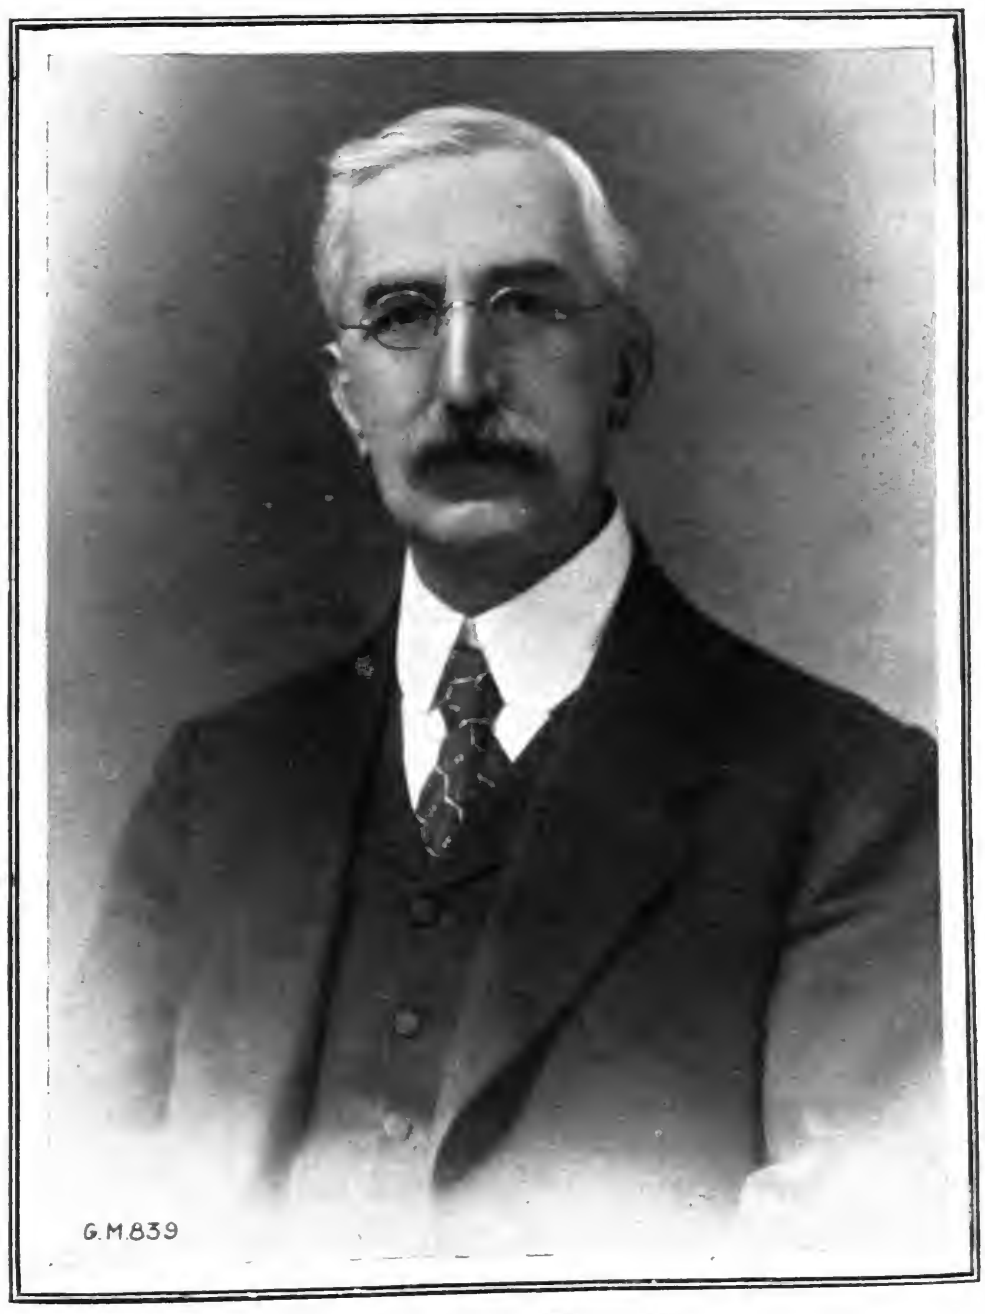
THE GARDENERS' MAGAZINE

NOTE OF THE WEEK.

Finances of the International.

The recollections of the great International Horticultural Exhibition, which attracted tens of thousands of flower lovers to Chelsea last year, will still be so fresh in the minds of the general body of horticulturists that in a reference to that remarkable gathering there is no occasion to touch upon its many highly interesting and wondrously beautiful features. So far from this being our intention, in referring to the exhibition, our object is to briefly direct attention to some of its financial aspects, which the issue of the balance-sheet now renders possible. Some time since we were able to inform our readers that the profit on the undertaking closely approached £3,000, and that the available surplus had been divided among the gardening charities, and the fund that is being raised for the purpose of republishing "Pritzel's Botanical Index," a work that is of great value to botanists, but is now out of print. The balance-sheet is of much interest as evidence that the carrying out of an International Horticultural Exhibition on so comprehensive a scale as that of last year is no light matter, and that the financial side thereof is not less important than the horticultural aspect. The total receipts amounted to £28,412 15s. 1d., a sum by no means excessive, considering the heavy expenditure that had to be incurred, and it is not difficult to appreciate the anxiety of those responsible for the management of the exhibition as the time approached for opening the gates to the public. The first entry on this side of the balance-sheet is one of £360, the share capital subscribed by the directors for the purpose of complying with the conditions associated with registering the Exhibition under the Limited Liability Act; and this sum, on the completion of the liquidation, was returned to the shareholders without any dividend or interest. The donations and subscriptions amounted to £5,976 16s., not a specially large sum, having regard to the importance of the undertaking, and the fact that not for nearly half a century had an exhibition of a similar character been held in this country. £10,000 would not have been in excess of what might reasonably have been expected. The receipts for admission to the exhibition amounted to £17,140, and as the eye scans these substantial figures, a feeling of thankfulness arises that the finest weather of the summer of 1912 should have been experienced during the two weeks in which the exhibition was held. Rent of spaces brought in £2,430 1s., and the catalogue £1,741 16s. 9d., and there are several smaller sums to which no reference need be made. Turning to the expenditure side, nothing is found to suggest extravagance, but the question arises whether it would not have been more economical for the Royal Horticultural Society to have carried out the exhibition as a part of its programme for the year. It may have been; but there were other considerations that had to be taken into account, such as the interference with the ordinary work of the society, and the fact that 15,000 or more visitors would have had the right of admission each day the exhibition was open without the payment of a single penny. The value of the prizes awarded was £2,727 19s., which is not a large sum, but the special cups, which must have represented a substantial amount, are not included. The tents and fittings cost £8,224 5s. 11d.; the working expenses were £4,112 3s. 8d.; and the office expenses £995 6s. 1d.; stationery, printing, and postages amounted to £2,067 6s. 5d., and catalogue printing to £1,696 7s. 5d. Advertising cost £1,941 6s. 6d., not an extravagant amount, considering the difficulty experienced in producing an impression upon the inhabitants of so large an area of London and its far-extending suburbs. The accountancy charges aggregated £589 17s., and the legal costs £478. The lunch to the jury on the day of opening, and the entertainment of the foreign guests was £661 3s. 5d., an expenditure that was by no means too large. As so well known, the Science and Education Committee formed an important part of the administration, and in no small degree contributed to the success of the gathering. Two important conferences were held under its auspices, one on the administration of the Plant Diseases and Insect Pests Acts in various parts of the world; and the other on horticultural education. Both attained a high level, and fully justified the feeling so generally expressed that they would long serve as models for what such gatherings should be. Not only did the committee arrange for two conferences, but they provided the papers that were read, and thus placed at the disposal of those who are interested in the several subjects discussed a large amount of information in a readily available form. It is therefore of special interest to mention that



MR. W. E. MARTIN,
President of the Finchley Horticultural Society.

the whole of the expenses of this committee, including the printing the several reports and the papers read, was only £87 12s. 4d. There are numerous other items on the expenditure side, but the only one of these that need be mentioned is the surplus or profit of £2,648 2s. 5d., this being distributed as follows: £100 to the Irish Gardeners' Association and Benevolent Society; £250 as a donation towards republishing "Pritzel's Botanical Index"; £1,532 1s. 7d. to the Gardeners' Royal Benevolent Institution; and £766 0s. 10d. to the Royal Gardeners' Orphan Fund. A more satisfactory distribution of the surplus could not well have been made, and the directors may be heartily congratulated on the judgment evinced in this matter, as in all that relates to the finances of the great gathering which they brought to so successful a conclusion.

Mr. W. E. Martin, president of the Finchley Horticultural Society, is an enthusiastic amateur gardener, and a great lover and successful cultivator of roses. An excellent speaker, with a talent for making everyone feel happy, he has done wonders in promoting horticulture in the north of London, especially among owners of small gardens, who are apt to think them too small to be of any use or beauty. He is a regular exhibitor at the National Rose Society's London exhibition, and invariably stages blooms in the suburban championship class. Twice has Mr. Martin been successful in winning the premier award in this class, which is of so much interest to amateurs who grow their roses in the suburbs of the metropolis, though this year he had to be content with second place. Finchley Horticultural Society is strong and vigorous, and the members did the right thing when they elected Mr. W. E. Martin as their president.

Attractions at Kew.—The Royal Gardens, Kew, are always attractive, and every season of the year has its own special interest for garden lovers. So many of our readers make holiday about this time of year, and so many of those who come Londonwards visit Kew, that we may refer to the beauty of the pentstemons and antirrhinums near the Palm House; the pelargoniums, etc., along either side of the Broad Walk; gerberas and the gorgeous Kniphofia Burchelli by the T range; violas round the ferneries; roses near the Palm House; aquatics near the Old Museum, in the Berberis Dell, by the Cedar Avenue, and in the lake; the glorious bed of Palling Belle hollyhock between the Shaft and the Palm House; the fine collection of herbaceous phloxes near the Orchid Houses and alongside the Herbaceous Ground; beds of ceanothus close to the Holly Walk, and the new vine pergola behind the Tea House.

Cancer in Plants.—At one of the sectional meetings of the International Medical Congress a short paper was read by Dr. Irwin Smith, of the U.S.A. Bureau of Agriculture, on the peculiar disease which attacks and destroys crops of beet, peach, etc. This, he demonstrated was due to a new growth affecting the plants at any part from the roots to the leaves, living with them, but ultimately getting the upper hand and destroying the plants entirely. The growth has much in common with cancer in animals. It spreads along the plants, could be reinoculated or grafted, and then produce its characteristic appearances. If removed cure was complete, but if a small portion remained it grew again. In the discussion which followed it was recognised that the disease had much in common with cancer, and though it could not at present be said to be identical, the data will form a valuable addition to our knowledge on this vexed problem. A further point was that Dr. Smith had isolated a specific bacteria, which after injection into any part of a plant set up a process of new growth which resulted in this "cancerous" formation. The importance of this work is great, apart from the economic aspect, which, of course, most intimately concerns Dr. Smith and the Bureau under which he works. The publications of the Department, together with numerous illustrations of the actual specimens themselves, have all been shown in the Museum during the Congress.

International Commission for Horticultural Congresses. — At the International Horticultural Congress of Brussels, 1910, it was proposed to establish an International Commission to deal with such gatherings. The Commission will be a permanent one, and will be composed of a certain number of representatives from each country having horticultural interests. There will be about sixty members, and the duty of the Commission is to meet on the occasion of each Congress to receive proposals as to time and place of the next gathering, and to consider questions of a scientific, practical, and economic nature relating to horticulture. A meeting of the provisional Commission was held in Ghent on the 7th inst., and the final constitution of the Commission will no doubt be effected shortly.

London Children's Gardens.—Mrs. Lyons, 5, Heathview Gardens, Roehampton, S.W., the hon. secretary of the London Children's Gardens and Recreation Fund, has written informing us that the aim of the society is to bring at least some portion of the joy of the country to town children, and the method employed is to acquire, on yearly tenancy, and at a nominal rent, vacant building or other sites in very poor districts. The ground so obtained is divided into plots, and when ready for cultivation is handed over to 70 or 100 children, according to the size of the site. Each child owns his or her plot for the season (March to September), and comes daily from 4.30 p.m. to 6.30 p.m. The society provides a teacher, a lady with a knowledge of gardening and a love of children, also a caretaker for each site, and the necessary seeds and tools. Four of such gardens are now being carried on by the society in Stepney, St. Pancras and elsewhere, and there is great competition among the children for plots. The society has had applications for the creation of new gardens in other parts of London, but lack of funds at present precludes the grant of such requests. Mrs. Lyons states that £100 will equip and start a garden, and £70 a year will maintain the site with plots for 100 children for six months.

Insectivorous Properties of the Petunia.—Writing from Sunnyside, Montrose, Dr. J. G. Havelock states that "the results of an investigation conducted for some time on the common varieties of the single petunia appear to indicate that that genus as represented in our gardens is a true insectivorous plant. Should these results be corroborated by other workers, a very notable addition therefore will be made to the known scanty list of insectivorous members among the higher vegetation. In other respects the petunia is a plant worthy of prolonged scientific attention. All its parts above ground, excepting the expanded portion and interior of the flower, are abundantly clothed with erect whitish hairs. These hairs are glands of a two-fold nature; they secrete a tenaciously viscid substance, and also a digestive fluid which acts instantly on new milk like rennet or the gastric juice of the human stomach. The hair walls appear to be composed, at least towards the apex, which is knobbed, of a brittle substance—probably silicious. The insect arriving on the plant breaks off or fractures the knobbed head of the hair, with the result that the gum which is collected in the knob holds the animal, and the irritated protoplasm within the hair ejects about it the digestive fluid. The products of the more digestible parts of the insect are then slowly absorbed by the plant."

Salix magnifica.—In describing a number of new Chinese trees and shrubs in the current issue of the "Kew Bulletin" Mr. W. J. Bean states, with reference to this willow: No more remarkable tree or shrub has been introduced from China than this. It is quite distinct among willows, to not one of which in cultivation does it bear any resemblance in leaf. It is a deciduous shrub up to 20 feet high, quite glabrous in leaf and branch; young shoots purple at first, assuming a reddish hue later. The leaves are the most remarkable part of the plant. They are oval or slightly obovate, sometimes ovate, entire, rounded or slightly cordate at the base, cuspidate at the apex, dull greyish green (with a bloom) above, pale and slightly glaucous beneath. In our young living plants they have not yet become more than 6 inches long by about 4 inches wide, but in the herbarium of the Arnold Arboretum the largest leaves on specimens collected by Wilson in China measure $8\frac{1}{4}$ inches long by $5\frac{1}{4}$ inches in width, the petiole 2 inches long. Male catkins 4 to 7 inches long; stamens 2, four times as long as the scale. Female catkins longer, sometimes as much as 11 inches. Mr. Wilson, who discovered the species, informs me that it is very common in parts of Western Szechuen between 7,000 and 10,000 feet. He also says the young shoots change to red the first winter and remain that colour for several years. The leaves assume a golden hue before they fall. It was introduced by means of cuttings and living plants to the Arnold Arboretum in 1909, and thence to Kew the following year. PAR

Wages in the Lancaster Parks.—At the monthly meeting of the Lancaster Town Council, Mr. Alderman Grieve, the chairman of the Parks Committee, stated that his committee had been asked by the men employed in the parks for an increase of wages. The Parks Committee considered the request reasonable, and recommended that a substantial increase should be made. They had, he said, a most loyal staff, who were most devoted to the work. The Council not only accepted the committee's report, but several of the members of the Council suggested that they should have gone further and given an increase to the men having the lower rate of pay.

Another International Exhibition in New York.—The success of the International Horticultural Exhibition held this year in New York, has led the Horticultural Society of New York to combine with the New York Florists' Club to promote an International Flower Show from March 21 to March 28, 1914. The exhibition will be held in the New Grand Central Palace, 46th Street. A preliminary schedule of some 208 classes has been issued, and the cash prizes are fairly liberal for hard-wooded plants in flower, palms and foliage plants, ferns, orchids, bulbs, roses, and new plants. The schedule is about equally divided between private and commercial growers, and copies may be obtained from Mr. John Young, 54, West 28th Street, New York. Mr. F. R. Pierson is chairman of the Show Committee. Mr.

R. G. Hollaman, at present staying at the Waldorf Hotel, Aldwych, W.C., is over here, trying to interest British and Continental nurserymen in this forthcoming exhibition, and he has already visited the two recent meetings of the Royal Horticultural Society, with that end in view.

Marriage of Mr. Leonard Cutbush.—On Wednesday, July 30, Mr. H. W. L. Cutbush, only son of Mr. and Mrs. Herbert Cutbush, of Normanhurst, Highgate, was married to Miss Flora Vardon, A.R.C.M., at St. Brelade's Parish Church, Jersey. The wedding was a quiet one, but the ceremony was largely attended as a consequence of the bride's popularity as a talented singer. Mr. and Mrs. H. W. L. Cutbush are spending their honeymoon on the Continent, and on their return will reside in Highgate.

Protection of Wild Plants.—The Selborne Society has made an appeal to county councils, rural district councils, landowners, and scientific societies for assistance in the way of obtaining reservations where wild plants which are in danger of extinction under present conditions may be preserved from the vandals of the countryside. A fair measure of support for this appeal has been received, but it is desirable that all local bodies and scientific societies should combine to check extermination. Mr. A. R. Horwood, recorder of the plant Protection Section of the Selborne Society, suggests the adoption by all county councils of the principle of obtaining a local order for prohibiting the hawking of wild flowers on the public highways, and also securing the general consent of landowners to a scheme of rules which shall apply to all alike for the protection of their private property.

July in the North.—In the south, writes our Aberdeen correspondent, there were complaints during July that the sun was scarcely ever seen. Here, in Aberdeenshire, there has actually been an expressed desire that there would be less sunshine and some rain—so that the strawberry crop might last a little longer, and that the fruit itself might be larger. "The strawberries come all together in this very bright weather," was the complaint of one large grower: "and there will soon be an end to them; the longer period they are spread over the better for us." In regard to flowers, there is a somewhat similar complaint, but another factor has here to be considered, and that was the cold, blighting snap we experienced one day. Buds, which gave every promise of rich blossom, were nipped; and in some gardens in exposed situations much damage was done. It was no compensation that the following day, generally, was bright and warm; the damage had been done, and, in many cases, the plants will not recover. Herbaceous flowers, in some private gardens, have suffered considerably on account of the cold snap and lack of moisture, especially where the soil is light and sandy. There has, however, been no lack of a splendid promise of blossom. Indeed, herbaceous borders are at the present time magnificent in their colouring. Sweet peas have come on very rapidly. In several of the nurseries and bigger gardens where they are grown to a large extent, well-flowered sprays, generally from three to four blooms on each, may be seen. They stood the cold wind snap remarkably well. The sunshine has been in their favour, and, generally, they have been well watched in regard to watering. A similar remark may be made with reference to roses, where the amount of bloom is, in many cases, remarkable. Rain here also would greatly benefit the bushes. Where flower beds have been laid out in several of the grounds of the larger mansions their parched appearance indicates the desirability of showers of rain. Antirrhinums, lobelia, calceolarias, stocks, the dwarf Phlox Drummondi, and a number of other popular bedding plants have a good appearance.

Influence of Gardening on Children.—If a child, through the work which he has done in his own garden plot, observes the "Globe," in referring to the civic and economic value of gardening for children, learns that he must care for his own piece of property, and has entire responsibility over it, he has learned a civic lesson. If a child learns that a piece of work must, after he has started it, be cared for to a finish, he has learned one of life's big lessons. If he learns that neglect of his own piece of property is a wrong to his neighbour, he will be a better citizen for that lesson. If he becomes interested, intelligently interested, in agriculture as a boy, he will be intelligently interested in the agricultural outlook of his country when he becomes a man. Big lessons of life which come through natural channels are lessons which are permanent. Evil can never be properly controlled by law; it can only be completely understood and stamped out through replacement by means of good. On the other hand, there is the economic value of the work. The child who has been taught through his garden to really need plants in his life is bound to carry that need into his future life, and the boy, the coming citizen of to-morow, will feel that he must live in a home surrounded, just as far as he can make it possible, by living, growing beautiful things. He will not only feel this from the æsthetic and civic side, but he will know full well that it is an economic proposition as well. The garden will be a part of his family plan, an asset, as it were.

Flower Show at Antwerp.—The Horticultural and Agricultural Society of Kiel, Antwerp, has arranged to celebrate the 25th year of its existence by holding a show on the 24th to the 31st of the present month. The schedule, printed in French and in Flemish, contains 29 classes for flowering plants, foliage plants, orchids, cut flowers, floral decorations, fruits, and vegetables. Medals are offered as prizes, and of these the King and Queen of the Belgians, the City of Antwerp, and others, are donors. The secretary is M. Emile Nagels, 218, Chaussée St. Bernard, Antwerp.

ALLAMANDAS.

Although the large-growing allamandas, such as A. Schotti, are now but little grown as large specimens, they are among the finest of all climbing plants for a large stove. Trained to the roof in such a structure, they will soon cover a considerable space, and the large, rich golden-yellow blossoms are always admired. The plants flower more readily if they are given a period of comparative rest during the summer months. Besides the members of the Schotti class, there are some very distinct species, especially A. neriifolia, which forms naturally an upright shrub, and produces its comparatively small golden-yellow flowers in great profusion. A. grandiflora, a slender-growing half-climber, with widely expanded blossoms of a charming shade of pale yellow, that are borne for a long period during the summer; and A. violacea, the purplish colour of whose blossoms is remarkable in this genus, the flowers of which are mostly some shade of yellow. This last-named species is decidedly variable in tint, some individuals being greatly superior to others. W.

STRAY THOUGHTS ON VARIED TOPICS.

At a sweet pea show the other day the judges were called upon to decide between two exhibits, but according to the standard set in respect of these flowers their task was an easy one, for one collection was characterised by long, stout stalks carrying three and four flowers each, and foliage round the tops of the vases, which little resembled that of sweet peas. The other exhibit was different, for though the varieties were much the same the flowers were smaller, they lacked substance, so the judges said, the stems were shorter, and not so stout. There was no doubt about which was first, according to the exhibition standard. "They didn't need a second glance," said one person, who, by the way, was interested, so the premier prize card was placed on the first-named collection, and everybody was satisfied.

Now come with me into the respective gardens in which the two collections of sweet peas were grown. In the first we see a long upright row of sweet peas that looks as if it were planted to serve as a wind break for something more tender beyond. The tops of the plants are nine feet or more from the ground, and the flowers that are mostly up there are picked by means of a step ladder, which stands near at hand ready for use. The tall plants are supported by sticks, strengthened by means of posts and wire, and we are told that all the flowers were picked off until just before the shows began. The big leathery foliage hardly seems natural, and such a contrast to that of the second prize row in the other garden. The latter plants, by the way, are not so tall. You can admire and pick the flowers from the ground; they look graceful and pleasing clustered over the bine, and the difference between the two is as great as a lithe young beast in a field and the same overfat, heavily-breathing animal in a stall. Flowers have been picked from this row ever since they began to open, and while one is natural the other looks artificial. But there, as with cattle, it is the forced and unnatural specimens that win at the show, whichever you may like best in the garden.

Another contrast. This time an onion class in a vegetable show. Here nine bumping specimens that would turn the scale at a pound and a-half each, with little outer skin, and necks that could hardly be called swan-like in proportion. Over there another bunch of onions, not more than a quarter the weight, but firm as rocks, encased in brown, ripened skins that gave evidence of perfect harvesting and a thoroughly-ripened condition. These had no necks to speak of, and the judges picked them up, looked at each other, and put them down again. Their better judgment was telling them something, but there is a law in showland that in onion classes the biggest bulbs must have the prize, so the coveted card fell on the large specimens, and they passed on to the next class. Nobody complained, unless it was the man with the smaller bulbs, and, if so, he did it silently, because there is a standard in show circles, i.e., the standard of size, and the world accepts it.

But follow the fortunes of these two types of onions a bit further, or on into the winter. A two-pounder that would win unstinted praise at the show is sent to the kitchen, a bit is cut off it to flavour the stew, and the rest meets with an ignominious fate in the pig tub at the back door, while the lady who presides over

the culinary office sends out a polite message that she would like a few onions next time, and not a football. Very well then, the big onions shall go to market, but with very much the same result, for the greengrocer sends back the message that when one of his customers comes in for a pound of onions she wants two or three, so that she can reserve one for to-morrow, if necessary, and has no use at all for a steak out of a monster. And towards the spring, when onions are getting scarce, we may see these two lots again in the store room, the first prize winners soft and pappy, with rootlets pushing at the base and green tops growing from the crowns, but those smaller onions that were passed over by the judges are as firm as they were on show day, and just as good, but there, according to the law of shows, the big ones must have the prize, and sufficient unto the day is the size of the bulbs.

Still another picture. Two expert vegetable judges pointing up the dishes in a collection at an August show, and in one there are excellent heads of celery. They stop to admire the celery. Wonderful for the time of the year they say, and, in a close competition, it turns the scale in favour of this collection over another which contains no celery. Well, that is the way of things, but in the same row in the garden where these heads come from that decided the question of the first prize for the collections a few heads of celery practically as good are left, but, not being required for exhibition, nobody wants them. The plain fact is they were grown for show at a cost that it is not well to inquire into, not to eat, and when autumn comes and celery digging for the table begins the remaining few in the show row, encased in their paper collars, are discarded, and left to go to seed or rot with the wet, as the case may be. This ends their story, but one wonders why so much importance is attached at summer shows to vegetables that are out of season.

It will be admitted that this season has been a trying one for cottage exhibitors, and one wonders how it has been possible to hold shows at all when one remembers the complaints of exhibitors earlier in the season that it was no good this time, the weather had been too much for them, and they would have nothing to show. But there, the cottage gardener is a man of devices, and is not easily beaten. As evidence of this, I saw, some weeks ago, a row of tall circular tins along the walk of a cottage garden that had originally been used to hold carbide for the supply of an acetylene gas plant. When I saw them, however, they were filled with soil, and in one was growing parsnips, another carrots, a third beet, and a fourth leeks—and these, of course, all for the show. When I questioned the man about his device he asked what he was to do, for at the time when seeds of the above things should have been sown in order to be ready for the show he couldn't get on the ground owing to its unfit state, and, not being easily thwarted, he thought of the carbide tins, and begged them for the purpose.

Just to change the subject for a moment, does anyone remember a season in which the black aphis was such a pest as it has been this year? It began with the broad beans, and taught its lesson here about the value of sowing broad beans early to escape its ravages. The strong, early-sown rows pulled through, but the aphis wrote finis on many a crop that was sown a bit later, and, having done its worst here, it spread its unwelcome presence to the scarlet runners, the French beans, parsnips, carrots, in fact, everything that would serve the purpose as a host plant. Remedies in the case of this pest are not an easy matter, as it locates itself under the leaves, and multiplies at a rate that is little short of being marvellous. Next perhaps to the broad beans the worst thing is with the scarlet runners, and, in consequence of the aphis, there are sickly little plants in dozens of gardens with crimped and twisted leaves, and bine only a few inches high, which, in ordinary circumstances, would now have reached the tops of the poles. H.

SUMMER-FLOWERING SHRUBS.

Shrubs that bloom late in the summer are not very numerous; consequently those kinds that produce their flowers from now onwards are of special value, and should be freely planted, as they help to brighten the shrubberies at a time when there are but few shrubs in bloom. Note may be taken at the present time of the different kinds in bloom, so that when the planting time arrives some of the more desirable of them can be included.

Several of the spiræas bloom rather late in the season, and of these S. ariæfolia, with dense plumes of creamy-white flowers, is very attractive. It frequently attains a height of 10ft., and is seen at its best when given an isolated position. S. Lindleyana is a handsome shrub, often 10ft. high; it has delicate green cut-leaved foliage of graceful habit, and its white plume-like flowers are at their best in August. It prefers a fairly warm loam of a porous nature, and should be planted in a sheltered position, as the cold winds sometimes damage the young foliage. S. Aitchisoni is similar in habit; it has rather larger blossoms, and the foliage is cut into smaller leaflets.

S. Douglasi has bright rosy-red flowers, and is very hardy. A good way to treat it is to cut down the growth close to the ground in the spring, young shoots are then produced which attain a height of from 3ft. to 4ft., and bear flowers in August. S. japonica Anthony Waterer is a desirable form that possesses bright crimson blossoms. In S. bullata we have a dwarf shrub of Japanese origin about 18in. high. It has rounded and wrinkled leaves and deep pink flowers, while, owing to its compact growth, it is a valuable subject for the rock garden.

Of the broom family Cytisus nigricans is a delightful summer-flowering shrub; its pale yellow blossoms are produced on slender, erect spikes in July and August. It is necessary to guard it against rabbits, as they have a partiality for it. A stock is easily raised from seed. The Spanish broom (Spartium junceum) should be largely planted in extensive pleasure grounds, as it produces its bright yellow blossoms freely from July to September. It is rather thin in growth, but often attains a height of 10ft.; it is quite hardy, and, like the common broom, will flourish on light, poor soils.

Cistus laurifolius is particularly bright and showy when in flower, its delicate white blossoms have a pale yellow blotch at the base of each petal. It is perfectly hardy, and can be easily raised from seed. The bark is a pleasing red, and the leaves give off a pleasant perfume. Ceanothus azureus Gloire de Versailles is a beautiful shrub for a pergola or wall, its pale blue flowers being freely produced in clusters on the young wood. It prefers a warm loamy soil, and in some districts makes a good shrub in the open.

The buddleias are very handsome when in flower, especially the newer varieties of C. variabilis. Of these C. variabilis magnifica has large spikes of deep rosy-purple flowers and C. v. Veitchiana has blooms of a bright mauve colour, with an orange-yellow throat. These are quite hardy, succeeding in any good soil, and should be pruned back fairly hard in the spring. Escallonia macrantha makes a good wall shrub, and in sheltered positions it can be grown in the open; its rosy-red blossoms contrast pleasantly with the deep green foliage. Olearia Haasti is a particularly desirable subject, as for several weeks in August its daisy-like flowers are produced in profusion, and when it is not in bloom it is quite a good evergreen. This species is very hardy, and frequently attains a large size. Although Choisya ternata can hardly be described as a late-flowering shrub, it rarely fails to produce a second display of blossoms in the autumn, and where it succeeds it is a great acquisition. It requires a warm, well-drained loam, and does best in a sheltered position. Its white, wax-like flowers are usually produced with freedom, and are sweetly scented. Clethra arborea, the lily of the valley tree, is usually grown in the conservatory, but where the soil and situation are suitable it succeeds out of doors in warm localities. The panicles of white bell-shaped flowers are very lovely, and a well-grown specimen has a picturesque appearance.

Batsford Park Gardens.

ROSES AT NUNEHAM PARK.

On several occasions we have referred to some of the more important features at Nuneham Park, the residence of L. Harcourt, Esq., near Oxford, and now present our readers with an illustration of the terrace rose garden there. It is not often one sees roses massed in such close proximity to the dwelling; it is seldom these flowers are planted in beds made on a flagged terrace, and rarely are they seen in such perfection anywhere as under these conditions at Nuneham. Exhibition flowers are not desired, but thorough cultivation, good feeding, and ample pruning are practised for the purpose of securing a fine display of bloom over as long a period as possible. That success follows these methods is evident from the wealth of blossom produced by the masses of Caroline Testout, Frau Karl Druschki, etc., on the terrace, and by Madame Abel Chatenay and other varieties at the foot of the terrace wall. These roses have been particularly beautiful at Nuneham this season, but those who would have similar displays must remember that in rose cultivation, as in many other things, withholding tends to poverty.

Cucumbers.—Sow a few seeds of Telegraph or other good winter variety at short intervals to keep up a supply of vigorous young plants in readiness for planting out as melons are disposed of. Plenty of top and bottom heat, and abundance of atmospheric moisture, and a compost somewhat lighter than for summer use, are the main factors, as cucumbers must be grown quickly to be worth eating. Never allow plants to stand about if the pits are not ready for them, as starvation in small pots leads to spider and disease, and fresh, healthy young plants can be quickly produced.—F. Jordan, Warter Priory Gardens.

AWARDS TO NEW ROSES.

Many beautiful roses of all classes have been introduced during late years, and each season sees fresh varieties added. Some of them, both in the shape of blooms and in the colouring of their petals, are very pleasing, but one is greatly disappointed on finding that many are lacking in that most essential point in all good roses—scent. One cannot help feeling sorry that such a number of these new roses are awarded F.C.C.'s and Gold Medals, seeing they are so very deficient in fragrance. While standing in the tent which was devoted to new roses at Gloucester, I saw a number of people turn away disappointed, as only one or two varieties possessed any perfume. If those responsible for awarding these honours continue in the course they are pursuing, we shall within the next few years have a class of flowers without scent, and the words

"No flower that blows is like the rose,
Or scatters such perfume,"

will have lost their meaning.

Among many of the new roses fragrance is lacking to such an extent that the flowers seem more artificial than real. Judges alone are to blame for this kind of thing; but as each individual has his or her own peculiar fancy, it would be a very difficult point to settle, unless some standard were set up as regards the perfume. Many people would as soon prefer an artificial flower made of wax or paper as have a real one which possesses no scent. All rose-growers are aware that at the present time the chief points they have to consider in exhibiting is the quality and freshness of their blooms; to them perfume counts for naught, but where this is taken into consideration, many of the blooms that at the present time find favour among exhibitors would ere long go out of cultivation. Take Bessie Brown as an example. How seldom do we find this variety expand its bloom properly under natural conditions, yet it is a Gold Medal variety. I remember planting a bed of this a year or two after it was introduced, but never succeeded in inducing a bloom to expand properly, and many others experienced the same difficulty.

Before awarding Gold Medals and F.C.C.'s it would be a good plan to have all the new roses thoroughly tested side by side with standard varieties by some disinterested person, so as to prove their worth. I am well aware that many will differ with me on this point but what we want to encourage if possible is not so much the production of fine roses suitable only for exhibition purposes, but varieties that are most useful for growing in gardens. As a rule, where roses are grown in private establishments, they are planted in beds containing one variety only, or, if more, they must be of the same colour. This being so, it is impossible to grow a large number of kinds, therefore the aim is to grow only the best, and after planting a rose garden in which some of these Gold Medal varieties are included, it is very disappointing to be obliged to take up a bed or two because the plants fail to expand their flowers, or are otherwise unsuitable.

I have no wish to discourage the production of new varieties, far from it; but let us have high honours awarded only to the very best in every respect. To me it seems an absurd practice to show roses on boards. There should be no difficulty where a grower has several acres of plants in cutting a single flower of one of them with just sufficient wood attached to admit of the bloom being raised above the show-board. If a dozen or so of blooms were shown on long stems in a vase or basket, one would then have an opportunity of seeing what they were like. H. C. Prinsep.

ROSES ON THE TERRACES AT NUNEHAM PARK.

The residence of the Right Hon. L. Harcourt. The principal variety on the Upper Terrace is Caroline Testout, and on the Lower Terrace Madame Abel Chatenay.

Phacelia campanularia.—Blue flowers are very generally admired, and this native of California is one of the best annuals of that tint which we have. There is, too, no half-and-half measure about the tone of blue, for the flowers of this phacelia suggest in colour one of the finest gentians.—W.

JUNE-FLOWERING LILIES.

(Continued from page 596.)

L. tenuifolium.

A dainty lily from Siberia, growing a foot to eighteen inches high, the first flowers opening outside quite early in June. One of the lower pockets on a sunny slope of the rock garden will suit L. tenuifolium. It is one of the easiest lilies to raise from seeds, the bulbs flowering the second year after sowing the seeds. The slender stems, narrow leaves, and wax-like scarlet flowers, give this lily an elegant and graceful appearance.

As it makes stem roots freely the bulbs should be planted fairly deep in a light sandy loam, mixed with plenty of flaky leaf-mould. To keep up a stock of this dainty little lily, a few seeds should be sown each year, as the old bulbs soon deteriorate. A variety of L. tenuifolium named Golden Gleam is said to be a hybrid between this species and one of the martagon section. It has golden-yellow flowers, and is stronger in growth than L. tenuifolium, and is altogether a very useful addition to the lily family.

L. elegans (or Thunbergianum).

Numerous varieties of this dwarf Japanese Lily are grown in gardens, most of which flower during June. They vary from six inches to two feet in height. The upright, cup-shaped flowers average four inches in diameter, and are borne from one to five, or more, on a stem. L. elegans thrives in light sandy soil, and, being one of the stem-rooting section, should be planted from six to eight inches deep. The bulbs may be planted in clusters between dwarf, low-growing shrubs, in groups along the front of a border, or in pockets in the rock garden.

The following varieties are all noteworthy, having large and brilliantly-coloured flowers: Alutaceum, a charming dwarf lily, six inches high, with apricot-yellow blooms; atrosanguineum, a dwarf chestnut-crimson variety, rich colour, and very effective; Orange Queen, one of the best "elegans" lilies, grows one foot high, and has large bright, orange-coloured flowers; Prince of Orange, apricot-yellow, dwarf, and showy; sanguineum, reddish-crimson, a vigorous variety, one to one and a-half feet high: Van Houttei, rich crimson, distinct and beautiful, large flowers, height one and a-half feet; venustum macranthum, a July-flowering variety, two feet high, with clear orange flowers.

L. monadelphum.

Under one or other of the three names, L. monadelphum, L. szovitzianum, or L. colchicum, we have in gardens a very beautiful, early-flowering lily, with straw or citron-yellow flowers, freely spotted with dark chocolate-brown. The stems are vigorous, three to five feet high, flowers pendulous, three to four inches across, and petals reflexed. The usual number of flowers is from six to ten on a stem, but extra vigorous specimens sometimes produce over twenty richly-coloured, fragrant blossoms.

A native of the Southern Caucasus, this lily will thrive in most soils, and is especially suitable for the herbaceous border. Plant the bulbs four to five inches deep.

L. candidum.

Opening its pure, waxy-white flowers towards the end of June, the White, or Madonna Lily is a popular garden plant, being probably grown more generally for border decoration than any other species. It is nowhere better seen than in cottage gardens, where, left undisturbed for years, the bulbs are often clustering together on the surface, neither frost nor sun seeming to harm them. L. candidum is grown extensively to supply cut flowers for sale and home decoration. Many growers have unfortunately had to give up the cultivation of this delightful lily owing to the ravages of the fungus Botrytis cinerea. Spraying with Bordeaux mixture or sulphide of potassium, one ounce to two gallons of water, may be used to prevent, or check the disease when prevalent. Badly affected plants should be dug up and burned. Dusting with sulphur previous to planting the bulbs is worth trying as a preventive measure.

While the Madonna Lily will grow and flower in most soils and situations, it is most at home in a good fibrous loam and a sunny position. A valuable lily for the herbaceous and shrubbery borders, L. candidum also does well grown in pots for conservatory decoration. Replanting when necessary should be done during August, active growth of roots and leaves starting in autumn. Growing three feet or more in height, the pure white flowers, with prominent yellow stamens, are delightfully fragrant. The number of flowers on a stem ranges from twelve to eighteen. L. candidum is said to have been first introduced into this country in 1596. It is a native of Southern Europe, and extends into Asia.

L. testaceum.

Grown also under the names of L. excelsum and L. isabellinum, this distinct lily is of doubtful origin. The generally-accepted theory is that it is a hybrid between L. candidum and L. chalcedonicum. The usual height is from three to four feet, but when growing luxuriantly stems five feet or more are not uncommon. The colour of the flowers is very distinct, being buff or nankeen-yellow, with prominent red anthers, and the fragrance is very noticeable. The flowers have the distinct reflexed petals of the Martagon lilies. L. testaceum, sometimes referred to as the Nankeen Lily, thrives in most garden soils, and is a splendid border lily. Replanting should invariably be done quite early in the autumn.

L. parvum.

This is a Californian Lily, growing about three feet high, with numerous small, upright, cup-shaped flowers, orange, tipped with crimson. L. parvum thrives in a well-drained sandy peat and leaf-mould. It delights in moisture at the roots in summer, but excess of moisture in winter is often fatal. One of the most suitable positions for this lily is along a shrubbery border with a south-west or western aspect, planted between kalmias, pieris, or dwarf-growing rhododendrons. The variety luteum is more vigorous than the type, growing four feet or more in height. I have just counted a spike with thirty-nine flowers, each about one and a half inches across, pale orange, spotted with maroon in the centre. The leaves are arranged on the stems in whorls.

L. Parryi.

A charming lily, also from California, with a pleasing fragrance, and rich yellow flowers. The average height is two and a half to three feet, with from three to twelve trumpet-shaped flowers. Similar conditions to that recommended for L. parvum will suit this lily. It will also thrive among hardy ferns, provided the soil is well drained, and contains plenty of leaf-mould.

A. Osborne.

Kew.

BORNMUELLER'S MEADOW SAFFRON.

Meadow saffrons are assuming greater importance than hitherto for the decoration of the garden in autumn. It is being rapidly realised that the newer species and their varieties include a number of plants which are of high value for the decoration of the rock garden and the front of the border in autumn—a time when the former, in particular, wants all the colouring it can receive. In clumps on the level parts of the rock garden, planted in the front of the border, or even in rough grass which does not require to be mown until autumn, when the leaves of the meadow saffrons die down, these flowers are admirable in their appearance. The old Colchicum autumnale, in its single forms, at least, is quite cast in the shade by its allies.

One of the earliest of these large-flowered meadow saffrons, and also one of the most beautiful, is Colchicum Bornmuelleri, a very handsome species, which opens earlier than C. speciosum, and which has lighter-coloured flowers of a different outline, and quite delightful in their own way. They open out almost white, but rapidly pass off to deep rose-purple, with an ivory-white zone at the base. A good clump is highly effective, and even one or two bulbs, or, rather, "corms," will produce flowers enough to be pleasing. They are large and handsome. The leaves do not appear until spring, but the flowers are produced in September. This handsome bulbous plant should be secured at once, and planted at a depth of about six inches, a little less doing, however, in strong soil, which it prefers to a light and dry compost. Increase is effected by seeds, which take a long time to produce flowering bulbs, or by division of established clumps, performed when the leaves have become brown.

S. Arnott.

Madonna Lilies.—Where this lily thrives there is a no more desirable subject for the flower garden. Attempts to establish it meet with very variable results: in some districts it is easily managed, while in others it resents all efforts. From examples one sees of it flourishing in cottage gardens, it is evident that it dislikes being disturbed, and that it does not require a soil over-rich in manure. The best time for planting is directly the flower stems have died down, usually about this season; the bulbs should be kept out of the ground for as short a period as possible, as they are most impatient, and undergo no real resting period. This lily does not appear particularly fastidious as to soil, but is to be seen thriving in most ordinary soils provided with good natural drainage. The fungoid disease which so frequently attacks the Madonna lily accounts for many failures that annually occur.—T. B. Field.

CLIANTHUS PUNICEUS ALBUS.

In this country the clianthus is generally regarded as a greenhouse climber, but in favoured districts, such as Devon and Cornwall, the plant will flourish well in the open air, the only protection advisable being a warm south wall; in some gardens it does well as a bush plant. The specimen shown in the accompanying illustration is growing on a south-west wall, and represents the white form, which is a pleasing addition to the scarlet-flowered type.

The name clianthus is said to mean Glory Flower, in allusion to the beautiful colour and form of the blooms of the type. It is popularly known as the Glory Pea, and also by the names Parrot's-bill and Lobster-claw, owing to the shape of the flowers.

Cuttings root readily in sand, provided they are started with a gentle bottom-heat. The plants grow vigorously when established, and are suitable for covering the roof or walls of the greenhouse or conservatory. The white variety was introduced into commerce a few years ago, and is now to be met with in many gardens. The type was first brought into this country from New Zealand in 1832, and is common in the south-west, where it provides a grand display in May, walls on which it is grown being a sheet of scarlet at that time. A few flowers are generally cut by Christmas Day, and from that time onward blossoms are borne in ever-increasing numbers, being most profuse in May.

Specimens of scarlet clianthus grown in bush form flower with freedom in the south-west, but it is certainly seen at its best on a wall, as it presents a larger expanse of colour than when grown as a shrub. Very large examples are to be seen in Devon and Cornwall, one having covered the side of a house to the eaves, a height of considerably over twenty feet. The white variety is not of a pure snow-white, but is tinged with faint green, and where only one can be grown, the scarlet type is to be preferred, as it is more striking in appearance. However, when the two are grown on the same wall, as they are here, they make a pleasing contrast. The clianthus may be considered practically hardy in Devon and Cornwall, but in the exceptionally severe frosts which occurred in February last year some plants were killed.

Here, as soon as the flowers have faded they are carefully cut off. Were they allowed to remain on the plant, many hundreds of seed-pods would be formed, which would inevitably weaken the plants considerably. As soon as the blossoms are removed the plants are heavily syringed every evening, and this is continued during the whole of the growing season. Were this not done they would become dust-dry, as the leaves prevent the rain from reaching the roots. When they become dry they are attacked by green-fly, which weakens them so that little new growth is made, but with copious nightly syringings these pests never make their appearance. When the growth is completed, the new shoots are laid in behind the wires strained against the wall, so that it is entirely covered with foliage, and no glimpse of stone is to be seen. Seeds saved from the white variety often give seedlings that throw back to the scarlet type.

Kingswear. WYNDHAM FITZHERBERT.

New Rose Moonlight.—At the recent exhibition of the Irish Rose and Floral Society at Belfast, a gold medal was awarded to the Rev. J. H. Pemberton's new seedling perpetual-flowering cluster rose Moonlight.

ESCALLONIA PHILIPPIANA.

Of the various species of escallonia suitable for outdoor culture this is the hardiest, and, whereas the majority of the other kinds can only be grown successfully in the southern counties, or further north in the vicinity of the sea, this is suitable for general outdoor cultivation, for it withstood the severe winter of 1894-1895 without injury. Mature bushes are met with between three feet and five feet in height, with a diameter up to six feet or so. The deciduous leaves are small and dark green, and amongst them the white flowers show to considerable advantage during late June and July. It is a native of Valdivia, and has been in general cultivation in this country for upwards of a quarter of a century.

By crossing it with the evergreen E. macrantha, Messrs. J. Veitch and Sons obtained a charming red-flowered hybrid, which is almost as hardy as E. philippiana. This is called E. langleyensis, and it forms a wide-spreading bush at least eight feet high, with long, graceful, arching branches which bear a profusion of showy blossoms. Should a mild winter be experienced it retains many of its leaves until spring, but a prolonged period of frost causes them to fall. Both shrubs are excellent for beds or large groups, and the hybrid is also suitable for planting against walls and trellises. Both plants thrive in light but good loamy soil, and are readily increased in July by means of cuttings of half-ripe shoots inserted in pots filled with sandy soil, and then placed in a close frame.

CLIANTHUS PUNICEUS ALBUS.

A fine specimen growing against a wall in a Devonshire garden.

SUCCULENT PLANTS FOR AMATEURS

(Continued from page 439.)

Agave.

The agaves form a large genus of Central American plants. Many of the species worthy of attention, and should be included in quite a small collection, excluding the large and coarser kinds. A selection should be made from the following: A. celsiana, A. albicans, A. hybrid A. Leopoldi, are all distinct, and have an additional charm in the dense rosettes of leaves, bearing numerous curly threads of a silvery-white colour all along the margins. In A. geminiflora these thread-like filaments hang in a large mass, and crowd the whole of the centre of the plant.

Several good variegated forms are in cultivation. A. americana variegata, and A. micracantha picta are pretty; A. Milleri variegata, grown under the erroneous name of A. americana var. picta in gardens, is a beautiful form. A. picta variegata is a dwarf variety with bluish-grey leaves, and with a broad stripe of white down the middle; A. atrovirens variegata has long, tapering leaves variegated with rich yellow. All the above are obtainable from the nursery trade.

AGAVE MICRACANTHA PICTA.

A handsome species with large leaves, marked with bands of pale yellow.

reach to 20 or 30 feet high when in flower. Most of them only bloom once, and then die, but there are a few species which do not, but develop lateral buds at the base of the old flower stem, and these soon grow into large plants. A number of species are Franzosini, A. marmorata, and A. Scolymus, are all species with greyish-white leaves: A. Victoriæ Reginæ, which is in a class by itself, is a regular gem, and should be in all collections. A. geminiflora, A. schidigera, A. filifera, and the

Aloes.

These are confined to tropical and subtropical Africa and the South of Europe. One species, viz., A. chinensis, is said to be a native of China, but is probably an introduced plant. Most are of easy culture, and highly decorative, especially when in flower. A selection may be made from the following: A. variegata, the Partridge Aloe, a common plant in cottagers' windows; a beautiful and easily-grown plant, with short, spirally-arranged green leaves prettily variegated with white; flowers brick-red, produced freely on quite small plants. A. obscura, A. Greeni, A. saponaria, and the hybrid A. marmorata are useful kinds, with thick, fleshy leaves spotted or striped with white or greenish-white, and of dwarf habit. A. mitriformis is another easily-grown species, with short, dark green leaves, covered near the apex and along the margins with bright yellow prickles. A. ferox has light, glaucous blue leaves, densely covered with short, hard prickles, and a neat, dwarf habit. A species frequently met with as a cottager's window plant is the South African A. arborescens, of free branching habit, and not at all fastidious as to culture. This is an ideal succulent plant for general purposes, as numerous suckers and branches are developed, from which any amount of stock may be obtained. The leaves are a light glaucous-blue shade when grown in full sun, but soon lose this colour if grown in even partial shade. The flowers are brick-red, and seldom produced, except by large specimens. A. vera, a native of the Mediterranean region, is a dwarf plant with light green leaves, and is of interest as being the source of the bitter aloes of commerce.

In a genus of which over 100 species are in cultivation it is difficult to restrict oneself to half-a-dozen species, but mention must be made of a few of the larger kinds suitable for large houses, such as the Giant Tree Aloes, A. Thraski and A. Bainesi, with their tall woody stems and spreading leaves, almost devoid of succulence; and the fine A. abyssinica, with large, fleshy, dark green leaves, spotted with pale greenish-white. The bulk of the species flower freely when once they have reached the adult stage, the flowers being mostly of some shade of brick-red or orange, while a few species have light yellow flowers.

Apicra and Haworthia.

The apicras and haworthias are nearly allied genera, of which only a few of each are in collections. They are all of small stature, and suitable for small collections where space is limited. The flowers are all small and of a dirty white colour, occasionally shaded with pink or some tint of brown, and borne on slender arching racemes. Of the apicras, A. deltoidea and A. spiralis are the two best for general purposes. Haworthias are a numerous family, and are often covered with a dense mass of warty corrugations or spots all over the leaves, giving them a distinct and handsome appearance. A few of the best are H. fasciata, H. Radula, H. margaritifera, H. Reinwardti, and H. tessellata.

Gasteria.

The gasterias are well-known as useful window plants, a hot, sunny window being an ideal position for them, and with very little attention they will thrive, and flower annually for many years. Numerous species are in cultivation, and are mostly dwarf in habit, and with thick, fleshy, warty, or spotted leaves, some of which are extremely handsome. Most of the species possess very beautiful flowers, being usually some shade of scarlet or pink, and shading off at the mouth of the perianth to bright green or white. The flowers are all curiously pouched near the base, and curved in outline, and are borne on long, erect, or arching racemes or panicles.

A few of the most easily-grown kinds are G. verrucosa, G. disticha, G. nitida, G. trigona, G. marmorata, and G. nigricans. These are all dwarf and compact in habit. A few of the larger kinds are G. excelsa, G. spiralis, G. Croucheri, and G. glabra.

C. P. Raffill.

(To be continued.)

SCHIZANTHUS WISETONENSIS.

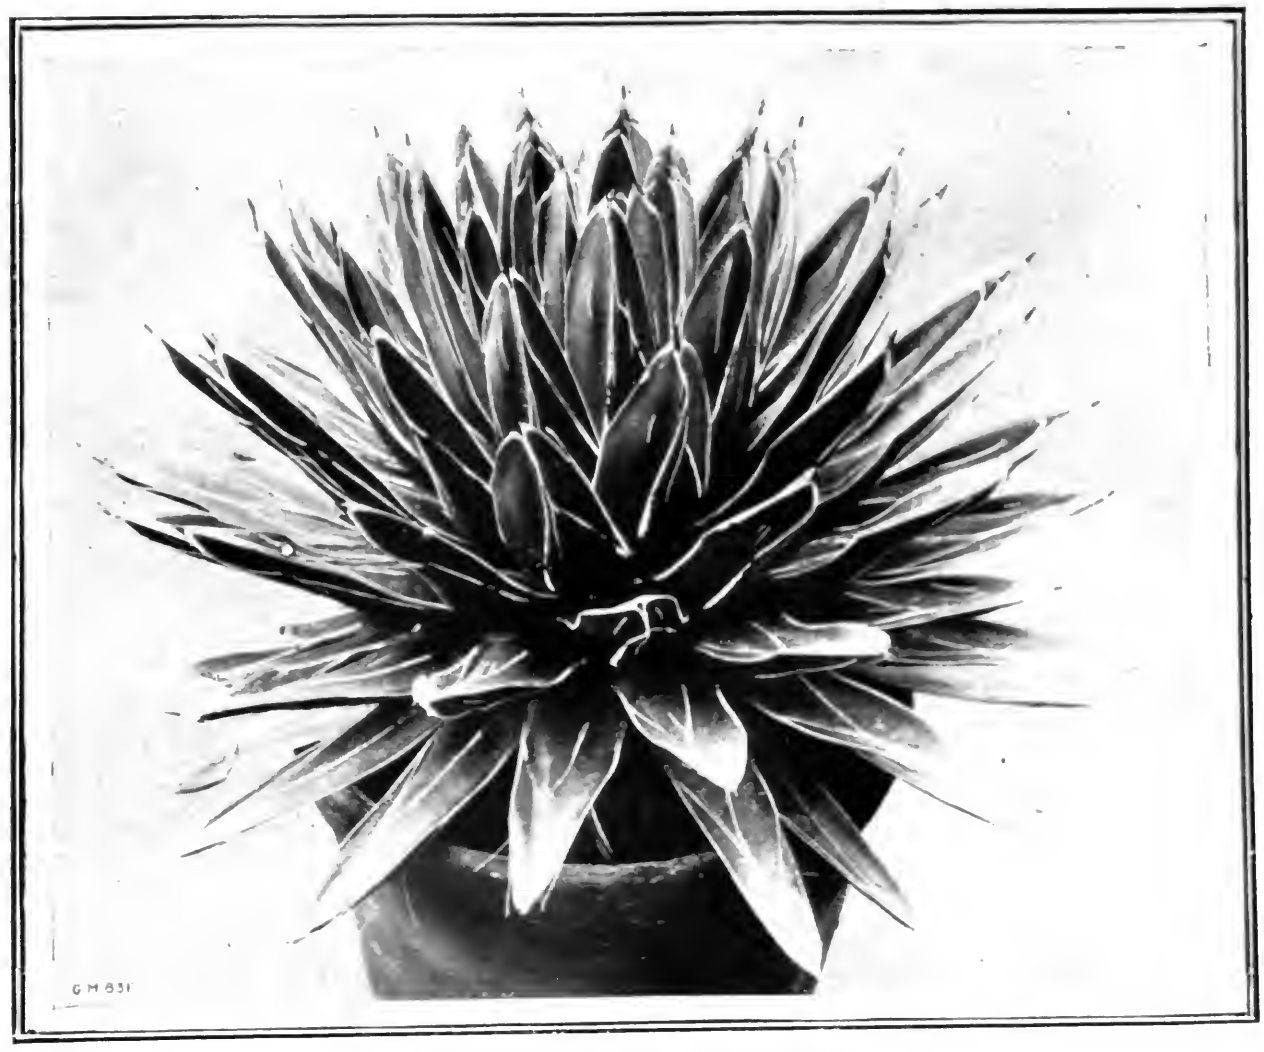
It is advisable to raise two batches of this schizanthus, one early in August and the other at the end of the month or early in September. Where the houses in which the plants are flowered are very sunny the blooms quickly fade as the hot weather increases; if there are structures with cool aspects the flowers will last longer and be very highly coloured. In the depth of winter the sunniest position in a house will not be too hot.

All cultivators of flowering plants for the embellishment of the conservatory in spring will be acting wisely by providing two good batches of plants, as even a few fine specimens give a furnished appearance to a greenhouse or similar structure. I well remember having to grow several plants in a pot of the old Schizanthus pinnatus, and train the shoots over a balloon-shaped arrangement of wires. But a well-grown specimen of the variety Wisetonensis does not require a wire support; one, or at most three, stakes will be sufficient, and one plant quite enough for a pot 6½in. or 7½in. in diameter.

The seedlings should be grown in the best compost procurable, not necessarily a rich one, but such as will support the roots in a healthy condition until the flowers have faded. Too often one sees plants in their early stages looking somewhat sickly in a poor, fibreless, rooting medium. Feeding later on will not make up for lack of poor soil, simply because the roots are too few. In the substantial compost roots will be plentiful and healthy, and when the feeding is judiciously carried out extra fine specimens will be the result. Frame accommodation is the most suitable until the middle of October; then a high, warm shelf will answer best from that time until the final potting, when space on a light, open stage should be provided. M. L.

LILIUM CHALCEDONICUM.

Known frequently as the Scarlet Turk's Cap Lily, this species, like many other members of the Martagon group to which it belongs, needs to become thoroughly established before it is seen at its best. The first season after planting it will often push up a poor, weak stem to a height of only a few inches, with insufficient vigour to enable the few flowers to develop. Favourably situated, an improvement may year by year be anticipated, till it forms one of the finest of all border lilies. In this lily stem-roots are very sparingly, if at all, produced, the entire plant depending for its support upon the stout thong-like roots from the base of the bulb. It is therefore evident that until these have thoroughly taken possession of the soil this lily will not be seen at its best. A good sandy loam of moderate consistency suits this lily, whose prettily recurved, sealing-wax-like coloured blossoms form such a pleasing feature in the flower border. They are not, however, adapted for cutting from, the heavy smell of the blossoms being against their use in confined places. Apart from any other consideration, this lily is particularly interesting, as it is one of the reputed parents (L. candidum being the other) of the beautiful and distinct Nankeen lily (Lilium testaceum), whose early history is doubtful. S.



AGAVE VICTORIÆ REGINÆ.

A handsome species of dwarf growth, the leaves greyish-green, with white variegation.

SPRING CABBAGES.

The succulent young hearts of spring cabbages are eagerly looked forward to in the spring of the year, as they provide the first real change that one can hope for after several months of winter greens and root vegetables. The spring cabbage bed is, therefore, a matter of real importance, and everything should be done to make it a success. Not many years ago much was written about the various varieties, their values, and earliness, and the leading seedsmen have been compelled to take the greatest possible care of their stocks of this vegetable so that their customers may not be disappointed.

One of the greatest troubles experienced with this crop, and sometimes a very prevalent one, is bolting. This, as all readers know, means that the plants run to flower prematurely, and do not make hearts. This trouble may be due to sowing at the wrong season, or to poor varieties, not necessarily bad cabbages, but entirely unsuited for spring supplies.

The preparation of the ground is of considerable importance. An open site should be selected, and the ground well worked, and have a liberal addition of good farmyard manure added. Spring cabbages form a good rotation to onions, so that as soon as the crop is harvested the ground should be turned up, and allowed to remain rough until the plants are ready for putting out. The time of seed sowing varies according to the locality, from the third week in July to the first week in August for the first sowing, and from the middle to the end of August for the second sowing. Select a portion of a border that has not just been manured or used recently for any member of the cabbage family. Break it up, and then make a firm and fine tilth, and sow the seeds thinly, broadcast. Cover the seeds with a dusting of wood ashes and old lime rubble and a sprinkling of fine soil, and then net the bed to protect the seeds from birds.

If the weather is summer-like and dry a light watering through a rose can, late in the evening, will greatly assist germination. As the young plants are clearly seen remove the net and give an occasional dusting with soot in the early morning while they are wet with dew. Preparatory to planting out have the surface of the bed neatly levelled down, after having strewn the surface with wood ashes and lime rubble. Mark out the rows eighteen inches to two feet six inches apart, and plant out at a foot apart, which will allow for the removal of alternate plants in the very early spring. Plant firmly, and give a good watering. Pay attention to hoeing, which will not only keep the plants free from weeds, but also stimulate growth, and allow the free passage of rain to the roots, as well as conserving the moisture in the ground. Beyond these little details no other attention will be required until a month or so from the end of the year, when a little soil should be drawn up to each plant.

In the early spring, when the plants begin to grow again, the hoe should be used among them during suitable weather, and as the plants grow a little artificial manure will assist the plants, but avoid too many applications, otherwise the growth made will be too vigorous and soft. As soon as the cabbages commence to heart a little nitrate of soda will hasten them, but here again, unless cautiously applied, it had better not be used. When cutting select the firmest, and, if possible, the alternate plants, at the commencement, which will allow the later ones more space to develop.

Ellam's Early is still one of the very best varieties for early supplies, and if treated properly, and the true stock is obtained, it can be relied upon. Sutton's April and Flower of Spring are each of excellent quality, and rarely bolt, while Harbinger is another very excellent early cabbage.

Aldenham House Gardens.

GATHERING EARLY APPLES AND PEARS.

Precise dates cannot be given for gathering any particular variety of apple or pear, as situation, climate, soil, and season affects them. The varieties also differ considerably as to the stages of maturity at which they should be gathered, some being best left upon the trees until ripe, while others would become insipid, or mealy, if so left. Experience, assisted by close observation, alone will help in these matters, but once this is gained there is no difficulty in ascertaining when each fruit is in condition.

The colour of the fruit will readily suggest to those experienced when it is fit to gather. The brown colour of the pips is also usually a safe guide, though the best practice to follow is to carefully raise each fruit to a horizontal position, then if its footstalk readily parts from the branch, it will be a certain proof that the fruit is ready to be gathered. On the other hand, should force be necessary, which invariably results in the footstalk being broken, the time for gathering will not have been reached.

Pains should be taken not to impair the appearance, and quality of the fruit by bruising, and to this end it should be carefully gathered, placed in padded baskets, and conveyed to the fruit room. The supply of fruit for the table can be economised by gathering it upon the piecemeal principle, and the best way of doing this is to attend to each variety daily as soon as its earliest fruits become fit; by this means some sorts, provided a sufficient quantity is grown, can be made to afford a prolonged supply.

It may be as well to select a few well-known varieties of early apples and pears and briefly touch upon some of the peculiarities which they possess, in reference to my subject.

Pears.

The Jargonelle pear is an old favourite that ripens in August and early in September, and is best in quality when it is gathered immediately before it is ripe. It must not, however, be stored for more than a few days before being taken to table, and it should then be eaten without delay otherwise it will commence to decay in the centre, and become useless, though externally it may appear to be quite sound. Williams' Bon Chrètien, another old favourite, should also be gathered a few days before it is ready to fall from the tree, and by daily selecting the most suitable fruits a good crop, even from a single tree, may be made to afford a moderate supply of excellent quality for a fortnight or so. When perfectly ripe the core readily decays, and those who are inexperienced may be easily deceived by judging the condition of the fruit from its appearance. Souvenir du Congrès ripens at the end of August, or early in September, and its peculiarities are similar to those of Williams' Bon Chrètien, which is one of its parents, and it should be treated in like manner to that variety. It is ready for table a few days after being gathered.

Marguerite Marillat is a fine pear of comparatively recent introduction, and may be specially referred to as an illustration of those varieties, such as Flemish Beauty, that require to be gathered somewhat early, before reaching maturity, in order to secure the flavour at its best. It is liable to become mealy and deteriorate in quality, if it becomes matured before being gathered, and there should be no delay in sending it to table after it ripens in September. Triomphe de Vienne is another fine September pear, of excellent quality and handsome appearance, but it is liable to decay at the centre if left too long before being gathered, and for the same reason it keeps in perfection only for a short time, and, consequently, should be sent to table as soon as it is ripe.

Beurre de Amanlis is an old variety, and a favourite, being deservedly so on account of its many good properties, though it is not attractive in appearance. It is large, juicy, and of pleasant flavour, and need not be used quite so soon after being gathered as such sorts as Williams' Bon Chrètien, while it also keeps in good condition a few days longer after getting ripe than does that variety. It ripens at the end of September.

Apples.

Among apples Irish Peach ripens thoroughly on the tree early in August. It quickly loses its refreshing flavour, and its crispness of texture, however, after being gathered, and to have it in its best condition it must be sent to table and eaten as soon as it is gathered. Beauty of Bath, an attractive variety, that may be termed an improved Irish Peach (which in many of its characteristics it much resembles), though it retains its good qualities for a short time after being gathered, and may be kept a little while before being sent to table. It ripens in August.

Mr. Gladstone, a good juicy apple, with sweet, pleasant flavour, deteriorates readily if kept after it is ripe. It should be gathered daily, as it becomes fit, and be sent to table without being kept. It ripens early in August. Red Astrachan, a handsome variety of Russian origin, has a sweet, moderately rich flavour, but, like Irish Peach, it readily becomes mealy, and loses its best flavour after being gathered, and should, therefore, be sent to table as soon as picked. It ripens early in September.

Lady Sudeley, one of the most handsome of early apples, ripens at the end of August and early in September. The fruits are tender and sweet, but soon lose flavour after being gathered, and should be sent to table without being stored. Devonshire Quarrenden, an old and well-known variety, rich and juicy, ripens in August, and it should be allowed to well ripen upon the tree, and then be sent to table as soon as gathered.

Thos. Coomber.

The Hendre Gardens.

Freesias.—These are useful for the conservatory, and may be had in flower over a long period if brought on in batches. If last season's bulbs have been properly matured they may again be made use of. The bulbs must, however, be graded, using only the largest for flowering this season. Put them in 5in. pots in a compost of loam, leaf-soil, and sand, and place them near the glass in a cold frame. Carefully apply water until they have made plenty of roots, and when growth is active, give abundance of air. Towards the end of the autumn place them near the glass in a cool house.—E. Harriss, Lockinge Park Gardens.

NEW PLANTS AND FLOWERS.

DENDROMECON RIGIDUM.

Though by no means a new plant, this species is not very largely represented in gardens, even in the south. It is hardy if planted in a warm position, and will generally succeed where Romneya Coulteri does well. The flowers are bright yellow, poppy-like, but flattish, and borne singly on young shoots. From the axil of the first leaf below the flower another shoot proceeds, and often extends beyond the flower ere the latter is fully open, and it in turn produces a bloom. The species is shrubby, is a native of the mountains of California, and has rather rigid, lance-shaped, glaucous green leaves. A.M., R.H.S., July 29. Sir Trevor Lawrence, Bart. (gardener, Mr. Bain), Burford Lodge, Dorking.

RHODODENDRON AUGUSTINI.

Named in honour of Dr. Augustine Henry, its first discoverer, this new hardy Chinese species is a promising garden plant. It grows 3½ft. to 5ft. high, and bears large, showy, purplish-lilac flowers, spotted with yellow or orange on the dorsal lobes of the corolla. The wavy corolla lobes are a conspicuous feature. "Bot. Mag.," t. 8,497.

HYPERICUM AUREUM.

An old, but distinct species of St. John's Wort, that flowers freely in August, producing golden-yellow flowers with deflexed petals, and a large cluster of orange-coloured stamens. It is quite hardy, and forms a neat tree-like shrub from 2ft. to 4ft. high. "Bot. Mag.," t. 8,498.

AMELANCHIER OLIGOCARPA.

A shrubby species, rarely exceeding 5ft. in height. Its white flowers are generally produced in clusters of three, so that in this respect, as well as in stature, it differs markedly from the freer flowering A. canadensis. "Bot Mag.," t. 8,499.

OSBECKIA STELLATA.

This shrubby greenhouse plant is reminiscent of Pleroma macrantha. It has strongly-veined leaves, and bears its flowers terminally. The four broad petals are deep rosy lilac, the stamens being yellow; each bloom is about three inches across. It appears to have been first discovered in 1802, and to have been first advertised for sale in this country in 1822. "Bot. Mag.," t. 8,500.

AGAVE WARELLIANA.

A rare species producing a rosette of large leaves, from 2ft. to 2½ft. long, and throwing up a spike 15ft. high. The flowers are produced along the upper 9ft., yellowish green, over three inches long, with stout violet-brown stamens, five or six inches long, each bearing a large, tawny-yellow anther. A Mexican species allied to A. macrantha. "Bot. Mag.," t. 8,501.

PODACHÆNIUM EMINENS.

A distinct composite, which thrives in the greenhouse, and has been in cultivation about seventy years. It is a native of Central America, and is met with at from 3,000 to 4,500 feet above the sea level. The plant is of vigorous growth, and forms a shrub of moderate size. The flowers are white with yellow disk, and are borne in loose corymbs. "Bot. Mag.," t. 8,502.

SEDUM PILOSUM.

An interesting stonecrop of biennial duration, remarkable both for its distinctness and beauty. The plants range from two to three inches in height, and produce large clusters of rose-coloured flowers. It is a native of the Caucasus, where it is found at an altitude of between 4,000 and 5,000 feet, and is quite hardy in this country. "Bot. Mag.," t. 8,503.

CUNONIA CAPENSIS.

A distinct tree, bearing elegant spikes of fragrant greenish-white flowers that at one time was frequently met with in gardens provided with cool houses, sufficiently lofty to accommodate trees of moderate stature, but it has shared in the fate that has befell many other Cape plants, and is now seldom seen in cultivation. It is a native of South Africa, and is known by the Kaffirs as the Umqwashube, and by the European settlers as the Red Alder. The tree is remarkable for the hardness and the rich red colour of its wood. "Bot. Mag.," t. 8,504.

VINCA DIFFORMIS.

This species of Vinca is a native of the Western and Central Mediterranean region, where it grows freely in moist and shady places. It is a dwarf shrublet, and of free growth in a genial climate, but is not so hardy as the well-known species Vinca major and V. minor, and therefore not so useful for general cultivation. Canon Ellacombe has grown it for many years in his garden at Bilton. "Bot. Mag.," t. 8,506.

DENDROMECON RIGIDUM.

A golden-flowered shrub that is hardy in favoured situations and sheltered gardens. A.M., R.H.S., July 29. Sir Trevor Lawrence, Bart. (gardener, Mr. Bain), Burford Lodge, Dorking.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

THE COOL HOUSE.—The bulk of the odontoglossums will now have reached that stage where the pseudo-bulb commences to form. It is generally found that at this time the new roots are pushed out from the base of the advancing growth, and any repotting that is necessary is best attended to before the new roots become too far advanced, as they are liable to injury. The weather in the north-east has become considerably cooler, especially at nights, and this will, to some extent, assist the pseudo-bulbs in retaining a plump condition. I pointed out only a short time ago in this column the undesirability of disturbing the plants until outside conditions become more moist and favourable; this may also be still kept in view where the outside atmosphere remains hot and extremely dry. It is better to wait a week or so than to disturb plants prematurely.

ODONTOGLOSSUMS.—It is foolish to expect all the plants to be ready for repotting at one and the same season of the year. Not only among the species do we find plants flowering at nearly all seasons, but the many hybrids have all had a tendency, as in the case of cattleyas, to provide flowers almost throughout the year. One therefore should not be induced under any circumstances, because this particular season has arrived, to disturb the plants unless they need to be repotted. We find the bulk of the plants ready at this season because the greater portion of them flower at or about the same time, and thus the growths are, generally speaking, nearly at the same stage of development. Plants do not all emit roots at this stage; some root after flowering, or it may be at the commencement of growth development, so one has to be constantly on the watch. It is not always desirable or necessary to annually repot. In the case of small plants in pots up to, say, six inches in diameter, if they are in a satisfactory condition and making vigorous growth, they may outgrow their pots and require annual repotting. If small plants want attention at all, it is best to repot. Plants of a larger size may be top-dressed where the compost is still good, and only the surface has become decayed or overgrown. For top-dressing two-thirds of the compost should consist of finely-chopped sphagnum moss. For the general potting we use a compost consisting of equal portions of chopped sphagnum moss and fibrous peat, with a third portion made up of broken leaves, sand, charcoal, or broken crocks. This is made moderately firm about the plants. The pots should be clean, sufficiently large to contain the plant comfortably, and filled to about one-third their depth with broken crocks and chopped bracken roots.—H. J. Chapman, Oakwood Gardens, Wylam-on-Tyne.

STOVE PLANTS.

BEGONIA GLOIRE DE LORRAINE and its varieties are now growing apace, and require frequent attention in regard to staking and tying. Earlier plants will require a central stake and several others for the support of side growths. A single central stake to which side growths may be loosely looped will be sufficient for plants in 48's or 54's. Allow plenty of room between the plants, and, when moving them, dust the surface of the bed on which they are standing with soot. For the maintenance of healthy, vigorous plants feeding will now become necessary, and occasional applications of diluted cow manure water, alternated by Clay's or other approved fertiliser, will be found beneficial. Carefully regulate the shading, which will now hardly be required so early in the morning, and may be removed a little earlier in the afternoon. Watch for any sign of mite, and should it appear keep it in check by dipping the plants in a solution of tobacco water, or by fuming with a nicotine compound. Remove all flowers as they appear.

BEGONIA GLOIRE DE SCEAUX.—These plants will require more room for development, and it will be advisable to allow a clear space between them. One strong 3ft. stake will be sufficient for each, care being taken to insert it at least an inch from the stem, otherwise roots may be severely damaged. In feeding this begonia we prefer to mix equal parts of fertiliser, soot, and finely-sifted soil, giving each plant a light top-dressing occasionally. A few early flowers may be showing now; if so, they should be removed. Ventilate when possible, close the house with sun-heat, but again slightly open the ventilators in the evening during mild weather.

CLERODENDRON FALLAX. — The flowers of the earliest seedlings will now be showing colour, and should be removed to a house having a slightly lower temperature and rather drier conditions, where the flowers will last over a much longer period. This will allow of the later plants receiving more room for full development. If the centre is removed from a few they will produce smaller panicles of flowers from the axils of each pair of leaves, and will make a useful batch for very late decorations. Frequent attention to watering will be necessary at this period, for the soil dries up very quickly, and the plants must not be allowed to suffer.

COLEUS.—A batch of cuttings of these useful ornamental foliage plants may now be rooted. Insert four or five round the side of a 54-sized pot, and keep the house or pit close. They will quickly root, and if potted up when sufficiently advanced they will provide useful plants for late autumn decorations and also stock for next season's propagations.—H. Prime, Hatfield Gardens.

FRUITS UNDER GLASS.

PEACH HOUSES.—Continue to give all the air possible to trees which have been cleared of fruit, and a good watering at least every ten or fourteen days. Where any of the trees have not done satisfactorily, or have shown signs of decline, the present is a suitable time to examine the seat of mischief. Have some fresh compost made ready, which should not be of too rich a nature, else gross growth is apt to be the result. Use fairly strong loam with a liberal quantity of charred soil and old mortar rubble added, the first to promote the development of fibrous roots, the second to build up the stone of the fruit. A few handfuls of bone-meal may also be added to young trees, and a light sprinkling of some patent manure to the borders in which old-established trees are growing, but no other manure should be used. Choose a cloudy day, and cut out a trench to the depth of the border four to six feet from the stem, according to its size, and proceed to prick out the soil from amongst the roots with a fork, using all possible care not to damage the roots, and clearing all the soil away as the work proceeds. It is not often necessary to disturb the tree entirely, unless the soil be in a wet and sour state, and in this case the whole should be removed. Examine the drainage and put it in order; spare no trouble in a matter of this kind, but let the work be done thoroughly. When everything is in readiness proceed to fill in the border; first place a layer of turf, grass side downwards, over the drainage, then fill in with the compost to within about 8 inches of the desired level, making thoroughly firm as the work proceeds. Prune back any strong roots, and cut the ends of others to induce more fibres; lay out the roots in proper form at different levels, until the desired level is obtained. After completion a good watering with tepid water should be given, shade the trees until it can be seen they are making fresh roots, and syringe freely twice or thrice a day.

SUCCESSION HOUSES.—Keep the atmosphere cool in houses where the fruit is ripe, and see that the borders do not become too dry, or the fruits will not hang well. Maintain a warm and fairly dry atmosphere in houses containing the latest varieties, where the fruits are ripening. Should the weather be dull and sunless, a little warmth in the hot-water pipes will promote higher flavour and finish. See that all trees in their various stages with or without crops have sufficient water at the roots, and assist old trees with weak liquid and guano water. Push aside the foliage from the fruits, so as to give them all the benefit of direct sunlight.—F. Jordan, Warter Priory Gardens.

THE FLOWER GARDEN.

CLIMBING ROSES.—The flowering season of climbing roses, notably wichuraiana varieties, is now practically over, and no other time of year is more suitable for pruning them; this operation amounts to cutting out wood which has borne flowers, and should there be plenty of young growths developing to replace it, which is more often than not the case with vigorous plants of this type, the old wood can be dispensed with entirely. Usually some of the strongest pieces must be retained, otherwise they will present an unfurnished appearance. After thinning has been completed, the remaining growths should be trained and made secure by nailing or tieing. Obviously, proceeding with such work about this time of the year commends itself in at least two ways; the young wood, being less crowded, is in a more suitable condition for becoming matured, and the work is carried out under better conditions than if left for the cold weather. Some varieties of climbing teas and hybrid tea roses provide us with autumn blooms, so the pruning of these is best deferred until early spring, as it is then possible to cut away at the same time any unripened wood which has suffered from frost—a not infrequent occurrence with some of the varieties belonging to these sections which are more or less delicate in constitution.

BEDDING VIOLAS.—The present time is very suitable for propagating violas to provide plants for early spring planting. Old plants are now throwing up young basal shoots, and these if taken off with a heel and inserted in sandy soil, and afforded the protection of a frame, will soon take root. Once rooted the lights should only be used as a protection against sharp frosts and to exclude excessive moisture; anything approaching coddling through keeping the lights on during mild weather will result in the plants becoming drawn and unsatisfactory.

BEDDING PELARGONIUMS.—The final batch of bedding pelargonium cuttings should be put in with as little delay as possible. Everyone is not so placed as to be able to secure sufficient cuttings from reserve plants, and stock has to be taken from those planted in beds, etc.; consequently they have to be dealt with on two or three occasions so as to cause as little disfigurement as possible. Inserting cuttings in an open border is an excellent plan for those taken early, but those taken now should be put into pots or boxes, then, should dull, wet weather be experienced, they are easily placed under cover and kept rather dry. Very late cuttings should be given a light, airy position in a house or pit which is slightly heated.—T. B. Field, Wych Cross Place Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and sixpence. Offices, 148 and 149, Aldersgate street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

The exhibition held on Tuesday, August 12, gave every evidence that the holidays are in full swing, for the show was much smaller than usual, and the number of visitors very much below the average. The outstanding features were the fruit trees in pots and the gladioli, the latter being very fine.

Messrs. H. B. May and Sons, Lim., Upper Edmonton, presented a charming exhibit of ferns, which were most tastefully arranged in blocks of each kind. The most striking forms were Nephrolepis muscosa, Adiantum Farleyense gloriosum, A. peruvianum, Pteris Summersi, some delightful plants of Nephrolepis exaltata superba, with Cheilanthes elegans, and well-developed plants of Osmunda palustris Mayi. Tall specimens of Selaginella cœsia arborea, and Lygodium scandens, introduced a graceful background. From Messrs. W. Cutbush and Son, Highgate, came a miscellaneous display of flowering and foliage plants. In the former were groups of Lilium lancifolium rubrum, L. auratum, and L. longiflorum, with Begonia President Carnot and the hybrid Fuchsia Thalia. The exhibit was rich with well-coloured foliage, Coleus cordelia being especially bright, as were also well-coloured plants of Dracæna Victoria, and caladiums in variety.

Mr. Amos Perry, Hardy Plant Farm, Enfield, had a group on the floor of the hall. This was composed of blocks of delphiniums which were unusually good for the late period. Some of the best were Mrs. Creighton, Mrs. Brunton, Belladonna, Semiplena, and Lamartin; while the chief feature was Achillea Perry's White. This variety again demonstrated its superiority over its compeers, and bids fair to become a widely-grown plant for the borders, and also as a market cutting variety. Mr. Geo. Reuthe, Hardy Plant Farm, Keston, had a nice display of hardy flowers, and a number of alpines in pots. The most notable features were Sparaxis pulcherrima atropurpurea, Eucryphia pinnatifolia, Romneya Coulteri, and Astilbe simplicifolia, with a variety of other hardy flowers. Mr. M. Prichard, Christchurch, had a very bright group of hardy flowers arranged on the floor of the hall, which presented a brilliant patch of colour. The group was rich in gladioli, phloxes, kniphofias, montbretias in variety; while Rudbeckia purpurea Brilliant was most conspicuous. The group was rendered light and graceful with the aid of gypsophila and grasses.

Mr. L. R. Russell, Richmond, had an entire table of hardy foliage and flowering plants. The latter were fuchsias, and included a nice collection. The best were F. coccinea Florian, F. bicolor, F. gracilis variegata, F. Riccartoni Elysee, F. Madame Corneillson, and F. corallina. The background was composed of vines in a good variety, some well-coloured plants of Dimorphanthus mandshurica argentea variegata were also noted.

Messrs. Dobbie and Co., Edinburgh, were represented by a fine display of annual scabious, which were admirably arranged in vases and other devices. The strain is undoubtedly a good one, embracing all colours, and, as arranged, made a charming feature. The same firm also had a large exhibit of collarette dahlias, arranged in stands and vases, with a foil of grasses and gypsophila. The most prominent varieties were Holyrood, Frogmore, Meteor, Cumbrae, Queen Bess, and Princess Lonise. Messrs. Wells and Co., Lim., Merstham, sent some fine examples of perennial phloxes, arranged in masses of each colour. Some of the best were Elizabeth Campbell, Iris, Rynstroom, Selma, Richard Strauss, Le Mahdi, and Antoiné Mercie. They also exhibited some good examples of perpetual carnations, Northport and Salmon Enchantress. Messrs. A. H. Cole, Lim., 326, Camberwell New Road, S.E., had a fine display of cut zonal pelargoniums, also a fine strain of gloxinias and pentstemons; these came from the Home of Flowers, Swanley, which has recently been purchased by the firm.

From Messrs. T. S. Ware, Lim., Feltham, came an entire table of hardy flowers, which were nicely displayed. The phloxes formed a fine feature, as were also the delphiniums, Chrysanthemum maximum in several varieties were also prominent, with Anchusa italica Dropmore var., Senecio clivorum, and some bright delphiniums.

Gladioli were a feature, especially the long table contributed by Messrs. Kelway and Son, Langport. These were staged in large vases and tubes, with a few light grasses, which added to the general effect. A few of the best varieties were Rosedrop, Indomitable, Fire Dragon, Prince of Orange, Baron Komura, Lady Digby, Pink Duchess, and White Swan. Certainly a fine collection. Messrs. W. Cutbush and Son, Highgate, had a pretty display of gladioli arranged in large mounds, with a bed of single spikes in vases. In the centre was the violet Baron J. Hulot, flanked on either side with Panama in grand colour, and Lily Lehmann; while other large groups contained Halley, Lucretia, America, and Brenchleyensis, which looked quite a pigmy in comparison with the Childsi forms. Europa was also in splendid condition. Messrs. Jas. Vert and Sons, Saffron Walden, exhibited a large collection of hollyhocks, for which these nurseries have been so famous for many years. Tall spikes of double flowers made a fine exhibit, as illustrating their worth in the border; while boxes of flowers in front pointed out their qualities as florists' flowers. The best varieties were Lady Bailey, Wm. Archer, Princess, Primrose Queen, Alba superba, and Constance.

The National Gladioli Society held a competition for the President's Cup, which was awarded to Messrs. G. Teestraten and Sons, Oegstgeest, Holland, for a very fine display. The vases were made up with three spikes each, and were arranged in a fan shape. The display was in every way worthy of the cup, the varieties being Glory of Noordwijk, very fine; America, Lily Lehmann, Baron J. Hulot, Niagara, Mrs. F. Pendleton, jun., Dick, Loveliness, grand spikes; Moonlight, L'Innocence, Goliath, Europa, Red Emperor, Pandura, Pink Perfection, Snowstorm, Princeps, Badenia, and Rosea perfecta. Messrs. de Ruyter and Hogewonig, Noordwijk, also had a display in this class in which were noted fine vases of Siegar, Yellow Hammer, America, Ida, Mahonie, Pink Perfection, and Apollo. Messrs. Kelway and Son, Langport, also competed with a splendid collection, including finely-developed examples of Pius X., Palene, King of Gladioli, Snowbird, and Modia.

Mr. K. Velthemy, Hillegom, in the same class, had some capital vases of Francis King, L'Immacule, Mont Enis, Pink Perfection, and Europa. Mrs. Atkinson, Locksheath, near Southampton, had some well-arranged vases, especially Excelsior, Michigan, America, Pink Perfection, and Faust.

FRUIT COMMITTEE.

The chief display of fruit was a large central group of trees in pots sent by Messrs. Jas. Veitch and Sons, Lim., Chelsea, which comprised splendid specimen trees of peaches, apples, pears, plums and figs. The peaches were heavily-laden pyramid trees of Marquis of Downshire, Nectarine Humboldt, while the pears not only carried good crops, but were remarkably well developed. The chief varieties were Marguerite Marillat, Souv. de Congrès, Triomphe de Vienne, and Louise Bonne de Jersey. Plums were represented by The Czar, Jefferson's, and Early Transparent Gage, while figs were carrying good crops in seven and eight-inch pots, as many as twenty fruits being seen in a twenty-four pot. The Veitch berry, a cross between Raspberry November Abundance and the wild blackberry, were large and of good colour.

ORCHID COMMITTEE.

A small group of orchids came from Mr. E. H. Davidson, Twyford, Berks, which included some nice odontoglossums, lælio-cattleyas, miltonias, and Odontioda Charlesworthi. Messrs. Charlesworth and Co., Hayward's Heath, also contributed a small display of choice specimens, in which were noted a well-flowered plant of Miltonia vexillaria robusta with four fine spikes. O. armainvilliersense Xanthotes, with splendid sprays: Miltonia Charlesworthi, and Cryptoheranthus Dayanus.

Mr. E. V. Low, Vale Bridge, Hayward's Heath, exhibited fine plants of Cattleya Atalanta and Lælio-cattleya Ophir, the former having a large spike of well-developed flowers.

From Mr. R. G. Thwaites, Christchurch Road, Streatham, came an interesting little group, which included Odontioda Charlesworthi, O. Lœana in several forms, and Cattleya Pittiana.

Messrs. Sander and Sons, St. Albans, exhibited a fine example of Lælio-cattleya Phœnix, var. King George, a very deep-coloured flower of the type. From Mr. De Barri Crawshay, Rosefield, Sevenoaks, came a well-flowered example of Odontioda Lœanum, with seven flowers, also a good, vigorous plant of Odontoglossum Queen Alexandra.

A beautiful group came from Messrs. J. and A. McBean, Cooksbridge, which included some fine plants of Odontoglossum crispum, Lælio-cattleya Ursula, a purple variety of great substance and good, rounded flower, with some beautiful odontiodas. These included fine examples of O. Charlesworthi, O. Bradshawense, O. Diana, and O. Keighleyensis.

Messrs. Stuart Low and Co., Bush Hill Park, N., staged a small exhibit, which had Lælia crispum, Cattleya Dowiana, and Oncidium Krameri as the chief sources of attraction. The quaint Coelogyne pandurata was to be seen with eleven well-developed flowers.

Mr. H. T. Pitt, Rosslyn, Stamford Hill, presented a nice group, in which were Cattleya Source d'Or, Cypripedium Richmanı, odontoglossums, and some well-flowered miltonias.

MEDALS AND AWARDS.

Awards of Merit.—To Lælio-cattleya Wellesleyi var. Flambeau, from Mr. E. H. Davidson; to Lælio-cattleya Ursula, from Messrs. J. and A. McBean; to Gladioli Craignour, from Messrs. Kelway and Son; to Collarette Dahlia Dungeness, from Messrs. Dobbie and Co.; to Caladium Madame Renee Marot, from Mr. Hoffman; to Lysinotus Warleyensis, from Miss Willmott; to Agapanthus Weilligi, from Mr. A. Worsley.

Silver-gilt Knightian Medal.—To Messrs. Jas. Veitch and Sons, Lim., for fruit trees in pots.

Silver-gilt Flora.—To Messrs. Kelway and Son, for gladioli.

Silver-gilt Banksian. — To Mr. M. Prichard, for hardy flowers.

Silver Flora.—To Messrs. J. Vert and Sons, for hollyhocks; to Mr. E. H. Davidson, for orchids.

Silver Banksian Medals.—To Messrs. W. Cutbush and Son, for gladioli; to Messrs. Dobbie and Co., for scabious and dahlias; to Messrs. H. B. May and Sons, for ferns; to Messrs. T. S. Ware, Lim., for hardy flowers; to Messrs. W. Wells and Co., for phloxes; to Mr. H. Pitt, for orchids; to Messrs. J. and A. McBean, for orchids; to Messrs. Charlesworth and Co., for orchids.

Bronze Flora Medals.—To Mr. A. Perry, for hardy flowers; to Mr. G. Reuthe, for hardy flowers.

Bronze Banksian Medal.—To Messrs. A. H. Cole, Lim., for pelargoniums, etc.

Aberdeen Sweet Pea Show.

On August 1 and 2, for the third year in succession, the Aberdeen and Northern Counties Sweet Pea Society held their annual show on the above dates in the Music Hall Buildings, Aberdeen. As the years roll on the entries continue to increase, and this year the numbers far outstripped those of preceding years. There were twenty-two competitive classes, all of which were well filled, and nothing could have exceeded the magnificent prize-winning specimens. The show was opened by the Hon. Mrs. Leith Hay, of Leith Hall, and the secretarial arrangements were, as usual, in the capable hands of Mr. M. H. Sinclair, and gave every satisfaction.

The leading class in the show was that for the best twelve bunches of sweet peas with waved standards, distinct varieties, and here a handsome silver cup was the leading prize. The competition was exceedingly keen. Sir Thomas Burnett, Bart., of Leys, Crathes Castle, near Aberdeen, scored first and second places with beautiful specimens, including Agricola, Melba, Rosabelle, Lady Miller, Sunproof Crimson, Edrom Beauty, and Dobbie's Cream. Sir Thomas's second-prize lot were composed of somewhat similar specimens, but they lacked the exquisite finish and beauty of his first-prize lot. His gardener, Mr. John Petrie, received many hearty congratulations on the display. Third place was taken by that redoubtable grower Mr. Grigor, gardener to Mrs. Dunbar Dunbar, Seapark, Forres, of whom a portrait and delightful little sketch was recently given in The Gardeners' Magazine. For the best six bunches of sweet peas with waved standards, Sir Thomas Burnett was again first, and took also third place, his entries comprising greatly admired specimens of Mrs. Cowdy, Inspector, Agricola, Hercules, Lavender Queen, Wenvoe Castle, and Sunproof Crimson; Mrs. Dunbar Dunbar was a capital second. For best three bunches, Sir Thomas Burnett was first and second, his first lot being composed of Lady E. Eyre, White Queen, and Mrs. Cowdy, and the second of Etta Dyke, Bertrand Deal, and Dobbie's Cream; Mrs. Dunbar Dunbar was third with a lot little short in excellence of the first and second.

In the class for three bunches of sweet peas, novelties introduced in 1912 and 1913, the places were similarly occupied. Here Mrs. Dunbar Dunbar's third lot were very fine blooms of Lavender, G. Herbert, Anglian Fairy, and Agricola. They, however, did not reach the quality shown by Sir Thomas in his first and second lots. For one bunch of lavender sweet peas, Mr. Grigor had matters entirely his own way with a very fine specimen of R. F. Fulton. For one bunch, scarlet, any variety, Mr. Petrie was again the leader, second place being taken by the Earl of Kintore, Keith Hall, Aberdeenshire, with a similar but hardly so well grown specimen. Mrs. Davidson, Dess House, Aberdeenshire, was third with Scarlet Empress, her gardener being Mr. W. Ingram. For one bunch, pink, any one variety, Mr. Petrie was first, being closely followed in second and third places by Mr. Grigor. The specimens shown of picotee-edged sweet peas were much admired, and here Mr. Petrie commanded first place. Mr. T. Stephen, Fernbank, Crathes (Mr. Reith, gardener), made an admirable second, with Mr. Grigor third.

The amateurs made a very fine display, the leading places being taken by Rev. E. V. Kissack, Aberlour, in the majority of the competitions, while Mr. R. W. Duncan, Kemnay, Aberdeenshire, also showed some capital flowers.

Floral decorations were a greatly admired feature, the leading contest being for the best dinner-table decoration. Mrs. Porter, Monaltrie, Ballater, Aberdeenshire, was placed first for a very artistic design of delicate pink blooms adorned with sprays of gypsophila; while Miss Mabel Slater, 4, Queen's Terrace, Aberdeen, made a worthy second; indeed, we rather preferred this young lady's centre arrangement to the first. No doubt the cutlery and crystal display on the first-prize table (the second having only the flowers) added more realism to the design. The bowls shown were really very fine, and the three leading prize-winners adopted entirely different colours, which made their entries, as they stood side by side, a great attraction. They were Miss Slater, Miss Sinclair, Kepplestone House, Aberdeen; and Mrs. Porter. The first and last-named ladies also did some very fine work in the other competitions open to them.

Baskets and bouquets were a charming display, and evoked the warm encomiums of the visitors. Miss Sinclair and Miss M. Smith, 210, Union Grove, Aberdeen, were leaders here for baskets, while Mr. James Smith, 210, Union Grove, showed far and away the best shower bouquet. Ladies' sprays were finely shown, and Mrs. Dunbar Dunbar worthily won leading honours.

An outstanding feature of the exhibition was a display of sweet peas arranged for effect on a space six feet by three feet, no restriction as to number of vases, style of arrangement, number of sprays, etc. All three leading exhibits were very fine. Mr. Petrie was deservedly first, his entry being a really meritorious one. Her Excellency the Countess of Aberdeen, Haddo House, Aberdeenshire (Mr. John Mackinnon, gardener), was second. Mr. Grigor was third.

Peterhead Horticultural Society.

In opening the annual exhibition of the Peterhead Horticultural Society, held in the Music Hall Buildings, Peterhead, on Friday and Saturday, August 8 and 9, Sir Jeremiah Colman, Bart., of Gatton Park, Surrey, who is meantime holidaying at Cruden Bay, Aberdeenshire, made an interesting speech on horticulture. Sir Jeremiah, who was very cordially received on rising to open the show, said he made no excuse for having hobbies, because those who lived the strenuous life were able to perform the duties they had to undertake very much better if they in their leisure time had some hobby which might occupy their thoughts. Hence it was that he had encouraged himself to have hobbies, and perhaps the chief was horticulture. He was a bit of an agriculturist as well, and when staying with Dr. Farquharson, of Fintzean (Aberdeenshire), whom he always looked upon as a typical Scottish laird, he had an opportunity of visiting one of their Aberdeenshire agricultural shows, and he could only say that if the high standard which they found agriculture occupied in Scotland was equalled by the standard of horticulture, they had very much to be congratulated upon. The Chairman, in introducing him, had asked him not to forget that he was in Scotland, which was a rather curious remark, because, as a matter of fact, it was the one thing which he (Sir Jeremiah) had been troubling himself most about that day, because they certainly had him at a disadvantage, for he was not nearly so familiar with a Scottish audience, and its expectations, as he was with an English one. When he began to think of horticulture, it embraced so much that really it would be quite impossible, in the short time at his disposal, to speak very seriously about the subject. He happened to be treasurer of the big international horticultural exhibition held in London last year, and in making a comparison with the schedules of the former exhibition in 1866, it was quite extraordinary to find the change that had taken place, and that was largely due to the industry of the gardener. He referred to the perfection of certain orchids, to the Shirley poppy, and the begonia, and remarked that he was over at Ghent a few months ago at the Quinquennial Show there, and went through several of the nurseries, and he could assure them there were tens of thousands of plants in flower there which only a few years ago were being sold at extravagant prices. All horticulturists should be encouraged to pursue the cultivation of plants, and to endeavour to produce new varieties and hybrids which would be of value to horticultural research. He always thought that Scottish character and Scottish climate were peculiarly adapted for horticulture, and he had great pleasure in declaring the show open.

The Bishop of Bristol, who is also holidaying amid the charming marine scenery of the east coast of Aberdeenshire, proposed votes of thanks.

THE EXHIBITS.

Perhaps the entries were somewhat fewer than has been the case during the fourteen years' history of the society, but the show was a distinctly successful one. There was a fine display of pot plants in both the professional and amateur sections, the geraniums, pelargoniums, and begonias being outstanding features. In the professional section for cut flowers the one great feature was the capital display of sweet peas, while the amateurs excelled in begonias and violas. Fruit was exceptionally well shown, the strawberries being remarkably fine. The leading exhibitors in the professional classes were: Pot Plants—Mr. George Dargie, Old Hospital, Peterhead, who has for years taken a very prominent part at this show; Mr. George Mann, Whitehall, Aberdeenshire; and Mr. Robert Shand, The Grange, Peterhead. Among amateurs Mr. John Sim, Constitution Street, Peterhead, gained the president's medal, with a capital all-round display in the various divisions; and Mr. William R. Forrest, and Mr. William Milne were successful. Messrs. Dargie, Mann, and Shand were again the leading winners in the cut flower section.

Fruits were poorly shown so far as number of entries was concerned, but the quality was very good. Messrs. Mann, Whitehall, and James McKay, The Grange, led in the professional classes, while in the amateur section, which was poorly represented this year, chief honours fell to Mr. John Christie, Hatton; Mrs. James C. Booth, Downiehills, Peterhead; and Mr. John Robb, Hatton.

Mr. George Dargie was the most successful exhibitor in the vegetable classes.

In the section devoted to pot plants grown in windows of dwelling-houses, a most desirable feature, and one which ought to receive every encouragement at these shows, Mr. John McKay, Fire Station, Peterhead, secured the leading honours with entries which reflected the greatest credit upon the growers.

Exhibition of Sweet Peas, Etc., at Dumfries.

The Dumfries Agricultural Society has for the past year or two organised an exhibition of sweet peas, and a few other horticultural subjects in connection with their annual show at Dumfries. That held on August 5 was quite equal to any of its predecessors, and the sweet peas were very fine indeed. In the gardeners' class for sweet peas in twelve varieties there was a strong competition, and many excellent flowers were shown. Mr. James M'Gill, Colonel Maxwell Witham's gardener at Kirkconnell, carried off the premier honour with very finely-grown blooms. Etta Dyke, Barbara, and Rosabelle being superb. Mr. C. G. Murray, Mr. Henry Kerwick's gardener at Cowhill Tower, made a good second; Mr. R. A. Grigor, Mr. J. Rankine's gardener at Dalswinton House, being third; Mr. M'Gill was fourth. In the amateurs' and cottagers' class for twelve varieties there were also some fine blooms, that good grower, Mr. G. L. Moffat, Mayfield, Lockerbie, being the winner of the first prize. Mr. J. Crosbie, Dalswinton Village, was second. In the open class for six varieties, Mr. France, Mr. James Brown's gardener at Knockbrex, Kirkcudbright, was first, Mr. J. M'Gill coming in second. The other classes for horticultural produce were few and contained a small number of entries.

National Sweet Pea Society.

The National Sweet Pea Society has just reason to congratulate itself upon the success of its provincial show held in the Market Hall, Carlisle, on August 13 and 14. The exhibition was a large one, and in the forty-three classes there were an aggregate of 237 entries, though not quite all of these were filled. The quality of the blooms and their wonderful colouring was the subject of comment among the army of sweet pea experts present. The shape of the hall scarcely permitted the arrangement of the classes in their natural sequence, but this did not give much trouble to the judges. Mr. F. N. Hepworth, the chairman, and Mr. Thackray, the secretary of the Carlisle Society, did their best to make all arrangements complete. Messrs. Herbert Smith, C. H. Curtis, H. J. Wright, and A. Hallam, acted officially on behalf of the National Sweet Pea Society. The exhibition was formally opened by Mrs. Murray, F. W. Chance, Esq., the President, presiding at the opening ceremony.

OPEN CLASSES.

Premier place in the classification class for eighteen bunches of sweet peas, distinct, representing as many colour classes, was won by Mr. J. Smellie, Pansy Gardens, Busby, who scored with fine bunches of May Campbell, Elfrida Pearson, Prince George, Hercules, White Queen, The Squire, Dobbie's Cream, King Manoel, Mrs. C. W. Breadmore, Wenvoe Castle, R. F. Felton, Edrom Beauty, Gladys Burt, Thos. Stevenson, Agricola, Edith Taylor, Mrs. Cuthbertson, and Rosabelle; Mr. E. Keith, gardener to Sir G. Trevelyan, Bart., Cambo, Morpeth, came second with a fine lot; and Messrs. Herd Brothers, Penrith, came third. In the open class for a dozen bunches, Mr. J. Smellie was again first, and here his best bunches were of Dobbie's Cream, Lady Miller, Dorothy, Edith Taylor, R. F. Felton, and Elfrida Pearson; Mr. G. Bowness came second, and Mr. J. A. Grigor, gardener to Mrs. Dundas Dundas, Forres, N.B., was third.

Mr. J. Smellie maintained his premier position in the class for six, distinct, staging a splendid set, comprising Lavender George Herbert, Elsie Herbert, Agricola, Hilda, Barbara, and Mrs. Cuthbertson. It was unfortunate that this class did not bring keen competition.

Mr. Chapman's piece of plate for two bunches of seedling sweet peas brought out two entries only, as winners in a similar class in London were debarred from competing with winning varieties there. Mr. Robert Wright, Formby, led with his fine new Royal Purple, which is well named and was well shown; and Josephine, intermediate between Edrom Beauty and Thos. Stevenson. Mr. R. Bolton second, with Up-to-Date, about midway between Chas. Foster and Prince George; and Cowdey Beauty, something after the style of Afterglow, but with more rosy-mauve shading.

SINGLE BUNCH CLASSES.

The single bunch classes were keenly contested as a general rule, though a few of them were surprisingly thin. Mr. J. A. Whitaker was first for a bicolor with a beautiful bunch of Mrs. Cuthbertson, Mr. Farquharson following. Mr. J. Smellie went to the front in the blue class with Princess Mary; the second prize went to Mr. W. Howie. For a bunch of blush, Mr. G. Bowness was a handsome first with Mrs. Hardcastle Sykes in superb form, and Mr. J. A. Whitaker was second. John Ingman, exhibited by Mr. Farquharson, was first in the class for a bunch of carmine sweet peas; Mr. J. A. Whitaker followed. Mr. G. Bowness staged Aggie Elder in the cerise class, and was deservedly placed in the front, with Mr. A. W. Appleton second. In the class for a bunch of cream, buff, or ivory sweet peas, Miss Humble was first with Dobbie's Cream in wonderful colour, and Mr. Farquharson was second. The last-named grower secured the lead with Lancashire in the pale pink class, Mr. J. A. Whitaker was second. For a bunch of deep cream-pink, Mr. Whitaker was first with Doris Usher in splendid condition, Mr. J. A. Grigor following. Maud Holmes won in the crimson class for Mr. G. Bowness, Mr. R. Tinlin being second. Mr. J. A. Whitaker was first in the fancy class with Prince George, and the second position was assigned to Mr. J. Smellie. The last-named, staging R. F. Felton, was first in the lavender class, with Mr. J. A. Whitaker second.

Mr. A. W. Appleton won in the lilac class with Agricola, which, as generally shown, might well go into the blush section. For a bunch of marbled or watered sweet peas, Mr. G. Bowness was first, and Mr. R. E. Hope second; the winner staged Birdbrook. The same grower held the lead for a maroon with King Manoel, Mr. Farquharson following. Queen of Norway, shown by Mr. T. Stoddard, won the class for a dark mauve; and Dorothy, staged by Mr. R. E. Hope, for a pale mauve. For a bunch of orange-pink, Mr. G. Bowness was first with King Alfred, Mr. J. Smellie being second. The same grower was first for a bunch of orange-scarlet with Thomas Stevenson in perfect colour; Mr. J. A. Whitaker was placed second. For a bunch of picotee-edged, Mr. T. Landreth was easily first with a beautiful bunch of Evelyn Hemus; Mr. R. Tinlin followed. Hercules, exhibited by Mr. J. A. Whitaker, was first in the deep pink class, Lady Evelyn Eyre taking the lead in the pale pink class as shown in fine form by Mr. J. A. Grigor. Miss Humble was second in the former class, and Mr. J. Graham in the latter. For one bunch of rose, Mr. G. Wilson, Lockerbie, was first with Rosabelle, Mr. T. F. Portnell following. Mr. J. A. Whitaker took the lead in the salmon class with Barbara, and maintained it in the scarlet section with Dobbie's Scarlet. Mr. G. Bowness was first for one bunch of striped or flaked with Mrs. W. J. Unwin; Mr. R. E. Hope followed. Mr. Farquharson won with White Queen, and Mr. G. Bowness was second.

MEMBERS' CLASSES.

The subjoined classes were open only to members of the National Sweet Pea Society, and they brought excellent competition, though the exhibitors were rather few in mere numbers. Mr. Ed. Keith was the only grower showing in the class representative of twelve of the colour classes of the society, his varieties being Agricola, Hercules, Rosabelle, Edrom Beauty, Lady Miller, Charles Foster, Thos. Stevenson, Lady Knox, Barbara, Elsie Herbert, Dorothy, and Nubian.

In the Northern Counties class for nine bunches, distinct, Mr. J. Shaw was first with handsome examples of Hercules, Etta Dyke, Rosabelle, R. F. Felton, Nubian, Lady Evelyn Eyre, Edrom Beauty, Clara Curtis, and Thomas Stevenson; Messrs. J. A. Whitaker, E. M. Allen, and C. Wareing were second, third, and fourth respectively. Mr. E. Cowdy alone represented the Emerald Isle, but his set in the Irish class did him and his country credit. His varieties were Black Knight Spencer, Mrs. C. W. Breadmore, Queen of Norway, Agricola, Thos. Stevenson, Mrs. R. Hallam, Gladys Burt, Rosabelle, and Dorothy. The Scottish class brought nine entrants, of whom Mr. Jas. Kerr was placed first with a handsome set comprising Lady Evelyn Eyre, Millie Maslin Spencer, Hercules, Lavender George Herbert, King Manoel, Rosabelle, Edith Taylor, Nora Unwin, and Elfrida Pearson; Mr. D. St. Smith was second, Mr. W. T. Landreth third, and Mr. G. Watson fourth.

TRADE EXCLUDED CLASSES.

In the Provincial Championship class, which was for a dozen bunches, distinct, there were seven competitors, and the piece of plate offered as first prize by Mr. A. Hallam was won by Mr. Thos. Jones, Bryn Penylan, Ruabon, with a grand exhibit of fresh, substantial blooms of Marjorie Linzie, Etta Dyke, Maggie Stark, Elsie Herbert, Dobbie's Cream, R. F. Felton, Nubian, Thos. Stevenson, Melba, Sunproof Crimson, Rosabelle, and Hercules; second prize fell to Mr. A. W. Appleton, gardener to C. L. Thompson, Esq., Farnham Hall, Brampton Junction, whose best bunches were R. F. Felton, Rosabelle, Mrs. E. Cowdy, and Mrs. C. W. Breadmore; Mr. Joseph Shaw third, and Mr. George Watson fourth.

Four competitors staged in the class for nine bunches, distinct, of whom Mr. A. W. Appleton was placed first with Elsie Herbert, R. F. Felton, Maud Holmes, Rosabelle, Lady Miller, Elfrida Pearson, Queen of Norway, Thos. Stevenson, and Mrs. Cowdy; Mr. F. J. Harrison was placed second, Mr. G. F. Hallet third, and Mr. H. G. Thackeray fourth. For six bunches, selected from varieties first put into commerce during or since the autumn of 1912, Mr. T. Jones was first with Birdbrook, T. Stevenson, Lady Miller, Mrs. Cowdy, Lavender George Herbert, and Agricola; Mr. J. A. Whitaker and J. Fletcher second and third. The last-named was first in the class for six varieties, exhibitors having to be among those who do not employ assistance in any part of their garden. The varieties were Elfrida Pearson, R. F. Felton, Dorothy, Sunproof Crimson, Mrs. C. W. Breadmore, and Duplex Spencer.

In the class for six varieties, distinct, open only to those who employ one gardener and do not provide him with any paid assistance whatever, Mr. J. Kerr was first with a fine set, comprising Lavender George Herbert, Hercules, Orion, Gladys Burt, Glory of Wilts, and Agricola. Mr. F. J. Harrison was second, Mr. R. Anderson third, and Miss A. H. Malcolm fourth.

INTERNATIONAL CLASS.

The International Competition arranged by the Carlisle Society, was a great success, and was the centre of much interest and comment. Unfortunately, Mr. Usher fell out for England, but Mr. Keith gallantly came forward to fill his place, and so each country in the kingdom was represented by a champion grower. The class was for a dozen bunches distinct, and Mr. Thomas Jones, Bryn Penylan, Ruabon, was placed first, and so Wales won the international contest with splendid bunches of Etta Dyke, Lavender George Herbert, Thos. Stevenson, King Manoel, John Ingman, Mrs. C. W. Breadmore, Mark's Tey, Audrey Crier (lovely), May Campbell (grand), Prince George, Sunproof Crimson, and Agricola. England, in the person of Mr. E. Keith, gardener to Sir G. Trevelyan, Wallington Gardens, Cambo, Morpeth, came second with good specimens of Mark's Tey, Edrom Beauty, Lady Knox, Lady Evelyn Eyre, Barbara, Hercules, Nubian, White Queen, Thos. Stevenson, R. F. Felton, May Campbell, and Sunproof Crimson. Ireland was third. Mr. Edward Cowdy, Longhall, the Irish champion, came third with R. F. Felton, Sunproof Crimson, Elsie Herbert, Hercules, Mrs. C. W. Breadmore, Queen of Norway, Jan Ridd, Florence Wright Spencer, Mrs. Hardcastle Sykes, Edna Unwin, Dobbie's Cream, and Audrey Crier. Scotland's champion, Mr. J. A. Grigor, gardener to Mrs. Dundas Dundas, Forres, N.B., came fourth with Hercules, White Queen, Sunproof Crimson, Mrs. C. W. Breadmore, R. F. Felton, Thos. Stevenson, Elsie Herbert, Queen of Norway, Dobbie's Cream, Mrs. E. Cowdy, Hilda, and Bertrand Deal.

DECORATIVE CLASSES.

There were six competitors in the table decoration class for sweet peas, and Mr. John Dixon scored with a decoration of Mrs. C. W. Breadmore, Elsie Herbert, Etta Dyke, and May Campbell, and a few narrow croton leaves and smilax; Mrs. Rowland second, with cerise and orange-scarlet varieties; and Mrs. F. J. Harrison, Ulverston, third, with cream, creamy-pink, and lavender varieties. The chief prize for a bunch of mixed sweet peas was won by Miss Humble, who associated lavender, maroon, and cream-pink varieties with gypsophila and asparagus; Mrs. Hodgson second, and Mrs. John Dixon third.

NON-COMPETITIVE.

Very elegant, and at the same time very imposing, was the beautiful exhibit of sweet peas arranged across one end of the Market Hall by Mr. Robert Bolton, Warton, Carn-

forth. From 3ft. to 6ft. above the staging Mr. Bolton raised twenty-eight large vases of sweet peas, set upon slender smilax-twined iron rods, and under these he set up nearly a hundred bunches of lovely flowers. In the matter of varieties Mr. Bolton had a rare selection, and was especially successful with Agricola, R. F. Felton, Afterglow, Melba, Thos. Stevenson, Hercules, Birdbrook, White Queen, Clara Curtis, King Alfred, Mrs. E. Cowdy Lady Miller, in fine form; Dorothy, the new rosy-lilac; Pluto, Rosabelle, Bolton's Scarlet, etc. It was a grand display, and one of the finest that the Warton specialist has ever staged. (Large Gold Medal.)

Three distinct sections went to make up the display provided by Messrs. Dobbie and Co., Edinburgh, but for the moment we will deal only with the sweet peas, which were very bright and attractive, as staged in vases and stands of varying height. Varieties that especially appealed to us were Ruby Palmer, a rose-cerise flower for 1914; Dobbie's Cream, King White, also a 1914 variety; Inspector, a fine orange-salmon; Red Star, Lavender George Herbert, Rosabelle, Thomas Stevenson, Mark's Tey, May Campbell, and Melba. (Gold Medal.)

Messrs. E. W. King and Co., Coggeshall, brought up a very pretty exhibit of sweet peas, and used the light elegant greenery of Kochia scoparia and Asparagus Sprengeri between the vases. Outstanding varieties were R. F. Felton, the dainty Anglian Fairy, Anglian Pink, Elfrida Pearson, Gladys Burt, King Manoel, and Thos. Stevenson. The flowers were clean and fresh, and the setting up was well done. (Silver-gilt Medal.)

Messrs. Herd Brothers, Penrith, filled a considerable space with sweet peas; they put up a five-arched background and four tiers of bunches, the latter of medium size, and consisting of clean, fresh blooms of a good selection of varieties. (Silver-gilt Medal.) Messrs. Thyne and Sons, Union Street, Dundee, put up a very fine lot of sweet peas, their flowers being of excellent substance and lovely colours. They staged all the leading varieties, but their six rows of vases were set in too regular order to make an artistic exhibit. (Silver-gilt Medal.)

Messrs. George Fairbairn and Sons, Edentown, Carlisle, put up about eighty vases and stands of sweet peas, with sweet pea arches behind. Theirs was a very big effort; it filled a big space, and proved a great attraction. Such varieties as are at the moment very popular were all capitally staged, and set up in large bunches with asparagus sprays. Messrs. Little and Ballantine, Carlisle, were also large exhibitors of sweet peas. (Silver Medal.)

Bristol Gardeners' Association.

At the recent monthly meeting of this society held at St. John's Parish Rooms, Clifton, Mr. Baston presided, and a lecture was given by Mr. Pratten, from Bath, on "Herbaceous Calceolarias." The lecturer recommended sowing the seeds about June in boxes, using two parts of soil, one part of leaf-mould, and one of sand, covering with glass, and placing the box in a cold frame on the north side of a wall. He advised pricking out the seedlings into thumb pots when ready, and afterwards potting them early. Mr. A. C. James gave prizes for twelve roses, named, and these were won by Mr. Scott, first; Mr. Daniels, second; and Mr. Binfield, third.

French Beans.—A good sowing of these may now be made, either in cold pits or on a warm border, where protection can be afforded when necessary; this sowing will frequently prove of much value, especially after autumn frosts. The compost used should be moderately light and porous, and sufficient space be allowed between the soil and the glass for the growths to mature. For this sowing the old Ne Plus Ultra is an excellent variety, and Masterpiece is another well worth growing.—W. Messenger.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of The Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of The Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in The Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

CULTIVATION OF THE GRANADILLA.—M. E. C., Skipton: Kindly tell me how to manage a Granadilla; a friend of mine has just given my employer a plant in a pot; it is labelled P. quadrangularis.—The title of Granadilla is given to the fruits of two or three species of Passiflora, of which P. quadrangularis is one. This is a strong-growing stove climber, and should be planted in a bed or border, in a well-drained compost of light, rich loam. The growth should be trained up under the roof, or against the wall of the stove, and it will be necessary annually to thin out the growths, clean and retrain those reserved. Plenty of moisture, heat, and sunshine are desirable. If the flowers show little disposition to set fruits they may be fertilised by the pollen from other flowers, or even other species.

THLADIANTHA DUBIA.—P. H., Cheltenham: A reference was recently made in your columns to the red-fruited Eastern climber Thladiantha dubia, and I fancy a statement was made to the effect that it was hardy in this country. I shall be glad if you will tell me where I can procure seeds, and how I should proceed to cultivate the species. I am interested because the plant was a familiar one where I once lived in India.—Thladiantha dubia is a strong-growing, tuberous-rooted climbing plant, and belongs to the great gourd family. It is hardy in the Metropolitan and Thames districts, and further south, but we cannot vouch for its hardiness at Cheltenham, though we expect it would be hardy if the roots were protected with ashes during the winter. The difficulty could be surmounted by lifting and potting the tuberous roots when the growths die down in the autumn. Seeds may be obtained through any leading seedsmen, and these should be sown in heat in March, the plants being potted as necessary, and looked after much in the same way as tender bedding plants until at the end of May or early in June they are planted out in a warm, sunny position. Good soil and plenty of moisture are necessary to ensure free growth. It must always be remembered that it is essential to have both male and female plants because the pollen from the male flowers on the one plant are needed to fertilise the female flowers borne on other plants. When the sexes have been determined by one year's growth, it is always an easy matter to maintain a stock of both by dividing the tuberous roots in spring time.

LANTANAS FOR BEDDING.—F. E. S., Douglas: I have some very fine lantanas raised from seeds this spring, and I should like to know how best to keep up a stock of the special plants which seem to be particularly well adapted for summer bedding. Take cuttings of the young shoots now and during September, and insert these in shallow boxes of sandy soil; place over gentle bottom heat until rooted, and grow in small pots in a warm greenhouse during the winter. Lift the stock plants before frost comes, pot them, and cut them back somewhat; these, if placed in gentle heat next spring, will produce cuttings that will root freely, and some of the best of the autumn-struck plants will likewise become useful for stock purposes in the spring. Follow out the usual hardening-off process prior to planting out. Carefully select the stock plants each year.

DOGWOOD.—C. W. S., Alverstoke: Can you tell me whether several kinds of trees are known under the popular title of Dogwood, or whether this common name should be applied only to one kind or genus?—It is generally understood that the various Dogwoods are members of the genus cornus, but at various times and in various places the title has been also given to other plants. For instance, the common Euonymus europæus, Rhamnus rangula, and even Viburnum Opulus have been called Dogwoods. The Jamaica Dogwoods are species of Piscidia, while in Australasia species of Emmenosperma, Jacksonia, and Bedfordia have been called Dogwoods.

ROOF WIRES IN A VINERY.—L. J. H., Bedale: How far apart should the roof wires be placed in a vinery, and how much space should there be between the wires and the roof?—These are matters over which the best cultivators differ considerably. We believe 10 inches apart is a good arrangement of the wires, and 18 or 20 inches from the wires to the roof glass. Formerly the space allowed between the wires and the glass was about a foot, but nowadays the general practice allows from 16 to 20 inches, though there are some growers who prefer from 24 to 30 inches.

POPULAR NAMES OF GALIUM APARINE.—C. W. S., Alverstoke: I hope I am not out of order in asking a second question relative to popular names of plants. Quite recently, in connection with a display of wild flowers by children, the Common Bed-straw (Galium Aparine) was shown under several popular names, including Cleavers and Mutton Chops. Can you give me a list of the popular names under which this widespread British plant is known?—We do not promise that ours is a complete list of popular names, but the Bed-straw is variously known as Burweed, Catch-weed, Clavergrass, Clever-grass, Cleavers, Geckdor, Goose-bill, Goose-tongue, Grip-grass, Gull-grass, Harif, Heiriff, Haireve, Haritch, Kandlegosses, Love-man, Mutton Chops, Mutton-Tops, and Turkey-grass.

PEACH STONES SPLITTING.—O. E. B., Warrington: I enclose a peach with the stone badly cracked; all the fruits are going the same way on one tree. The tree appears quite healthy and carries about a dozen and a-half fruits, and this is the second year the stones have split in this fashion. I shall be very grateful if you will tell me what is the cause of stone splitting, and how the trouble can be cured.—Uncongenial soil and imperfect root action are the cause of stone splitting in peaches. A warmer, lighter soil, with a good admixture of lime or plaster rubbish will encourage fibrous roots instead of strong, fleshy ones; the latter are easily injured, and when injured the tree is not able to properly bear the strain of cropping, whereas in the case of fibrous roots there are multitudinous "mouths" absorbing soil moisture. Lift the tree as soon as the wood is ripe and the leaves change colour, put soil and drainage in order, cut back all strong, fleshy roots, and replant firmly.

CARE OF A JAPANESE DWARFED TREE.—E. G., Minehead: I have a fair-sized Cupressus obtusa in a fancy Japanese bowl, and the tree is itself of the popular dwarfed Japanese style, and after the Fuji Yama model; it is not, however, looking in the best of health, although it has been carefully watered; it is kept inside the window of the drawing-room, and receives plenty of light. I shall be glad if you will suggest how I may keep the plant ingood health.—The little tree will be all the better for a sojourn out of doors until towards the end of October, but it should be so placed that the sun does not shine directly upon the bowl containing the soil and roots. Failing showers, water it overhead occasionally with soft water, and be quite sure that the roots

do not suffer from lack of moisture. At the same time remember that the plant must not be allowed to stand continually in a pan of water. Give three teaspoonfuls of fine bone-meal four times between now and the end of October, mixing it with a little fine soil, and spreading it evenly over the soil surface. Such a dressing will suit a plant growing in a pot a foot in diameter, and must be reduced or increased according to the size of the bowl. These Japanese trees often suffer from semi-starvation.

THE LOOFAH.—E. C. C., Is not the Loofah a vegetable product; and, if so, what?—The Loofah so frequently used in the bath as a flesh rubber, is the vascular network of the interior of a gourd named Luffa egyptiaca. This gourd, known also as the Towel Gourd, is very largely grown in the tropics, and the vascular network of the fruits is put to a variety of uses, such as stuffing saddles, lining helmets, etc.

NAMES OF PLANTS.

Under this heading we can only undertake to name species and well-marked varieties of plants, and not florists' flowers. Specimens should be packed in stout boxes with damp (not wet) moss, or some leaves, as packing material, to ensure their reaching us in a fresh state. It is essential that flowers must accompany specimens of flowering plants, that fern fronds be fertile, and that numbers be firmly attached to the specimens so that they can be seen without any untying. We cannot promise to name more than six specimens at one time from any one correspondent.

M. M., Shirley.—Acanthus mollis.

L. B. C., Oxshott.—1, Globularia vulgaris; 2, Liatris pycnostachya.

D. W., Abingdon.—1, Eupatorium cannabinum; 2, Trachelium cæruleum.

O. F. R., Uttoxeter.—1, Cattleya Harrisonæ; 2, Odontoglossum Harryanum.

C. M., Aldershot.—1, Epidendrum vitellinum majus; 2, Pentstemon Newbury Gem; 3, Helianthus rigidus; 4, Statice latifolia.

B. G., Teignmouth.—1, Solanum jasminoides; 2, Hypericum Moserianum; 3, Olearia Haasti; 4, Veronica incana; 5, Leucophyta Brownei.

OBITUARY.

SIR RICHARD COOPER, BART.

With much regret we record the death of Sir Richard Cooper, Bart., which occurred recently at White Hill, Berkhamsted, in his 66th year. Sir Richard, who was a native of Shropshire, was the head of the firm of Messrs. Cooper and Nephews, Berkhamsted, the well-known manufacturers of fungicides and insecticides for use in the garden and on the farm, and exporters of pedigree live stock. Sir Richard Cooper was a keen agriculturist, farming some 2,000 acres of land chiefly in Shropshire, and a generous supporter of the Smithfield Club and other societies associated with the improvement of cattle.

FORTHCOMING ENGAGEMENTS.

NEXT WEEK.

WEDNESDAY, August 20.—Shrewsbury Floral Fête, two days.

THURSDAY, August 21. Aberdeen Horticultural Society; three days.

SATURDAY, August 23.—Bridge of Allan Horticultural Society.

The following dates of exhibitions have been recently announced:—

Brighton Chrysanthemum Show, November 11 and 12, in the Dome and Corn Exchange; thirty-first exhibition.

Bedford Chrysanthemum Show, November 12.

Chester Paxton Society's Chrysanthemum Show, November 18 and 19, in the Town Hall, Chester.

The Rev. J. Bernard Hall, B.A., secretary of the North of England Horticultural Society, has accepted the living of Farnham-with-Scotton, near Knaresborough, but will continue to act as hon. secretary of the northern society.

THE GARDENERS' MAGAZINE

NOTE OF THE WEEK.

Haze.

Though it is difficult, if not impossible, to draw any definite line between haze, mist, and actual fog, the two latter may, in a general way, be imputed to the existence of aerial moisture alone while the former may be due entirely to suspended solid matter of a quite different nature. The air, as is well known in these days, by no means consists solely of the two gases—oxygen, the active principle of life; and nitrogen, as a diluent of apparent innocuous nature, though capable of forming materials of a terribly explosive character in combination with other elements, but also acts as a vehicle for an infinite number of solid particles even in its most transparent and apparently pure state. It is also pervaded by an immense proportion of water in an invisible form, but not in a gaseous form despite its invisibility. Since it is still composed of its constituent two gases, oxygen and nitrogen, and only maintains its invisibility in proportion to the temperature which, higher or lower, determines the amount which the air can contain at any given time. Thus the atmosphere may on a hot day be perfectly transparent but given a cooling wind from a cold quarter, and clouds will immediately form, and if the cold be sufficiently maintained, these will condense still further and rain result. Both mist and fog are the result of such suspended moisture pervading the lower atmosphere in varied degrees. Haze, on the other hand, may, as we have said, affect the transparency of the atmosphere by other means, the true nature of which can only be evidenced by the microscopist. Some years ago investigation was undertaken with almost incredible results, though confirmation by a number of eminent scientists established their correctness beyond all doubt. It was found that practically everywhere, but particularly in, or in the vicinity of, large towns, the air, even when optically clear, contained enormous numbers of solid particles, consisting both of living germs and of the débris of both organic and inorganic matter, raised by traffic and other means, and conveyed by the wind from the surface. So great was the number of these suspended particles of dust that, incredible as it appears, a single cubic inch of air may contain from many thousands up to several millions of them, according to the locality chosen for their collection. These immense numbers, therefore, may be taken as doubled within the area of an ordinary match-box. At Hyères, in the Mediterranean, with the wind from the land, some 60,000 to 1,200,000 per cubic inch were so collected, and with the wind from the sea, as many as 90,000. At Cannes the difference between the air from the mountains and that from the town was 75,000 in the one case, as compared with no fewer than 7,000,000 in the other, due doubtless to the disturbance caused by traffic, and the generation of germs etc., in the town refuse, a fact more or less confirmed by much lower figures being recorded at night-time. At the top of the Eiffel Tower only 11,300 were recorded after a heavy shower which purified the air, as against 5,000,000 at another time. The presence of these particles had been also determined by passing a beam of light through a cylinder filled with air, in a dark room, the result being the appearance of a "haze." This haze, however, disappeared gradually and entirely as the dust settled down, leaving the air pure, and no such "haze" was produced when the air was previously filtered through cotton-wool.

Now it has furthermore been abundantly demonstrated that a large proportion of this dust consists of living spores of fungi and disease-producing germs, which are responsible not merely for human diseases but also for those of plants, and as from their enormous numbers and practical ubiquity it is clear that if a suitable nidus or breeding-place be afforded, it is bound to be speedily utilised. So we have here the strongest possible arguments for cleanliness in our greenhouses, conservatories, and propagating houses, and the careful removal and destruction of all sources of infection, since in the contrary case the plant lover, to say nothing of humanity in general, is simply adding to the myriads of noxious germs against which he has ever to contend.

MR. MARK WEBSTER.

Mr. Mark Webster,

who has had charge of the beautiful gardens of Kelsey Park, Beckenham, the residence of E. J. Preston, Esq., during the past twenty-three years, has shown such conspicuous ability in the discharge of his multifarious duties as to have attained to a high position among the leading practical horticulturists of the present day. Evidently at the commencement of his gardening career Mr. Webster fully appreciated the importance of a thorough acquaintance of the gardening art to those who are desirous of achieving a high degree of success therein, for at the first stage of his training he entered the gardens of Endcliff Hall, Sheffield, where he remained seven years, and passed through the several departments with much success. Leaving Endcliff Hall gardens, he entered those of Widmerpool, Nottingham; and subsequently served in those of Newstead Abbey, Cyfartha Castle, and Caversham

Park, the period of training in these well-known gardening establishments extending over about eight years. By this time he had proceeded far enough in the pursuit of knowledge as to fit himself for bearing the highest responsibilities associated with the gardening craft, and on his leaving Caversham Park he received the appointment he now holds. At Kelsey Park he has afforded ample proof of his skill in the cultivation of the several classes of ornamental and useful plants that receive attention in gardens of the first class, and in association with his employer has done much to enhance the beauty and interest of the ornamental aspects of the gardens. In no sense a specialist, as that term is usually understood, Mr. Webster endeavours, and with much success, to obtain the best possible results in the cultivation of both useful crops and ornamental plants. This is plainly evident in a leisurely walk round the gardens, and a further proof is found in the reports of the exhibitions held during the past twenty years. Mr. Webster has exhibited, and with much success, at the leading flower shows held in the district of which Beckenham is the centre, and the products of the Kelsey Park gardens have been prominent at such important gatherings as the Royal International Horticultural Exhibition, 1912, those of the Royal Horticultural Society, the Royal Caledonian Horticultural Society, the National Chrysanthemum Society, and at those held at Brighton, Crystal Palace, Southampton, and Sevenoaks. The awards comprise gold and silver medals, challenge cups, and some hundreds of ordinary prizes. While in no way boastful of his successes, Mr. Webster appreciates the honour of having been awarded the gold medal as the most successful exhibitor at the Co-operative Flower Show at the Crystal Palace in 1896, and the gold medal at Beckenham in 1912, for a remarkably fine group of plants. One of the most interesting of his achievements has, perhaps, been the winning of the first prize of £5 offered by Messrs. Selfridge and Co. for plants of cotton grown in this country. The firm gave away seeds of the cotton, and offered a number of prizes for the best-grown plants. There were many entries, but the plants from the Kelsey Park gardens were so finely developed as to occasion no difficulty to assign them their proper position in the competition.

Selection and Culture of Daffodils.—As the season has now arrived when those who would achieve success in the cultivation of daffodils should proceed with the selection of varieties and the planting of bulbs, we shall give special attention to these beautiful flowers in our next issue. The contributions specially dealing with daffodils will include notes on the new varieties, a selection of inexpensive varieties for exhibition, the forcing of daffodils, the most useful varieties for the supply of cut flowers from the open, daffodils on clay soil, and the increase and usefulness of daffodil exhibitions.

Kendal Fruit and Potato Congress.—On Wednesday and Thursday, September 24 and 25, a Fruit and Potato Conference will be held at Kendal, under the auspices of the North of England Horticultural Society and the Northern Fruit Congress. There will be an exhibition of fruits and potatoes, and the congress will be attended by delegates from the Royal Horticultural Society. Mr. W. B. Little, Petterie Street, Carlisle, is organising an exhibit of potato diseases. On the first day, at 6 p.m., Mr. C. J. R. Tipper, B.Sc., will lecture on "The Organisation of the Fruit Industry in Westmorland, with Special Reference to Damsons"; at 8 p.m. Mr. R. A. H. Gray, M.A., M.Sc., of Armstrong College, will deal with "Fruit Insect Pests." The first meeting on Thursday commences at 3 p.m., when Mr. W. F. Emptage will lecture on "Land Tenure and Fruit Culture"; at 5.30, Mr. G. P. Berry, Chief Inspector of the Horticultural Branch of the Board of Agriculture, will discourse upon "Potato Culture"; and at 8 o'clock, Mr. W. B. Mercer, B.Sc., of Armstrong College, will deliver the concluding lecture, on "Diseases of Potatoes."

Centenary of Lawes and Gilbert.—It has been decided to commemorate the centenaries of Lawes and Gilbert, the founders of the Rothamsted Experimental Station, and committees are being formed for giving practical expression to this decision. Sir John Lawes was born in 1814, and Sir Henry Gilbert in 1817, and it is proposed to erect at Rothamsted, at a cost of £12,000, a commemoration laboratory. It is proposed to raise half this sum by public subscription; and, if this is done, a grant of £6,000 can be obtained from the Development Fund.

Begonias.—At the afternoon meeting of the Royal Horticultural Society on Tuesday next a lecture on begonias will be given by Messrs. Blackmore and Langdon.

Royal Botanic Society.—According to the report presented to the Fellows at the recent annual meeting, the attendance of visitors, inclusive of Fellows, to the Gardens last year amounted to 121,000. During the present season the weather had been exceptionally fine, and it was believed that a great increase would be shown at the end of 1913. The total of new Fellows elected in 1912 numbered 275, and for the first seven months of the present year 240. During the first sixty years of the Society's history the average yearly increase of new Fellows was only 104. In the last four years there had been added to the list over 1,400. Many improvements had been carried out in the Gardens. A large portion of the paths have been regravelled, and a rose bed made and planted with all the varieties of roses likely to do well in London.

An Exhibition of Gladioli was held by Messrs. Kelway and Son at Messrs. Selfridge and Co.'s establishment in Oxford Street, London, on Wednesday, and two following days. The array of splendidly-developed flower-spikes proved highly attractive to the many visitors. All the types for which the Langport firm has become famous were admirably represented, and the display produced was not less remarkable for its educational value than for the diversity of form and colour of the flowers.

Midland Daffodil Society.—Mr. C. Lemeslie Adams, Pendeford Hall, Wolverhampton, writes: "As the R.H.S. have responded to so large an extent to the wants of those who advocated a National Daffodil Society, and consequently the foundation of such a society is likely to be postponed sine die, may I urge the claims of the Midland Society to the support of all lovers of daffodils, and to the advantages that such membership confers. Firstly, the society (owing greatly to the energy of the late Mr. Robert Sydenham), after struggling in its early days, now holds the premier position amongst daffodil societies, and its shows have done very much to encourage and popularise the love of the daffodil, and impart a knowledge of what the capabilities of the flower are. Consequently I think a debt of gratitude is due from all lovers of the flower, and especially from those who are hybridisers, as the shows have been the means of encouraging more new seedlings being shown than any others. Secondly, membership means (1) joining the leading "club" of the daffodil world, and bringing a member into touch with those who are the busiest workers amongst the daffodils. (2) the right to attend and exhibit at the shows, which are acknowledged to be the pleasantest gatherings of the kind, and where the leaders in the cult are always to be found with the latest up-to-date flowers. With a larger membership and more funds at command, more could be done by the committee on the lines of the suggestions of those in favour of a national society. I would ask all lovers of the daffodil who are not already members to write now to Mr. Herbert Smith, Secretary of the Midland Daffodil Society, Tenby Street, Birmingham, intimating their willingness to join the society.

Queen Adelaide Hill, Windermere.—The hon. secretaries (Canon H. D. Rawnsley, Keswick, and Mr. Gordon Somervell, Windermere) of the committee which has done such excellent service in connection with the preservation of beauty spots in the Lake Country, write with reference to the purchase of Adelaide Hill: "Your readers who realise what a boon it will be to those who take their holiday on Windermere to have the chance of free landing and rambling on the shore will be glad to know that all but £200 out of the necessary £5,000 has been raised for the actual purchase of Adelaide Hill. This hill commemorates the only visit of a British Queen to our Lake Country. From its grassy height is obtained one of the finest panoramic views of Windermere and the surrounding hills, from Coniston Old Man in the west round to the High Street range in the east. It lies within a walk of 12 minutes from the railway station, and the right of way through the Rayrigg Woods to Miller Ground landing is part of the purchase. The Speaker has kindly consented to declare the property open to the public on the afternoon of Thursday, September 11. After the opening ceremony guests may like to go forward to Borran's Field, at Waterhead, another of the lately-acquired trust properties, when Professor Haverfield will give an address on the Roman Fort and recent excavations." It need hardly be said that subscriptions towards the deficit of £200 will be gladly received by either of the hon. secretaries.

Presentation to Messrs. W. H. Adnitt and W. W. Naunton.—Advantage was taken of the Shrewsbury Show to present Messrs. Adnitt and Naunton with a testimonial in recognition of the services they have rendered to horticulture as hon. secretaries of the Shrewsbury Floral Fête over a period of thirty-eight years. The presentation was made in the committee tent at 3 p.m. on Wednesday, August 20, when E. B. Fielding, Esq., the President, presided over a very influential gathering of horticulturists from all parts of the United Kingdom. The testimonial consisted of a cheque for £125 to each of these gentlemen. The President made the presentation in a few graceful words, and amid great applause. Sir Harry J Veitch presented Veitch Memorial Medals on behalf of the Veitch Memorial Trustees, and diplomas from the Royal Horticultural Society, conferring honorary life Fellowships upon Messrs. Adnitt and Naunton. Mr. Naunton replied for himself and his lifelong colleague, Mr. Adnitt being unavoidably absent owing to ill-health. Votes of thanks were accorded the President and Sir Harry J. Veitch, and reference was made to the services of Mr. N. F. Barnes and Mr. Brazier, who have acted as hon. secretaries to the testimonial fund.

SHREWSBURY FLORAL FÊTE.

We have often written that the exhibition of the Shropshire Horticultural Society was better than ever, but we have never written it with such ready emphasis as on this occasion. The Quarry Grounds were at their best, the avenues of trees in full leafage, the beautiful little Dingle at its gayest with summer flowers, and the weather was behaving splendidly on the opening day of the show—Wednesday, August 20. The sun shone brightly, but a little breeze tempered the heat, although the latter was almost overpowering in the great tents when the visitors crowded in during the early part of the afternoon. It was a gaily-dressed crowd, and the ladies took full advantage of the occasion to come in their lightest and brightest dresses. The show was larger than usual, there being one extra tent and some large exhibits out of doors. In point of quality it was superb, "never better" was the general comment. Groups, grapes, vegetables, roses, plants, sweet peas, and begonias deserve special mention.

One of the features of the first day was the presentation of a testimonial to Messrs. Admitt and Naunton, who for thirty-eight years were hon. secretaries of the show; the president made the presentation of cheques, and Sir Harry Veitch presented diplomas from the R.H.S., and Veitch Memorial Medals from the Veitch Memorial Trustees. Mr. Brazier, the new secretary, is to be congratulated upon the success of his first year of office, and the various chairmen of sub-committees, Mr. Andrews, Mr. Deakin, Mr. Trevor Corbett, Mr. H. W. Hughes, and Mr. Bromley also merit a word of thanks for work capably done. We may add that in no year have so many cheap admission tickets been purchased before the show date as this year, the income from this source alone amounting to nearly £1,000. So far as we could judge, and also so far as we could gather from the gate-keepers, the gate was a record one for a first afternoon.

GROUPS AND PLANTS.

There were three competitors in the great class for a group of miscellaneous flowering and foliage plants. Here Messrs. Jas. Cypher and Sons, Cheltenham, occupied their accustomed first place, winning the £25 prize with a very charming arrangement. The high background of palms was particularly light and elegant above an arch of crotons, ixoras, and liliums. In the foreground the use of Oncidium flexuosum, O. phymato chilum, O. oblongatum, O. Forbes, and O. incurvum, with Francoa ramosa, was particularly pleasing; in the basal portion, cattleyas, crotons, and odontoglossums gave colour, and Nertera depressa was used as an edging. Mr. J. V. Macdonald, gardener to Sir J. H. Kenrick, Whetstone, Edgbaston, came second with a grand group in which crotons, ixoras, and cattleyas were very fine, and Nandina domestica gave colour to the foreground; Mr. W. R. Manning, Dudley, third, with a group that lacked finish towards the back.

Five entrants came forward in the county class for a group of miscellaneous plants, and here Mr. Bernard Howson, Market Drayton, was first with crotons, Humea elegans, and campanulas as chief subjects; Mr. F. Brummell, gardener to A. M. Barber, Esq., Wellington, second, and Mr. Edwards, gardener to Mrs. F. Burd, Shrewsbury, third.

In a very close competition Messrs. Blackmore and Langdon, Bath, secured first prize for a group of begonias, the space allowed being 25ft. by 4ft. They had a superb lot of plants and charming varieties; their Princess Victoria Louise, Royal George, Mrs. Peter Blair, Mrs. W. L. Ainslie, the hanging baskets of Lena, Golden Shower, and Mrs. Bilkey, and the erect spikes of B. Martiana grandiflora commanding attention. Messrs. Thos. S. Ware, Lim., Feltham, came second, and in their display the lovely pink variety Lady Cromer was a central feature, and a great attraction; theirs was a grand exhibit, but arranged a little too flatly.

A magnificent exhibit of fifteen stove and greenhouse plants from Messrs. J. Cypher and Sons, Cheltenham, secured for that firm the first prize. We thought last year the Cheltenham firm had reached high-water mark for specimens, but they were even better on this occasion. They staged huge, freely-flowered, fresh examples of Allamanda nobilis, Bougainvillea Sanderiana, Statice Gilberti, S. profusa, Erica Aitoniana, E. Eweriana, a superb plant six feet through; Ixora Duffi, Clerodendron Balfouri, and Rondeletia speciosa, with Croton Countess, C. Warreni, and Kentia Fosteriana. Mr. W. R. Manning, Dudley, second with much smaller plants. Messrs. J. Cypher and Sons also led for thirty stove and greenhouse plants arranged on a space of 250 sq. ft.; here the leading kinds were Ixora Regina, I. Duffi, Croton Sunset, and Statice Gilberti; Mr. W. R. Manning again second.

PRIZE COLLECTIONS OF CHOICE DESSERT FRUITS AT SHREWSBURY FLORAL FETE.
Mr. S. Barker's first prize collection of twelve dishes on the right; Mr. D. McIntosh's second prize collection on the left.

HARDY PLANT AND ALPINE GROUPS.

The schedule required a group of hardy flowering plants and aquatics (cut flowers staged in water allowed). Artistic arrangement, and the most natural presentment of established growth to count; 300 sq. ft. allowed. Messrs. Gunn and Sons, Olton, were placed first, and their design was that of a broad, semi-circular border, grass verged, and a small semi-circular pool of water-lilies, rimmed with rockwork, in front. It was a

capital effort, and certainly did suggest natural conditions better than is usually the case in such exhibits. Liliums and helianthuses formed a background, with masses of hollyhocks, Lilium auratum, campanulas, and Galtonia candicans rising above phloxes, gladioli, violas, montbretias, scabious, etc.; Messrs. W. Artindale and Son, Sheffield, second, their design being a border with an irregular pool of nymphæas in front. The background was chiefly of phloxes and senecios, and was a trifle flat for its width. The astilbes and montbretias by the water side were very bright.

A quite new class was one for a rock garden, arranged out of doors on a space of 500 sq. ft. The three competitors arranged their exhibits on the far left-hand side of the Quarry grounds, and the crowds of visitors who thronged each display, traversing the tiny pathways, and carefully inspecting the designs and plants, showed how keenly interested they were in this class. The difficulty was to get anywhere near the exhibits during the afternoon. The prizes were £50, £30, and £20 respectively, and the premier position was filled by Mr. T. R. Hayes, Keswick, whose arrangement of finely-weathered grey stone was good, and was not overdone. There were dry watercourses and tiny pathways amid the low mounds of rocky outcrop, and heather of various kinds, St. Dabeoc's Heath, and hardy ferns were planted in the most natural fashion. Pinus austriaca formed a background, and dwarf pines topped the rocks here and there. Primula capitata, gentians, double Welsh poppies, hypericums, dianthuses, and berberis were the most showy subjects, and they were disposed in suitable colonies. Three red Japanese maples capped vantage points, and did not seem quite in keeping with the rest of the vegetation. The second prize fell to Mr. J. Woods, Boston Spa, Yorks, arranged a beautiful rock garden, wherein the rocks and water were disposed in the most natural fashion, but the planting was in no degree effective, and, indeed, was a trifle weak. The idea was a rocky mound with a watercourse leading to a little pool. Sedums, heather, ferns, campanulas, antirrhinums, and Thalictrum dipterocarpum were a few of the plants most in evidence. Mr. J. E. Knight, Wolverhampton, had a quite effective contribution, but it was scarcely in accordance with the best ideas of a rock garden. Liliums, astilbes, spiræas, bamboos, achilleas, and Hydrangea paniculata were grouped high at the back above a mound of rock, with a pool of lilies, etc., at the base. Other mounds of rock were planted with bamboos, campanulas, statice, lilies, berberis, spiræas, etc. Mr. Knight gained third prize.

THE GREAT GRAPE CLASS.

Tremendous interest always centres in the great grape class, for a dozen bunches in four or more distinct varieties, but not more than four bunches of any one variety. The prizes offered were £20, £16, £12, £9, and £6. A space allowed for each exhibit is 8ft. by 4ft., and the grapes have to be set up in two tiers, with floral decorations.

The premier award of £20 was won by Mr. S. Barker, gardener to the Duke of Newcastle, Clumber, Worksop, with medium-sized bunches of very high-quality grapes, beautifully decorated with blush carnations, pink Lilium speciosum, Francoa ramosa, and Thalictrum dipterocarpum spikes. His bunches were as follows, with maximum and awarded points:—

Variety.	Maximum Points.	Points Awarded.
1. Black Hamburgh	10	9
2. Madresfield Court	10	9½
3. Muscat of Alexandria ...	11	9
4. Muscat Hamburgh ...	10	9½
5. Muscat of Alexandria ...	11	9½
6. Madresfield Court	10	8½
7. Black Hamburgh	10	8½
8. Madresfield Court	10	8
9. Muscat of Alexandria ...	11	6½
10. Madresfield Court	10	8
11. Muscat of Alexandria ...	11	6½
12. Black Hamburgh	10	7
	124	99½

Second prize fell to Mr. J. Dixon, gardener to Lord Rowallan, Kilmarnock, for enormous bunches, which, however, did not carry the bloom and finish of Mr. Barker's, though they greatly outweighed his bunches. Mr. Dixon's points were:

Variety.	Maximum Points.	Points Awarded.
1 Gros Maroc	9	9
2 Muscat of Alexandria ...	11	9
3 Madresfield Court	10	8
4 Muscat Hamburgh	10	8
5 Muscat of Alexandria ...	11	9
6 Black Hamburgh	10	7½
7 Madresfield Court	10	9
8 Muscat Hamburgh	10	7
9 Muscat of Alexandria ...	11	8
10 Madresfield Court	10	8
11 Muscat Hamburgh	10	7
12 Muscat of Alexandria ...	11	9
	123	98½

Mr. J. H. Goodacre, gardener to the Earl of Harrington, Elvaston Castle, Derby, was third, with 96 points out of a possible 122; Mr. G. Mullins, gardener to Lady Henry Somerset, Eastnor Castle, Ledbury, fourth, with 94 points out of 122; Mr. G. Richardson, gardener to H. St. Maur, Esq., Newton Abbott, fifth, with 90½ points out of a possible 124. The unplaced exhibitors were Mr. T. Pateman, gardener to C. A. Cain, Esq., J.P., Welwyn, Herts, with 89 points out of 121; Mr. J. R. Tooley, gardener to Hugh Andrews, Esq., Winchcombe, also with 89 points out of a possible 121; and Mr. T. Wilkinson, gardener to Colonel G. A. Gibbs, M.P., Tyntesfield, Bristol, with 69½ points out of a possible 123. It will thus be seen that there were eight competitors in this important class.

CHAMPION DESSERT TABLE CLASS.

In the champion class for a decorated table of dessert fruit, there were three competitors. A table 10ft. by 4ft. 3in. was allowed, and thirty dishes of fruit (not more than fourteen bunches of grapes allowed) required, with cut flower decorations. The prizes offered were £25, £20, £17 10s., and £10 respectively, but no points or awards were allowed on this occasion for the decorations. The successful exhibitor was Mr. N. F. Barnes, gardener to the Duke of Westminster, Eaton Hall, Chester, who had a grand exhibit daintily decorated with Montbretias and francoa sprays. His dishes were: Grapes—Muscat of Alexandria (four bunches—(11), 8½, 6½, 7, and 6½; Madresfield Court, four bunches (10), 8½, 8, 9, and 7½; Appley Towers, four bunches (9), 7, 7, 6½, and 7; Chasselas Napoleon, two bunches (9), 6½ and 7½. Brunswick and Brown Turkey figs (7), 5½ and 6. Melons (8)—Eaton Seedling, 6½ and 7, and Hero of Lockinge, 6½. Nectarines (8)—Pineapple 7; Dryden, 5; Dryden, 5½; and Pineapple, 6. Peaches (8)—Bellegarde, 6½; Royal George, 6; Royal George, 6; and Merlin, 6½. Plums (8)—Jefferson, 5½. Pears (8)—Marguerite Marrillat, Louise Bonne of Jersey, Doyenne du Comice, and Doyenne du Comice, 6½, 6, 5½, and 5. Apples (7)—Cox's Orange Pippin, Gascoigne's Scarlet, Cox's Orange Pippin, and Charles Ross, 6½, 6½, 6½, and 6½. Total, 240 points. The figures in brackets are the possible points obtainable.

Second award fell to Mr. Mullins, gardener to Lady Henry Somerset, Eastnor Castle, Ledbury, who scored 217 points, with a grand table of fruit. Mr. J. H. Goodacre, Elvaston Castle Gardens, third, with 213½ points, his peaches being fine.

CHOICE DESSERT FRUITS.

A first prize of £10 was offered in a class for a florally-decorated collection of twelve dishes of dessert fruits. There were two entries, first place falling to Mr. S. Barker, gardener to the Duke of Newcastle, for capital Madresfield Court, Muscat of Alexandria, and Black Hamburgh grapes, a melon, Triomphe de Vienne pears, Wealthy and Ribston Pippin apples, Crimson Galande and Stirling Castle peaches, Humboldt nectarines, Negro Largo figs, and Golden Gage plums. Second prize was won by Mr. D. McIntosh, gardener to E. Bewley, Esq., Rathgar, Dublin, his Peasgood's Nonsuch apples and Marguerite Marrillat pears being extra good.

There were four entries in the class for nine dishes of dessert fruit, and here Mr. J. Mills, gardener to Captan Heywood Lonsdale, Shevington Hall, gained premier place, with Madresfield Court and Muscat of Alexandria grapes, Barrington and Royal George peaches, Pineapple and Swanwick Elruge nectarines, Brown Turkey figs, James Grieve apples, and New Peerless melon. Mr. W. Willdig, West Felton, second; Mr. W. Catt, gardener to A. H. Heber Percy, Esq., Hodnet Hall, third, his Gascoigne's Scarlet apples being excellent. Mr. Staward, gardener to Major-Gen. Sir F. Lloyd, K.C.B., Aston Hall, fourth.

Mr. A. H. Heber Percy, Hodnet Hall, was a capital first for a collection of six dishes of hardy fruits, currants, gooseberries, raspberries, and apples being very fine. The same competitor was first for a dish of apples with Gascoigne's Scarlet. Mr. Mullins led for Morello cherries.

GRAPE CLASSES.

Mr. T. Mills, gardener to Captain Heywood Lonsdale, Shevington, came first for two bunches each of white and black grapes, scoring with Madresfield Court and Muscat of Alexandria, the latter finely coloured. Mr. A. J. Cook, gardener to Colonel H. C. Legh, Knutsford, second; and Mr. D. McIntosh, gardener to E. Bewley, Esq., Dublin, third. Five entries.

Out of eleven competitors, Mr. J. H. Goodacre scored for two bunches of Black Hamburgh grapes, with solid clusters of deeply-coloured berries. Mr. J. Dixon, gardener to Lord Rowallan, Kilmarnock, second; and Mr. G. Mullins, gardener to Lady Henry Somerset, Eastnor Castle, Ledbury, third. For a single bunch of this variety, Mr. J. Dixon was first, followed by Mr. G. Richardson, gardener to H. St. Maur, Esq., Newton Abbot; and Mr. S. Barker, Clumber Gardens, third.

Mr. J. H. Goodacre led for a brace of bunches of Black Muscat grapes, with Muscat Hamburgh. Mr. J. J. Cook had the finest pair of bunches of Madresfield Court, with Mr. Goodacre second, and Mr. W. H. Wilson, Stourport, third. Mr. Mullins led for two bunches of Alicante, with big bunches, well coloured. For two bunches of any other black variety, Mr. J. Dixon was first with Gros Maroc in grand form, the berries like plums. Mr. Mullins second.

For two bunches of white muscats Mr. W. Campbell, gardener to Lord Seaforth, Barham Castle, scored with Muscat of Alexandria, with Mr. S. Barker second, and Mr. J. R. Tooley third. For any other white grape, two bunches, Mr. S. Barker, gardener to the Duke of Newcastle, Worksop, led with Buckland Sweetwater. Mr. G. Davies, gardener to F. Alderson, Esq., Oswestry, second; and Mr. Curtis, gardener to Sir Howell Davies, M.P., Stoke Bishop, Bristol, third.

In the county classes (Shropshire) for grapes, Mr. J. Mills, Shevington Hall; Mr. J. Birch, gardener to Lady Mary Herbert, Market Drayton; Mr. W. Ashwood, gardener to Major Newill, Admaston; Mr. W. Willdig, gardener to Colonel Mainwaring Jackson, West Felton; Mr. J. Hopwood, gardener to J. Barker, Esq., Shrewsbury; and Mr. A. Jones, gardener to G. Burr, Esq., Oaklands, were the successful prize-winners.

CUT FLOWERS.

There were four competitors in the fine class for twenty-four bunches of hardy flowers, and the only fault one had to find with the class was lack of space for the splendid bunches displayed. Premier award fell to Messrs. Harkness and Sons Leeming Bar, for a famous lot, wherein Verbascum New Departure (soft nankeen-yellow), gladioli, Gaillardia Miss Mackellar, Galtonia candicans, Lilium longiflorum, and Helianthus multiflora maximus were very fine. Second prize fell to Messrs. W. Artindale and Son,

(Continued on page 643.)

NEW PLANTS AND FLOWERS.

AGAPANTHUS WEILLIGI.

A new species that is likely to prove hardy in many parts of the country. It bears a large umbellate head of fifty or sixty violet-blue flowers, which are of deeper violet shade at the base. The head is denser than in A. umbellatus, and the individual blooms are more tubular than in that species. Where A. Mooreanus does well this newcomer should also be a success. The leaves are rather short for the genus, stiff and erect. A.M., R.H.S., August 12. A. Worsley, Esq., Mandeville House, Isleworth.

DAHLIA DUNGENESS.

This is the first variety to gain an award this season, and, curiously enough, it is a variety belonging to the new collarette section. The blooms are about five inches across, bright rich crimson-scarlet, and the quilled collar florets are light yellow. A very effective and striking variety. A.M., R.H.S., August 12. Messrs. Dobbie and Co., Edinburgh.

GLADIOLUS CRAIGANOUR.

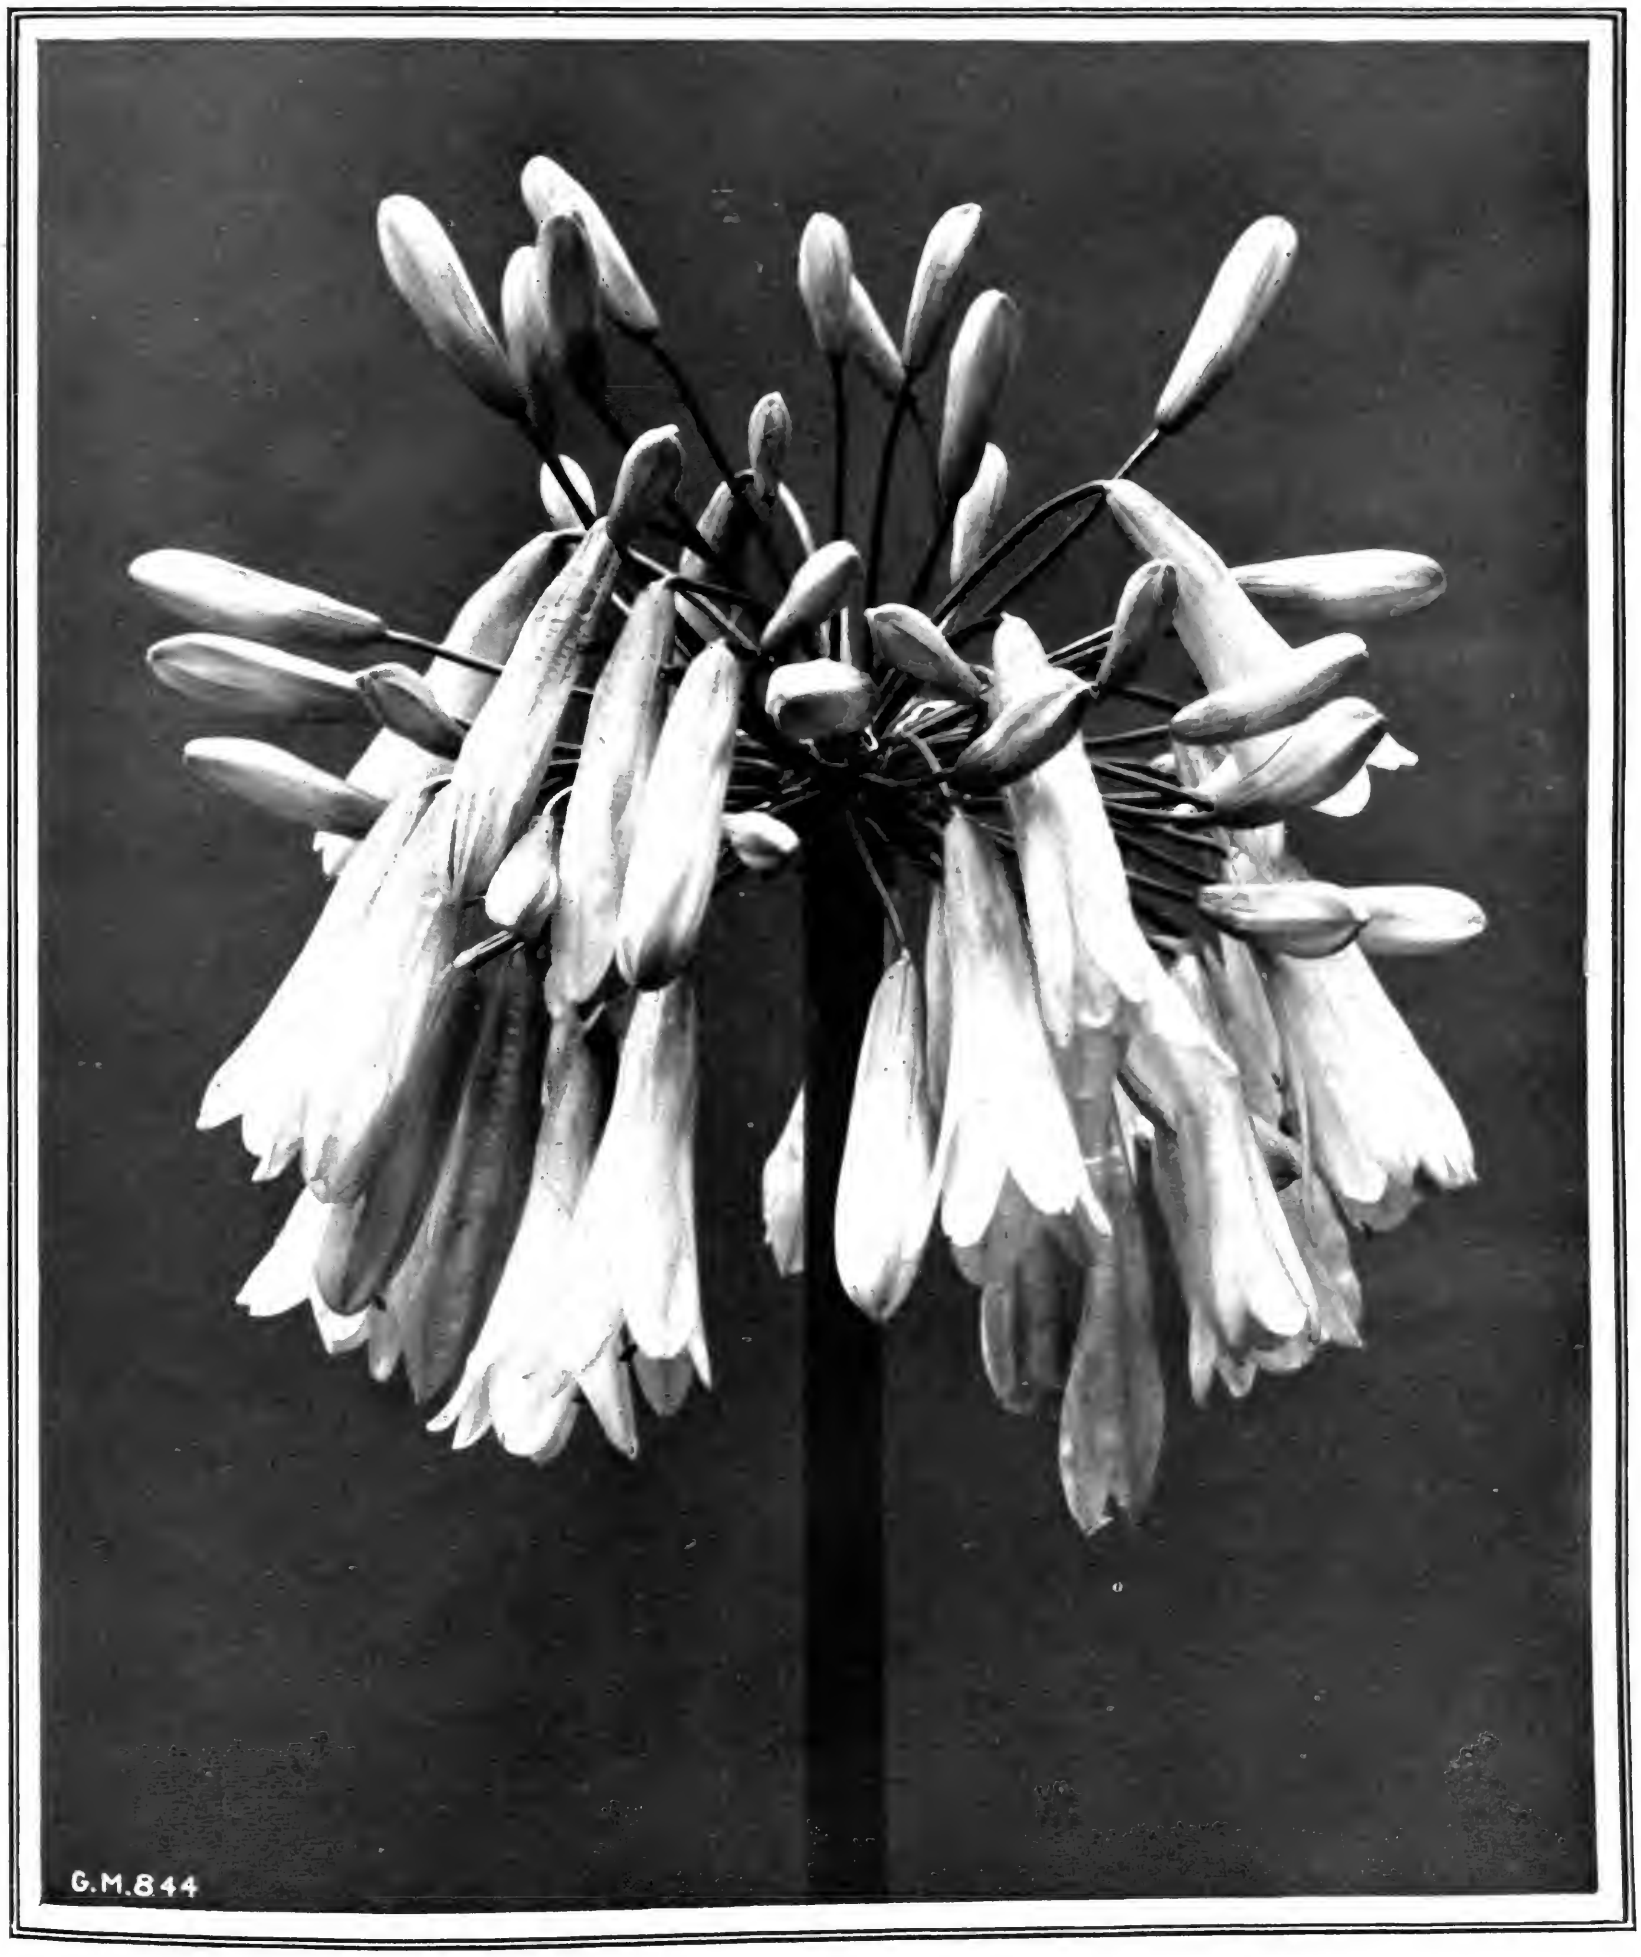
A very fine variety, with well expanded flowers, carried boldly on a stout spike. The colouring is rather difficult to describe, but light rose-red about fits it, though there is a white line down the middle of each inner segment, and the lower petal is deeper and brighter red with a light sheen or suffusion of purple. A.M., R.H.S., August 12. Messrs. Kelway and Son, Langport, Somerset.

LYSIONOTUS WARLEYENSIS.

Forming a little bush about nine inches high, bearing oblong-lanceolate, fleshy leaves that are white on the under surface, and white, purple-lined, tubular flowers, this Chinese plant attracted a good deal of attention. Both flowers and leaves are about two inches long, and the former are produced in the axils of the upper leaves. This gesneriad was collected by Mr. E. H. Wilson, and, though interesting, it is not especially attractive. A.M., R.H.S., August 12. Miss Willmott, V.M.H. (gardener, Mr. C. Fielder, V.M.H.), Warley Place, Great Warley, Essex.

CALADIUM MADAME RENE MAROT.

A delightful variety, chiefly of crimson colouring, with silvery-pink central area, deep carmine veins, and bronze shading at the margins of the moderate-sized leaves.



AGAPANTHUS WEILLIGI.

Flowers violet-blue. A.M., R.H.S., August 12. A. Worsley, Esq., Isleworth.

A.M., R.H.S., August 12. Mr. Hoffmann, Tower House, Streatham.

CROTALARIA AGATIFLORA.

This crotalaria is described as one of the finest and one of the largest-flowered of the African species of this genus, and the specimen figured fully justifies this description. It is a native of Uganda, and British East Africa, and forms in a wild state a large handsome shrub, and bears numerous long racemes of large, bright, greenish-yellow flowers. The credit of first flowering this species in England belongs to Mr. W. F. Hamilton, gardener to Ingham Whitaker, Esq., Pylewell Park, Lymington, who appears not to have experienced any great difficulty in growing and flowering the plant. "Bot. Mag.," t. 8,505.

LÆLIO-CATTLEYA URSULA.

A new hybrid derived from L.-c. Ingrami and C. Mantini, and one that will doubtless become finer as the plant develops. In form and substance the flower is strongly reminiscent of L.-c. Ingrami, while the colouring is very like the deep rose-purple of C. Mantini. A.M., R.H.S., August 12. Messrs. J. and A. McBean, Cooksbridge, Sussex.

LÆLIO-CATTLEYA WELLESLEYI VAR. FLAMBEAU.

A fine bold form of the hybrid between C. Warscewiczi and L.-c. Martinetti, and one in which the influence of the first-named parent is very marked. The sepals and petals are rose-purple with old gold shading, and the large lip is rich purplish-crimson shading to red-purple near the yellow disk. A.M., R.H.S., August 12. Mr. E. H. Davidson, Orchid Dene, Twyford.

DAHLIA DUNGENESS.

Flowers rich scarlet with light yellow collar. A.M., R.H.S., August 12. Messrs. Dobbie and Co., Edinburgh.

(See page 633.)

Veronica Autumn Beauty. — This is an exceedingly pretty free-flowering veronica of garden origin, whose rich, bluish-purple-coloured blossoms are borne over a lengthened period. It is a dwarfer plant than the varieties which have originated from Veronica speciosa. Though bearing the name of Autumn Beauty, it is finely in flower in the month of July.—K.

ROSES FLOWERING LATE.

During the first week in August hundreds of rose trees, especially those of climbing varieties such as Dorothy Perkins, Hiawatha, and Stella, seemed to be at their best, flowering profusely. Hybrid teas and hybrid perpetuals, too, were masses of blossom. This condition obtained in Bournemouth, where roses are usually in bloom early in the season; this year the display has been a prolonged one. Owing to the prevalence of green aphides at the end of May and early in June, many rose trees, especially those of Dorothy Perkins, were almost denuded of foliage. Since then new growths have come, and much blossom of a particularly bright colour. A large plant of Mdme. Berard in my garden is only just commencing to flower, and the foliage is lovely, showing off the pleasing light yellow flowers to the best possible advantage.

G. B.

CHRYSANTHEMUM NOTES.

The plants generally make rapid growth from the middle of July to the same date in September. In dull and rather cool weather the growth is very free even after the buds are "taken." But as it is not possible to have all plants in the same condition at a given time, the cultivator should very carefully examine them, and give treatment accordingly.

The wood and main leaves of some varieties may be much riper than the stems and leaves of others. Plants in such a condition can be well fed, whereas much feeding of plants that are less matured would do harm, as the unripe shoots would grow unduly, and the buds be of little value for developing into fine flowers. The little extra labour entailed in picking out the plants possessing the hardest wood, and top-dressing and feeding them more frequently, will be more than compensated for, as the resultant blooms will be good ones. And if those plants that are not as matured be grown for a time without the aid of strong stimulants, the blooms they bear will be more refined and suitable for the show table.

It is a mistake to overfeed plants of the incurved section. When the blooms are three-parts developed, a small dose or two of nitrate of soda, or some approved concentrated chemical manure, would soon have the effect of forcing out the central petals and deepening the flower considerably. If given too early, such stimulants would cause the basal petals to reflex.

Border Varieties.

There are now some very beautiful varieties among the early-flowering section, and those generally grown in the open borders. The dwarf habit of growth is a vast improvement on that of some of the older sorts, and very little staking is necessary. But where it is, the final staking and tying-out of the stems is work that must be done at once.

The presence of these plants in the open borders adds considerably to the variety and general beauty of autumn-flowering subjects in them—not only in herbaceous borders, but those in the flower garden too.

Here, again, the matter of feeding should receive attention. I have recently had an opportunity of examining many batches of plants growing in districts wide apart. Some cultivators were content to put out plants in poor, unmanured ground last May, and these have not grown satisfactorily. Only repeated doses of diluted liquid manure or chemicals will assist the plants to yield a moderate harvest of bloom in September and October.

There are other cases where one or two applications of liquid manure will be sufficient, as the plants are now making good progress in fairly rich soil, and much feeding would make them gross and too tall.

Where plants are growing in beds in the flower garden some disbudding may be essential. When the work is judiciously done the blooms are more erect, and possess more substance; and, if the plants are not tied too stiffly, they present a very fine appearance, and add considerably to the cheerful displays of autumn flowers.

GEO. GARNER.

Lantanas. — These have doubtless within recent years made great headway in popular favour, both for the embellishment of the greenhouse and for bedding out during the summer months. This is not surprising, as the different varieties are profuse in flowering, of easy culture, and readily wintered much as fuchsias are. Among the best are Drap d'Or, golden-yellow; Incendie, scarlet; and salviæfolia, lilac.—S. W.

WINTER ONIONS.

Winter onions and spring cabbages are two of the most important crops to be sown during the present month. Especial care should be taken in preparing the site for onions, as the crop will have to stand the varying weather the whole winter through. It is necessary to choose soil of fairly light texture; to secure this, if the ground is heavy, thoroughly dig a plot from which the main crop of potatoes are being lifted. Over this strew a good dressing of burnt garden refuse, with soot and lime rubble added; then roll or tread the whole firmly; this will bring the plot into good tilth, quite suitable for sowing the seeds without much raking. It is possible to make the surface too fine at this season, and it would then harden under rain, and prevent a free passage of air.

Sow thinly in drills, and when the seeds have germinated all that will be necessary is to ply the Dutch hoe regularly, and give an occasional dusting of soot. The latter will prevent the ravages of slugs, and act as a splendid fertiliser. Two sowings should be made, one during the middle of August and the other a week later. Well-tried varieties are White Leviathan, White Emperor, White Tripoli, Blood Rocca, and Lemon Rocca.

During late autumn a plot of ground should be trenched in readiness to receive the plants the following February or March as the climatic conditions allow. Any ground will do, providing it is given a good dressing of farmyard or stable manure. Place the longest manure in the bottom of the trench where it will drain and thereby lighten and warm the soil. Under the top spit place a layer of fairly-decayed manure. Leave the surface as rough as possible.

Nothing further will be needed until planting time arrives, when, in dry weather, the surface should be strewn with wood ashes, then broken down with a fork, and levelled up. Plant in lines one foot apart. When lifting the onions from the seed bed use a hand fork, so as to avoid breaking the roots; plant shallow and firmly, and if the weather is dry, water in thoroughly.

GEO. ELLWOOD.

Swanmore Park Gardens.

GLADIOLUS CRAIGANOUR.

Flowers bright rose-red, with darker shade on lower segment. A.M., R.H.S., August 12. Messrs. Kelway and Son, Langport. (See page 633.)

Potentilla Gibson's Scarlet.—A spreading mass of this potentilla, thickly studded with its brilliantly-coloured blossoms, forms a prominent feature on an elevated portion of the open border. When growing freely its plaited leaves are in themselves very ornamental, while the flowers attract by reason of their vivid tints.—K.

HAMPTON COURT GARDENS.

The gardens at Hampton Court have long been famous for their different phases of beauty at various periods of the year. Of the present summer's display it may be safely said that the high standard so generally recognised has been fully maintained, or even, in some instances, surpassed.

Despite the fact that the Palace itself is, owing to the militant suffragists, closed to the public, the gardens prove a source of attraction to a very large number, including many artists seeking to reproduce the various features on canvas.

While the summer bedding may be looked upon as the dominant feature at the present time, it by no means stands alone, for there are many other features which prove valuable accessories to the floral display. The rich green of the elastic turf, for instance, is unsurpassed as a setting for the masses of brightly-hued flowers, while the remarkable old yews, in their dark sombre tone of green, stand out like sentinels against the light tint of the lime trees which encircle that portion of the gardens. These limes, too, form, when devoid of foliage, a very uncommon winter feature, as they are heavily laden with mistletoe, which stands out very conspicuously when all around is devoid of leafage.

The many climbers on the old walls include some very fine forms of clematis and of rambler roses, among which last Dorothy Perkins and Hiawatha occupy a foremost position. These roses are by no means the only ones there represented, for some beds of the most suitable kinds are very attractive, and one very large bed planted with a varied selection is particularly striking at a distance, and, closely inspected, full of interest. Some of the weeping standards are unusually good, while the value of the dwarfer members of the polyantha race as an edging, or in the foreground of the larger-growing kinds, is well exemplified. The tall ramblers, secured to stout, erect poles, show off their beauty admirably.

The herbaceous border is always a source of attraction, chiefly owing to the fact that the various subjects planted there are quite hardy. The plants therein are so well assorted that a display is kept up until the autumn frosts end the last of the chrysanthemums and Michaelmas daisies. Just now the phloxes are very beautiful, and beside these may be especially noted various pentstemons and antirrhinums, now so popular; potentillas of sorts, Gibson's Scarlet being very conspicuous; Geum Mrs. Bradshaw, already a well-established favourite; Salvia nemorosa, well worthy of extended cultivation; the ubiquitous Galega officinalis, and its white variety, both good border plants; Lychnis Haageana, distinct in its tone of red; heleniums, of sorts; chrysanthemums, of which Mrs. Lowthian Bell is one of the best; Sidalcea alba, whose flowering season extends over a lengthened period; the brilliantly-coloured and highly-fragrant Bergamot or Oswego Tea (Monarda didyma), and many others.

In addition to the different subjects in the herbaceous border there is a large bed filled with the choicer varieties of delphinium, and while the main spikes are, in most cases, exhausted, the policy of cutting them away directly the flowers are over is well exemplified, as the secondary crop of blossoms is quite sufficient to make a goodly show. This is a point that is not so generally borne in mind as it should be.

The water lilies in the circular pond in the front of the Palace are at times surrounded by admirers, while the old historic vine, which has its regular stream of visitors, is in very good condition.

Of tender subjects there is a varied collection in the long border on the opposite side of the Palace to that given up to herbaceous plants. For the most part the plants of which this border is composed are arranged in blocks, or groups, containing several of each kind, a method far preferable to planting them in straight lines. Most of them are flowering with great freedom, and the chief are Bougainvillea glabra, Calceolaria Burbidgei, C. amplexicaulis, fuchsias in variety, Carnation Britannia, Salvia patens, S. Pride of Zurich, Acalypha musaica, heliotrope, astilbes in variety, pelargoniums of sorts, antirrhinums in variety, Gilia coronopifolia, Cacalia aurea, lantanas, Solanum jasminoides, S. Wendlandi, Humea elegans, Asclepias curassavica, Lilium longiflorum, sweet peas, annual chrysanthemums, celosias, and Marguerite Mrs. F. Sander.

Of the different pelargoniums planted in the various beds the variety Paul Crampel still holds its own as the finest of the scarlets, while as a white Queen of the

A CHARMING BED OF BOUVARDIAS AND IVY-LEAF PELARGONIUMS, HAMPTON COURT.
The bouvardia is B. Humboldti corymbiflora, and the pelargonium Rose Queen.

Belgians has yet to be beaten. At a little distance the strange orange tint of the variety Maxime Kovalevsky is somewhat of a puzzle to the uninitiated. It fills a large bed, with a few tall plants of Leucophyta Brownei raised above it. Of ivy-leaved pelargoniums those two old varieties, Galilee and Souvenir de Charles Turner are, in their way, unsurpassed. The pale mauve-tinted Baden Powell is admired by some, and its growth seems to be on the increase. Its fine large flowers are certainly very effective.

No flower garden seems to be complete without a selection of fuchsias, and though at Hampton Court they are not grown to the same extent as in some places, there is quite sufficient to form a fine display. Prominent among them are the varieties Ballet Girl, Alice Hoffmann, Mrs. Marshall, Mrs. Rundle, Scarcity, Annette, Rose of Castile, Madame Cornellison, Riccartoni (a good hardy kind), Erecta Another bed suitable for a similar position has also a carpet of koniga, but the begonia employed is apparently of local origin, the name of Hampton Court being applied to it. It is a dwarf variety, with large double flowers of a pleasing shade of cherry-red. The dot plants are Phlox Comtesse de Jarnac, Kochia scoparia, and Centaurea candidissima.

Another pretty bed is planted with the upright-growing, orange-scarlet Begonia Bertini, springing from a carpet of koniga. A few plants of variegated grass and Leucophyta Brownei complete the bed, which is edged with Echeveria secunda glauca. A bold effect is produced by a bed of cannas well overtopped by Humea elegans and Campanula pyramidalis, and edged with white violas, beds of sweet peas grown in pots are very striking, while an unexpected floral display at the end of July was a bed of Aubrietia Dr. Mules laden with blossoms.

AN EFFECTIVE BORDER OF SUMMER FLOWERS, HAMPTON COURT.
Both hardy and half-hardy plants are utilised in the furnishing of this border.

Novelty, remarkable for its upright flowers, and the two variegated-leaved forms, namely, gracilis variegata and Sunray.

Other subjects include Humea elegans, always well done at Hampton Court; Lantana Drap d'Or, yellow; L. delicatissima, lilac; and L. Incendie, scarlet; Streptosolen Jamesoni, cannas, verbenas, Leucophyta Brownei, in all sizes; Cuphea ignea, several varieties of begonia, and numerous others.

Space only permits mention of a few of the most pleasing or more uncommon floral combinations, though there are many worthy of note. One particularly suitable for inspection from high windows is planted with Koniga maritima, over which is dotted the pretty pink Begonia Major Hope. A few tall slender plants of Leucophyta Brownei complete the bed, except for an edging of Echeveria secunda glauca.

This notice might be indefinitely extended, but enough has, I think, been said to show that the condition of the gardens and their surroundings is such that the superintendent, Mr. W. J. Marlow, is justly entitled to feel proud of it.

W. Truelove.

The Golden-leaved Elder.—It is a well-recognised fact that the common elder will hold its own in poor, dry, stony soils, a remark that applies equally to the golden-leaved kind. It is, in fact, under such conditions that it is seen at its best, for in moist spots it does not acquire that richness of colouring which it does under less liberal conditions. The colour intensifies by exposure to the summer's sun, instead of being burnt up as some of them do. The beautifully variegated Cornus Spathi is another of this class.—S. W.

GALTONIA CANDICANS.

The Cape hyacinth, which was formerly styled Hyacinthus candicans, is one of the most decorative plants for the embellishment of the garden. It is of the easiest possible culture, and bulbs may now be procured at a remarkably cheap rate, while anyone possessing plants may readily increase their number by sowing seeds, which will produce flowering plants within three or four years. The seeds should be sown as soon as ripe, in pans of porous soil, and placed in a cold frame, while, since it requires no heat, it may be raised by amateurs not having a greenhouse. In their second year the seedlings should be planted out in a prepared bed, and transferred to their permanent quarters after they have become dormant the following autumn.

Early in August the Cape hyacinth is at its best, its tall flower-spires, with pendant, ivory-white bells rising, in the case of vigorous specimens, to a height of five feet or more. Associated with the deep blue Salvia patens or the scarlet Gladiolus Brenchleyensis, the effect of this galtonia is especially striking, while it is equally valuable when planted among low-growing, fine-leaved subjects, such as the funkias. F. Sieboldi, with its cordate, glaucous foliage, interspersed with the lofty shafts and graceful flower-heads of Galtonia candicans, presents a satisfying picture, but of a subdued colour scheme, that, though lacking the vivid contrasts afforded by the salvia and gladiolus before referred to, is restful to the eye.

As a cut flower the Cape hyacinth yields to few in excellence, the lofty bloom-scapes, with their white blossoms poised at the extremities of the long foot-stalks, creating a stately effect when arranged loosely in vases. Wyndham Fitzherbert.

NOTES ON HARDY FLOWERS.

Statice latifolia.

This is the best of all the sea lavenders or statices for the ordinary flower border, and it is a pity such a plant is so little known, although, of course, it is not a rare one. In a good border, not too wet, yet not poverty-stricken, S. latifolia is really very fine. A large plant, between two and three feet high, is most ornamental with its handsome spreading spikes of blue or lilac-blue flowers, which, though individually small, are effective in a mass. The leaves are handsome, and the general effect of a specimen is decidedly good. Although a nominal June flowerer, it lasts a long time in bloom, and we see it in flower into August. Apart from its value in the garden, the flowers are in request for cutting, and the fact that they can be dried for winter decoration adds greatly to their value to many. One finds that a good, though not too heavy, soil suits it well. S. latifolia is increased by means of division or seeds, and is quite hardy. It is a native of South Russia, whence it was introduced in 1791.

Chrysanthemum maximum Hendersoni.

There is a bewildering array of varieties of Chrysanthemum maximum nowadays, and the purchaser is at a loss which to choose from among such a host, many of which differ only in name. The laciniated varieties are highly ornamental, and lend themselves to purposes where the other forms are not so valuable, and quite a number of those with the ends of the ray petals laciniated are in commerce. One which is, I am certain, of long-past introduction is named C. m. Hendersoni, and, when well grown, is very difficult to beat in its way. Growing variously from two to three and a-half feet high, it gives a mass of shapely, prettily-cut flowers of purest white, save for the golden centre, for a considerable time in succession. This is a very handsome chrysanthemum, and may well be placed among the best of the really good varieties now so common. In a good soil it is of special excellence, and gives for a considerable time handsome flowers for cutting, as well as for the decoration of the border. I do not know its origin with any certainty, but, unless I am mistaken it came from the once-famous nursery of E. G. Henderson and Son, St. John's Wood, London, who sent out so many good hardy plants.

Agapanthus umbellatus, var. Mooreanus.

For garden purposes we may well be content to call this little blue African lily simply Agapanthus Mooreanus, although we have it on the highest authority that it is only a variety of the well-known A. umbellatus. It is inferior in size and effect to the ordinary A. umbellatus, but to the many who are debarred from cultivating its more impressive sister flower it has the merit of being much hardier, and of thriving where the other would fail because of the severity of the winters. Of course, when properly treated, A. umbellatus itself, and its white variety, are much hardier than is generally understood, but A. Mooreanus is really hardy throughout a great part of the United Kingdom. The writer has grown it for five and twenty years or more in the open border, and that without a shred of protection during winter. A. Mooreanus is much smaller in its scapes and individual flowers than the type. It has also shorter and blunter leaves, and does not usually grow so tall. I see that an authoritative work gives the height as eighteen inches, but I have measured a clump in my own garden to-day, and the stems and their surmounting scape reach at least fifteen inches more. The flowers are of a good blue, and a large clump in autumn is a pleasing feature of the border. It likes a good, but well-drained soil, and occasional applications of weak liquid manure will help to give the plant vigour and the flowers a greater size. This is not necessary, however, and in fairly good soil the agapanthus will increase in size and beauty with the ordinary treatment afforded to other border plants. I prefer spring planting, and the crowns should be about two inches beneath the surface. Increase is effected by division.

Inula Hookeri.

A capital hardy effective border plant for autumn flowering is Inula Hookeri, a handsome subject, with ornamental flowers of a good orange, with a deep centre, and very pleasing in the autumn months from July, late in the month, to the end of September, and in this garden even into October if the frost is only moderate in its touch. It is variously from two to three feet high, according to the nature of the season or the character of the soil and position. Its one fault in the border is that it is apt to spread too much at the roots, but this is easily condoned for the sake of the effectiveness of this handsome composite plant, and the value of its blooms, either in the garden or cut for the home. It is increased by division, and is quite hardy.

S. Arnott.

LEUCOPHYTA BROWNEI.

The above is the name most generally used in gardens for this well-known plant, but by botanists it is placed in the genus Calocephalus, the specific name remaining the same. Owing to the intense silvery-whiteness of the entire plant, it is much used for bedding purposes, the neutral tint serving admirably as a foil to the brighter-hued blossoms. It is employed in several different ways—firstly, when pegged down, it may be used as an edging or a carpet to taller-growing subjects; next, as dot plants of any height from 1ft. to 4ft., it is in considerable demand. It can be readily struck from cuttings inserted at any time during the growing season, and kept close till rooted. In early spring they are benefited by a gentle bottom heat, but in summer this is not needed. The cutting-pots should be filled with light, sandy soil, sifted moderately fine and pressed down firmly. Plants struck in the autumn, or even early in the spring, are available for edging or for carpeting, but the dot plants will, of course, be older. From a flowering point of view, this leucophyta has nothing to recommend it, the whitish blossoms being borne in small terminal heads. It is a native of Australia, and has been long grown in this country, but it has not previously been so popular as it is at the present time.

W.

SAXIFRAGA UMBROSA AND ITS ALLIES.

There is probably no better-known plant than the old "London Pride" (Saxifraga umbrosa), which is still one of the delights of the old cottage gardens. This useful species, which is charming by reason of its clouds of pinkish blossom and its evergreen foliage, is a wildling in many parts of the west and south-west of Ireland, and naturalised in other places.

The easy manner in which S. umbrosa adapts itself to varied positions and soils is very noticeable, and it seems to delight in a cool, sandy soil, either in sunshine or half-shade. It is especially suitable for rock garden grouping, particularly where one has plenty of space to fill, and it can be used in conjunction with some of the stronger-growing, spring-flowering bulbs, which should be chosen so as to give early patches of colour before the saxifrages are in blossom.

Selected spots in the wild garden might also be planted up with this subject, it being extremely pretty for crowning small hillocks, or for breaking over the edges of informal pathways. Gracilis, the dainty white-flowered variety of S. umbrosa, is charming, with its misty masses of graceful blossoms. Serratifolia, a slightly dwarfer form, with serrated foliage, is much the same colour as its parent, while variegata is interesting by reason of its white and green foliage.

Saxifraga geum, a near relative of S. umbrosa, is found in quantity on the mountains of Cork and Kerry, and is a useful little plant for the rock garden. Its neat habit, its white blossoms borne freely upon slender stems, and the toothed, reniform, hairy leafage, combine to make it a serviceable little subject. There are several interesting varieties of S. geum, among which are minima, Doni, Linnæi, and others. As these differ slightly in size and in formation of the foliage, while occasionally the tiny flowers exhibit pinkish or rose-spotted colourings, they are certainly replete with interest.

In S. cuneifolia we have one of the prettiest gems of the whole group. Its small tufts of green, leathery, miniature leaves, which possess a reddish reverse, and the tiny spikes, gemmed with white blossoms, spotted with yellow, are delightful in well-drained spots on the rocks. Its varieties, which include the snow-white appennina (or subintegra) and multicaulis, are full of interest and charm.

Other interesting allies of S. umbrosa are S. Andrewsi, a natural hybrid between S. umbrosa and S. aizoon, which was found in Ireland. The foliage is bright green, and the serrate edges are margined with silver. The blossoms are white, prettily spotted with red. S. hirsuta, a useful saxifrage of dwarf habit, in character midway between S. umbrosa and S. geum, has pink-shaded flowers, and S. pseudo-Forsteri, a dainty hybrid form, which claims S. cuneifolia as one of its parents, is also good.

In addition to these there is the little pink-flowered S. primuloides, which is a choice little subject and quite a miniature plant. Taken together, the little Robertsonia section of the saxifrages, which contains the foregoing species and varieties, is well worth the attention of those who have the planning and planting of rock gardens, and during early summer the wealth of tiny blossoms produced by these subjects, and their neat, effective appearance at all times, should ensure them due appreciation from the garden lover.

P. S. Hayward.

PERPETUAL CARNATIONS AT SAFFRON WALDEN.

A very clear and convincing demonstration of the important position the perpetual-flowering carnation has attained in this country is available to anyone who takes the journey to Saffron Walden, and visits Horneybrook Nurseries, where Mr. C. Engelmann grows a marvellous quantity of practically all varieties worth cultivating. It is not my intention here to dwell upon the extent of the nursery or the area of glass devoted to carnation culture, for I was far more impressed by the quality of the flowers, the robust vigour of the plants in all stages of growth, and the superb varieties—many of them quite new—among which I spent a most enjoyable afternoon, and of which I am anxious to tell the readers of The Gardeners' Magazine.

The general collection numbers about seven dozen varieties, besides the novelties of both Continental, American, and British origin, which are at present either under trial at Saffron Walden or are being propagated prior to distribution. Mr. Engelmann has also a large number of well-bred seedlings of his own raising, and some of these are destined to become general favourites and useful additions to the best collections. A goodly number of varieties that already have made their mark and become widely grown had their birth-place in Horneybrook Nurseries, and almost every one that Mr. Engelmann has sent out possesses some important quality that makes it quite distinct and especially desirable, either for exhibition or ordinary decorative purposes. Rex, for instance, which was sent out in 1911, has perfection of form and a delightful pale rose colour, and is so profuse in flowering during the early part of the year, as well as during the longer and sunnier days, that it is a decided acquisition to either trade or private growers, albeit the individual flowers are not so large as in some other varieties. Rosa has flowers of large size, and is of a shade of pink, somewhat brighter than the old favourite, Mrs. T. W. Lawson, and the distinguishing feature of this flower is its splendid substance and long-keeping qualities.

Sunstar stands alone, as an almost self yellow of wonderful vigour and freedom. The petals are just slightly splashed with pink, but whether on the plant or in a cut state the flowers of Sunstar are delightful, and in contrast with other varieties of this much-desired hue the plants of Sunstar are conspicuous for their strong, healthy growth and abundance of flowers and buds. Salome is quite a fancy variety; indeed, it is almost fantastic in colouring. Mr. Englemann's own description is "deep pink, shaded round the margin of the petals with heliotrope. There is a shimmering sheen over the flower that makes it bright and attractive, and the flower is well built in a strong non-splitting calyx."

British Triumph, the splendid crimson self, which received the distinction of the Perpetual Carnation Society's First Class Certificate, has already become so widely known that it needs but little recommendation from me. It is a grand flower. As the raiser, Mr. Engelmann might well be excused for claiming that there is nothing of its colour to equal it, but we know sufficient of him to affirm that he is a keen, impartial judge, and is as critical of his own productions as of those of his compeers. Of course, Carola is very largely grown, big houses being filled with this remarkable variety. It seems to me that the coarseness that at first was too evident in Carola has disappeared, and the flower is now far more pleasing. My opinion is that in its early days it was endowed with more strength than it could make good use of, but the hard propagation which was necessary to keep pace with the demand for plants resulted in toning it down, and now, provided propagation is not overdone, we shall find Carola a good grower, and its flowers bold and handsome, but not too coarse. A scarlet sport from Carola, which I saw at Saffron Walden, and Mr. Engelmann has already exhibited, is a most striking flower that will be highly valued, and the striped Carola will also take the fancy of many growers.

One may be pretty sure that when Mr. Engelmann sets himself to grow a certain carnation in exceptionally large quantities, there is something of more than ordinary merit in that variety, and it is therefore worthy of note that Lady Northcliffe is grown at Saffron Walden in exceptionally large numbers. Walking through one of the large houses filled with plants in full bloom, I noticed that the plants were vigorous, the grass broad and handsome, and there were literally sheaves of big, well-built flowers borne on splendid stems. The petals are broad and substantial, so that the blooms both pack and keep well, and in colour it is a very pleasing shade of the ever-popular salmon-pink. Another exceptionally good winter-blooming variety is Lucy, which is about the same shade of colour as May Day, and, as it is quite one of the best keepers, Mr. Engelmann is devoting a large space to its cultivation.

Among the seedlings to which reference is made above was one large, symmetrical flower that pleased me very much. It is a "fancy," with a lilac-mauve ground, closely and evenly chequered or splashed with a lively red. The habit of the plant is as good as the form of the flower, and I venture to predict a great future for this variety. Another flower of unique colouring, and of a perfection of form almost equalling an ideal border carnation, had peculiar but pretty flowers, with orange and white markings on a buff ground. I also saw a good scarlet sport from Lady Northcliffe, and a seedling white that answered in all respects the description of a pure white of first-class quality.

In a batch of seedling Malmaisons was one of a real slate-grey shade, and also a white of large size. Among American-raised varieties which find favour at Horneybrook that fine fancy, Benora, holds a prominent place. This is a big flower and full of quality, and does as much credit to its raiser as Enchantress, which was brought out by the same grower. May Day has from the first appealed to me on account of its perfect form, and I was not surprised to find it well done at Saffron Walden. But one might continue until every variety in the nursery had been mentioned, so interesting is the admirably-formed collection.

The whole place is arranged and managed in a manner that convinces one of the keenness, enthusiasm, and careful forethought of the man at the helm. The houses are in two big batches on either side of the road. A huge water-tank, 90ft. long, 20ft. wide, and 16ft. deep, is kept filled with water by a powerful pump, and from this tank the whole of the water is obtained for the plants, all the watering being done through the hose-pipe. The packing sheds are cool, airy, and convenient, as they need to be, for in addition to an extensive home trade, both wholesale and retail, Mr. Engelmann is constantly shipping large consignments of plants to distant countries, and his cut flower trade is also extensive, while, as our readers know, the exhibits of carnations staged at important shows by Mr. Engelmann are extensive as well as highly meritorious. Visitor.

Chironia ixifera.—This is a valuable greenhouse-flowering plant for the summer months. Like some other subjects, it was introduced very many years ago, and for a time was popular in gardens, then disappeared, or nearly so, and, after a long rest, again made its appearance to be now extensively grown. It is a South African member of the Gentian Wort family, which forms a shrubby plant of a somewhat erect habit and bears a great profusion of pretty lilac-pink blossoms. In the narrow leaves, and their greyish tone, it is somewhat suggestive of one of the dianthuses.—T.

A PROFITABLE SMALL HOLDING.

Prominent among the instances of successful small holdings given in the annual report of the Board of Agriculture for 1912 is the following description of a holding of seven acres, which is all the more interesting from the fact that it is wholly devoted to fruit and flowers:

The tenant in this case began with one rood of land and he has now seven acres, of which three acres are leased from the County Council. One acre was taken from the Council at Michaelmas, 1908, at a rent of £3 5s., and the other two acres were taken from Michaelmas, 1912, at a rent of £3 10s. per acre. The tenant pays, therefore, a rent of £10 5s. for his holding under the Act comprising three acres without buildings, but as he had previously to rent small pieces of land at £5 5s. an acre, he is well content.

The land which was first hired from the Council was part of a 21-acre field which they purchased in 1908 for £50 an acre. It was then a piece of stubble in bad condition, but the present tenant has devoted it mainly to fruit and flower growing. The crops grown thereon in 1912 consisted of asparagus, apple stocks, plums, raspberries, strawberries, and gooseberries, and the following flowers, viz., marguerite daisies, Spanish iris, asters, Michaelmas daisies, and pyrethrums. Prior to Michaelmas, 1912, the holding of 5½ acres afforded employment for the tenant, his son, and one other man, and provided them with their whole living. The flowers are grown between bush fruit, and the tenant estimates that they produce a profit of £50 an acre. They are mostly sold as cut flowers in Manchester and Sheffield, and the tenant also sells plants and apple stocks to other growers, and makes a speciality of mint.

The tenant has also a good-sized glasshouse in his home garden. He grows chrysanthemums and tomatoes with a crop of mint between the two. This year (1912) he cleared out his chrysanthemums before Christmas, and on Boxing Day planted the whole ground space with mint, which was nearly ready for picking on January 20. It will make way for tomatoes. The glasshouse is heated by a central overhead flow pipe, the return pipes being laid on the ground level round the two sides. This arrangement saves the necessity of putting the boiler in a pit, and secures a more rapid circulation and more even heat throughout.

A remarkable feature in the development of fruit and flower growing in this village is the rapid rise in the land values. In 1908 the Council bought land for small holdings at £50 an acre. In 1912 the adjoining field was sold by auction in 2-acre plots. The two plots next the Council's small holdings realised £130 and £125 per acre respectively. The whole field averaged £112 per acre. It is let until Michaelmas, 1913, to a farmer at 30s. an acre rent, and it is now planted with wheat. The purchasers were small men who in several cases have risen from agricultural labourers, and will themselves occupy the land. An allotment field, let at £4 an acre, sold at the same sale for £106 an acre to a purchaser who requires it for fruit-growing, probably raspberries. The County Council purchased 71 acres at the same sale, of which 35 acres of land suitable for fruit-growing averaged £71 per acre. This land was let for farming at 30s. per acre, and is now let by the Council in small holdings at £3 10s. per acre. The development of fruit and flower growing in this village is chiefly the work of small holders, and has been much stimulated by the Small Holdings Act.

Clethra arborea. — Unlike the hardy species of clethra, this is evergreen in character, while it also needs the protection of a greenhouse during the winter months. It forms a large shrub or small tree, clothed with dark green arbutus-like leaves, and the spikes of pure white bell-shaped flowers are borne in great profusion from the points of the shoots during the summer months.—W.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

EPIDENDRUM VITELLINUM. — The plants of this species, and the finer variety E. v. majus, will now be starting into growth, and will need more liberal treatment in respect to root moisture and conditions that will give every assistance in the development of growth. The plants will be found to do quite satisfactory in a light position of the cool or odontoglossum house. In respect to the repotting that may be necessary, this may be done as soon as root action commences about the end of the present month or during the first fortnight in September. I would particularly advise that this species should not be disturbed at the roots more frequently than is absolutely necessary. As long as there is ample room in the pots and the potting compost is in a good state of preservation it is not advisable to disturb them. It will generally be found that they suffer more or less from the effects of repotting, generally shrivelling, and it takes a season before they regain their normal plump state. When the plants are repotted the material used should be of a lasting nature, such as good fibrous peat, two parts to one of chopped sphagnum moss, with sufficient silver sand and broken crocks added to render the compost porous. The pots or pans used should be clean, and at least filled to one-third their depth with drainage. The young or leading growth should be kept slightly above the level of the compost. Shade after repotting, and spray daily overhead, when the outside conditions permit. The variety majus blooms in the autumn, and the growths are more advanced than the type. Immediately the flower spikes make their appearance close observation is necessary to protect them from attacks of thrips and other insect pests, but where the plants are sprayed with some safe insecticide about once a fortnight, these pests will be kept in check.

DISA GRANDIFLORA.—This attractive Cape species will now be flowering freely, and every care is necessary to guard the flowers and young growths at the base from being injured by thrips and greenfly. The plants should be carefully sprayed overhead once or twice daily, taking care not to wet the flowers after they are expanded. The repotting of disas may be done immediately after they pass out of bloom, but here again potting must not be done unless absolutely necessary, and when the plants need more root room. Larger pots may be used than is the case of most orchids. Where plants do well it is surprising the amount of root space they require. The compost used should be of a lasting nature, and made moderately firm, and as they require liberal watering at all seasons of the year, plenty of drainage must be given. The plants should be placed in a moist position where they may have ample light and an abundance of air at all seasons.—H. J. Chapman, Oakwood Gardens.

CONSERVATORY AND GREENHOUSE.

CYCLAMEN.—The pots being now full of roots, it will be safe to give the plants more liberal treatment in regard to watering and feeding. The stimulant should take the form of diluted liquid manure made from cow's or sheep dung, or soot-water. This may with advantage be supplemented occasionally with a little Clay's fertilizer. Keep a sharp look-out for aphis, which attacks the leaves on the under-side. Let the lights be entirely removed on warm nights. Seed may now be sown for raising the early batch of plants. There is nothing better than shallow pans for this purpose, and these must be well drained. The soil must be of a light nature, and free from insect life. Loam, leaf-soil, and sand will form a suitable compost, the latter constituents must be used in accordance with the nature of the loam. Place the seeds about an inch apart on the surface and cover lightly with finely-sifted soil. After a thorough soaking with water cover the pans with a sheet of glass, and place them in a warm house, keeping them shaded till the seedlings are seen.

ARUM LILIES.—These must now be put into the pots in which they are to produce their spathes. The tubers must be carefully divided, keeping those together which look strong enough to bloom. Unless very large plants are desired, 6-inch or 7-inch pots will be quite large enough to use, placing one or two tubers in each. A compost of loam, leaf-soil, cow manure, and old mortar rubble will be suitable, and this must be in proper condition, so that potting may be done quite firmly. When potted place them on the north side of a wall till they have commenced to grow freely. Water must be applied with care till the pots are full of roots. On the approach of frost they must be placed in a light, airy structure.

BOUVARDIAS.—Water to these must be given more freely now that the pots are full of roots, supplying a stimulant at every alternate watering. The growth must not be stopped after this date. Plants growing in an outside border must be lifted before there is any danger of frost and put into pots of a suitable size. Place them in a close frame or pit, and keep close and shaded till they have recovered from the check.

ANNUALS FOR POT CULTURE.—Seeds of various kinds of annuals may be sown now for flowering in spring and early summer. The schizanthuses are perhaps the most popular of all the annuals grown for this purpose, especially the Wisetonensis and Retusus strains. Clarkia elegans is also a very beautiful plant for the conservatory, and is very useful for cutting. Seeds should be sown at the end of the month or early in September in three-inch pots. Place the pots in a frame, and when the seedlings make their appearance thin them to one or two plants. Maintain a steady growth in the frame till the approach of severe frost, and then place in a cool house near the glass.—E. Harriss, Lockinge Park Gardens.

HARDY FRUITS.

STRAWBERRIES.—Layers pegged on small pots, filled with suitable soil, in the beginning of July, will now be well rooted and fit for planting, and they should be set out as early as possible to give the plants ample time to develop good fruiting crowns by the end of the year. See that the land is in good heart, and made somewhat firm; a liberal dressing of soot well raked in will prove very helpful to the young plants. Set out the rows two feet apart, and plant quite that distance in the rows if the beds are to be permanent. If only to fruit one year sixteen inches apart will be ample on warm borders. See that the ball of soil is thoroughly wet before turning them out of the pots, when slightly disentangle the outer roots and plant firmly. If the weather continues dry give the beds a good soaking with water to settle the soil, and in dry weather syringe well overhead on bright afternoons to encourage a free, healthy growth. Keep the soil between the rows free from weeds and the plants from runners. Label correctly, and use large, stout tallies, driving them well into the soil to prevent them being shifted when working amongst the plants.

PLUMS ON WALLS.—Train the young shoots thinly and evenly all over the bare spaces, and if this is not done shorten back to within a few buds the young growths not required. I am greatly in favour of training plum trees fan-shape, and each year adding a few young shoots at intervals all to within a few buds the young growths trained to the walls I mostly obtain the best fruits. Where the growths are too strong to be fruitful, take note of the trees, and root prune during the latter part of October, and in some cases a little earlier. These remarks will apply with equal force to other unfruitful trees.

PEARS.—If not already done it will be advisable to shorten the young shoots back to within a few buds of the base. The leaders, etc., if required for extension, can be left at their full length. Although most of the trees are very lightly cropped, do not neglect the roots, especially surface rooting, feed liberally if the land is poor, and the growths weak. I strongly advise this treatment, so that the buds forming may be strengthened. Soak thoroughly the roots of all trees bearing good crops. We have thoroughly watered all our bush trees three time, the soil being light. Keep the surface between all fruit trees thoroughly hoed and free from weeds, and remove all suckers springing up. It will also be well to see that the ties of young trees are not so tight as to injure the bark, also the suspended labels which may have been fixed with wire.

WASPS.—Should these pests become troublesome, look out for the nests and destroy them. One of the quickest ways is to pour a pint of tar into the entrance of the nest, and place a good turf over it.—H. Markham, Wrotham Park, Barnet.

THE KITCHEN GARDEN.

SPINACH.—To ensure a good supply of this useful vegetable all through the winter at least two sowings should be made. This is necessary in case the earlier sowing runs to seed before the early spring-sown spinach comes into use. For the early sowing it is somewhat difficult to advise as to dates, so much depending upon the locality and character of the soil of the garden. In the majority of cases the first sowing may be made at once, successive sowings (if more than two are required) at intervals of a fortnight. For this crop the soil should be in good condition and should have a good surface dressing of soot and freshly-slaked lime, thoroughly raked in with a wooden rake. If the soil is on the dry side, give it a good watering, and when in a suitable condition, sow in drills drawn about 14in. apart. Land may now be prepared for later sowings, for which Long Standing Prickly is the best variety.

MUSHROOMS.—The material for making up beds in the mushroom house should now be collected; for this purpose stable dung from corn-fed horses is much the best, but this is not always available, and it is necessary to make use of what is procurable. If the necessary amount of material can be quickly collected it should be thinly spread out for a few days to sweeten and then thrown into a heap, which must be turned over several times until the heat is on the decline. When making up the beds the manure should be put together as firmly as possible. Examine the beds daily, and when the heat has declined to about 85 degrees, the spawn may be inserted and the beds covered with loamy soil to a depth of two inches. If the heat declines too rapidly, cover the beds with a good thickness of stable litter. The temperature of the house should be kept at about 60 degrees. In many cases it is not possible to secure material in quantity; it is therefore advisable to make up half beds in preference to having the material laying about too long, and most probably becoming sour and mouldy.

SALADING.—Seeds of corn-salad, mustard and cress, and radishes may still be sown weekly, first giving a copious watering to the soil if dry; cover the beds with mats until germination takes place. Chervil is a herb much in demand in some gardens, and a bed may now be sown on a warm border, the soil being kept moist. It may be either sown broadcast or in drills and not very thickly.—W. Messenger, Woolverstone Park Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Carlisle and Cumberland Horticultural Association.

This border society held its sixth exhibition in the Market Hall, Carlisle, on Wednesday and Thursday, August 13 and 14, and on the same dates entertained the National Sweet Pea Society, which was holding there its provincial exhibition. The Market Hall is a fine place for a flower show, spacious, airy, and well lighted, and the society has a splendid opportunity for good work because of the fine hall at its disposal and the unique facilities Carlisle possesses in being a great railway centre for the North of England and Scotland.

We confess to some disappointment with the Carlisle Show, but it must be remembered that practically all the sweet pea classes were on this occasion under the ægis of the National Sweet Pea Society. It is unfortunate that here, as in the case of so many provincial societies, no addresses are placed upon the exhibitor's class cards, and few exhibitors appear to understand that a great deal of the educational value of an exhibition depends upon the legible and correct naming of their exhibits.

Messrs. Thos. Smith and Sons, Annan, led for a dozen roses with capital blooms in a close competition; Mr. F. J. Harrison was a close second, and did well in this open class; Lieut.-Colonel Woodburne third. For eighteen roses the chief award fell to Messrs. Hugh Dickson, Lim., Belfast, whose G. Dickson, Coronation, Mrs. Cornwallis West, and Ferniehurst were superb flowers; Mr. F. France, Kircudbright, second, and Messrs. Thos. Smith and Sons third. Messrs. Thos. Smith and Sons led for four vases of roses, and Mr. France for six bunches of garden roses. Mr. Thos. McGarr scored for stocks with splendid spikes, his yellow being very fine. Asters were poor, the date of the show being too early for these flowers. For annuals, Mr. E. Keith was placed first for Clarkia Firefly, stocks, and candytuft.

First prize for six bunches of early chrysanthemums was won by Mr. G. Bowness, Burly, with grand bunches of Roi des Blancs, Mrs. W. Sydenham, Crimson Polly, Hector, Leslie, and G. Bowness; Mr. J. Smellie second. In the carnation classes the chief winners were Mr. Joseph Shaw, who had two firsts, and Mr. Jas. Hay. Mr. Thos. McGarr was first for six vases of phloxes, but neither he nor his fellow competitors thought it worth while to label the varieties they exhibited.

Mr. James Hay had the finest collection of hardy flowers, and he set up capital bunches of Romneya Coulteri, Chrysanthemum Mrs. C. H. Bell, fine gaillardias, Bocconia cordata, and Galega officinalis; Mr. W. Hodgson, gardener to F. W. Chance, Esq., second.

The best six bunches of hardy flowers came from Mr. W. Grice, and his best were Helianthus Miss Mellish, a good form of Chrysanthemum maximum, and Achillea ptarmica The Pearl; Mr. Thos. McGarr second, and Mr. J. Hodgson, gardener to Lieut.-Colonel Woodburne, third. Mr. Herbert Thackray, Eda Place, Stanwix, led for a vase of phloxes in a keen competition, and Mr. J. Hodgson was second.

In the class for a dozen bunches of sweet peas, prizes given by Mr. R. Bolton, there were thirteen entries, and the awards fell as named to Mr. Joseph Shaw, Mr. A. W. Appleton, and Mr. J. Farquaharson. The prizes for a dozen varieties offered by Robert Sydenham Limited were given in a local class, and here Messrs. E. Keith, Cambo, Mr. Jas. Hay, and Mr. Hallett were first, second and third respectively. The local sweet pea cup was won by Mr. Thos. Abbott.

The plant classes were not a success, the leading prize-winners being Mr. Jas. Hay, Mr. John Bolton, and Mr. C. Lewis, the first-named taking the lion's share of the awards.

Mr. G. F. Hallett, gardener to Sir R. J. Graham, Bart., Netherby, was a grand first for a collection of six kinds of vegetables, and also first in another class for six kinds where the prizes were given by Messrs. Webb and Son. Mr. F. France, gardener to Samuel Brown, Esq., J.P., Kircudbright, led for twelve kinds of vegetables, and he had grand onions, runner beans, cauliflowers, carrots, beets, leeks, and potatoes; Mr. W. Walton second, and Mr. Hallett third.

The competition in the single-dish classes was capital, but methods of staging were rather rough. Mr. J. Forrester was credited with first place for tomatoes; Mr. J. Farquaharson for onions, a weighty lot; Mr. T. Abbott, for six cauliflowers.

In the fruit classes Mr. W. Scott, gardener to C. H. Shaw, Esq., scored for six dishes of outdoor fruits with fine gooseberries, plums, red currants, and strawberry Givon's Late Prolific. Miss Grill led for two dozen apples. Mr. W. Scott scored for black grapes with heavy clusters of Black Hamburgh, and Mr. Hallett was second. For one bunch of black grapes Mr. T. Fixter led with a beautiful bunch of Madresfield Court. Mr. Fixter was also first for white grapes with Muscat of Alexandria, beautifully coloured; Mr. A. W. Appleton coming second. Apparently no first prize was awarded for six dishes of dessert fruits, but Mr. W. Scott was awarded a second for Muscat and Madresfield Court grapes, Luck of Edenhall melon, Princess of Wales peaches, Spencer nectarines, and Czar plums. Princess of Wales was the peach with which Mr. Scott won first prize for a dish of six.

NON-COMPETITIVE.

The collarette dahlias presented by Messrs. Dobbie and Co., Edinburgh, associated with Gypsophila paniculata, were especially bright, and proved a great atraction, particularly the varieties Princess Louise, Queen Bess, Holyrood, The Czar, Comtesse Icy Hartegge, Goldstein, Prince de Venosa, Skerryvale, a new scarlet and yellow; and May, pure white. The roses from the same firm were fragrant and bright, but in some cases the vases were scarcely large enough for the large bunches staged. Messrs. E. F. Fairbairn and Sons, Edentown, Carlisle, were represented by delphiniums, lupins, hybrid astilbes, double tropæolums, cactus, pompon, and pæony-flowered dahlias, associated with palms and hardy ferns.

A large, circular, and fairly central exhibit put up by Messrs. Little and Ballantyne, Carlisle, was, we thought, rather spoiled by the display of four very large cards high up in the centre. However, it was a good exhibit of well-grown palms, nephrolepis, adiantums, hybrid astilbes, variegated ivies, Vitis Henryi, Salvia splendens, Lilium longiflorum and L. speciosum, crotons, roses, phloxes, and some superb heads of hydrangea. In another part of the hall this firm showed sweet peas.

The most extensive non-competitive exhibitors on this occasion were Messrs. George Fairbairn and Sons, English Street, Carlisle. Arches of smilax formed an elegant background for sweet peas, dahlias, and carnations; to the former we refer to elsewhere. The carnations were perpetual varieties arranged lightly in vases; the pick of these were Geisha, Britannia, Enchantress, the new mauve and red fancy named Cinderella, a new clear seedling yellow of great promise, and a deep crimson, provisionally named Dreadnought. The dahlias were also good, and consisted of tall stands of pæony-flowered varieties behind vases of cactus and pompon sorts, with stands of selected blooms of leading cactus varieties in front.

Messrs. Hugh Dickson, Lim., Belfast, made a handsome display of roses: they used rambling roses on arches as a background, and in front of these they displayed handsome blooms of such capital varieties as Lyon Rose, Pharisaer, Hugh Dickson, Edward Mawley, and H. E. Richardson, brilliant crimson. Mr. H. A. Ellison, West Bromwich, contributed a large and interesting collection of choice ferns that was particularly rich in fine varieties of nephrolepis.

Scottish Horticultural Association.

The monthly meeting of this association was held in the Goold Hall, 5, St. Andrew Square, Edinburgh, on the 5th inst. Mr. King, the president, was in the chair, and there were 75 members present.

A paper, entitled "Villa Gardening from the Professional Gardener's Point of View," was read by Mr. John Highgate, Hopetoun Gardens, South Queensferry. One thing, Mr. Highgate said, which struck one more than any other in connection with villa gardening was the sameness of the subjects used in their embellishment. Possibly what attracted most attention was the lawn, no matter how small, and it added a charm to every flower and shrub around it; yet how often was grass expected to thrive on impoverished soil? Like every other plant, grass required nourishment, and to keep a lawn in good condition it required to be top-dressed with some fertiliser annually. Next to the lawn, perhaps the most important feature of a villa garden was the trees and shrubs. Trees like the lime, chestnut, elm, etc., were entirely out of place in the average villa garden, and when they were lopped to keep them within bounds they lost their true character, and often became hideous. But there were many other suitable subjects for the purpose. True, in our northern climate we had not the extensive variety of trees and shrubs that dwellers in the south had to draw from, yet a large number of very effective subjects, which were little known, could be employed, and among climbing and wall shrubs such things as Wistaria, evergreen thorn, ceanothus, buddleia, escallonia, etc., were recommended. There had been a tendency to belittle the scarlet geranium, calceolaria, and lobelia, but they afforded a great amount of pleasure to those who had not the means or opportunity to grow other things. Nevertheless, there was necessity for greater variety in floral decoration, and begonias, pentstemons, antirrhinums, etc., were mentioned as being well-suited to the purpose. It was a common practice to plant apples and pears on the walls of back gardens, with the view of obtaining fruit, but the walls were generally too low, and cordon gooseberries and red currants would give more satisfactory results, and were much easier to manage.

The exhibits were: Lilium testaceum, L. Humboldti magnificum, L. chalcedonicum, L. chalcedonicum maculatum, and "Feather Fleece" (Stenanthium robustum), from Messrs. Dicksons and Co., Edinburgh, who were awarded a Cultural Certificate for the liliums; Astilbe Pink Pearl, from Mr. John Downie, Edinburgh.

At the meeting on September 2, Mr. J. Stuart, of the Edinburgh and East of Scotland College of Agriculture, will give a lecture on "Fruit and Vegetable Bottling" (with demonstration).

On Saturday, 9th inst., on the invitation of Lord Elphinstone, ninety members of the Scottish Horticultural Association, under the leadership of Mr. King, the president, paid a visit to Carberry Tower. On arrival, the party was met by Mr. Kidd, the head gardener at Carberry, who conducted them over the beautiful gardens and grounds. The ground in the vicinity of the lake, where many hardy shrubs and herbaceous plants have been naturalised, was first inspected, and afterwards the party made their way to the garden, where the artistic displays of roses and hardy herbaceous plants, which are two of the leading features of Carberry, were much admired. A visit was also paid to the quaint Dutch garden, and before leaving

the party was very kindly entertained to tea by Lord and Lady Elphinstone, to whom, on the motion of Mr. King, a very hearty vote of thanks was accorded. Mr. Kidd was also cordially thanked for his kindness and courtesy in showing the party over the grounds.

A visit was afterwards paid to the newly-formed experiment garden of the Edinburgh and East of Scotland College of Agriculture at Liberton, where, in the unavoidable absence of Mr. Chisholm, the party was conducted over the establishment by Mr. J. Harris.

Market Bosworth Agricultural and Horticultural Society.

This society held its annual show on Thursday, August 7, in the beautiful park surrounding Bosworth Hall, and in every respect it may be recorded as a most excellent show so far as the horticultural section is concerned. The entries reached the remarkable total of 1,863, and throughout the keenly-contested classes for flowers and vegetables, as well as fruits, the quality was highly creditable to the exhibitors.

It is customary to make reference to non-competitive exhibits at the end of a report, but the remarkable display of hardy flowers arranged by Mr. F. Bouskell, was so far beyond the average exhibit, and so full of real merit that we feel bound to lead off with a brief description of what we have no hesitation in designating one of the finest exhibits of hardy border perennials ever arranged in a flower show in this country. We have more than once suggested that the best method of showing hardy perennials is to group them on the ground, and in connection with the National Hardy Plant Society we gave at Harrogate The Gardeners' Magazine Gold Medal for a group of hardy flowers arranged in the form of a bed. Mr. Bouskell's exhibit was literally a reproduction of a well-arranged border of excellent hardy perennials, showing as nearly as possible the natural habit, and decorative effect of every subject.

This is exactly what we wish to see, and we are glad to have the opportunity to remark that Market Bosworth has done great service in that its exhibition has been the birthplace of the ideal method of showing hardy border flowers. The exhibit occupied the end of the largest tent. A suitable background was made with bamboos. Prunus Pissardi, acers, etc., and among the principal flowers used were some grand verbascums, liliums in variety, Scabiosa caucasica, and several varieties of heleniums and gaillardias. A gold medal was awarded this exhibit. Mr. H. Rogers, Leicester, also received a gold medal for an effective group of flowering and foliage plants, among which heliotropes, hydrangeas, salvias, and ferns contributed to a fine display. Mr. P. Hurst, gardener to the Earl of Huntingdon, staged a table of choice fruit, which, with the aid of cut flowers and trails of asparagus, etc., was made most attractive. Mr. Hurst was awarded a silver medal.

Sweet peas were very well shown, competition being keen throughout the classes, and the winners may be congratulated on the excellent manner in which their flowers were shown. Roses brought a good number of entries, but it was evident that most of the exhibitors lack the experience in exhibiting necessary to avoid pitfalls in the way of showing uneven sized blooms, staging H.P.'s in classes for teas or hybrid teas, and putting up flowers that only have size to their credit whilst being bad in form and colour.

The flowers of herbaceous plants are evidently much in favour at Market Bosworth, and the classes for nine bunches, six bunches, and single vase brought not only numerous entries but excellent flowers. A vase of Scabiosa caucasica which received a first prize was particularly good, the flowers being of fine form and rich colour. Mr. Bonskell was the exhibitor.

Taunton Deane.

The exhibition held at Taunton on Thursday, August 14, was the forty-sixth annual show organised by the Taunton Deane Horticultural Society, and in extent and excellence it was, despite the fact that the whole district around has suffered a prolonged drought, quite in accordance with the society's high reputation.

PLANTS (OPEN).

The principal class for plants was for a miscellaneous group occupying a space of 13ft. by 10ft. Messrs. Jas. Cypher and Sons, Cheltenham, were the successful exhibitors, their plants being set up in an oval group spanned lengthwise by a rustic arch. A fine Kentia crowned the group, supported on either side the arch by small Cocos Weddelliana, crotons and ferns. Tall, brightly-coloured crotons were tastefully used in the body of the group, and chief among the flowering subjects were cattleyas and odontoglossums, with a few liliums and the graceful spikes of Francoa ramosa. Mr. C. J. Ellis, Weston-super-Mare, was second, his group being bright and effective. Third prize was awarded Mr. A. E. Truman, gardener to A. W. Brock, Esq.

The Messrs. Cypher had the only exhibit of four orchids, for which first prize was awarded. Three entries were staged in the class for a plant introduced within two years, the leading award being made to a splendid plant of Nephrolepis Marshalli, shown by Messrs. Cypher and Son; Mr. J. Stuckey, gardener to Mrs. Shepherd, was second with Nephrolepis Willmottæ. Mr. J. Stuckey took the lead with six begonias, double and single, showing some large, well-flowered plants; second prize going to Mr. W. Hayward, gardener to Miss Neal. These two exhibitors were placed in reverse order for one plant of begonia, and Mr. A. E. Truman took leading honours for four fuchsias. Four zonal pelargoniums found Mr. H. Bruford in the leading position, followed by Mr. J. Parrish, gardener to R. A. Goodman, Esq.

CUT FLOWERS.

A new class was introduced this year for a collection of cut roses, arranged for effect on 6ft. by 4ft. of staging. Only two entries were forthcoming, but they were very good. Mr. J. Mattock, Headington, Oxford, was adjudged the winner of the premier award. Messrs. Jarman and Co., Chard, were second, their stand being nicely built up, but the flowers lacked something of freshness. For eighteen roses, distinct, Messrs. Jarman and Co. received first prize, varieties included in their stand being J. B. Clarke, Florence Pemberton, Mrs. Foley Hobbs, and others. Mr. J. Mattock was second.

Mr. Mattock led the way for eighteen teas, his flowers of Molly Sharman Crawford, Muriel Grahame, E. V. Hermanos, and Mrs. E. Mawley being very good. Second prize went to Messrs. Jarman and Co.

Messrs. Charles Wall, Melrose Nursery, Bath, put up a good group of carnations in a new class for a display occupying 6ft. by 4ft. The blooms were splendidly grown and very fresh and clean, the arrangement was artistic, and the varieties included such good things as Lady Fuller (a rich salmon-rose coloured flower of capital substance), White Wonder, C. W. Ward, Scarlet Glow, and others. First prize was worthily awarded this fine exhibit. Messrs. A. R. Brown, Lim., King's Norton, scored a good win with six bunches of border carnations, each bunch containing six blooms. They had Agnes Sorrel, Clement, Mrs. Ethel Ellson, Lara, Bridesmaid, and Mrs. Chas. Russell; Mr. C. W. Ward came second in this class, and Mr. Jas. Webber third.

A class for dahlias arranged effectively on 6ft. of staging, found Messrs. Jarman and Co. easily first, their flowers and style of arrangement being both good. Messrs. Jarman and Co. were equally successful with six varieties of cactus dahlias arranged in triplets. The varieties used were H. H. Thomas, Mrs. Dyer, Arthur Pickard, Red Admiral, The Imp, and Johannesburg; Mr. J. Stuckey was second, third prize going to Mr. G. Humphries. Mr. Humphries received first prize for nine bunches of pompons, showing a neat, refined set. We heard visitors regretting that none of the varieties bore labels.

SWEET PEAS.

The sweet pea classes were more strongly contested than any other of the flower classes and there were flowers of very good quality shown. Mr. F. Tomlin took the lead for twelve bunches, each containing twenty-five stems, showing remarkably fine flowers on long, stout stems. Etta Dyke, Barbara, Queen of Norway, and May Campbell were noted among others. In a special class provided by Robert Sydenham Limited for twelve bunches, containing fifteen to twenty stems, there were nine entries, Mr. H. Cullwick, gardener to Captain D. MacPherson, securing the first prize. He had Red Chief, Scarlet Emperor, Thos. Stevenson, Barbara, Lilian, Etta Dyke, Lady Evelyn Eyre, Edith Taylor, Princess May, Lord Nelson Spencer, Bertrand Deal, and Moonstone. Second prize was awarded to Mr. A. W. Hosegood, and third to Mr. Chas. Purchase, gardener to W. MacMillan, Esq.

HARDY FLOWERS.

There were four entries in the class for a collection of hardy perennial and bulbous flowers occupying 9ft. by 4ft. Mr. H. Clarke led the way, gladioli being a feature of his exhibit, the spikes, however, being somewhat densely packed into the vases. He had good bunches of Sidalcea Rosy Gem, Chelone barbata, Asclepias tuberosa, and Lilium tigrinum splendens. Mr. Jas. Webber received second prize, but we did not like the manner in which he had mixed his bunches, phloxes, gladioli, and late spikes of delphiniums all being shown in a mixture of colours. Mr. Geo. Humphries was third with a rather stiffly arranged group of very nice flowers. Mr. Jas. Webber was first for twelve spikes of phloxes, Messrs. Rich and Co., Bath, being second prize winners, third place being taken by H. Byard Sheppard, Esq. Mr. Webber also took the lead for twenty-four gladioli, his flowers being of good size.

PLANTS—AMATEURS' AND GARDENERS'.

Some nice groups, occupying a space 10ft. by 8ft., were arranged in the amateurs' class, the first prize being secured by Mr. W. Sims, gardener to the exors. of Major D. H. Doughty. Mr. Chas. Cook, gardener to H. Cornelius, Esq., was second, and Mr. A. E. Truman third. For twelve specimen stove and greenhouse plants, Mr. A. E. Truman scored with some well-grown allamandas, bougainvilleas, palms, etc.; second prize going to Mr. J. Stuckey, who had gloriosa, lantana, crotons, etc. Mr. Truman was again first for six plants, second prize being accounted for by Mr. Chas. Cook. Six ferns, distinct, brought success to Mr. W. H. Bruford. The Mayoress of Taunton offered prizes for six ferns, any one or more varieties, and here again Mr. Bruford scored, Mr. Chas. Cook taking second prize.

CUT FLOWERS.

A class for eighteen bunches of hardy flowers brought some good exhibits, but there was room for improvement in the method of arrangement. Mr. J. Cording, gardener to Rev. P. W. Brancker, was first, showing Romneya Coulteri, Lobelia fulgens, Chelone barbata, Lathyrus latifolius albus, and other useful flowers. Mr. W. Norris, gardener to the Hon. Mrs. Stanley, came second. A very big class for twelve bunches found Mr. H. Ellis the winner, a capital lot of flowers being rather cramped for room on the side staging. Mr. T. Harriss's second prize lot was likewise not seen to the best advantage.

FRUIT.

For a collection of eight dishes of dessert fruit, Mr. G. F. Richardson, gardener to H. St. Maur, Esq., was a capital first. He had both black and white grapes, Melon

Emerald Gem, Plum Orleans, Peach Grosse Mignonne, Apple Rival, and nice dishes of nectarines and pears. Mr. Richardson also won for four dishes with three good bunches of Muscat grapes, melon, peaches, and nectarines; second prize was awarded Mr. J. Stuckey, who lost points on his grapes. The best three bunches of Black Hamburgh grapes were shown by Mr. W. C. Hancock, gardener to Mrs. W. S. Battiscombe, second prize going to Mr. F. J. Little, gardener to Right. Hon. Sir G. Farwell, P.C., and third to Mr. J. Webber. Mr. Richardson took first place for three bunches of black grapes other than Black Hamburgh with fine Madresfield Court, Mr. J. Webber showing the same variety for second prize. Mr. J. Webber won again for three bunches of Muscat of Alexandra with some very good clusters.

VEGETABLES.

Several classes for collections of vegetables were provided by various seed firms. The first prize in Messrs. Carter and Co.'s class was won by Mr. Stuckey with six excellent dishes Mr. T. Harrison was second. Messrs. Sutton and Sons, Reading, also found Mr. Stuckey at the head of the class they provided, Mr. Harrison again occupying second place. The same order was maintained in Messrs. Webbs' class, Mr. Stuckey also winning first prizes provided by Messrs. R. Veitch and Son and Messrs. Clibrans.

NON-COMPETITIVE.

Messrs. J. Kelway and Son, Langport, exhibited a magnificent display of gladioli occupying 100ft. run of table space, and the flushed white flowers of Lady Scott, which received an Award of Merit at the hands of the National Hardy Plant Society's deputation, were of superb form and rich quality. Craiganour, another certificated variety, was grand. Mr. Vincent Slade, Staplegrove Nursery, Taunton, put up an exhibit of large extent and comprehensive character. Zonal pelargoniums were a bold feature, these being Mr. Slade's speciality. Messrs. Isaac House and Son, Westbury-on-Trym, showed a splendid lot of phloxes, border perennials, and a range of choice alpine plants in pans. Messrs. R. Veitch and Son, Exeter, put up a group of shrubby plants, alpines, etc., of great interest. Pentstemon heterophyllus, Pentstemon cordifolium with tubular orange-scarlet flowers, Perowskia atriplicifolia, and Lobelia Cavanillesi were there, but the whole stand teemed with rarities and plants of unusual character. From Mr. Vernon T. Hill, Mendip Nurseries, came bright phloxes and an assortment of hardy flowers. Messrs. A. A. Walters and Son, Bath, showed some good phloxes, pentstemons, kniphofias, and a variety of other hardy flowers, as also did Messrs. Rich and Co., Bath.

Messrs. A. R. Brown, Lim., King's Norton, made a fine display of border carnations, which they set up in an attractive manner in tall tubes and vases. Among their most attractive varieties were Lady Golightly, Royal Velvet, Iberia, Droitwich, Father O'Flynn, and Madge. Messrs. W. E. and T. Cousins, Taunton, had some very artistic floral designs which were pleasing in conception and execution. Mr. C. J. Ellis, Weston-super-Mare, had a number of more or less uncommon plants.

AWARDS.

Gold Medals.—Messrs. J. Kelway and Son, Langport.

Silver-gilt Medals.—Messrs. R. Veitch and Son, Messrs. Isaac House and Son, Messrs. W. E. and T. Cousins, and Mr. Vernon T. Hill.

Silver Medals.—Mr. Vincent Slade, Messrs. A. R. Brown, Lim., and Messrs. A. A. Walters and Son.

NATIONAL HARDY PLANT SOCIETY'S AWARDS.

Gold Medals.—To Messrs. J. Kelway and Son, and Messrs. Isaac House and Son.

Silver Medal.—To Mr. Vernon T. Hill.

Award of Merit.—To Gladiolus Craiganour and Gladiolus Lady Scott, from Messrs. J. Kelway and Son.

Shrewsbury Floral Fete.

(Continued from page 632.)

Sheffield; and third to Messrs. W. and C. Bull, Frome. Messrs. G. Mair and Son, Prestwick, were easily first for two dozen gladioli, with superb spikes of clear, well-opened flowers, their Camicule and Alexander being extra fine; Messrs. Harkness and Sons, second.

Five competitors came forward in the class for a collection of perpetual carnations arranged on a space 15ft. by 4ft. The £15 first prize fell to Mr. Chas. Wall, Melrose Nursery, Bath, who won with a delightful exhibit of well-arranged bunches of Lady Fuller, White Perfection, Geisha, Carola, Mrs. C. W. Waud, White Wonder, Rose Doré, etc., disposed over asparagus sprays and a little Gypsophila paniculata. The second prize fell to Messrs. Young and Co., Hatherley, Cheltenham, who had an imposing display from the ground up to about 12ft. high; they had Mrs. Raphael, Mr. C. W. Waud, Mikado, Sunstar, Empire Day, and Scarlet Gem in splendid form and in quantity. Mr. J. E. Knight, Wolverhampton, third.

A BEAUTIFUL BASKET OF FLOWERS.

Exhibited by Mr. A. Adshead, of Gatley, at Shrewsbury Floral Fête.

First prize for a collection of carnations and picotees was secured by Mr. C. H. Herbert, Acocks Green, Birmingham, with a bright and rather massive display, wherein yellow selfs and yellow-ground picotees and fancies were the chief feature; Messrs. A. R. Brown, Lim., King's Norton, second; and Messrs. M. Campbell and Son, High Blantyre, third.

A good class was the one for a dozen bunches of hardy or half-hardy annuals, the first prize falling to Mr. G. Bamfield, gardener to W. H. Banks, Esq., Kington, who showed scarlet Phlox Drummondi, candytuft, sweet sultan, cactus-flowered sunflowers, Nigella Miss Jekyll, Godetia Schamini, lupins, mallows, yellow stocks, double clarkia (spoiled because all leaves and buds had been cut out of the spikes), and eschscholtzia; Mr. O. Oakley, gardener to A. E. Humphreys Owen, Esq., Berriew, a good second; and Mr. G. Tagg, Stafford, third; ten entries.

For cut pelargoniums the chief awards fell to Mr. A. Myers, Sutton Lane, Shrewsbury; and Mr. E. Bewley, Rathgar, Dublin.

Messrs. Bottomley and Burton, Ellard, beat Messrs. G. Fairbairn and Sons, Carlisle, for a dozen bunches of cactus dahlias, and they were also first for two dozen cactus dahlia blooms on boards, leading with a capital lot for such an early date; Messrs. H. Clarke and Son, Leeds, second. Mr. J. W. Barker, gardener to F. R. Dixon Nuttall, Esq., Prescot, scored for twelve bunches of choice cut flowers, his crinums, lapagerias, anthuriums, gloriosas, and bruguansias being very good; Mr. J. Taylor, gardener to Frank Bibby, Esq., Hardwicke Grange, second.

SWEET PEAS AND ROSES.

Out of a dozen entries in the class for eighteen bunches of sweet peas, arranged on a space 8ft. by 3ft. 6in., Mr. Thos. Jones, Ruabon, was once more the champion, and he set up grand bunches of Etta Dyke, Edrom Beauty, Elsie Herbert, Syeira Lee, Mrs. C. W. Breadmore, Melba, Dobbie's Cream, King Manoel, Agricola, Thos. Stevenson, May Campbell, Marks Tey, Marjorie Linzee, Lavender George Herbert, Audrey Crier, Rosabelle, R. F. Felton, and Prince George; Mr. J. Haycocks, Gyfelia, Welshpool, second; Mr. J. A. Whittaker, gardener to G. H. Garnett Orme, Esq., Skipton, third; and Mr. G. Bowness, Busby, fourth.

Twelve bunches of sweet peas was also a fine class, and there were no fewer than seven entries, the winner of the first prize being Mr. Stewart Robinson, Kington, whose collection included glorious bunches of Anglian Pink, Lady Miller, Hercules, Thos. Stevenson, and Elfrida Pearson; Mr. W. H. Holloway, Port Hill, Shrewsbury, second; and Mr. H. Forder, gardener to Colonel Cornwallis West, Ruthin Castle, third. Mr. J. Roberts, Gresford, won first place for six bunches of sweet peas with excellent bunches of King Manoel, Chas. Foster, Melba, John Ingman, White Queen, and Hercules; Mr. St. Robinson, Kington, second; and Mr. E. Price, Skipton, third.

The displays of roses made a grand feature; the space allowed is 20ft. by 4ft., and the

premier award is a beautiful silver champion rose-bowl value £45, a large gold medal, and £10, the cup to be won three times before becoming the property of a winner. Messrs. Gunn and Sons, Olton, won the cup with a glorious arrangement of roses on pillars, arches, and stands of varying height, the whole exhibit rising above 12ft. high. Lyon, Hiawatha, Molly Sharman Crawford, Irish Elegance, Lady Hillingdon, and Mrs. David McKee were a few of the varieties so delightfully displayed; Messrs. Hugh Dickson, Lim., Belfast, a good second, their general design being much the same as that of the first prize-winner; their blooms on the lower part of the exhibit were of very fine quality, notably King George V., Mrs. Cooper, and Muriel Dickson. Messrs. W. and J. Brown, Peterborough, fourth.

Mr. J. Mattock, Headington, Oxford, was a good first for a dozen bunches of decorative roses with a lovely set of Duchess of Wellington, Lady Waterlow, Mrs. A. Tate, etc.; Messrs. W. and J. Brown second.

FLORAL DESIGNS.

In the floral decorations section, Messrs. Felton and Sons, Hanover Square, London, gained a first for a bouquet of roses with a lovely design in light orange-yellow flowers; Mr. Adshead, Gatley, was placed equal first with a somewhat similar design. Messrs. Felton and Mr. Adshead were first and second for a bouquet of flowers, and both used orchids in a light and dainty fashion. For a bouquet, orchids excluded, Mr. A. Adshead scored with gloriosa flowers and croton leaves, Messrs. Felton and Son coming second with carnations. In the class for a bouquet of carnations, Messrs. Felton and Sons beat Mr. Adshead. The best hand basket of flowers was a magnificent but rather too large exhibit of blue vandas, golden oncidiums, and white odontoglossums and phalænopsis, arranged by Mr. J. Sheratt, Burton-on-Trent. Messrs. Felton and Sons second with a very light design, more in keeping with the schedule requirements. For a hand basket of flowers, orchids excluded, Messrs. Felton and Sons scored with a charming bouquet of pale yellow roses, and Mr. Adshead was a very close second with pink carnations and francoa sprays. Miss Newham, of Ormskirk, led for an epergne of flowers with gloriosas, gerberas, and yellow sweet sultans; Mrs. Verron second.

VEGETABLES.

In the open class for a dozen dishes of vegetables, Mr. E. Beckett, V.M.H., gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, won the leading award with Early Giant cauliflowers (7), 6½; Prizetaker leeks (7), 7; Superb Pink celery (7), 6; Tender and True parsnips (7), 5½; Delicacy cucumbers (7), 6; Ailsa Craig onions (7), 6½; Sutton's Black beet (7), 6; Intermediate carrots (7), 5; Up-to-Date peas (7), 7; Best of All tomatoes (7), 6½; Best of All runner beans (7), 6; Windsor Castle potatoes (7) 6; total, 74 points out of a possible 84. Mr. J. R. Tooley second. Mr. Searle, Castle Ashby Gardens, led in the class provided by Messrs. Clibrans for nine dishes of vegetables; Mr. T. Sanderson, Whittington, second. Mr. J. Taylor, Hardwicke Gardens, led for a county collection of vegetables.

Messrs. Sutton and Sons' prizes for a collection of nine dishes of vegetables brought out seven competitors. Mr. David Gibson, gardener to Captain H. Spender Clay, M.P., Lingfield, Sussex, led the way with splendid Solid White celery, Ailsa Craig onions, New Red Intermediate carrots, Autumn Giant cauliflowers, Satisfaction potatoes, Prizetaker leeks, Best of All runner beans, Best of All tomatoes, and Duke of Albany peas; Mr. James, gardener to Lord North, Wroxton Abbey, Banbury, second, and Mr. J. R. Tooley, Winchcombe, Gloucester, third. The competition for Messrs. J. Carter and Co.'s prizes was also very keen and the best six dishes here came from Mr. F. Barnett, Ellesmere; Mr. E. Deakin, Hay Mills, Birmingham, second, and Mr. T. H. Pugh, Newtown, third.

Mr. A. H. Searle, gardener to the Marquis of Northampton, Castle Ashby, led in Messrs. Dickson and Robinson's class for nine dishes of vegetables; his carrots, Perfection Intermediate, were marvellously long and clean, and his onions were great; Mr. Thos. Jones, Ruabon, a good second, his runner beans and onions being extra good; Mr. W. Griffiths, gardener to F. Rule Owen, Esq., Haverford West, third. The single dish classes for vegetables were remarkably well filled, and leading winners were Mr. J. Birch, Styche, cauliflowers; Mr. J. Wainwright, Nantwich, celery; Mr. Wheeler, Wenvoe Castle Gardens, Cardiff, onions; Rev. J. Davies, Crowle, Worcester, parsnips; Mr. J. Breeze, Coleham, turnips; Mr. W. Weaver, Mold, potatoes; Mr. D. Gibson, runner beans, and Mr. H. L. Collins, Lindley, peas.

Mr. E. Winchester, Birmingham, led for Messrs. Webb and Sons' prizes. Mr. F. Barnett, Overton, Ellesmere, scored in the class provided by Robert Sydenham Limited, followed by Mr. E. R. James, Wroxton, and Mr. E. Deakin, Hay Mills, in a very good class.

MEDAL AWARDS.

We are compelled to hold over our report of the non-competitive groups, but append the awards made in this section:

Large Gold Medals.—Messrs. Hobbies, Lim., Dereham; King's Acre Nurseries, Lim., Hereford; Messrs. Sutton and Sons, Reading; Messrs. Alex. Dickson and Sons, Lim., Newtownards; Mr. Robert Bolton, Warton Carnforth; Messrs. Dickson and Robinson, Manchester; Mr. Amos Perry, Enfield; Messrs. Jas. Veitch and Sons, Lim., Chelsea; Messrs. E. Webb and Sons, Wordsley; Messrs. Bakers, Codsall, Wolverhampton; Mr. E. Beckett, Aldenham House, Elstree.

Small Gold Medals.—Messrs. Jones and Son, Shrewsbury; Mr. E. Murrell, Shrewsbury; Messrs. F. W. Rideout, Cherry Nurseries, Langley, Bucks; Messrs. George Fairbairn and Sons, Botcherby, Carlisle; Mr. James Box, Lindfield; Mr. L. R. Russell, Richmond.

Silver-gilt Medals.—Messrs. John Forbes, Lim., Hawick; Messrs. Dicksons, Lim., Chester; Messrs. Isaac House and Son, Westbury-on-Trym; Messrs. R. Wallace and Co., Colchester; Messrs. Pipers, Bayswater; Mr. R. C. Notcutt, Woodbridge; Mr. Henry Eckford, Wem; Messrs. H. B. May and Sons, Edmonton; Messrs. John Peed and Sons, Norwood; Messrs. Pritchard and Sons, Shrewsbury; Mr. Maurice Prichard, Christchurch; Messrs. Hewitt and Co., Lim., Solihull; Messrs. J. Vert and Sons, Saffron Walden; Messrs. Barr and Sons, Covent Garden, W.C.; Messrs. Fred Smith and Co., Woodbridge; Messrs. Rich and Co., Bath; Messrs. Robert Sydenham Limited, Birmingham; and Messrs. S. R. Compston and Sons, Macclesfield.

Silver Medals.—Mr. H. N. Ellison, West Bromwich; Messrs. G. Gibson and Co., Leeming Bar; Mr. A. Myers, Shrewsbury; Messrs. Jones, Gowram Kilkenny; Messrs. Jarman and Co., Chard; Messrs. Aldersey, Aldersey Hall, Chester; Messrs. A. R. Brown, Lim., King's Norton; Messrs. Stuart Low and Co., Enfield; Messrs. W. H. Simpson and Sons, Birmingham; Messrs. Caldwell and Sons, Knutsford; Messrs. R. P. Ker and Sons, Aigburth, Liverpool; Mr. A. W. Thorpe, Lichfield; Mr. Vincent Slade, Taunton; Mr. H. Woolman, Shirley, Birmingham; Mr. Vernon T. Hill, Longford, Bristol; Mr. G. W. Miller, Wisbech; Mr. G. Underwood, Leicester; and Mr. G. Redmond, Clapham, Yorks.

Bronze Medals.—Miss S. S. Thompson, Handsworth; and Mr. C. W. Price, Brecon.

Fuchsia Alice Hoffmann.—This fuchsia did not take long to become popular for beautifying the flower garden, as its comparatively dwarf, compact habit and great profusion of bloom eminently fits it for bedding purposes. As an edging or an undergrowth to the large growing kinds, it is just the thing. In this variety the tube and sepals are red and the corolla white.—K.

ANSWERS TO CORRESPONDENTS.

DISTRIBUTION OF BARTSIA ALPINA.—S. H., Chard: I believe Bartsia alpina is found in Great Britain; can you tell me whereabouts it has been found at home, and where it is chiefly found on the Continent? My excuse for sending two questions is that, having been released from pressing official duties in another land, I am resuming my old interest in gardening, and have begun to find a great liking for alpine plants. — Bartsia alpina, the little blue-purple-flowered scrophulariad, is found at home, according to Hooker's "Student's Flora," in sub-alpine meadows and wet banks in Yorkshire, Durham, and Westmorland, on the mountains in Perthshire, Ross-shire, and Inverness, and flourishes up to 3,000ft. in Scotland. On the Continent it is found in practically all mountainous regions, and in Arctic Russia. It is recorded from the Sudetic Mountains, the Carpathians, the Pyrenees, the Jura, Vosges, and the Black Forest, and from the Central, Eastern, and Western Alps. We are pleased to hear you are finding an interest in hardy plants, and, so far as possible, we shall be pleased to help you.

APPLE WILLIAM CRUMP.—N. E. M., Canterbury: Some time last autumn you described some of the newer apples in The Gardeners' Magazine. I do not file the "G.M.," but make indexed notes of anything that specially appeals to me, and which I think will be valuable in my particular position. I made notes of the apples described, but, unfortunately, those of William Crump apple have gone astray. If not asking too much, I should be very grateful if you will repeat the description, as probably it may help others who contemplate planting dessert apples in the approaching autumn.—Apple William Crump was described as follows in our issue of November 23, 1912: A dessert apple of so high a degree of excellence as to be worthy of the name it bears. The variety was raised from a cross effected between Cox's Orange Pippin and Worcester Pearmain, and the fruits have much the appearance of those of the latter, both in shape and colour. It is of much higher quality than Worcester Pearmain, the flavour being intermediate between that of the two parents. It is later, and has a much longer season than the last-named, the fruit keeping well into the new year.

ADDRESS.—T. J., Shaftesbury: Mr. S Wyndham Fitzherbert's address is Kingswear, South Devon; we have only one Mr. Wyndham Fitzherbert contributing to our pages, and the address given is quite sufficient.

BRITISH GARDENERS' ASSOCIATION.—G. C. L., Oswestry: During my holidays here I have heard something that has interested me in the British Gardeners' Association, and I should therefore be glad if you will let me know the association's secretary and his address, and where the various branches are.—The secretary of the B.G.A. is Mr. C. Harding, and his address Ulysses, Fortune Green, London, N.W. There are branches of the association at Altrincham, secretary, Mr. W. Ellis, Denzell Gardens, Bowden; Birmingham, secretary, Mr. D. Jones, Bournville; Blackburn, secretary, Mr. J. Batty, The Cemetery, Blackburn; Cardiff, Mr. P. Meyer, Malefort Place, Cathays, Cardiff; Carlisle, secretary, Mr. J. Tait, Lynehow Gardens, Carlile; Colwyn Bay, secretary Mr. C. Cheese, Beech Holm Gardens, Colwyn Bay; Edinburgh, secretary, Mr. J. Harris, College Garden, Liberton; Haslemere, secretary, Mr. H. Eavis, Fir Cottage, Hazel Grove, Hindhead; Kew, secretary, Mr. H. Tindall, Alexandra Road, Richmond; Leeds, secretary, Mr. J. R. Groundwell, Scott Hall Gardens, Buslingthorpe, Leeds; London, secretary, Mr. W. H. North, 18, South Vale, Blackheath; Oxton (Cheshire), secretary, Mr. F. E. Childs, Houghton Road, Upton, Birkenhead; Penrith, secretary, Mr. C. Lamb, Carleton Hill Gardens, Penrith; Sunderland, secretary, Mr. W. Hall, Mowbray Park, Sunderland; Swansea, secretary,

MESSENGER & Co LTD
HORTICULTURAL BUILDERS & HEATING ENGINEERS
LOUGHBOROUGH LEICESTERSHIRE
London Office 122 VICTORIA ST S.W.

The following letter was recently received by us on the completion of a contract for a well-known Member of Parliament.

February, 1911.

"I should not be doing my duty to your workmen if I did not at once tell you, on the completion of your work, how pleased I have been with each and all of them.

"They have been most obliging throughout the whole job, and have endeavoured to do everything in an efficient and thoroughly workmanlike manner, and I must congratulate you upon having such capable employees."

Mr. A. Blackburn, 17, Queen's Road, Mumbles, Swansea; Watford, secretary, Mr. E. G. Hartley, The Lodge, Glenthorne, Harrow Weald; and St. Albans, secretary, Mr. T. Ely, Lower Cravells Road, Harpenden.

EUROPEAN ALPINE CAMPANULAS.—S. H., Chard: Will you kindly give me as complete a list as possible of European alpine campanulas, in an early issue?—The following are all European alpine species of campanula: C. alpina, C. Allioni, C. barbata, C. cenisia, C. excisa, C. linifolia, C. Morettiana, C. pusilla, C. pulla, C. Raineri Perpeti, C. rhomboidalis, C. rotundifolia, C. Scheucheri, C. spicata, C. thyrsoidea, and C. Zoysi.

DISEASED VIOLAS.—B., Suffolk: I enclose a few specimens of violas which represent the condition of scores of plants in my garden. The leaves become spotted, and in many cases punctured with small clean cut holes; the foliage turns yellow and the plants collapse. Kindly say what the disease is, and, what is of more importance, please tell me how to cure it so that I may save the apparently healthy plants.—The disease that has attacked your violas is a fungus named Cercospora violæ, a species that is often troublesome on violets grown under glass. Lift and burn all the plants that are suffering badly, and spray the rest with weak Bordeaux mixture. Propagate from clean stock, and when the bed or border is cleared burn all the old plants, and remove the top two or three inches of soil, burning it or burying it very deeply, so that the possibility of infection from the conidia in the dropped-out circular portions may be reduced to a minimum. Plant new stock on a new site if possible, and spray occasionally with weak Bordeaux mixture as a preventive.

NAMES OF PLANTS.

B. R., Sherborne.—Calochortus venustus.

L. A., Upminster.—1, Drosera rotundifolia; 2, Eecremocarpus scaber.

M. E. H., Bowden.—1, Sedum Sieboldi variegata; 2, Watsonia Ardernei; 3, Hibiscus Cooperi.

S. D., Bingley.—1, Bouvardia Humboldti; 2, Rhodochiton volubile; 3, Thunbergia alata; 4, Calceolaria Burbidgei.

G. J. G., Hertford.—1, Sidalcea candida; 2, Rudbeckia laciniata; 3, Polygonum Baldschuanicum; 4, Potentilla argentea; 5, Isatis glauca.

M. C. G., Warminster.—1, Alonsoa Warscewiczi; 2, Actæa spicata; 3, Lysimachia vulgaris; 4, Trachelium cœruleum; 5, Platystemon californicus.

OBITUARY.

MR. JOHN FURSE.

We regret to record the death of Mr. John Furse, of Raglan, Briton Ferry, South Wales, which occurred on the 15th inst. in his 71st year. A native of Paignton, South Devon, he migrated some fifty years ago to South Wales, where he had obtained an appointment in the gardens of Rheola. Later he was appointed head gardener to the late Griffith Llewellyn, Esq., at Raglan Hall, where he eventually became gardener and bailiff, and later was appointed steward also. The late Mr. Furse was forty-five years at Raglan Hall, and retired in February last owing to ill-health. He was highly esteemed by his employers, and also by the many men who passed through the gardens during his long term of office.

GARDENING ENGAGEMENT.

Mr. R. Day, for eleven years head gardener to G. F. Rutter, Esq., Coulamore Priory, Bedford, and seven years head gardener to S. E. Hurst Hodgson, Esq., St. Mary's Abbey, Bedford, has been appointed head gardener to F. Langdon, Esq., J.P., Highfield, Boston Road, Derby.

FORTHCOMING ENGAGEMENTS.

NEXT WEEK.

TUESDAY, August 26.—Royal Horticultural Society; committees meet at 12 o'clock; lecture at 3 p.m. on "Begonias," by Messrs. Blackmore and Langdon; Scientific Committee at 4 o'clock.

Royal Horticultural Society of Ireland; Summer Show.

FRIDAY, August 29.—Dunfermline Show; two days.

Dundee Show; two days.

CATALOGUES RECEIVED.

JAMES VEITCH AND SONS, CHELSEA.—An admirably illustrated catalogue of bulbs, roots, and shrubs for forcing, and of seeds for autumn sowing, etc.

LAXTON BROTHERS, BEDFORD.—Strawberries, small fruits, and roses are included in the present catalogue, but strawberries are the most prominent feature.

WILLIAM PAUL AND SON, WALTHAM CROSS.—An illustrated catalogue of bulbs and other winter and spring-flowering plants, together with strawberries, etc.

DICKSON AND ROBINSON, CATHEDRAL STREET, MANCHESTER.—Bulbous plants, shrubs for forcing, strawberries, and roses are all listed in this firm's new issue.

ANT. ROOZEN AND SON, OVERVEEN, near HAARLEM.—A very comprehensive and interesting bulb catalogue. The general agents for Great Britain are Messrs. Mertens and Co., Cross Lane, St. Mary-at-Hill, E.C.

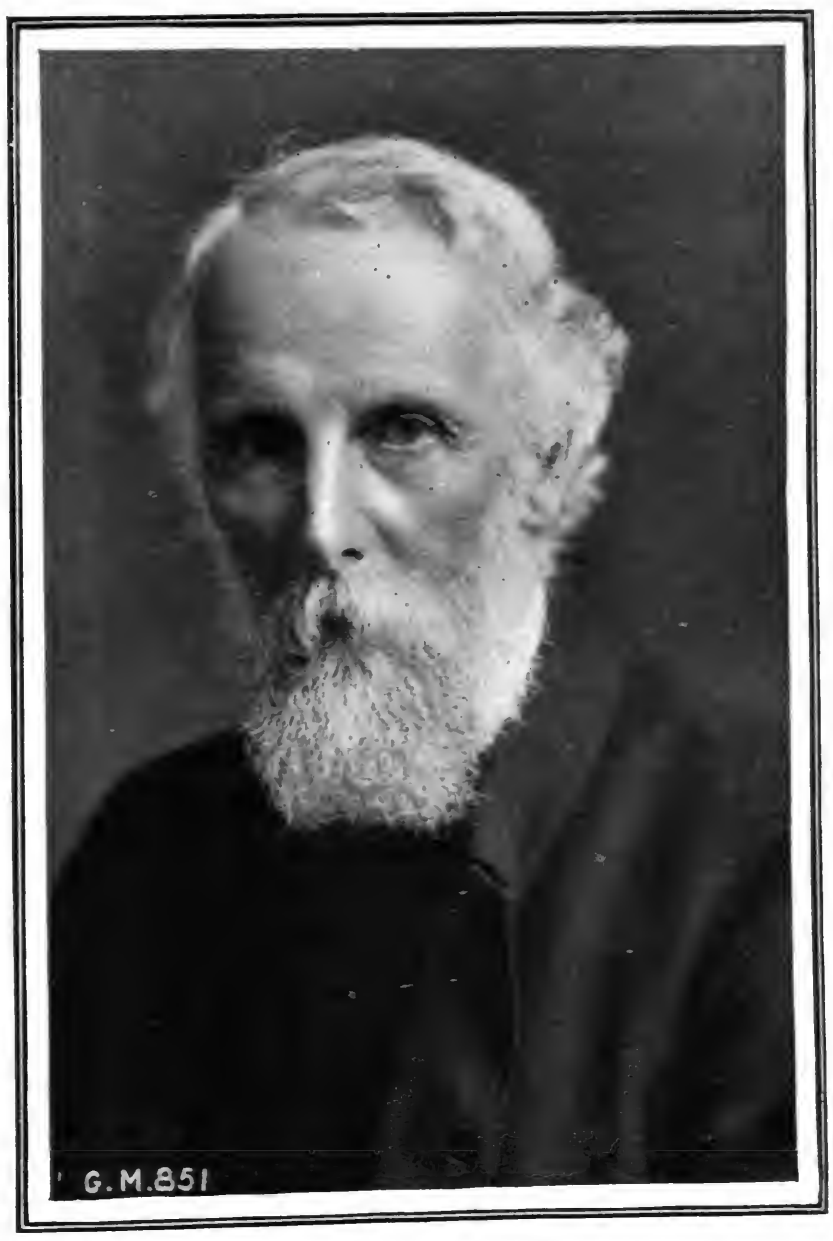
NOTE OF THE WEEK.

Increase and Usefulness of Daffodil Shows.

However divergent may be the views held with regard to the usefulness, or otherwise, of many of the horticultural exhibitions held in this country, there can be no question that those held with the object of extending the cultivation and encouraging the development of daffodils have exercised a highly beneficial influence upon both the culture and the improvement of these delightful flowers. We have only to go back some thirty years, which is by no means a lengthy period in the history of either the garden or these flowers, to find ample evidence of the assistance the exhibitions have rendered in popularising the daffodils as garden flowers, and in bringing into prominence the many beautiful varieties that we owe to the energy and judgment of the raisers. Forty years ago daffodils were practically unknown to the general body of horticulturists. Many owners of gardens, and a considerable number of those engaged in garden management, had, it may be assumed, read of the work that had been accomplished by Dean Herbert in the hybridisation of certain of the species. Some may also have heard of the splendid work that was being done in the creation of new forms by the late William Backhouse and Edward Leeds, whose accomplishments will long remain fresh in the memories of those who have a strong affection for these flowers. Beyond this the knowledge of daffodils did not extend very far. Few indeed were those who, between thirty and forty years ago, gave serious attention to their cultivation, as proved by the fact that not in one garden in five hundred were daffodils to be met with. Here and there, during the season of spring, a few flowers of the common Lent lily might, in some old orchard, have been seen nodding their golden flowers to the passing breeze, and in a few gardens, early in the year, the old Narcissus telamonus plenus might have been met with growing in pots for the supply of cut flowers or for contributing to the attractions of the conservatory. There were a few to whom the daffodils were well known—the late Peter Barr, for example; but daffodil culture, as we now understand the term, was practically unknown. It was not, indeed, until the exhibition and conference held by the Royal Horticultural Society at South Kensington, in the spring of 1884, that daffodils attracted any considerable share of attention from the flower-loving community. The exhibition was, with the conference, held in the great conservatory, and, as the pioneers of the cult made strenuous endeavours to obtain an adequate representation of the species and their varieties then available, the flowers shown produced a display that was very attractive, and of much interest. It was, indeed, so comprehensive and beautiful as to come as a veritable surprise to the greater proportion of the visitors, of whom not a few at once recognised their charms, and also their possibilities, in spring gardening. Subsequent to this epoch-making show the daffodil cult made rapid progress, but the pace was not such as to exhaust even those who had proceeded to enrich their gardens with the finer varieties, without giving much consideration to the question of cost The impetus given to the interest in daffodils by the 1884 exhibition was unquestionably great, and it was well maintained until 1896, when a second exhibition, with conference, was held by the Royal Horticultural Society at Chiswick. In far greater numbers were the flowers shown on this occasion than at South Kensington six years previously. A larger number of the seedlings that had been raised by William Backhouse and Edward Leeds were represented, and there was a considerable increase in the exhibitors, this last point being of interest as evidence of the greatly-increased popularity of the daffodil. After the Chiswick exhibition the cultivation of the older forms, and the production of new varieties, proceeded by leaps and bounds, and, in due course the Royal Horticultural Society found it necessary to add a Daffodil and Tulip Committee to its existing agencies for dealing with new introductions. The society has, by means of its fortnightly meetings held during the spring season, afforded further opportunities to both growers and raisers for presenting the finest examples of their skill to public notice. These have been taken advantage of, and visitors have been able to see the novelties as they made their appearance, and to become well acquainted with all the finest of the varieties that are in commerce, while the facilities for determining the relative merits of new varieties, and for showing visitors the best of those which are no longer new, have been increased. Much has, within the past twenty years, been done in the provinces to stimulate increased interest in daffodils and their cultivation. There are now ten provincial societies that have for their object the extension and improvement of daffodil culture, and the oldest of these is the Cornwall Daffodil Society, which was founded in 1896, and has its headquarters at Truro. From the first its exhibitions have been



REV. T. G. WYATT.

of a high order of merit, and the influence for good they have had on the daffodil cult throughout the West of England would be difficult to overestimate. Two years later the Midland Daffodil Society was formed, with Birmingham as its headquarters, and, having regard to its constitution and the lines along which its work has been conducted, it may be described as very closely approaching the ideal special society. The schedule has from the first been of so comprehensive a character as to enable all classes of cultivators to take part in the competition. There are classes adapted to the requirements of the leading trade cultivators, and classes that are specially suited to the amateur with but limited scope for the exercise of his skill; there are classes in which raisers alone can stage varieties raised by themselves, and there are others in which varieties that have not been in commerce more than four years can alone be shown. On the other hand, there are classes from which varieties exceeding in value a specified sum are excluded. Thus it is that all who are desirous of competing can do so under conditions that possess the element of equality, and then, at the close of the first day, the exhibitors and others interested in the show dined together through the liberality of the late Mr. Robert Sydenham, and, after the function, talked over matters relating to the society and the flowers with which it is concerned. The other daffodil societies are Lincolnshire (1901), Devon (1903), Huntingdon and Kent (1906), Hereford and Kingsbridge (1909), Glamorgan, and Presteigne, and they are all doing excellent work. Whether the number of societies specially associated with these flowers should be increased depends, in a large measure, upon local conditions, but there can be no doubt as to the advantages that would result from giving daffodils greater prominence in the schedules of spring exhibitions of a general character than has yet been assigned them.

Rev. T. G. Wyatt, the Vicar of Hayward's Heath, is a lover of gardens and gardening because he delights in all that is beautiful in nature and in the "art which does mend nature," and also because he finds that a knowledge of gardening enables him the more readily to reach the hearts of his people, and is a distinct asset in his ministrations. He is an enthusiast, and ever since he, with a few others, instituted the Haywards Heath Horticultural Society over five and twenty years ago, he has been the moving spirit in the society's work. For many years he acted as treasurer of the society, and he has invariably advocated a forward movement consistent with the society's finances and the growth of the district. It is his great hope that the Haywards Heath Society may become the central horticultural body for the county of Sussex, and he points out that his church, St. Wilfrid's, is exactly in the middle of the county, and that Haywards Heath is admirably served by railways, and has in late years become a great centre of commercial horticulture, especially in connection with orchids, carnations, and hardy plants. He is himself very keenly interested in roses and hardy border flowers, but the former have to give place to the latter in their importance in his garden. He is an excellent showman, and with his gardener, Mr. J. E. Shirley, succeeds years after year in winning the chief award in a special class for eighteen bunches of hardy perennials. For three successive years he has held the premier position, and now the coming of age cup, presented by Sir J. E. Kleinwort four years ago, becomes his property, and Mr. Shirley has a gold medal to remind him of these successes. Haywards Heath is fortunate in having such an able and enthusiastic worker as the vicar, a fact that is fully recognised by the residents, as evidenced by the high degree of popularity he enjoys. If the county families rally round the Rev. T. G. Wyatt, there is no good reason why the vicar's dream of a great central county show should not come true in a few years hence.

Salix magnifica.—With reference to this new and handsome willow, the Hon. Vicary Gibbs writes from Aldenham House as follows: "I was interested to read in your issue of August 16, p. 612, Mr. W. J. Bean's remarks on the above. I am entirely in agreement with him that it is one of the most striking among the many plants introduced from China by Mr. Wilson, and should prove to be an invaluable plant for marshy places in the ornamental grounds. I came possesed of a small plant through the kindness of Professor Sargent, of the Arnold Arboretum, about two years ago, which is, at the time of writing, 7ft. 7½in. in height. The size of our largest leaf is, length including petiole, 11½in., without petiole, 10in.; breadth of leaf, 5in., which I may mention is considerably larger than those described by Mr. Bean; and it will be interesting to observe what height it will attain in this country. Judging from its present behaviour, it promises to exceed that of its native habitat. Our plant this year has made growth 5ft. 10in., with its roots confined in a pot."

Instruction in Practical Forestry.—A scheme has been prepared by the Board of Agriculture with a view to afford an opportunity for young men who have had a scientific training, and are desirous of entering the Forestry Service in the Dominions or under the Indian Government, to receive practical forestry instruction in the Forest of Dean from the Chief Administrator of the Forest. An application has been made to the Development Commissioners for assistance in financing the scheme, and they have undertaken to give it sympathetic consideration. Within recent years the Forest of Dean has been greatly improved under the administration of the Department of Woods and Forests. The erection of a wood distillation factory at Park End, in the forest, should be useful to the owners of large woods who are desirous of obtaining a knowledge of the best methods of disposing of their bye-products. In the distillation factory the wood-refuse which would otherwise go to waste is distilled, and from it are produced acetate of lime, tar, wood-spirit, etc. It is proposed to erect a hostelry for the accommodation of the students.

Fairy Flies and their Hosts.—So little, comparatively speaking, is known of the somewhat large group of minute flies scientifically known as the mymaridæ, that the recent lecture given by Mr. F. Enock, F.L.S., before the Royal Horticultural Society possessed, in a marked degree, the element of freshness. It was also so intensely interesting that, in thanking Mr. Enock at the close of the proceedings for his lecture, Mr. George Gordon, who presided, said he had no doubt not a few of the large number of Fellows present would be under the impression that they had been listening to a fairy tale rather than to the exposition of great scientific truths. Eighty years ago some thirty or forty species were known, but now the number is large, and Mr. Enock stated that since he had turned his attention to them he had added 180 species to the list. All the known species are small in size, even Polynema flanipes, the largest of them, being only one-twentieth of an inch in length, while the smallest, Alaptus minimus, is one-ninety-fifth of an inch long. For elegance of form and richness of colour these microscopic flies are veritable fairies. Their chief interest to horticulturists consists in the fact that they lay their eggs in the eggs of other insects, with the result that the latter are destroyed. One of the species lays its eggs in those of the white cabbage butterfly, and thereby renders material aid in checking the multiplication of this handsome, but troublesome, butterfly. Mr. Enock showed on the screen a batch of about 600 eggs that had thus been destroyed.

A Famous Bird Charmer.—A short time since the National Horticultural Society of France awarded its gold medal to M. Pol, who for nearly a quarter of a century has been a well-known figure in the gardens of the Tuileries, and his remarkable influence over the sparrows, which he fed daily, has interested many thousands of visitors. The society which has recognised M. Pol's work in the training of the sparrow has of late years devoted special attention to the protection of wild birds in France, and, in accordance with the fitness of things, made the presentation in the Tuileries Gardens.

The Florist's Bibliography.—We learn that a new edition of this useful work of reference by our old correspondent Mr. Harman Payne, is in the press, and will be shortly ready for publication. By the addition of a supplement the work has been brought up to date, and it now contains the details of every work, in all languages, that deals with florists' flowers and the flower garden. A comprehensive index of authors is also added, thus rendering research much more easy. The publishers are Messrs. Wesley and Son, 28, Essex Street, Strand.

The Public in Private Grounds.—On the 20th inst. "The Times" devoted one of its leaders to the question of opening private parks and gardens to the public, and strongly advocated an extension of this privilege wherever practicable. With reference thereto Sir Frank Crisp, Bart., who has freely opened the beautiful gardens and grounds of Friars Park to the public, wrote as follows: "May I support your article of yesterday on this subject by my personal experience of admitting the public to private gardens? I first opened my garden (which is a garden, and not a park) at Henley-on-Thames, 15 years ago, and it has been open ever since on Wednesdays in each week from May to October. On Bank Holiday fêtes over 4,000 people visit it, and on ordinary Wednesdays the record stands at over 700. Children are not excluded. The garden is of a special character in so far as it consists of a variety of more or less unusual features (including mediæval gardens, a Japanese garden, underground caves by land and water, sundials, a maze, Alpine effects, greenhouses, etc.) that require careful treatment, and in parts specially careful treatment where the ordered tracks are narrow and deviation likely to be injurious to plants. During the whole 15 years, with more than 100,000 visitors, only three cases of definite damage have been recorded. Ten years ago a man gathered a bunch of rhododendrons; five years ago a cannon was taken from a sundial, and last Bank Holiday a china image was broken. Full freedom is given to all, and a notice at the entrance gate has the (strange to say puzzling) inscription, 'Don't

keep off the grass." On the day following the 4,000-people fêtes the only difference to be seen in the garden may be compared to the difference between the head-dressing of my cottage neighbours' wives when in their morning attire, and that of the afternoon, when a light touch has removed a little dishevelment. After ordinary days no difference can be detected even by a critical eye."

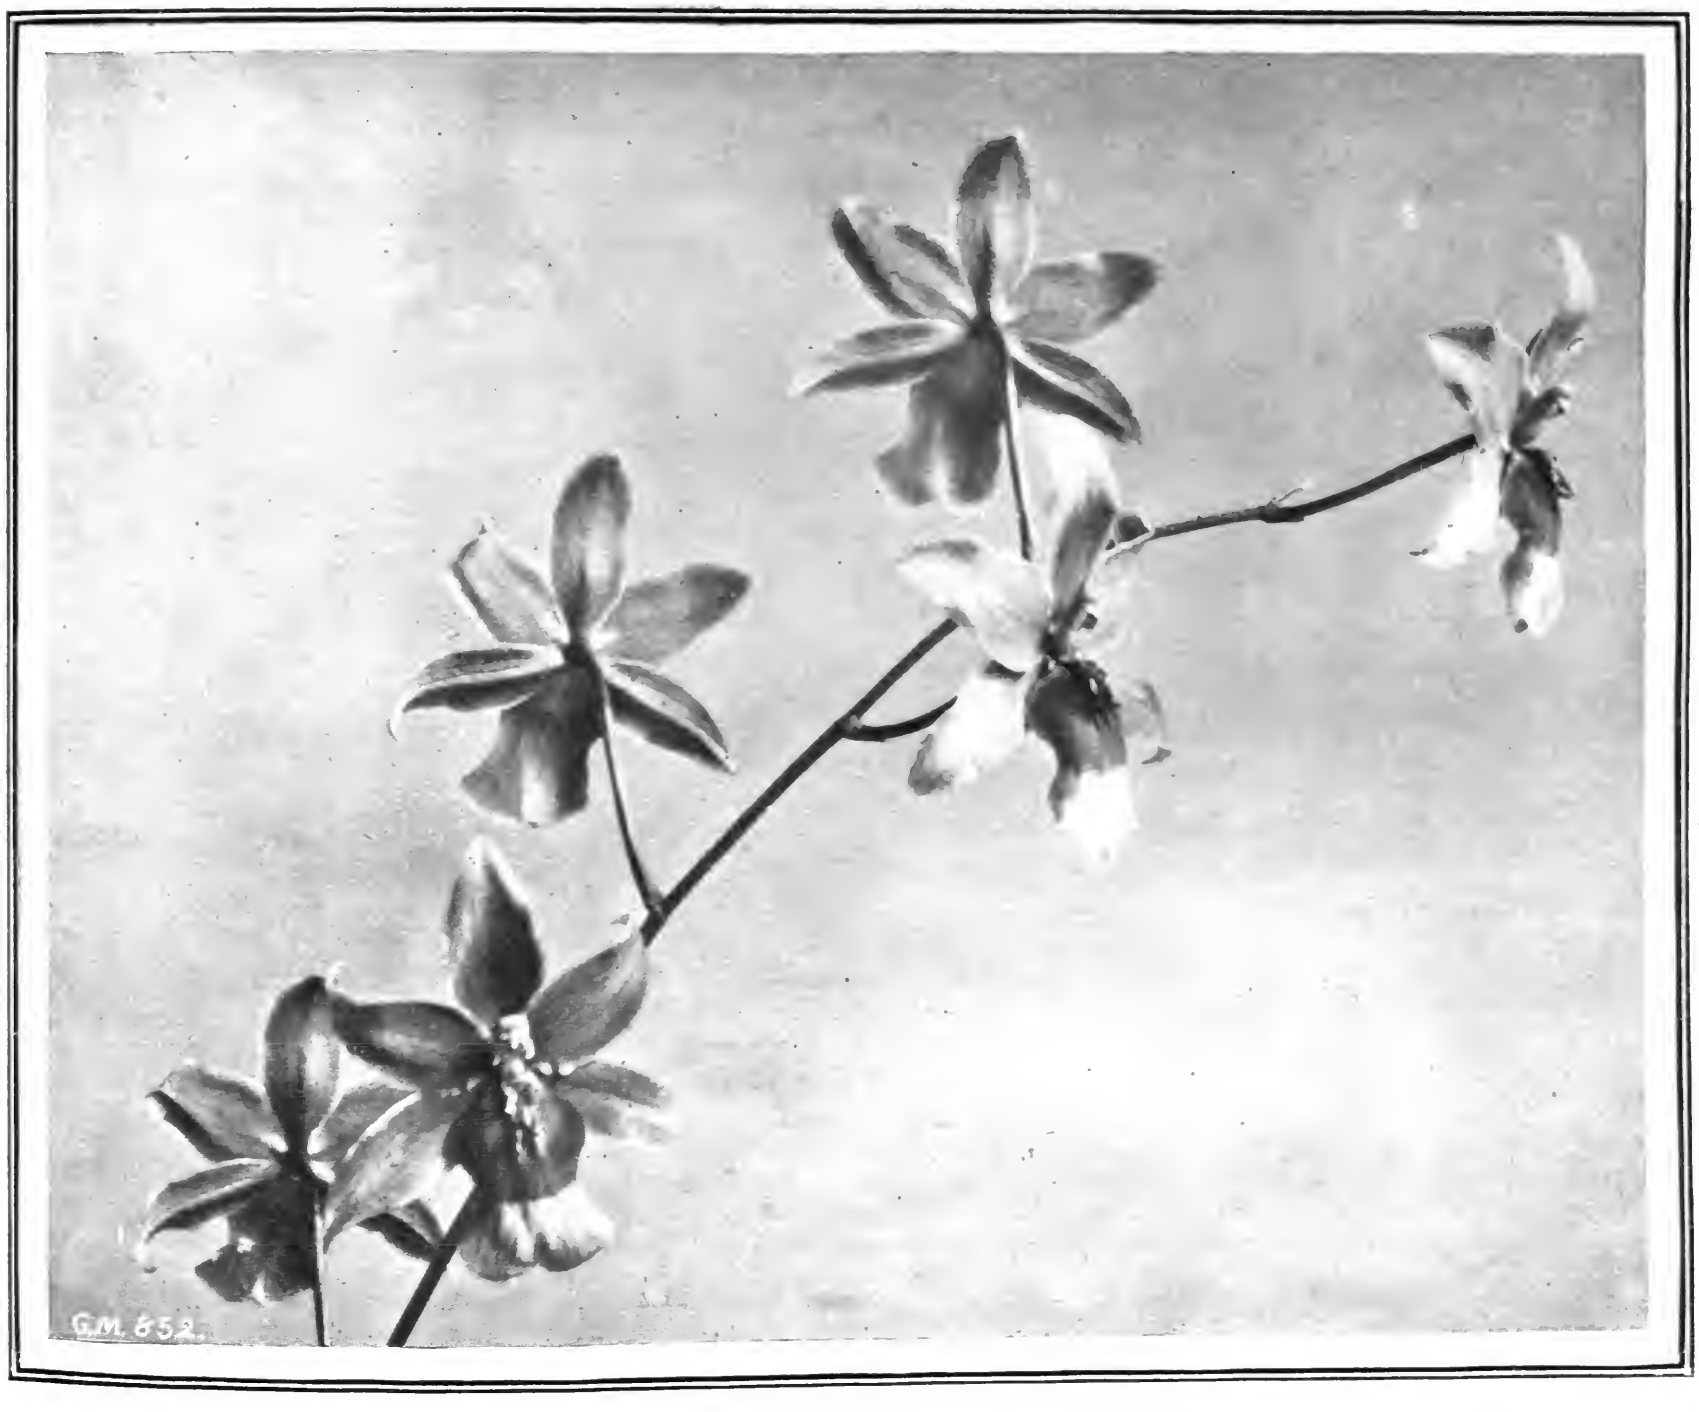
The National Diploma in Horticulture.—For a considerable time it has been felt desirable by the more advanced horticulturists that a Diploma should be available for professional gardeners which would be an indication of real professional ability on the part of the holder. In 1912 the Council of the Royal Horticultural Society approached the Board of Agriculture on the subject, with the result that the approval of the Board was given to the proposal, and authority from his Majesty's Government obtained for the Diploma to carry the title "National." The Diploma will be awarded by the Royal Horticultural Society on the result of examinations, which will, as far as possible, be held in the latter part of June of each year, and we give, in another part of this issue, the scheme that has been prepared for carrying them out. To this we specially direct the attention of our readers, especially those who are entering on their gardening career, and have a real desire to attain, in due course, a high position in the craft. We derive much satisfaction from the fact that the candidates will be required to show that they have a sound general education before proceeding to the preliminary, for it is hardly less essential to success than the higher distinction, and certainly not difficult to attain by those possessing an ordinary degree of intelligence, and are equal to some amount of sustained effort in the utilisation of the time available for leisure. It is satisfactory also to find that candidates must have served at least four years in a public or private garden, nursery, or approved public institution, or in two or more of the several establishments. We would strongly advise all young men who have adopted horticulture as their profession to take advantage of the opportunities the examinations will afford of testing their knowledge of the practical and scientific sides of horticulture, and, if possible, of obtaining a distinction that will afford evidence of considerable ability. While it will be possible for those engaged in gardens and nurseries to obtain the Diploma, their chances will be considerably enhanced by their entering an approved institution wherein special attention is given to examination work, for two years or so.

New Park for South London.—It is satisfactory to be able to record the fact that the London County Council have included a public park in their scheme for the clearance and development of the Tabard Street area, which is a short distance from the Southwark Bridge Road, on the south side of the Thames, and one of the largest of the slums in London. The nearest open spaces are Kennington Park and Southwark Park, and both are about one and a-half miles from the area. The need for a small park, or recreation ground, in the locality is, therefore, great, and the London County Council have decided to devote the central portion, about five acres in extent, to public use, and lay it out as a recreation ground.

King of Buganda at Reading.—A few days since the King of Buganda, who is now in England, paid a visit to Messrs. Sutton and Sons' establishment at Reading. The King, who was accompanied by five of his chiefs, was received by the members of the firm, and shown over the various departments in the Market Place, and was subsequently taken to the trial grounds in the London Road. Need it be said the many features of the establishment proved of much interest to the King?

Discolouration of Peaches when Packed.—The brownish colouring and unpleasant flavour assumed by peaches in course of transit over long distances has for some years past been a matter of considerable concern to the American growers of these fruits. This deterioration has been generally attributed to what is known as "ice-scald"; but, according to the investigations made by Mr. G. R. Hill, of the Cornell University, the injury is not the effect of temperature, but is due to an accumulation of carbon-dioxide within the paper wrapped round the fruits to protect them in the course of transit.

New Open Space for Chertsey.—Mr. H. E. Paine, lord of the manor for Chertsey, has presented to the town the land known as the Sand Pits, and has offered to contribute to the cost of providing seats, etc.



ODONTIODA CRUYENSIS VAR. EILEEN.

Flowers purple, with large crimson blotch on the lip. F.C.C., R.H.S., August 26. J. Gurney Fowler, Esq., Glebelands, South Woodford.

THE NATIONAL DIPLOMA IN HORTICULTURE.

The following is the scheme for the National Diploma in Horticulture to be awarded by the Royal Horticultural Society under the arrangements approved by the Board of Agriculture and Fisheries:

1. Candidates for the Diploma must
   (a) Register themselves with the Society, and
   (b) Pass two examinations, a Preliminary and a Final.

2. The Examinations are open to both men and women.

Registration.

3. Candidates must register themselves at least four months before the date fixed for the Preliminary Examination, and may do so at any time after they have attained the age of 19.

4. In order to register themselves candidates must supply the Council of the R.H.S. with
   (a) A birth certificate as evidence of age, and
   (b) Some documentary evidence of the sufficiency of their previous general education (paragraph 5).

5. To satisfy the requirements under 4b, the certificate of the College of Preceptors, the Oxford and Cambridge Local Examinations Boards, Matriculation at any British University, or any similar certificate which may from time to time be approved by the Council of the Society will be accepted.

Candidates who are unable to produce any such certificate must submit themselves to (and pass) a qualifying test established by the Society in the simple subjects mentioned in Syllabus 1.

Qualifications for the Preliminary Examination.

6. Registered candidates before sitting for the Preliminary Examination must, by the date of the examination,
   (a) Have reached the age of 21 years, and
   (b) Have served at least four years
      (1) in a public or private garden or nursery; or
      (2) in an approved Horticultural Institution, and have received a satisfactory report as regards conduct and work from the authorities of such Institution; or
      (3) partly as in (1) and partly as in (2).

Note.—It is absolutely necessary for all Candidates for the Diploma to pass the Preliminary Examination before they can enter for the Final, but the Preliminary Examination by itself does not entitle those who pass it to any form of Diploma.

Qualifications for Final Examination.

7. The Final Examination is only open to those who have passed the Preliminary Examination, and have subsequently been engaged for not less than two years in the Practice of Horticulture.

The Practice of Horticulture includes the following:—Florists, Fruit Growers, Gardeners, Horticultural Inspectors, Horticultural Instructors, Landscape Gardeners, Market Gardeners, Nurserymen, Public Park Gardeners, and Seedsmen.

8. Candidates for the Final Examination must give at least four months' notice to the Society of their intention to present themselves in order that sufficient arrangements may be made.

Nature of Examination.

9. In both Examinations the principal part will consist of tests of the candidates' practical acquaintance with plants and general garden work, and practical knowledge of horticulture. The practical tests will be conducted in a suitable garden or nursery, and will be supplemented by viva voce questions and written papers. Candidates will be required to pass in all three parts of the examinations: practical, viva voce, and written; but no amount of excellence in the written part will qualify a candidate if he fail in the practical.

Time of Examinations.

10. The Examinations will, as far as possible, be held in the latter part of June of each year.

Fees.

11. The entrance fees, which are payable in advance, are—
   (a) for the Preliminary Examination, £1;
   (b) for the Final Examination, £3.

Half the entrance fee will be returned to candidates unavoidably prevented from attending the examination.

There will be no fee for registration, or for the qualifying test when that is necessary.

12. The fees payable by rejected candidates entering again will be 10s. for the Preliminary Examination, and £1 10s. for the Final.

Examination Centres.

13. The Examinations will be held at different centres in Great Britain, regard being had especially to
   (a) The number of candidates in any district, and
   (b) The suitability of a locality for the practical part of the examination.

14. All particulars, forms, etc., may be obtained from the Secretary of the Royal Horticultural Society, Vincent Square, London, S.W.

SYLLABUS.

I.—Qualifying Tests.

Candidates requiring to take this test (paragraph 5) will be expected to

15. Write on some given subject of general knowledge, as a test of their handwriting, spelling, and ability to express themselves clearly and grammatically.

16. Show an acquaintance with arithmetic up to and including decimals and elementary mensuration. The questions asked will usually be such as might occur in ordinary garden practice.

17. Having a general elementary knowledge of geography, such as the relative positions of the principal countries of the world, with some knowledge of their climates and of the causes which determine climate.

At this stage no special knowledge of plants will be expected of the candidates.

II.—Preliminary Examination.

The Preliminary Examination will be based upon the general principles of plant-growing, an elementary knowledge of botany, chemistry, and physics, as far as acquaintance with these subjects is essential to an understanding of garden practice. Care will be taken to ascertain that the Candidate is able to perform the operations of gardening with proper skill, and also that he understands the reasons for the methods employed.

The Examination will be based on the subjects mentioned in the following Syllabus, many more questions being asked than will be required to be answered, so that candidates will be given considerable choice.

Syllabus.

18. Choice of site, laying out, levelling, etc., of a garden.

19. Composition of soils, and the manner of their formation.

20. Cultivation of the soil: Trenching, digging, hoeing, raking, rolling; drainage and its effects upon soil and crops; the relation of the plant to the soil. The making of composts.

21. Preparation of the ground for crops, and rotation in cropping.

22. Nature and uses of manures in the garden.

23. The part played by root, stem, leaf, flower, fruit, and seed in the life of the plant. The effect of water, air, light, and temperature on the growth of plants, and the influence of these on the choice of aspect and soil.

24. Seed sowing, transplanting, and permanent planting.

25. Cultivation of kitchen garden plants.

26. Care of lawns, paths, flower beds, herbaceous borders, and rock gardens.

27. Methods of propagation by seeds and vegetative processes.

28. Cultivation of ornamental plants under glass: ventilation, watering, and regulation of light and temperature.

29. Fruit and vegetable cultivation under glass.

30. Planting, pruning, and training of fruit trees and bushes in the open on walls and otherwise.

31. Planting, pruning, and training of ornamental trees and shrubs, including roses.

32. Knowledge of the ordinary names, Latin or English, of garden plants, shrubs, trees, and weeds.

33. Symptoms and treatment of the commonest plant diseases and insect pests. Methods of fumigation and spraying.

34. Use and care of tools and implements employed in the making and maintenance of gardens.

III.—Final Examination.

The Syllabus for the Final Examination will be divided into sections, each dealing with one particular branch of horticulture. Candidates may enter for the branch in which they feel themselves most proficient. Syllabuses will be published later.

SUBSIDISED ORGANISATIONS.

The President and Council of the Royal Horticultural Society have asked me to communicate to you the following report of their Parliamentary Committee on Subsidies to Co-operative Organisations:—

"Your Committee, whilst welcoming the subsidies given out of public monies to agricultural and horticultural organisations, when such organisations confine themselves to educational, experimental, and research subjects, deprecates any subsidies from Government, County Council, and other public bodies being granted to any organisation which is allowed to embark in trading pursuits, holding it to be manifestly unfair to private traders to allow such subsidised organisations to be financially helped to compete with the trade. Your Committee desires also to point out a further aggravation of the injustice, viz., that often such subsidised organisations do not pay local rates and taxes, nor income tax, whereas private traders have to bear their full share of such burdens."

The Parliamentary Committee of the R.H.S. was established in March last. Its object is generally to watch over the interests of horticulture in all its branches, and to advise the council of the society of opportunities (1) for using the great influence of the society, either in initiating legislation in favour of horticulture, or for influencing measures in any way affecting horticulture which may at any time be introduced into Parliament: and (2) for informing the Department of Agriculture and Horticulture of the views, wishes, and wants of horticulturists; and (3) for co-operating with the Department in any useful and desirable horticultural movement.

W. WILKS,
Secretary, R.H.S.

Plumbago rosea.—The plants of this attractive species are now growing apace, and where attention has been paid to stopping and giving plenty of room for development, they are well furnished with side growths. Those required for early winter-flowering should be pinched for the last time about this date, while those required to be at their best after Christmas may be stopped again about the last week in September for the last time. They must not be allowed to suffer from dryness at the roots, and they will be greatly improved by a weekly application of some approved plant fertiliser until the colour of the flower is seen.—H. Prime.

NEW DAFFODILS.

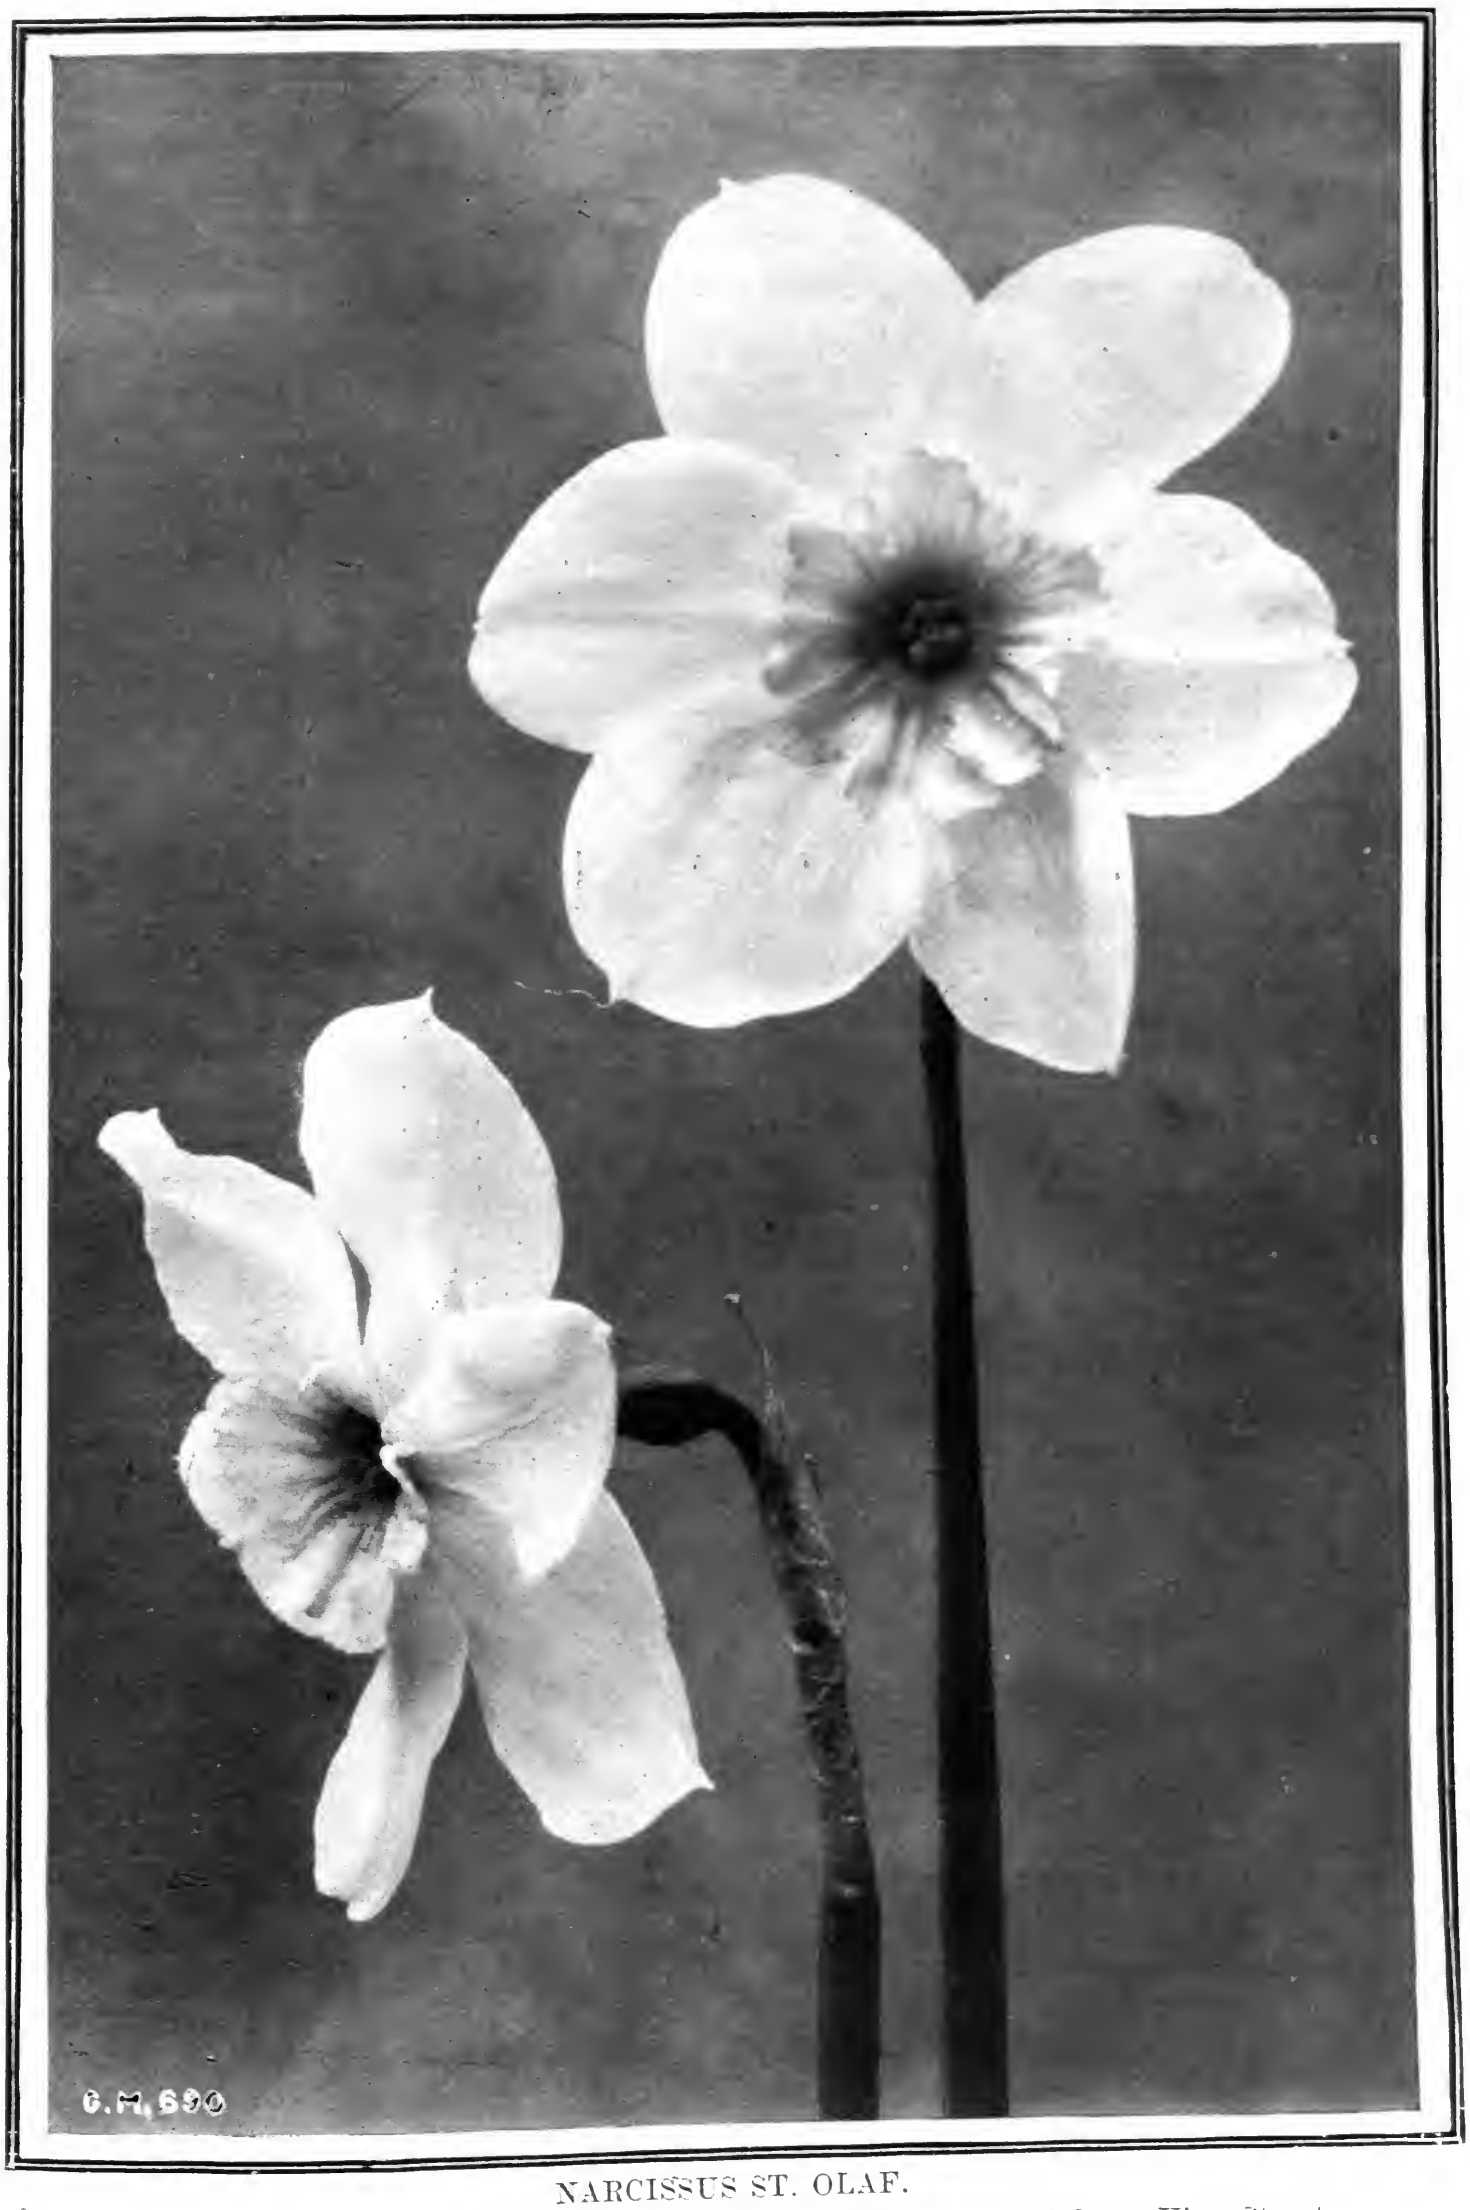
The following descriptive notes of new daffodils, will, I hope, prove of service to readers of The Gardeners' Magazine, especially at this season, when the best varieties are being ordered and planted.

and the trumpet is exquisitely rolled back at the mouth. This variety gained a F.C.C. at the hands of the R.H.S., April 15, 1913—a rare honour nowadays.

Brilliancy (R. H. Bath, Lim.).—This is flower is a very much glorified Barri conspicuus. It is a large and very showy flower, and lasts wonderfully when cut. I have seen blooms three weeks old still looking quite passable. The plant is a good doer, and increases rapidly.

Kingdom (W. T. Ware).—A giant Leedsi of faultless form, with overlapping segments of pure white, large, well expanded cup of pale lemon-yellow, prettily frilled. A.M., Midland Daffodil Society, 1913.

Norah Pearson (J. R. Pearson and Sons).



NARCISSUS ST. OLAF.

A distinct and beautiful Leedsi, raised by Messrs. Barr and Sons, King Street, Covent Garden, W.C. A.M., R.H.S., April 15, 1913.

Mdme. Ernst Krelage (Krelage).—A very perfect white trumpet daffodil, somewhat like Mdme. de Graaff, but superior in every way. The perianth is very flat and firm, not quite a novelty, but is a grand thing, and deserves to be widely known. There are many of the same breed (C. J. Berkeley x Red Cup), but I think this is the best. The —A very distinct giant Leedsi. A very firm-looking flower with somewhat pointed petals, large, deep cup of deep lemon-yellow. A.M., Midland Daffodil Society, 1913.

Lord Lister (Welchman). — A very fine white trumpet exhibited by Mr. Welchman in his prize collection of white trumpets at Birmingham, 1913.

Emerald Eye (Cartwright and Goodwin). —A very distinct and dainty Leedsi, with the deepest green eye I have yet seen. This novelty was much admired at the Midland Daffodil Show this year.

Queen of Hearts (C. Bourne). — Not quite a novelty, but still one of the best of the red-cupped section. The flower is of good size, and well set up; the perianth is of a pale maize tint, with large expanded cup of brilliant orange. A.M., Midland Daffodil Society, 1913.

Challenger (J. R. Pearson and Sons).— This variety, raised by Mr. Crosfield some years ago, has not been much seen by the public, as it is very late; it is a faultless flower of the Barri type, with pure white segments of an almost leathery texture, and a nearly flat eye, yellow, with deep band of bright red. A very healthy plant, but a slow propagater.

Poeticus Dulcimer (Hawker).—A very fine poet, of the Recurvus type; the eye is deeply banded with crimson. A.M., Midland Daffodil Society, 1913.

Evangeline is quite an old friend with some of us, but it only gained its A.M. this year, when it was wonderfully well shown by Mr. Phillips, of Olton. The first year or two I had this plant I thought very little of it, but this year, on bulbs which had stood for two years on light soil, it was grand, the rows being covered with blooms, nearly all of which were fit for exhibition.

Vestal Virgin (J. R. Pearson and Sons). —This was bought from Mr. Henry Backhouse as a white trumpet, but I can hardly classify it as such. It comes in the same category as Mdme. de Graaff—i.e., it is white if one cuts it young and opens it in water. Nevertheless, whether it be called white or pale bicolor, it is a grand thing—the blooms are so very firm and perfect in form; it is also a very robust plant, and the flowers are carried on really long stems.

Poeticus Caedmon (Barr and Sons). A very large and well-formed flower of the Recurvus type, with a beautifully-banded eye of deep crimson. (A.M., R.H.S., April 15, 1913). Admirers of this fine novelty will have to wait a while, as Messrs. Barr and Sons tell me they have already parted with all the stock they have to spare.

Crœsus (A. M. Wilson).—This is generally considered the finest red-cupped variety which has been as yet sent out. It is a large and almost perfectly round flower of pale maize, with a very large and widely-expanded cup of deep orange-red. Besides being a flower of the highest exhibition character, it has a fine long stalk, and the plant is very robust in habit; while the bulb is large and shapely. I remember when unpacking my bulb from Mr. Wilson, exclaiming: "What a grand bulb for a red-cupped daffodil!" First-class Certificate, R.H.S., and Midland Daffodil Society.

Europa (W. T. Ware).—This is a very fine pale bicolor trumpet daffodil, with a long stalk and nice pose. The blooms exhibited on April 15, 1913, at Vincent Square, gave promise of a vigorous plant, and received an A.M. at the hands of the Daffodil Committee.

Gipsy Queen (J. R. Pearson and Sons).— A large and attractive Barri. The segments are pale maize colour when the bloom is young, passing to white with age. The cup is large and spreading, yellow-edged, deep orange-red; long stalk, and a healthy and rapidly-increasing plant on light land.

St. Olaf (Barr and Sons).—A perfectly distinct and very attractive Leedsi, which should in the near future be frequently met with at exhibitions. The flower is pure white, of good size, and perfect form. The cup or disc is of the flat or Englehearti type of a pale citron shade. A.M., R.H.S., April 15, 1913.

White Emperor (C. Bourne and Cartwright and Goodwin).—This is a very beautiful and perfectly white trumpet daffodil, much in the way of Mdme. E. Krelage, but, to my mind, a better flower. It is perfect in form, balance, and pose. A.M., R.H.S., April 1, 1913.

The above does not exhaust the list of good things exhibited this season, but I think the editor would grumble at the space required if the list were to be extended.

Duncan Pearson.

Lowdham, Notts.

INEXPENSIVE DAFFODILS FOR EXHIBITION.

Daffodils are so accommodating in their cultural requirements that they may, with a few exceptions, be planted at any time between the months of August and December, with the full assurance of their yielding freely in the following spring of the floral wealth with which Nature has so liberally endowed them. The late period at which the bulbs can be planted with satisfactory results is an advantage to those who grow daffodils specially for the production of colour effects in the flower garden, inasmuch as it enables them to defer the planting of the bulbs until the beds have been cleared of their summer occupants. There is no other advantage in delaying planting operations after the proper season for such work, and, as in the case of the bulbs of other plants, those of daffodils undergo some deterioration when they remain out of the ground for any considerable period. The large, solid bulbs of such varieties as the Emperor and Empress suffer less from exposure than do those belonging to the incomparabilis section, but in no case is it possible to obtain such finely-developed flowers as from bulbs that are planted within a comparatively short period of their being lifted. Early planting is, therefore, essential to success in growing for exhibition, and it is most desirable in the case of choice varieties, for from that practice alone can bulbs of the finest possible quality be obtained in the following season.

Therefore those who are desirous of achieving success in the production of flowers for exhibition should make a beginning at once by purchasing bulbs of the varieties they are desirous of growing Those to whom the cost of the bulbs is not a matter requiring serious consideration will select from the newest of the varieties they have seen at the exhibitions, or that have been described in these pages. Others there are who fully appreciate the charms of these flowers, but have to be content with varieties that are so moderate in price that they may be described as inexpensive. At the exhibitions of a considerable number of daffodil societies classes are provided for collections of varieties that may be purchased at a certain price, and usually there is a spirited contest for the prizes offered. In some cases these classes constitute a feature of much interest, for fortunately the number of the finer forms that are inexpensive is now very considerable.

For the guidance of those who purpose exhibiting in the restricted classes the following selection has been prepared. It should be useful also to those who wish to grow a selection of varieties of a higher order of merit than those grown for decorative purposes, for the purpose of enjoying the individuality of the flowers. None of those mentioned exceed four shillings per bulb, but the majority are much lower in price. The catalogues of the firms advertising in the pages of The Gardeners' Magazine will give all the information necessary with regard to this detail. The selection is as follows:

Trumpet Varieties.

Bennett Poë.—A beautiful triandrus hybrid; the flowers pale yellow with elegant trumpet.

Cornelia.—A late-flowering variety, the perianth of great breadth and the trumpet finely expanded; the colour soft yellow.

Duke of Bedford.—A superb bicolor, the flowers of the largest size and superb form, the perianth white, and the trumpet soft yellow.

Glory of Leiden.—A remarkably handsome variety that possesses much value for the garden as well as for the exhibition stage; the perianth is soft yellow, and the trumpet deep rich yellow.

King Alfred.—One of the finest of the rich golden trumpets; the flowers are of the largest size and fine form. It is vigorous in growth.

Glory of Noordwijk.—A remarkably fine bicolor, the flowers similar in form and colour to Empress, but at least double the size. They are highly refined, and the elegant frilling of the trumpet adds considerably to the charm of the flower. The plant is very strong in growth.

Mrs. H. J. Veitch.—In its general aspect this beautiful variety bears a resemblance to the Emperor, but the flowers are larger, and possess greater refinement. The broad perianth is pale yellow, and the finely-expanded trumpet is rich golden-yellow.

Madame de Graaff.—Unquestionably the best of the cream-coloured varieties in its section, and fortunately now so inexpensive that it may be planted by the hundred in the garden. The flowers are of large size, with stout perianth, lemon-white passing to cream-white, and the finely-formed trumpet is soft primrose passing to white. Twenty-six years have elapsed since this variety received the distinction of a F.C.C. from the Royal Horticultural Society, and as yet it has no superior.

Mrs. Betteridge.—A beautiful variety, with stout, regular perianth and a straight trumpet of considerable length, and with an elegant fringe or rim; colour ivory-white.

Victoria.—A handsome bicolor, the flowers large in size and of good form; the cream-white perianth is broad and of good substance, and the elegantly-frilled trumpet is bright yellow.

Weardale Perfection.—One of the finest varieties of its class, for while possessing a constitution and effectiveness that renders it of the highest value in the garden, it bears flowers of so high a quality as to place it in the front rank of exhibition varieties. The flowers are of large size, the cream-white perianth is of great breadth with overlapping segments, and the finely-shaped trumpet is of a pleasing yellow hue.

Incomparabilis Varieties.

Amber.—A charming variety with broad, white perianth and a rather deep, bright yellow cup, which is sometimes suffused with amber.

Flambeau.—An effective flower, the perianth yellow and the large cup bright orange.

Fusilier.—A charming variety, with flowers of comparatively large size, the perianth cream-white and the cup scarlet.

Gloria Mundi.—A superb and deservedly popular variety, the flowers large, with fine, rich yellow perianth and large, fully-expanded orange-red cup.

Homespun.—A remarkably fine flower, large in size, with superb form, and of a rich yellow colour.

Lady Margaret Boscawen.—An exquisitely beautiful variety, the flowers large and of fine form, the perianth pure white, and the well-expanded cup deep yellow.

Magpie.—A large, well-formed flower, with white perianth and lemon-coloured cup.

Queen Sophia.—A charming flower, with sulphur-coloured perianth and a bright orange-coloured, widely-expanded cup.

Solfatare.—A pleasing flower of high quality and of a pleasing lemon colour; the perianth is formed with broad, stout segments, and the cup is of considerable length and well expanded.

Strongbow.—A handsome flower, the segments pure white, smooth, and of great breadth, and the cup rich yellow and widely expanded.

Barri Varieties.

Armorel.—An attractive variety, the flowers large with white perianth, the centre light green with orange margin.

Beacon.—A very handsome flower, with finely-formed, yellow perianth, and deep red, flat crown.

Circlet.—A charming flower of large size, the perianth even in outline with overlapping segments and of the purest white, the centre yellow with deep orange margin.

Cresset.—An excellent variety, the flowers of fine form, the perianth white, and the cup bright red.

Incognita. — An exquisitely beautiful flower of rather large size, the perianth cream-white, and the centre apricot.

Red Armorel.—An effective flower, the perianth white, and the centre red.

Sea Bird.—A distinct variety, with flowers of relatively large size, perianth white, tinted green at the base of the segments, and crown deep yellow.

Southern Star.—A comparatively large flower of fine form, the perianth white, and the crown yellow with red margin.

Leedsi Varieties.

Ariadne.—A distinct and beautiful variety, the flowers of fine form, the perianth pure white, and the spreading, frilled cup ivory-white.

Bianca.—A charming variety, with pure white perianth and bright yellow cup.

Evangeline.—A beautiful variety, with flowers of exquisite form, the perianth white with overlapping segments, and the widely-expanded cup lemon-yellow.

Maggie May.—A large flower of superb form, the perianth white, and cup bright lemon-yellow.

Selene.—A distinct variety, with large, finely-formed flowers, the perianth white, with long, citron-coloured cup. The plant has a robust habit.

White Lady.—A popular and beautiful variety; the flowers large, with broad, smooth, white perianth, and finely-frilled, pale yellow cup.

Poeticus Varieties.

Barcarolle.—An effective variety, the flowers of large size and fine form; the white segments of great breadth, and the centre margined with red.

Cassandra.—A vigorous-growing variety, bearing large flowers with broad, overlapping pure white segments, and a small centre with deep red margin.

Comus.—A handsome flower of large size and fine form, the perianth pure white, and the centre with broad edge of bright red.

Horace. — A handsome variety, the flowers large and symmetrical, and the centre brilliant red.

Laureate.—A beautiful flower with large perianth, the segments slightly recurved, the centre yellowish with red margin.

Virgil.—A distinct flower of large size and superb form, the perianth white and of good substance, the centre bright red.

Walt Whitman.—An attractive flower of good form; the perianth is regular in outline, and the centre is pale green, passing to light red at the margin. G.

DAFFODILS FOR CUTTING.

The cultivation of daffodils for the production of cut flowers has of late become an important branch of horticulture, both commercially and for private use. It is not, however, on the subject of growing for market that we wish to deal at the present time, but the production of flowers for home decorations. There being few, if any, of our early spring flowers that are more popular than these, it is necessary, where large quantities are required for decorating rooms, that special treatment be afforded them. It will, however, be found that of the numerous varieties in cultivation not many are suitable for cutting, for though the flowers are most beautiful in themselves, and are borne on long stems that enable them to be arranged with effect, they are wanting in substance, and on that account soon fade when introduced into the dry atmosphere of a warm room in the dwelling-house.

NARCISSUS EUROPA.

A fine bicolor trumpet variety, raised by Messrs. W. T. Ware, Lim., Inglescombe, Bath. A.M., R.H.S., April 15, 1913.

Soil Preparation.

To grow daffodils well a deep, rich, loamy soil is necessary, and the plants must have ample room to develop their foliage. It is surprising what a difference there is in the quality of the flowers even of the same variety when liberal treatment has been afforded them. In private gardens quarters in the kitchen garden, or a piece of spare ground, should be set apart for the plants required to give a supply of cut flowers. This will obviate the necessity of cutting flowers from those in the beds

and borders, which remain where they will continue to bloom and make the place gay. It is a mistake to cut the flowers growing in the borders. This often renders the latter unattractive. The plot of ground set apart for this purpose need not be a large one, but should be of sufficient size for the requirements of the establishment, and situated in a rather sheltered position, and out of sight as much as possible. for such a place cannot always be kept as tidy as one would wish. A piece of land of this description is always useful, not only for providing cut flowers, but for growing plants and bulbs to fill up gaps elsewhere. As it will be found necessary to lift a portion of the bulbs each year, the space should be sufficiently large to admit of this being done, as the best and finest flowers are obtained from bulbs the second season after planting. They have then become established but not so overcrowded as to deteriorate, as in the case of those undisturbed for a number of years. To ensure the production of finely-developed flowers the ground must be liberally treated. For this reason, as soon as the bulbs have been lifted, which should be directly the foliage has died down in summer, give a liberal dressing of thoroughly decayed manure, and dig this in as deeply as the soil will admit, then leave rough until planting time.

Planting.

The best time for planting is the first opportunity in September, for the earlier the bulbs are planted after the present month the better will they become rooted before winter sets in. A stronger growth will, as the result, be made in spring.

Planting is most readily performed by taking out small trenches. These should vary from three to six inches deep, according to the size of the bulbs to be planted. If these lines are a foot apart this will admit of a person walking between the rows to gather the flowers without injuring the foliage. The bulbs should be placed at even distances from each other, the larger size about three inches, and those of the smaller kinds two, which will allow ample room for them to attain full development. When planting is completed the ground should be raked over to make it level. It can then be left until spring, when a hoe should be run between the rows to destroy any small weeds that may be making their appearance.

Cutting the Flowers.

Gathering the flowers is an operation that requires more care than is generally bestowed on such work, and those who have the responsibility of filling the vases would do well to only gather those flowers that are just expanding, as such will last much longer when placed in water.

Varieties to Grow.

As the daffodils may be in season from the open ground for at least four months in the year, care should be taken to make a selection that will ensure flowers both early and late. The first variety to bloom in the open that has any substance in its flowers is the well-known and popular yellow variety, obvallaris or Tenby. If given some protection, flowers of this may be had from a sheltered spot as early in the season as February. To have really good early flowers we must turn our attention to Golden Spur. When grown in a sheltered place, and the winter is mild, flowers of this may be had towards the end of February. Their rich golden colour is very effective, and as the stems are of considerable length, the flowers are useful for large vases, which is a consideration.

When we look back to the days of the introduction of Emperor, one wonders how it was that this did not command a higher price, seeing so many of less value that have been placed on the market since. It is now more than thirty years since we purchased the first bulbs of this variety, and still look upon it as one of the best of its class. The flowers are large in size, of good substance, standing on long, stout stems, which when well grown often exceed eighteen inches in length. For cutting this is without doubt a fine kind, as the blooms remain a long time in perfection when placed in water. Horsfieldi was introduced more than a quarter of a century ago, and though not so large as Empress it is earlier, and on that account more useful, though a few of each may be planted. Their flower-stems are a foot or more in length. Sir Watkin is a variety that has become so very popular that acres of it are grown specially for the production of cut flowers. It is a mid-season kind, which produces large yellow flowers of good substance. When grown in a deep, rich soil, in a moist, sheltered place, the flower-stems exceed two feet in length. Barri conspicuus is a grand variety, especially when grown in a moist, shady place, as the flowers are then much larger and of a better colour; the stems are also much longer than they are when grown in the open. M. J. Berkeley, when well grown, is one of the best late varieties we have. The large yellow flowers are borne on long, rather slender, stems of a very dark green hue. As a decorative variety this is par excellence, as it stands well in water. Poeticus ornatus should be grown by all who have to provide large quantities of flowers for decoration, it being the most useful of its class.

J. B. M. Camm is a most beautiful variety, having long, trumpet-shaped flowers, which when grown in the shade are pure white, and keep fresh for a considerable time in water. Grandee is a late bicolor that should be grown in a moist, shady place so as to prolong the season of its usefulness. Should the ground be inclined to become dry, give a copious watering; this will somewhat retard the blooming period. Madame de Graaff is somewhat after the form of J. B. M. Camm, but the flowers are larger and produced on longer stems. Maximus is also a deep orange-coloured variety that lasts well in water. Gloria Mundi is one of rather recent introduction, that will prove to be a good variety for decorative purposes. When well grown the flower-stems of this are about fifteen inches in length, and of sufficient substance to hold the flowers well up. There are, of course, many others, but those named have proved with us to be amongst the best.

Some of the light forms of Leedsi and Barri are very pretty, and look well in vases, but they have not the lasting properties of those named, and where flowers are required in great quantities the gardener has to make them last as long as possible, especially where space for their production is limited. We have grown many thousands of daffodils of different kinds for the production of cut flowers, but found there was always the greatest demand for those that remain fresh the longest.

H. C. Prinsep.

Salvia patens.—In the beautiful blue of its flowers, this salvia has but few rivals, on which account it is always admired. It was introduced from Mexico in 1838, and, as might be expected of a native of that region, it is none too hardy in this country. Owing to this its tuberous roots are often lifted in the autumn, and wintered where safe from frost as dahlias are.—T.

DAFFODILS FOR FORCING.

The forcing of daffodils for winter and early spring-flowering is becoming more popular year by year, and this is not to be wondered at, seeing the very many beautiful varieties that are being raised, some of which are probably more suitable for cultivation under glass or shelter of some kind than for the open ground. But my task is to give a few notes on those varieties which can be had in quantity, and cheaply, and with a minimum of attention will produce a wealth of bloom early in the year. Narcissi, to be of much use as a source of profit, must be early, as one cannot always depend on the Scilly Islands crop being a failure, and when the flowers from these isles are put on the market, it naturally means that there is a distinct drop in price. Private growers have not this matter to worry about, but they nevertheless require to have narcissi in bloom as early as they are to be seen in the shops, or they will have some very pointed questions to answer.

Forced daffodils certainly do come in at a time of the year when they can be appreciated, for, if we leave out the chrysanthemums and carnations, there are very few flowers at this season which can be cut with good stems, and they are a welcome change after a long season of the two other flowers.

Early potting or boxing is decidedly an advantage, and the work must be done in the latter part of August or early September for the earliest varieties, following on as soon as possible with the later ones. Boxes possibly produce the best results, as the greater amount of soil ensures a more equable state of moisture than where pots are used, and though this may not make much difference while they are plunged out of doors, yet, when taken from under the plunging material, the pot-grown plants are likely to receive a check by becoming dry, and more often than not the failure of early forced bulbs is, I think, a result of insufficient moisture at the roots. At Woburn Place we have the banks of a stream planted with various varieties of daffodils, and those nearest the water, which are flooded two or three times during the winter, are invariably earlier and stronger than those further up the banks; from this one can judge that daffodils like a fair amount of moisture; even when ours have been covered with water for two or three weeks it has not appeared in any way detrimental to them.

The amount of heat daffodils will stand after being brought indoors is also a very important point, and, though they appreciate a fair amount after the flowers have begun to show among the foliage, they do not like being hurried before this stage, and when batches of daffodils have gone blind, or, more correctly, when the flowers have died in the sheath, we may put it down to one of two things—i.e., being allowed to get too dry, or given too much heat at the outset.

As with other forced plants, so with daffodils, there are a few standard varieties that we cannot possibly do without, such as Telamonius plenus (double Van Sion) for very early use, followed very closely by Golden Spur, after which we have Emperor and Victoria, probably the two finest daffodils for any purpose; the latter is a much better bicolor grown indoors than when flowered outside, and entirely supersedes Empress for forcing purposes. Sir Watkin, an incomparabilis, is a fitting companion to these two, and comes in at about the same time. Poeticus ornatus comes at about the same time as these varieties, as also does Barri

conspicuus, though this variety out of doors is considerably later. As a late trumpet variety Mdme. Plemp is decidedly good, the somewhat whorled perianth making it quite distinct; Vanilla should be grown on account of its perfume.

The Leedsi variety Mrs. Langtry is also a good forcer, and, with the other varieties named, is cheap. Among the newer varieties that I have tried for pot culture are Madame de Graaff, excellent, and a fine grower; King Alfred, one of the finest in form and colour, but still rather expensive; Whitewell, an incomparabilis, its bold, expanded cup, making it a very telling variety; Glory of Leiden, sometimes streaky in the perianth, but very fine for pots, its great size being sufficient to recommend it; Gloria Mundi, Evangeline, Lucifer, Firebrand, Ariadne, White Lady, and Dairymaid are all varieties that do well in pots, being particularly pleasing in form, and, when grouped with some of the more bold trumpet varieties, make a very pleasing contrast. One of the most striking varieties I noted last season (in quantity) was Dazzler, its very large orange scarlet cup providing colour rarely equalled in a narcissus.

The double incomparabilis varieties, though somewhat heavy, make good pot plants if carefully staked, and Sulphur Phœnix is probably the best. The newer Poetaz varieties I am quite pleased with as pot plants, the foliage and flowers standing up well under conditions where many of the other varieties would be limp. Klondyke, Alsace, Elvira, and Jaune à Merveille are about the best.

Daffodils are probably grown more for cut flower purposes than as pot plants, but grown under proper conditions they are equally as useful in pots, while for filling large bowls, jardinières, etc., I think they are unequalled, and if we could see more exhibits staged similar to those at the Surbiton show last spring, it would tend to still further popularise one of the most beautiful of spring-flowering bulbs.

T. Stevenson.

Woburn Place Gardens.

THE TUPELO TREE.

This North American tree is known under the scientific name of Nyssa sylvatica, and, although it was introduced into European gardens about ninety years ago, it is still very uncommon. In America it is usually met with between forty and sixty feet in height although when grown under the most satisfactory conditions it sometimes attains a height of one hundred feet, with a diameter of five feet. Belonging to the order Cornaceæ, it is recognised by its usually oblong or oval leaves, which are dark green and glossy, and up to five inches long and three inches wide. They are at their best in autumn, for towards the last week in August they commence to change colour, and throughout September are of a brilliant red or orange-scarlet hue. The flowers are borne during early June, but they are small and inconspicuous.

In this country the tree is only suitable for planting for ornamental purposes, and it thrives most satisfactorily in moist loamy soil, but in America its wood is used for various purposes, such as hubbs of wheels, rollers, etc. An effort has been made to introduce the wood of this and other species of nyssa into this country under the name of bay poplar, but without much success, the wood of the yellow poplar, or tulip tree, Liriodendron tulipifera, which has sometimes a very similar appearance, being considered a better wood for the various purposes for which the wood of the nyssa can be used. W. D.

NARCISSUS ON HEAVY SOILS.

The unfavourable character of my Essex clay for the cultivation of narcissus may be gathered from the fact that bulbs of the old double daffodil cease to flower if not taken up and replanted after two or three years, and after the wet summer of 1909 most of them disappeared altogether. The soil in its unameliorated condition is a very tenacious clay, and the top soil naturally very thin, clear yellow clay being found at a depth of two or three inches under the lawn. In the kitchen garden quarters, thirty years of good cultivation has resulted in a considerable raising of the ground level, and made it pretty rich and fairly friable.

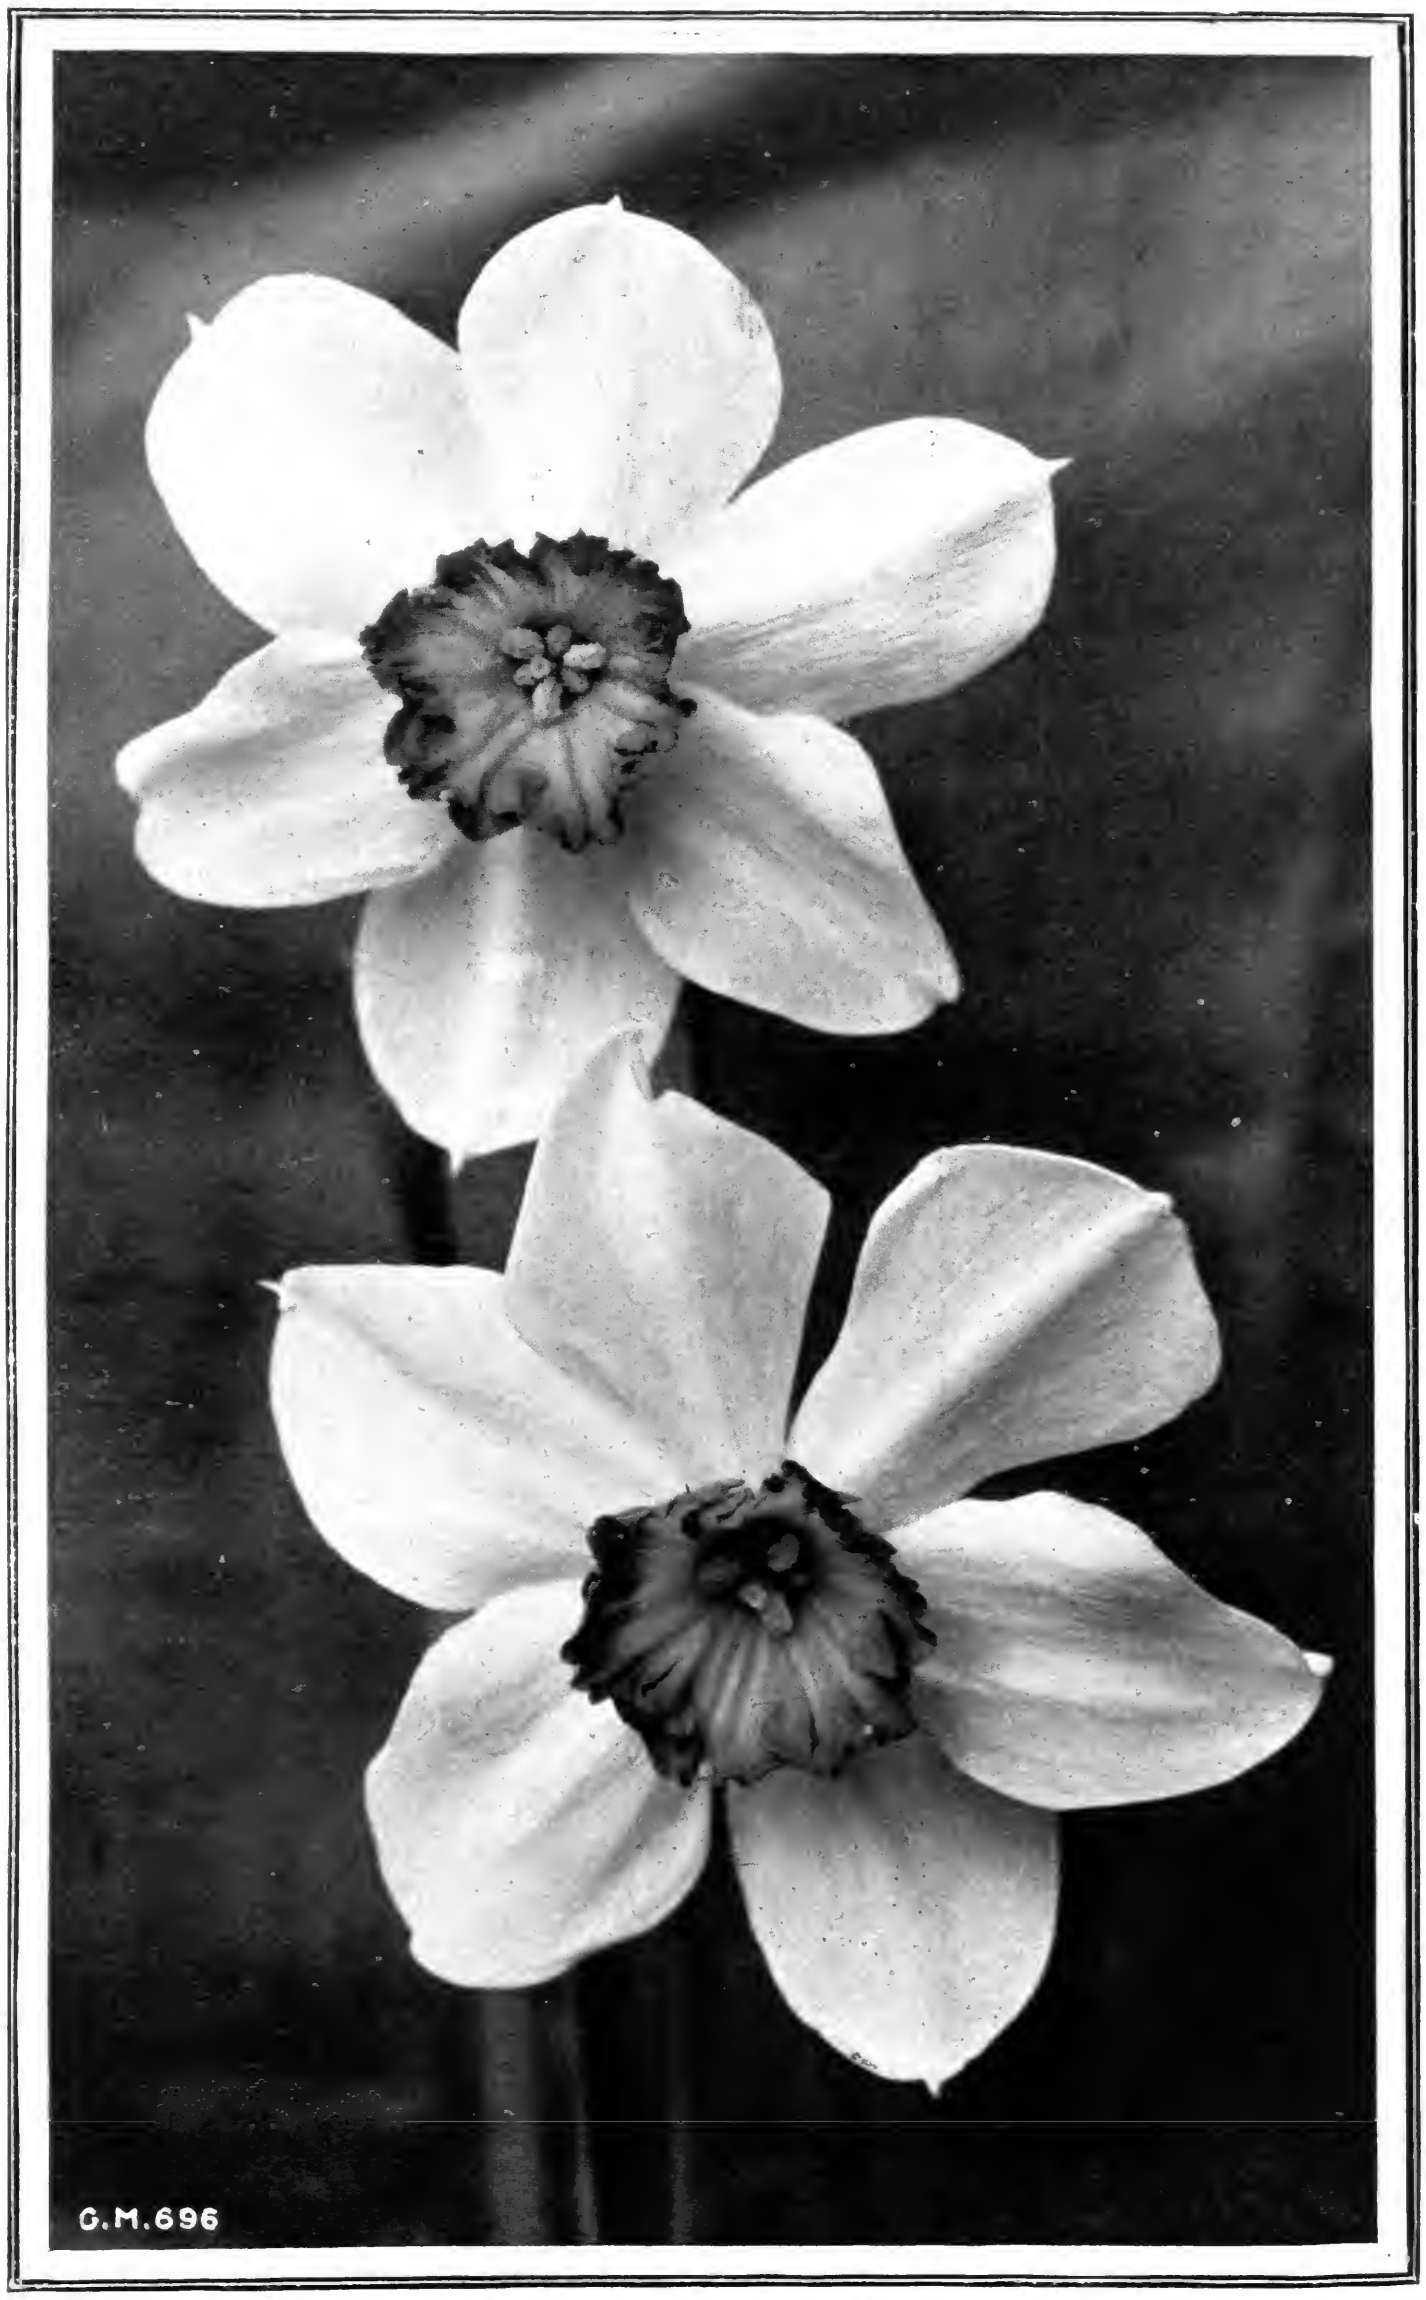
NARCISSUS CRŒSUS.

A handsome red-cupped variety, raised by Mr. A. M. Wilson, Shovel, Bridgewater. F.C.C., R.H.S. and Midland Daffodil Society, in 1912.

It was on this latter, in a partially-shaded position, that an experiment was conducted with ten varieties of narcissus, extending over a period of six years with some and five years with others, twelve bulbs being planted of each variety. All of the bulbs were of the best quality, being obtained from one of the leading English narcissus specialists, and were very large and sound, the twelve bulbs of Sir Watkin weighing exactly six pounds. The bulbs were first planted the latter part of August, and after the second year's flowering were lifted in late June or early July, with the exception of double Poeticus, and replanted in late August or early September in different soil, though in a similar position, this lifting and replanting being repeated each alternate year afterwards. On each occasion the ground was well dressed before planting with basic slag or bone-meal, and sometimes some sulphate of potash or fish guano was hoed in between the rows in February or March. In any ordinary soil they should have done splendidly, and though there were some good average blooms, both in size and texture, there were none of really first quality, and the increase of bulbs, taking all varieties together, must be considered very poor. The following table shows the number of blooms produced each year; three varieties were not planted till 1908.

	Planted.		No. of blooms.					
			1908	1909	1910	1911	1912	1913
Henry Irving ...	Aug.,	1907	14	15	4	—	—	—
Golden Spur ...	,,	,,	23	9	10	5	—	—
Horsfieldi ...	,,	,,	24	29	34	22	49	64
Emperor	,,	,,	16	30	26	26	53	46
Empress	,,	,,	18	29	32	22	40	64
Grandis	,,	,,	23	19	5	4	8	7
Double Poeticus	,,	,,	2	3	10	9	—	—
Mrs. Langtry ...	Aug.,	1908	—	22	32	26	22	22
Barri conspicuus	,,	,,	—	32	47	74	48	88
Sir Watkin ...	,,	,,	—	42	81	117	148	285

Henry Irving was one of the most conspicuous failures. The blossoms were very fine the first year, but were not more than half the size the second year, and not much larger than N. minimus the third year, after which the bulbs were taken up and thrown away, every one being diseased. It teriorating after the dull season of 1910, but improving after the hot summer of 1911, though never robust. Emperor was fairly satisfactory, especially after 1911, but the blossoms were not, as a rule, very fine for this variety, though of good substance. Empress was the most successful of the height. In 1910 the bulbs were treated differently from the others, being taken up from a well-cultivated border and planted in a dry part, which was raided by the roots of clematis and other hungry things. Two years showed a considerable improvement, the blooms being not much below



NARCISSUS GIPSY QUEEN.

A large and beautiful Barri variety, raised by Messrs. J. R. Pearson and Sons, Lowdham, Notts.

has the reputation of being an uncertain grower, but it should always be tried, as it is one of the earliest and best, both in form and colour. Golden Spur did not do much better, though it was allowed to linger on for a fourth season. Horsfieldi never produced any blossoms of first quality, especially detrumpets next to Emperor, but, as with that variety, no exhibition blooms were ever produced.

Grandis was a signal failure. The blooms were only half the proper size the first year, and the second and third years even smaller, the stems being less than six inches in average size. It was the fine blossoms of this variety to be seen in the light, dry soil at Wisley which suggested this treatment.

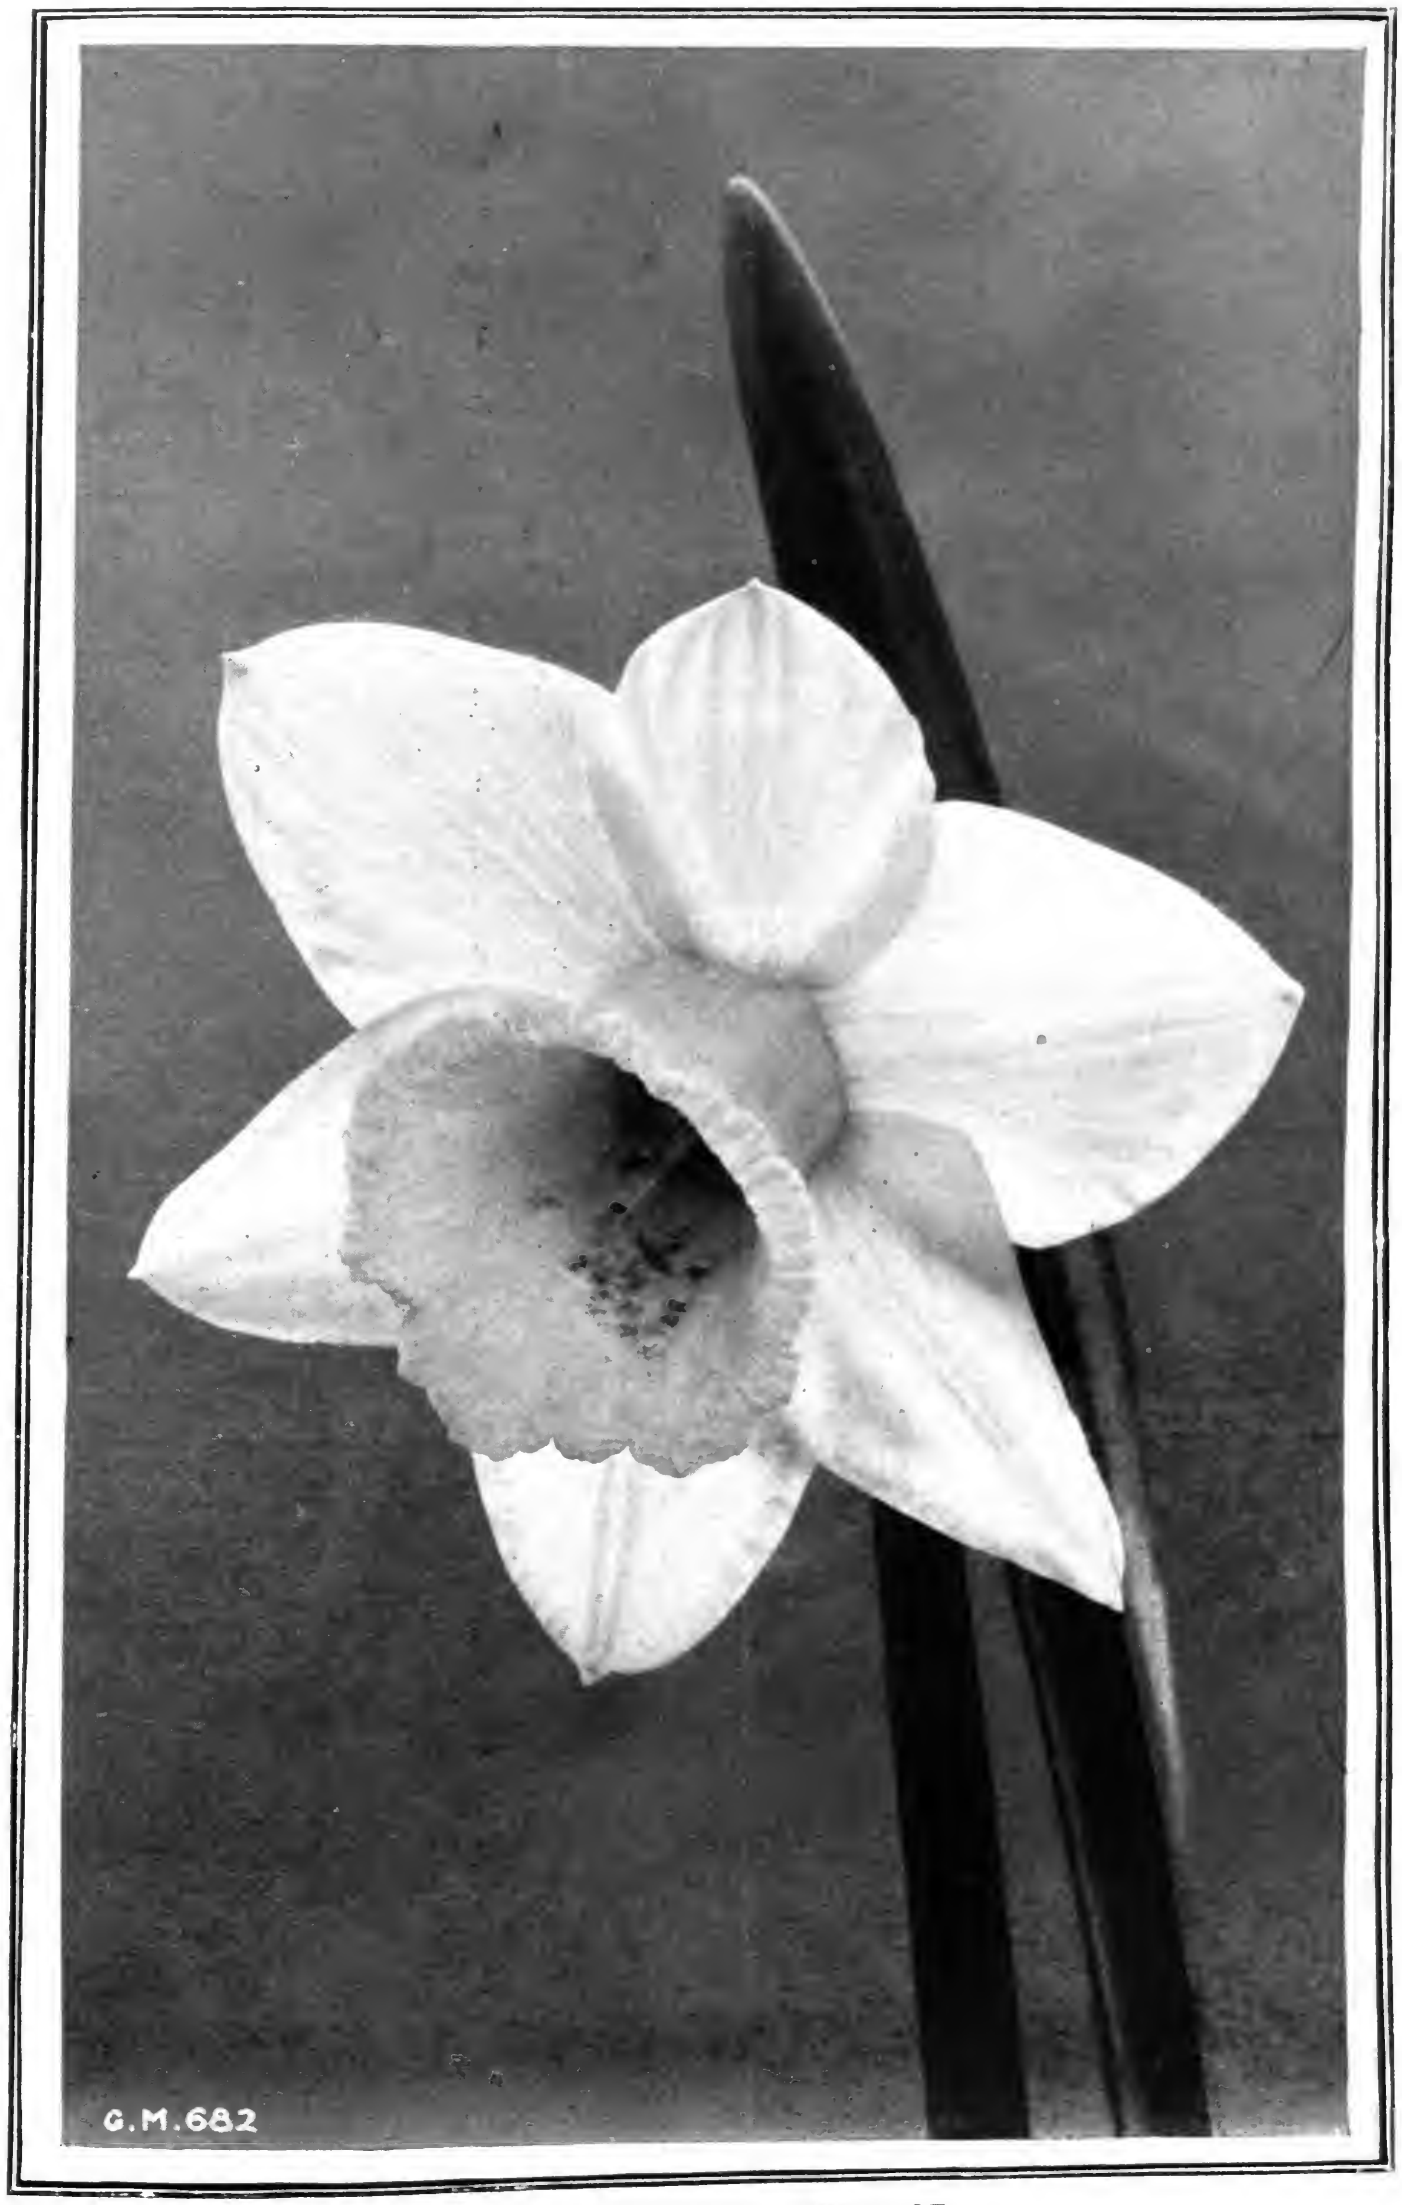
Double Poeticus was another failure. The first year there were twenty buds, and all but two dried up; the third year there

were thirty buds, and all but ten did the same, those that lived to open being very poor specimens. After the second year's growth the bulbs were lifted in July while the leaves were yet green, and replanted at once in a different situation, with a drier and more friable soil, but the results were no better, and the bulbs were done away with. It was thought that the cool, damp soil in partial shade would have suited this variety admirably. It was never dryness at the roots which caused the buds to dry up.

Mrs. Langtry grew rather feebly from the first, and the blooms became smaller each year. Barri conspicuus did fairly well, though the immense size of the blossoms of the first year was not repeated. The setback in number after 1911 was probably due to their having become very crowded that year, following on their rapid increase the previous year. Sir Watkin, as might have been expected, was certainly the most successful of all, though the flowers were not of such extraordinary size again as they were the first year. Alger Petts.

GLADIOLUS COLVILLEI.

The two varieties of this early-flowering gladiolus, rosea and alba The Bride, are very popular for growing to supppply cut flowers for house decoration in various forms. When given ordinary but correct treatment the corms rarely fail to produce good flower-spikes, provided they are of proper size and well matured. I have seen so many fail through unsuitable treatment that it may be of advantage to inexperienced cultivators to state the conditions under which the corms were grown. They



NARCISSUS WHITE EMPEROR.

A fine white trumpet variety, introduced to commerce by Mr. C. Bourne, Bletchley, and Messrs. Cartwright and Goodwin, Kidderminster. A.M., R.H.S., April 1.

were put in very close together in deep boxes of rather heavy soil, the boxes being placed on wet borders. Nearly all the leaves turned yellow. A lighter loam should have been used and the drainage made efficient; then, with careful watering, success, even in boxes, would have been secured. The beginner, however, will be wise if he grows these flowers in clean, well-drained pots. G. B.

AWARDS TO NEW ROSES.

An article by your contributor, Mr. H. C. Prinsep, in the issue of The Gardeners' Magazine for the 16th inst. under the above heading, would appear to call for some comment, as if allowed to pass unnoticed it might help to create a false impression with regard to these awards. He states that "one is greatly disappointed to find that many (of the roses) are lacking in perfume, that most essential point in all good roses." I would suggest that, so far as the awards of the N.R.S. are concerned, the statement is not correct.

Roses are broadly divided into two classes—decorative or garden roses and exhibition roses. With regard to the latter class, scent, although much to be desired, is not essential; but with regard to the first-named, scent, or its absence, is a factor that should be considered, and in making these awards is certainly taken into consideration.

As a matter of curiosity I have examined the gold medal awards of the N.R.S. for the last three years, namely, 1910, 1911, and 1912; they have been twenty-five in number—ten in 1910, three in 1911, and 12 in 1912.

The ten gold medals awarded in 1910 were given to three garden roses and seven exhibition varieties. Now every single one of these ten roses have perfume, some more so than others. Mrs. A. E. Coxhead, an exhibition variety, has a perfume that can hardly be surpassed by any rose. In 1911 the three roses, although all exhibition varieties, are all fragrant. In 1912 I can vouch that ten out of the twelve have fragrance, as I have them growing here in my garden; two only I cannot speak so positively about, namely, Mrs. A. Carnegie and Coronation, though I believe the raisers claim some fragrance for both of them.

With these facts before us, what becomes of your correspondent's grievance? I see he quotes as an example Bessie Brown, that was given a gold medal (and rightly so, as it is one of the most beautiful roses we have) back in the last century—in 1898, I think. He was foolish enough to plant a bed of this variety a year or two after it was introduced, and finds fault with the award because the rose was unsuitable for his purpose.

I respectfully submit that the only party to blame in the matter was himself. An enquiry of you, Sir, or of anyone who knew, would have prevented his mistake—told him that Bessie Brown was a rose requiring high culture, and some care and attention if you want to see her at her best.

Now the gold medal is open, and rightly so, to all classes of roses, and your contributor has no more right to complain about the behaviour of Bessie Brown than he would have if he had planted an Irish single, say, Irish Fireflame, and expected it to produce exhibition blooms, or to climb to the top of his pergola; in other words, he must not use a rose fitted for one purpose for quite another, and then blame someone else for his own ignorance, because, in blunt English, that is what it amounts to.

I am glad your correspondent does not desire to discourage the production of new varieties (I do not think he need worry himself that anything he has written will have that effect), but it might tend to foster or create a wrong impression that the new roses have very little or no scent; it might have been true 20 years ago, it certainly is not true to-day.

Herbert E. Molyneux.

NOTES ON SMALL FRUITS.

Raspberries.

The crops of this most accommodating and valuable fruit have been exceptionally fine here, both as regards size, firmness of berry, and flavour; in fact, very much superior to that of last year. We depend almost entirely on Superlative for our main supply, and right well does it succeed at Wrotham. It was raised, if my memory serves me well, by Mr. Merryfield, at Waldersham Park, Dover, in the year 1883, and is the result of a cross between the old white and Falstaff. This variety is at the present time one of the most popular, and when given good treatment rarely fails to yield excellent crops.

Our soil here is light and porous, so that heavy feeding, annually is necessary, with attention to cutting out old canes that have ceased to bear, and training to the wires or stakes just the required number of new canes for next year's crop. Any delay in this respect results in loss. It has been my practice for many years, the instant all the fruits have been gathered, to remove the nets when dry, fold them up, and put them away, and then clear away weeds, cut out all the old useless canes, so that air and light may circulate freely amongst the remaining ones; give the roots a thorough supply of liquid manure, and a good mulching.

If young canes are wanted for planting the small ones should be lifted carefully with roots attached, and planted elsewhere until the proper times arrives for making new plantations.

Black Currants.

More frequently than otherwise we find black currant bushes much too dense, overcrowded, and, in some instances, planted in an out-of-the-way place, where they are very apt to be overlooked. The fruits are borne on the young wood, so that the growth is best when about one and a-half to two feet long, stout, and firm. I am strongly in favour of going over the bushes after the fruits have all been gathered, and giving them a good thinning, so that light and air may reach and ripen up the new growths by the end of the season. Old bushes well thinned at the present time of all useless wood ought to produce much finer berries, and require but little further pruning in winter. When thinning the bushes at this season remove some of the oldest branches, and allow strong healthy young wood to take their places.

Black currants delight in a rather deep, cool, well-drained soil, and when in this medium the growths annually made are strong and fruitful, without much assistance at the roots, but just the opposite is the case on light soils.

It is a good plan when the bushes are in a bad state to cut down alternate ones to the ground level, and encourage fresh young wood; this is best done in the spring. All bushes growing on poor land should be well fed with liquid manure, and receive every encouragement to build up strength and vigour.

The variety Baldwin is good, producing capital crops of large firm berries that travel well when gathered a trifle under than over-ripe. Boskoop Giant we grow, and find it crops heavily, but it should be gathered as soon as ripe, otherwise it travels badly.

Red Currants.

These, too, should not be neglected if good and regular crops are to be expected. They fruit quite differently from the blacks, and require rather severe spurring after the main branches have been formed, but the heads of bushes should not be allowed to become too crowded. The same remarks apply to trees trained on walls. After the crops have been gathered the land between the bushes should be thoroughly cleaned, and the young growths shortened back a little to allow light and air to reach all parts of the bushes.

The varieties Fay's Prolific and Raby Castle are very good, and crop freely in most seasons, but there are others which grow to a good size and crop satisfactorily.

Loganberries.

These do well when planted and trained to fences, posts, etc., and require similar treatment to the American blackberries. At this time of the year all old fruiting shoots should be removed to give room for the new growths required to fruit next year. Remove them very carefully, and train the new growths rather thinly in their stead. H. Markham.

Wrotham Park Gardens.

FLORAL TABLE DECORATIONS AT EXHIBITIONS.

Can anything be done to improve the floral table decorations at our flower shows? I have been decorator, or assistant, for the past sixteen years in some of the best private establishments in the country, and have attended the principal shows; but at the latter I have hardly seen half a dozen table decorations that I would dare to place on a gentleman's dinner table. I should think 99 out of every 100 exhibitors use what are called rustic or rural stands to place their flowers in. I cannot say arrange the flowers, because the exhibitor simply fills the tubes that are distributed about the devices. But has any decorator of repute ever seen anything approaching these metal constructions in any mansion?

I was an exhibitor at a local show recently in a class for "best arrangement of sweet peas suitable for a dinner table, 4ft. by 3ft." I was the only one who used vases, and I arranged my exhibit about eighteen inches high at the highest point. All the other competitors used the articles referred to above, and the first prize was awarded to a display between three and four feet high, and with not six inches of space between any flowers or foliage from end to end. Would any decorator in a good establishment be bold enough to place the like on a dinner table in his charge? May I say I am not disappointed with the awards. I told my employer previously that the judges would not look at a table as arranged for a private house. It was solely to try and improve the public taste that I entered the competition.

Now, the object of my remarks is this. Practically every young gardener goes to a show to add to his knowledge and become acquainted with plants, fruits, etc., he is not familiar with, and to pick up fresh ideas. Of all the branches of his business he is expected to have experience in later on, dinner-table decoration is one he has least opportunity of practising, for the simple reason that a decorator or foreman makes this his personal charge, and it is only with his consent that a journeyman is allowed in the room while the work is being done. Thus it is that the only insight the majority have of decorated tables is at our flower shows, and where is the dining-room in a large house where a rustic stand would be tolerated? If glass or china vases (silver is not always used) are good enough for the nobility, why not for the show tent? Will some employers and other decorators give their views on present-day floral decorations for competition?

E. B. Wise (Foreman).

NOTES FROM SCOTLAND.

The Drought.

Not for many years has such a protracted drought been experienced in Scotland as that prevailing at the present time. In many districts not an inch of rain has been recorded during the past six weeks, the last four of which in the Glasgow district have been almost rainless. Throughout generally bright, warm weather has been the rule, and as a consequence the soil is dry and contracted to an extent seldom witnessed in the northern kingdom.

Drought Effects upon Fruit Crops.

Strawberries were well advanced ere the want of moisture was very seriously felt, and the crop in general gathered in the best possible condition, and with a minimum of loss and anxiety to the grower. Moreover, fair prices were maintained, as at no period was there anything approaching a surfeit of produce at one time. Notwithstanding this, well-founded complaints have been made by growers at the great disparity of the market returns and the charges made in the retail trade, which indicate that the greater proportion of the profit connected therewith is annexed by the latter. On the other hand the retailer has bitterly complained of short weight in the bulk supplies delivered to him, these having compelled him to charge a higher price to recoup himself for the losses sustained from this cause.

Raspberries, which promised so well in June, have not realised expectations, the latter portion of the crop being very much curtailed through the drought. On raised or shallow soils the plants at present bear a very poor appearance, as the current year's shoots are making but little progress, hence the crop prospects for the succeeding season are not viewed with complacency.

Bush Fruits.

Gooseberries, taken all over, are a variable crop, in some parts plentiful, in others quite the reverse. Fruiterers, however, have been well supplied with the immature as well as, at present, with the ripe fruits, and the quality in general has left but little to be desired.

Some few years ago it was feared that the black currant would become well-nigh exterminated owing to the ravages of the well-known bud disease, as in some districts extensive plantations were rendered useless through its attack. Perseverance in cultivation, and probably remedial measures taken, have to some extent at least dispelled such fears, and supplies of fruit seem now to be as plentiful as formerly, while the quality is generally a fair average.

Black currants are largely in demand in Scotland, and full value is always easily obtained for the produce. So much is this the case that one might be pardoned for expressing surprise that larger areas of suitable land are not devoted to their culture, seeing that the cost is considerably less and the attendant risks (disease apart) smaller than in the case of most other fruits. The red variety, on the other hand, apart from the larger households, is not much in request, and is used to give sprightliness or tone to other fruits rather than as a preserve separate by itself.

Apples, Pears, and Plums.

The crops of these, which comprise the bulk of the orchard fruits of Scotland, can only be described as very moderate, the two last-named particularly so, and in some places, even where provided with efficient wall space, the crops of both are failures. Apples are variable, the most fruitful being the early-maturing varieties, as Keswick Codlin, Lord Suffield, Golden Spire, Domino, The Queen, Stirling Castle, and Lane's Prince Albert. In the same order the earlier dessert varieties present a much better appearance than do those of mid-season, or later, but why such should be is difficult to comprehend. Taken in its widest scope, the home supply of apples, so far as the northern portion of the kingdom is concerned, will not be heavy, though the size and quality may be very good.

James Day.

THE AVENS, OR GEUMS.

Of considerable decorative value are the various species and varieties of geums, and happily they are represented in most gardens. In addition to being very accommodating in their cultural requirements, they possess a continuous flowering habit, or, at any rate, blossoms are produced in rapid succession over a considerable period. Further, the habit of the plant is elegant and pleasing, and its behaviour is everything that can be desired in town gardens and congested areas.

The best results are obtained where the soil is of a loamy and retentive nature, and, in view of the fact that they are impatient of drought at the roots, it is advisable to mulch with manure in the early part of the season. In order to maintain rude health and vigour it is necessary to divide the plants once in three or four years, and I would advise that new sites be found for them on each occasion. I have noted colonies doing remarkably well in shady spots in the country, but they are a dismal failure when given shady positions in city gardens.

The geums are easily and readily raised from seeds, and the plan adopted by the writer is to form a shallow hotbed in a sheltered spot in the nursery ground, and here sowings are made in April of hollyhocks, potentillas, geums, hybrid gaillardias, Coreopsis grandiflora, sweet williams, foxgloves, and other hardy plants, and immediately the frames are cleared of bedding plants large batches of seedlings of each kind are planted therein. The lights, of course, are not required, and by the end of the season splendid plants are produced which go through our smoke and chemical-laden atmosphere unscathed, and yield a great wealth of flowers.

In speaking of the best geums for garden work, the newcomer, Mrs. J. Bradshaw must be given first place. It is a fine acquisition in a beautiful and soft scarlet shade, while the individual flowers are of fine proportions. Following closely to the foregoing is G. chilense fl. pl., which is perhaps best known as G. coccineum plenum, which produces semi-double flowers of an extremely brilliant shade of scarlet. Both G. miniatum and G. Heldreichi give us similar colouring, and are of great merit, while a variety of the last-named bears yellow flowers, and is known as G. H. luteum. We also obtain yellow colouring in G. montanum, and its variety aurantiacum, and then we have G. Eweni, whose orange blossoms are produced over a long period. What may be termed an art shade is found in G. hybridum, which attains to a height of 3ft., and, although this is not intended as an exhaustive list, it represents the best for garden decoration. Several species and varieties are of botanic interest only. Walter H. Aggett.

Gilia coronopifolia.—Whether indoors or out, this biennial species of gilia attracts attention by reason of the soft scarlet hue of its flowers, which are borne on erect spikes. For this reason it has made great headway in popular favour within the last few years.—W.

WINTER SPINACH.

Few of our winter green crops are more appreciated than spinach, yet it does not always receive the attention necessary to ensure success. It should be remembered that vegetation is very slow in winter, and unless plants have made good headway before the severe weather sets in it is impossible for them to make growth when the ground is frozen and covered with snow. Spinach does not require a very high temperature to induce growth, but no plant, even of the hardiest nature, can grow when the conditions are so adverse, as frequently happens during our winters; for this reason growth should have been made beforehand, when, if not too sappy, the leaves will remain fresh, and in otherwise good condition, during the greater part of the winter.

To grow good spinach the seeds should be sown fairly early in August, so as to allow ample time for the plants to develop themselves slowly. It is not advisable to have the soil too rich for this crop, though there must be sufficient fertility in it to promote a healthy growth. On cold heavy soils, and in low, damp situations, the plants suffer more in winter than they do on high, dry, and light gravelly ones. Therefore, in damp situations, the highest and driest places should be chosen for the crop. The soil ought to be well tilled to let the long tap roots descend readily, but if too rich there will be a superabundance of luxurious leaves that will be cut down by the first severe frost.

The seeds should be sown in drills about fifteen inches apart, and when the plants have made three or four rough leaves they should be thinned, leaving them about four inches from each other in the row. A second thinning may take place later, finally leaving them about eight inches apart. These second thinnings may be found useful in the kitchen, as the foliage will then be large enough for cooking, but should they not be required for that purpose, they ought to be pulled up and thrown away, so as to allow the remaining plants ample space. The foliage made should be as sturdy as possible, otherwise it will be too tender to withstand the frost.

Gathering the leaves for use needs great care; to strip the plants promiscuously, as is often done, is a great mistake; the outer leaves only should be removed, leaving all the others to become more fully developed, and if this method was followed generally we should hear of fewer failures than is now the case. As previously pointed out, spinach on dry soils and in elevated situations stands much better than in low and damp places. This being so, in some seasons it is necessary to afford the plants some protection where they are likely to suffer seriously in heavy soils. A few spruce boughs stuck into the ground on the north and east sides of the plot will often break the force of cold winds, and thus save the crop, which is a matter of no small importance.

There has been much controversy of late as to which is the most hardy, the prickly or the round-seeded spinach, but having grown both side by side I have found little, if any, difference between them. The round-seeded form is usually sown in January for an early crop, and the weather is often as severe after that date as at any time during the winter, yet this has no effect on the small plants. Therefore, whether the prickly or round-seeded forms be grown, it is always essential to allow the plants ample room to fully develop their leaves. H. C.

WORK FOR THE WEEK.

THE ORCHID HOUSES.

INCREASING STOCK OF COOL ORHIDS.—There are many cases in which it is desirable to increase the stock of odontoglossums, odontiodas, oncidiodas, masdevallias, and other cool house orchids, and the potting season affords a good opportunity for the purpose of making divisions. In the case of odontoglossums, odontiodas, oncidiodas, and allied genera, it is a good practice to sever the rhizome between the pseudo-bulbs some weeks before for repotting plants of those kinds from which increased stock is desired. It is generally considered now that the back pseudo-bulbs, which have shed their leaves, obtain their sustenance from the more active portions of the plants. Thus in many cases, if they are not removed by severing the rhizome, they become a strain on the developing growths, and these in consequence are generally found to be more or less retarded or stunted. There is no reason why the divisions of the pseudo-bulbs should not be effected, for even if it is not desirable to increase the stock of plants, it is generally the aim to produce nice specimens. As the only means of increasing the leading growths of many plants is by making these divisions, no opportunity should be lost in effecting them some time previous to repotting. When the division is made it will usually be found that the new growths from the divided pseudo-bulbs will have commenced, and they may thus be potted at the time when the repotting is in progress; and, as most of the growths produced form fresh roots at an early stage of development, with ordinary care they soon become established in the new potting compost. The pots used should be of just sufficient size to contain the plants comfortably, using ample drainage and a good open compost. Plants that require immediate repotting, and have numerous leafless pseudo-bulbs, these latter may be cut off at the time of repotting. It is best to place these bulbs in a dry, airy position for a few days, after which they may be laid on a bed of chopped sphagnum moss, or placed in small pots with little potting compost about them. The same method may be applied to pseudo-bulbs that have been previously severed and have not produced new growths at the time of potting.

MASDEVALLIAS and other tufted-leaved kinds are divided at the time of repotting. It is generally found when repotting the large-flowered section of masdevallias, especially in the case of large specimens, that they have become hollow from loss of leaves in the centre. To convert them into good specimens again, the only thing that can be done is to divide them and arrange the growths towards the centre. Small pieces not required for making up the specimens may be placed in suitable sized pots. Masdevallias do not require a deep root run, being practically surface-rooting. As they require a liberal supply of moisture at all seasons of the year, ample and clean drainage must be given. No stagnant water must remain about the plants at any season.—H. J. Chapman, Oakwood Gardens.

STOVE PLANTS.

WINTER-FLOWERING GESNERAS. — Plants of Gesnera refulgens and G. exoniensis, raised from corms put singly in three-inch pots as previously recommended, will by this time be ready for shifting into their flowering pots—six-inch for the larger and five-inch for the weaker will be found the most suitable. The compost should be the same as previously advised, but be used in a rougher condition. After repotting place a neat stake to each plant, and stand them, if possible, on a damp surface within a warm pit; syringe daily in bright weather, and until well rooted water sparingly that the soil does not become soured. For the next few weeks shading from bright sunshine will be necessary.

CENTROPOGON LUCYANUS. — Plants should not be stopped after this date, but must be given ample room, for, in addition to the growths from the head, they will throw up several strong shoots from the base which will carry fine racemes of flowers. Great care must be exercised in watering, for, while they should not be allowed to suffer from drought, they must not be overwatered; when this happens they quickly assume a sickly appearance, and good flowers are out of the question. They should at present be growing in an intermediate house, but they must be transferred to stove conditions before the damp autumn weather commences.

ISOLOMA HIRSUTUM.—If not already in their flowering pots the plants should be shifted without delay. Pinch out the point when the plants are about six inches in height, which will be sufficient to produce good bushy examples. Place under similar conditions to those recommended for gesneras.

EUPHORBIA FULGENS (SYN. JACQUINIÆFLORA).—With the commencement of September the house in which this species has been growing will probably be required for housing plants from frames while the euphorbias will also need a house where warmer conditions may be applied. A pit used recently for melon culture will provide a suitable place. If not already done, a stake should be placed to the plants as they are moved, and this should be of such length as to allow a graceful curve to the upper part of the growths. A little food will assist greatly from now, but it must be used carefully. Damp down frequently in bright weather, syringe lightly occasionally. A thin shading during the brightest part of the day will be necessary for three or four weeks longer. Poinsettias will require very similar treatment.—H. Prime, Hatfield Gardens.

FRUITS UNDER GLASS.

PINES.—Plants that are swelling their fruits will now require careful attention to keep the soil in a moderate state of moisture. Do not give them too strong doses of liquid manure as the sun declines in power, and use the syringe with caution on swelling fruits, otherwise the crowns will develop to a large size. Let the temperature be about 80 degrees at 10 p.m., falling to 70 degrees at daybreak, sprinkling the paths and plunging material on the morning and evenings of fine days.

SUCCESSIONS.—The plants of Queens that are intended for starting early next year may be maintained in a progressive state a little longer, but a certain amount of rest being essential to a good start into growth, they should be induced to rest by gradually reducing the water, lowering the temperature, and giving a freer admission of air on all favourable occasions. Cease overhead syringings and sprinkle the paths and other surfaces. Maintain a temperature of 70 degrees at 10 p.m., falling to 65 degrees in the morning. Growing stock should be kept steadily moving until growth is fully made, which to the experienced eye is easily perceptible.

FIGS.—The weather for some time has been of a favourable character for the production of this luscious fruit, the temperature having been maintained without the use of much artificial heat. Where the trees that fruited early are producing their second crop of fruit, the atmosphere will have to be kept much drier than was recommended for the trees when swelling their crop. It must, however, be remembered that excessive dryness causes red spider to put in an appearance. When the fruits which are ready are picked, a good syringing may be given the trees, and the night temperature maintained at about 75 degrees with ventilation. Where the trees are grown in tubs or pots liberal supplies of weak liquid manure must be given to assist them to finish their crops. Strip off all late fruits that appear, and any trees that require shifting should be seen to as soon as they have finished fruiting. Guard against overpotting, once in two years being sufficient if all has gone well. Use good turfy loam, with lime rubble and a fair sprinkling of bone-meal, and see that the drainage is efficient.

STRAWBERRIES.—Plants that were in a condition to be potted in July will have now well filled their pots with roots, and a little weak liquid manure may be given them twice a week. Do not overcrowd them, but let them stand clear of each other. Keep the pots clear of weeds, and pick off all runners as they appear. Look over duplicate crowns and reduce to one, and raise the pots on boards or trellises should the weather be wet.—F. Jordan, Warter Priory Gardens.

THE FLOWER GARDEN.

BORDER CARNATIONS.—Layers of carnations that were put down in July will now be rooting freely, and the most forward can be severed from the old plants, making them self-supporting. Preparations for planting must now be considered, as directly the young plants are ready nothing should delay this operation, thus giving them an opportunity to become well established before winter. The practice of providing a change of ground each season is well worth adhering to whenever it can be arranged, especially so in districts not particularly suited to carnation culture. The soil should at all times be deeply worked, and if it is of a heavy, retentive nature an addition of burnt earth and wood ashes will give better results than by digging in manure. To very light sandy soil must be added materials that will assist in retaining moisture, such as good stiff loam, and well-rotted cow manure.

HERBACEOUS PÆONIES.—Once established, pæonies usually flourish a number of years without being disturbed, provided they receive a mulch, or the assistance of dressings of well-decayed manure each season. At times it becomes necessary to replant owing to their becoming overcrowded, or some other cause. It is generally supposed that at least a season's flowers must be forfeited by doing so, but this is not the case should the operation be carried out at the right time, and in a proper manner. The first opportunity from this date should be taken advantage of to proceed with such work, as their foliage at this period is becoming matured, and their roots less active than at any other period. The soil should be in a moist condition at the time of planting. Every care must be exercised in lifting the plants to avoid injury to the roots, and to retain soil about them.

PROPAGATING SUMMER BEDDING PLANTS.—Numerous kinds of summer bedders require propagating at this time to provide either individual plants for another season, or stock plants from which to obtain cuttings early in the year. As many of them are tender, it is advisable not to delay the operation until there is a risk of injury from early frosts. Heliotropiums, iresine, lobelias, lantanas, coleus, ageratum, etc., should be placed in a close pit having a brisk bottom heat. Cuttings of pentstemons and marguerites should also be rooted, but a cold frame containing sandy soil from which frost can be excluded will be found most suitable for them. The cuttings, if not inserted too thickly, can remain undisturbed until early spring without fear of injury from overcrowding.—T. B. Field, Wych Cross Place Gardens.

HORTICULTURAL SHOW ADVERTISEMENTS are inserted in this column at Sixpence per line, the minimum charge being Two Shillings and Sixpence. Offices, 148 and 149, Aldersgate Street, London, E.C.

EXHIBITIONS AND MEETINGS.

Royal Horticultural Society.

AUGUST 26.

This meeting, like its two predecessors, was somewhat small as the exhibitions held at Vincent Square usually go by comparison. On the other hand, the exhibits as a whole were really fine for the last meeting in August. The outstanding features were the gladioli, the hardy flowers, and the real advent of the dahlias; while the collections of fruit denoted early autumn.

FLORAL COMMITTEE.

Messrs. Dobbie and Co., Edinburgh, had a fine exhibit of collarette dahlias, arranged in a light style with gypsophila, asparagus, and tamarisk. Fine bold masses of Buckingham, Holyrood, Princess Louise, Balmoral, Meteor, Queen Anne, May, and Goldstern were to be seen, and were certainly the most distinct in this now well-known section.

From Messrs. John Piper and Sons, Bayswater, came an attractive exhibit of pæony-flowered dahlias. These were arranged in large vases, with sprays of elm foliage. The most striking varieties were Cæsar, Hortulanus Budde, Liberty, Germania, Warrior, and Hortulanus Witte. The flowers had evidently been cut too early, for there was a dullness not usually associated with this section.

Messrs. Kelway and Sons, Langport, had a large exhibit of gladioli, beyond a doubt the best effort of the firm this season. The beautiful hybrids of G. primulinus were greatly admired, the yellow and apricot shades being especially good, as were also fine vases of Duchess of Somerset, Golden Ray, Taddes, Langport Queen, Duke of Richmond, Queen Maud, and Marie Studholme. The whole exhibit was delightfully fresh and bright.

A magnificent group of double begonias came from Messrs. Blackmore and Langdon, Twerton Hill Nursery, Bath. Not only were the flowers large, but each plant was carrying plenty of flowers. A few of the most striking were R. F. Awdry, Mrs. R. Norton, Mrs. A. S. Hitchins, Mrs. J. B. Blackmore, Mrs. Peter Blair, Grand Monarch, Irene Tambling, and Lady Dorrington. A few single frilled varieties were also very fine. The entire exhibit was well arranged with suitable foliage plants. Mention should also be made of the bedding varieties.

Messrs. Barr and Sons, King Street, Covent Garden, had an interesting display of hardy flowers. The vases of Nepeta Mussini, Salvia virgata nemorosa, and Statice Lavender were the objects of much attention, as were also the lupines in a variety of art colours, while a collection of gladioli included La Nuit, a deep blue variety; Royal Purple, Madame Mounet Sullay, Afterglow, Negro Prince, and America. A fine feature were the Lilium tigrinums in three varieties in splendid condition.

From Messrs. Carter Page and Co., 52 and 53, London Wall, came a very bright collection of dahlias, which embraced the cactus, pæony, single, and collarette types. The latter were very bright, especially the varieties Giant de Lyon, Madame E. Wauters, and Holyrood. In the singles Union Jack was most striking, while the best of the cactus varieties were Florid, Dr. Roy Appleton, and Mary Purrier.

Mr. A. F. Dutton, Iver, Bucks, staged an attractive display of his carnation novelty, Mrs. A. F. Dutton. The blooms were arranged in huge baskets with asparagus, and presented a delightful appearance. The variety was certainly in its top form, the colour being especially good.

Mr. A. Perry, Hardy Plant Farm, Enfield, presented a fine group of Achillea Perry's White, which were arranged in deep bays, relieved by semi-circular groups of delphiniums. There is no doubt as to the merits of this achillea, which will undoubtedly become a great favourite for cutting purposes.

Messrs. Whitelegg and Page, Chislehurst, were represented by a table of hardy flowers, in which were noted some nice hardy fuchsias, tall stands of Lilium tigrinum, L. speciosum, L. speciosum magnificum, and L. speciosum album.

Mr. Jas. Box, Lindfield Nurseries, Haywards Heath, arranged a splendid display of hardy flowers on the floor of the hall in his well-known style. Huge clusters of phloxes amply displayed the value of these flowers in the border, the most conspicuous being Widar, Glorie de Marc, Baron von Dedom, Albert Leteur, and Hodur, all more or less new varieties, while gladioli were equally conspicuous, especially Baron Hulot, Hollandia, White Excelsior, and America. Montbretias were also very good. Border flowers also came from Mr. G. Reuthe, Hardy Plant Nursery, Keston. The ericas were a feature here, as were also hardy cyclamen. Desfontainea spinosa was also flowering freely, while a collection of alpine plants in pots seemed a source of attraction to some of the visitors.

Messrs. S. Low and Co., Bush Hill Park, exhibited a small group of Chironia baccifera in fine condition, the plants being well flowered and developed.

Messrs. W. Cutbush and Son, Highgate, staged a fine exhibit of gladioli and pentstemons, with a separate collection of antirrhinums.

Mr. A. Ll. Gwillim, Cambria Nursery, Sidcup, staged both double and single tuberous begonias, the doubles being excellent. Begonias were also splendidly staged by Messrs. T. S. Ware, Lim., Feltham, the exhibit making a fine bank in a foil of maidenhair ferns, abutilons, and grasses. The best begonias were Lady Cromer, still the finest of its colour; Dorando, R. H. Whitelaw, Mrs. P. Blair, and Lady Dorrington; at the same time no doubt there were numbers equally good.

Mons. Jules Ragot, 211, Rue Lafayette, Paris, staged some nice novelties in his collection of gladioli; the weird colours of Mons. Picot and Iris were quite new to the flower, while other fine varieties were Jean Ragot, and Madame Bienfait; the seedlings included some fine hybrids of G. primulinus.

Phloxes were well staged by Messrs. W. Wells and Co., Merstham, who had excellent examples of Selma, Iris, Mons. Kind, Dove, Glorie du Marc, and Distinction.

Messrs. J. Cheal and Sons, Lim., Crawley, Sussex, staged some very fine dahlias, which embraced all sections. The singles were, however, a splendid feature, the best being Leander, Leopold, Glencoe, Marion, Aurore, very fine; the pompon cactus were exhibited in their true form, and were a source of attraction. The new single variety, Crawley Star, was once more in evidence, and was greatly admired for its colour and decorative value.

Messrs. J. Veitch and Sons, Lim., Chelsea, staged a beautiful collection of streptocarpus in pots, the seeds being sown in February, 1913. The colours ranged from pure white, through pink, rose, blue, and violet shades. The plants were splendidly developed in such a short period. Hardy flowers came from Messrs. T. S. Ware, Lim., and included some good examples of Crinum Moorei, pentstemons in variety, phloxes, and the double gypsophila.

From Messrs. R. Wallace and Co., Colchester, came a fine collection of montbretias, with a few bunches of kniphofias in the rear. The montbretias included such varieties as Westwick, the yellow King Edmund, Prometheus, Germania, Star of the East in grand style, Lord Nelson, and Lady Hamilton.

Messrs. Jas. Cocker and Sons, Aberdeen, staged blooms of their new rose, Mrs. Andrew Carnegie, a fine deep form of Scabiosa caucasica named Magnifica, and Potentilla atrosanguinea Cocker's Scarlet. From Messrs. Jas. Stredwick and Son, St. Leonards-on-Sea, came some good seedling dahlias of the cactus type.

Messrs. H. B. May and Sons, Lim., Upper Edmonton, staged a miscellaneous exhibit of ferns, aloiasias, Ixora Fraseri and I. Williamsi being well flowered in five-inch pots; while a group of Croton Edmontoniense were beautifully coloured and developed. Tall plants of Selaginella cæsia arborea were taking on their autumn tints, which were most striking.

FRUIT AND VEGETABLE COMMITTEE.

Messrs. G. Bunyard and Co., Lim., Maidstone, exhibited about fifty dishes of apples and pears. The best of the former were Gold Medal, No Surrender, Norfolk Beauty, Ben's Red, Lady Sudeley (splendidly coloured), Maidstone Favourite (fine specimens), Emperor Napoleon, and Rev. W. Wilks. The pears were good examples of Triomphe de Vienne, Clapp's Favourite, and Souvenir du Congrès.

Messrs. Bakers, Wolverhampton, staged a very good display of vegetables up to exhibition form. The background was made up with huge mounds of Seakale beet, Lyon leeks, Autumn Giant cauliflower, and Celery Clayworth Prize Pink. The Ailsa Craig onions, too, were excellent, as were also the various types of carrots, tomatoes, potatoes, and cucumbers. The arrangement was distinctly good and attractive.

Messrs. S. Spooner and Sons, Hounslow Nurseries, Hounslow, exhibited a nice collection of fruit, which embraced some fine baskets of apples, including Grenadier, Stirling Castle, Lord Suffield, Duchess Favourite, and Lady Sudeley. Blackberries and the fruit of the strawberry-raspberry were also on view.

Mr. C. E. Baring Young, Oak Hill Park, East Barnet (gardener, Mr. J. G. Walker), sent some well-grown peaches, nectarines, pears, and plums. These would have been more interesting to the visitors had they been named.

Messrs. Bucks, Tresco Nursery, Ipswich, exhibited their new tomato Buck's Tresco, which they exhibited in the bunches as gathered; also individual fruits.

ORCHID COMMITTEE.

Messrs. Sander and Sons, St. Albans, staged a small group which included Cattleya Davisi, C. Pittiana var. Colossa, with three fine flowers; some fine forms of C. Atalanta, with Lælio-cattleya Invincible, a fine variety with a rich velvety purple lip; L.-c. Phœnix, a good dark form; while a plant of Vanda Sanderiana, with nine developed flowers, was most attractive, as were Odontoglossum armainvilliersense album and Lycaste hybrida.

Messrs. Jas. Veitch and Sons, Lim., Chelsea, contributed a display rich in Lælio-cattleyas, such as L.-c. callistoglossa, L.-c. Gertrude, L.-c. Ettrick, a fine large flower; also well-flowered plants of Odontoglossum grande, some carrying eighteen flowers, with odontoglossums chiefly of the crispum type.

Messrs. Armstrong and Brown, Tunbridge Wells, staged a fine group of Lælio-cattleyas, which included fine specimens of L.-c. Bletchleyensis, L.-c. eximia, Orchidhurst var., a large, handsome form; L.-c. Geo. Woodhams, L.-c. Baroness Schröder, also some fine forms of Cattleya Hardyana.

Mr. Pitt, Rosslyn, Stamford Hill, N., staged a small exhibit in which were noted some good cypripediums, Miltonia Bleuana, Cattleya Venus, and Brasso-cattleya Thwaitesi. From Messrs. Hassall and Co., Southgate, came a small group of orchids, in which was noted a fine specimen of Cypripedium A. de Lairesse, with six fine flowers; Cattleya aurea was also good and numerous, as were also plants of Cattleya Hardyana, Odontoglossum Uro-Skinneri, and Cattleya Gaskelliana alba.

Messrs. Charlesworth and Co., Haywards Heath, also staged a small group. The chief features were well-flowered plants of Vanda cærulea in fine colour, Odontoglossum Phœbe with two beautiful spikes, a fine example of O. Armainvilliersense Xanthotes and the quaint Paphinia cristata.

Sir J. Coleman, Bart., Gatton Park, Surrey (gardener, Mr. T. Collier), staged a few plants, which included a charming example of Ornithidium sophronites covered with flowers; also Brassia brachiata, Lælia monophylla, and Pleurothallis velaticaulis.

MEDALS AND AWARDS.

First-class Certificates.—To Baron Bruno Schröder, Englefield, for Brasso-lælio Cattleya The Baroness; to Mr. J. Gurney Fowler, for Odontioda Cruyensis var. Eileen.

Awards of Merit.—To Mr. W. Waters Butler, Edgbaston, for Cattleya Hardyana Mrs. Waters Butler; to Messrs. Armstrong and Brown, Tunbridge Wells, for Lælio-cattleya Marquis de Waverin var. Orchidhurst; to Messrs. Jas. Veitch and Sons, Chelsea, for Lælio-cattleya Ettrich; to Messrs. G. Bunyard and Co., Lim., Maidstone, for apple Maidstone Favourite; to Messrs. R. Veitch and Sons, Exeter, for potato Great Scot; to gladioli Lady Faire, Lady Northcote, and Mrs. Bromet, all from Messrs. Kelway and Son, Langport; to Messrs. J. Cocker and Son, Aberdeen, for rose Mrs. Andrew Carnegie, and for Scabiosa caucasica magnifica; to Mr. S. Morris, for montbretia Queen Adelaide; to Messrs. Dobbie and Co., Edinburgh, for chrysanthemum Improved Northern Star.

The following awards were made by a joint committee of the Royal Horticultural Society and the National Dahlia Society: To Mr. H. Shoesmith, Woking, for cactus dahlia Lily Reed; to Mr. Chas. Turner, Slough, for pæony dahlia Aphrodite; to Messrs. Dobbie and Co., Edinburgh, for collarette dahlias Tuscan and Prince of Orange; to Messrs. J. Cheal and Sons, Lim., Crawley, for pompon dahlia Regulus; to Messrs. Barr and Sons, Covent Garden, for potato Irish King and tomato Lightning.

Silver-gilt Flora.—To Mr. J. Box, Lindfield, for phloxes, etc.; to Messrs. J. Kelway and Son, Langport, for gladioli.

Silver-gilt Knightian.—To Messrs. Baker, Wolverhampton, for vegetables.

Silver-gilt Banksian Medals.—To Messrs. Blackmore and Langdon, Bath, for tuberous begonias; to Messrs. T. S. Ware, Lim., Feltham, for tuberous begonias; to Messrs. G. Bunyard and Co., Lim., Maidstone, for collection of fruit.

Silver Flora Medals.—To Messrs. Sander and Sons, St. Albans, for orchids; to Messrs. Jas. Veitch and Sons, Lim., Chelsea, for orchids; to Messrs. Armstrong and Brown, Tunbridge Wells, for orchids; to Mr. A. F. Dutton, Iver, Bucks, for carnations; to Messrs. R. Wallace and Co., Colchester, for montbretias; to Messrs. Dobbie and Co., Edinburgh, for collarette dahlias.

Silver Knightian Medal.—To Messrs. S. Spooner and Sons, Hounslow, for a collection of fruit.

Silver Banksian Medals.—To Messrs. W. Cutbush and Son, Highgate, for gladioli; to Mr. A. L. Gwillim, New Eltham, for begonias; to Messrs. H. B. May and Sons, Upper Edmonton, for miscellaneous plants; to Messrs. Carter Page and Co., London Wall, E.C., for dahlias; to Messrs. W. Wells and Co., Lim., Merstham, for phloxes; to Messrs. Whitelegg and Page, Chislehurst, for hardy flowers; to Messrs. Charlesworth and Co., Haywards Heath, for orchids; to Messrs. Hassall, Southgate, for orchids; to Mr. Pitt, Stamford Hill, N.E., for orchids.

Bronze Flora Medals.—To Mons. Jules Ragot, Paris, for gladioli; to Messrs. Barr and Sons, King Street, Covent Garden, for hardy plants.

Bronze Banksian Medals.—To Messrs. J. Cheal and Sons, Lim., Crawley, for dahlias; to Messrs. J. Piper and Son, Bayswater, for pæony dahlias; to Mr. L. R. Russell, Richmond, for hardy heaths; to Mr. C. E. Baring Young, East Barnet, for hardy fruit.

SCIENTIFIC COMMITTEE, August 12.

Present: Mr. E. A. Bowles, M.A., F.E.S., F.L.S. (in the chair), Messrs. J. Fraser, A. Worsley, E. M. Holmes, and F. J. Chittenden (hon. sec.), with Mr. R. Farrer, visitor.

AGAPANTHUS WEILLIGI.—Mr. Worsley showed a specimen of this beautiful species of agapanthus, which he had obtained from Holland. It was admirably illustrated in our issue of August 23.

DOUBLE CINERARIA.—Mr. Worsley also showed heads of a cineraria with proliferation similar to that seen in the "hen and chickens" daisies, but with the separate capitula more congested. He remarked that this type of doubling often occurred in forms that normally bear single flowers when they blossom in summer, as in the present instance, and that the normal type would be resumed later on.

SAXIFRAGA FLORULENTA.—This curious species of saxifraga was sent by Mr. Chaplin, of Great Amwell, Ware, in whose garden it had flowered. It was collected by him, and had apparently been growing in shade in cultivation, though it appears to grow alike in sun and shade in its home in the Maritime Alps, where it occurs at high altitudes. It has, perhaps, only once before flowered in this country, when it received a first-class certificate in June, 1872, when shown by Mr. Maw. Its foliage is more attractive than its flowers.

RUBUS DISCOLOR DOUBLE-FLOWERED.—Mr. Chittenden showed from a correspondent at Haywards Heath a beautiful pink-flowered form of the common bramble, with double flowers. It had been found in a hedge, and apparently wild. Several such forms are in cultivation.

XANTHORRHŒA AUSTRALIS. — Mr. E. M. Holmes showed the lower part of the leaf-rosette of this plant, which is now being imported for cattle food on account of the sugar it contains.

APHIS ON PICEA.—Some shoots of the Piceas pungens glauca and magnifica were sent from Lexden attacked by the large aphis which has been so prevalent this year and last on these trees in several parts of the country, and has worked great damage to them. Mr. Chittenden said that several trees had been attacked at Wisley, but the insects had all been killed by one thorough spraying with "Niquas" in May, and the trees had quite regained their beauty. The winter is passed in the egg stage, and spraying should be resorted to as soon as the insects hatch out in spring, any wash containing nicotine being useful.

APPLES SHOWING GLASSINESS.—Some specimens of the apple Lord Derby were sent from South Devon, from some cordon trees, and showed the curious phenomenon known as glassiness in a marked manner. The cause leading to this peculiar condition is so far unknown, though frost is often credited with it. It is evident that in this, and in several similar cases that have recently come to our notice, this cause cannot have been acting.

CROWN GALL.—Mr. H. T. Gussow sent a cultivation of the Bacterium tumefaciens, which Dr. Erwin Smith has shown to be the cause of the disease known as Crown Gall. This disease attacks a large variety of plants, producing large swelling, generally of a soft nature, on the roots and lower parts of the stems, and in America is frequently credited with doing damage to the plants attacked. The committee would be glad to learn whether any serious results have followed the occurrence of such swellings on the roots of plants. Instances of their occurrence have been brought to our notice on apple, plum, birch, cherry, peach, carnation, marguerite, blackberry, loganberry, and cupressus.

Shrewsbury Floral Fete.

The following notes concerning the trade displays at Shrewsbury on August 20 and 21 were unavoidably held over from our previous issue.

We need add nothing to the following extract we made from Mr. S. T. Wright's judging book in connection with the trade displays: "During the many years I have had the honour of judging at this show the trade exhibits have never been better, and they show a marked improvement in staging and quality, both individually and collectively. I congratulate the society upon such a magnificent lot."

The great feature of Messrs. R. Wallace and Co.'s exhibit from Colchester was a grand lot of montbretias. Star of the East was a sheet of glorious gold, and Germania, Lord Nelson, Comet, and Pageant were each exquisite and desirable. Messrs. Wallace also showed a few good liliums and a select lot of gladioli and phloxes, whilst remarkable for the season was a good bunch of Iris germanica Mrs. Alan Gray. King's Acre Nurseries, Hereford, made a splendid exhibit of fruit trees in pots, which were loaded with fruit of tip-top quality. Lady Sudeley and Chas. Ross apples, Marguerite Marrillat and Duroudeau pears, and a splendid tree of Peach Exquisite were particularly noteworthy; whilst Gloria Mundi apples were of remarkable size. Grapes, plums, nectarines, and other fruits helped to make up a grand exhibit.

Among the exhibitors of sweet peas Messrs. Geo. Fairbairn and Sons, Botcherby, Carlisle, were well to the fore with a big stand, on which such things as Audrey Crier, Safrano, Lady Cynthia, and a host of other nice varieties were shown in grand bunches. Mr. Henry Eckford, Wem, Salop, also occupied a lengthy stage with sweet peas of quality and variety that upheld the fame of this great sweet pea house.

The Clury Nurseries, Langley, Bucks, showed a big group of perpetual carnations, put up in bamboo stands, the varieties including most of the more popular varieties in commerce. An exhibit of the strawberry-raspberry was put up by Mr. B. Bowdler, 33, New Street, Shrewsbury. Messrs. Jones, Kilkenny, Ireland, showed gladioli in good form. Zonal pelargoniums from Mr. A. Myers, Sutton Lane Nurseries, Shrewsbury, provided a splash of vivid colour. Hardy perennials were effectively staged by Messrs. Dicksons Lim., Chester. Romneya Coulteri, Iceland poppies, late spikes of delphiniums, and bright montbretias were backed up by some great sheaves of Lilium auratum, and its varieties rubro vittatum and platyphyllum, and there were also a number of fresh roses on the stand.

Messrs. Jones and Sons, Coton Hill Nursery, Shrewsbury, occupied their usual position immediately in front of the entrance to the big fruit tent, and on an extensive double-fronted stage they displayed sweet peas, carnations, gladioli, and a variety of annual and perennial flowers, and a large bed of violas on the ground contained useful bright-coloured sorts of close habit and freely flowered. Messrs. Hobbies, Lim., Norfolk Nurseries, Dereham, filled one of the bays in the fruit tent with a varied and pleasing assortment of dahlias and garden roses. Rayon d'Or was very rich, and so also was The Lyon. Beauté de Lyon was one of the newer things that stood out well. Its coppery tints were very lovely.

Quite in their best form was the large exhibit staged by Messrs. Sutton and Sons, Reading. There was a deal of merit in the vegetables, and their quality was well backed up by the great taste exercised in the staging, the tints of sweet peas, antirrhinums, and other flowers used being just such as provided the best possible setting to the vegetables without detracting in the slightest degree from the individuality of the various dishes. Ailsa Craig onions were represented by some really splendid bulbs. Beans of various colours, yellow, purple, and red, as well as green, golden tomatoes and ruddy red ones, purple aubergines, and showy capsicums, were as gay as many floral subjects in the show.

On the stand of ferns shown by Mr. H. N. Ellison, West Bromwich, there were some good plants of Polypodium glaucum crispum, Nephrolepis Neuberti, Nothoclæna sinuata, and Platycerium grande; but many of the smaller plants were of most interesting varieties. Messrs. Pipers, Bayswater, London, occupied a great length of staging with a creditable exhibit of herbaceous flowers. Lilium tigrinum flore plena, L. Melpomene, and L. auratum made good

mounds of colour between groups of white scabious, Achillea The Pearl, double gypsophila, and a variety of phloxes, gaillardias, and veronicas. At the back were some big masses of the brighter-coloured phloxes and the golden Gaillardia Lady Rolleston.

Pæony-flowered dahlias were also shown by Messrs. Piper, the flowers being massive and of dazzling colour. Messrs. Isaac House and Son, Westbury-on-Trym, showed capital phloxes in rather densely filled vases. Iris, Jocelyn, Jean Gerbaud, Genl. von Strohlein, Pyramide, and Boule de Feu, were a good half-dozen varieties among the many staged. Messrs. House's exhibit of alpine and herbaceous plants was full of merit, there being a large number of rarities, as well as the more familiar denizens of the border and rockery.

Phloxes, pentstemons, and carnations were equally fine on Messrs. John Forbes' stand, the well-known Hawick firm being well up to usual form. Among the phloxes, Salmonea, Muriel Rogers, Europa, and Aurore were a few we liked, and Pentstemons John Ruthven, Thomas Heron, Jessie, and George Horne were very nice. Messrs. G. Gibson and Co., Leeming Bar, Bedale, were large exhibitors of herbaceous flowers, Verbascum Caledonia, Scabiosa caucasica, Geum Mrs. Bradshaw, and Delphinium grandiflorum were prominent vases.

Messrs. Dobbie and Co., Edinburgh, made a feature of collarette dahlias, among which Queen Anne, Frogmore, Prince John, Goldstern, and Balmoral were distinct and good. A fine bank of roses and choice selections of sweet peas made up the firm's exhibit. Mr. Edwin Murrell, Shrewsbury, put up a grand lot of roses chiefly of the newer hybrid teas. Sunburst, Edu Meyer, Edward Mawley, and Hugh Dickson all possessed rich colour, against which Kaiserin Augusta Victoria, Frau Karl Druschki, and Mildred Grant showed up by contrast. An interesting exhibit of cacti came from Miss S. S. Thompson, Alfred Road, Handsworth. The plants were nicely developed specimens of choice mamillarias, opuntias, and phyllocacti, together with echeverias and other interesting succulents.

Messrs. Alex. Dickson and Sons, Lim., Newtownards, Co. Down, made a magnificent display of roses, the stage being devoted to boxes of superb blooms of the best exhibition varieties, a box of 24 blooms of George Dickson being simply grand. There were a series of arches running the whole length of the stand furnished with such good things as Red Letter Day, Irish Fireflame, Carine, and many other gems. Messrs. Dickson and Robinson, Cathedral Street, Manchester, staged choice vegetables, their stand being effectively decorated with groups of carnations, liliums, larkspurs, scabious, etc. The vegetables were clean, well grown, and well shown.

Messrs. Aldersey, Kingsbridge, Devon, showed new varieties of sweet peas, and a variety of choice hardy flowers, including good phloxes, and some good buddleias and ceanothus. A very fine lot of sweet peas was arranged in a tasteful manner by Mr. Robert Bolton, Warton, Carnforth. Barbara was fine in colour, as also were Edrom Beauty and Thos. Stevenson. Queen of Norway and Mrs. E. Cowdy were distinct colours, and Mrs. Hardcastle Sykes was very delicate. Zonal pelargoniums, cactus dahlias, centaureas, and carnations were all well shown by Messrs. Jarman and Co., Chard, who also showed good onions and Prizewinner scarlet runners.

Messrs. Stuart Low and Co., Bush Hill Park, displayed a quantity of their carnation Baroness de Brienen, which, as has been remarked in these pages before, is of fine form and a pleasing shade of pale salmon-pink. Mr. J. E. Knight, Wolverhampton, had a varied and bright collection of carnations in baskets and tubes; and Mr. A. F. Dutton, Iver, confined himself to a display of his fine variety Mrs. A. F. Dutton, the flowers being well arranged in baskets. Messrs. W. H. Simpson and Sons, Birmingham, arranged in round baskets a splendid lot of antirrhinums, each basket being filled with a distinct named variety, there being about twenty in all, and every one a really good one. Colours were bright in Mr. Vincent Slade's zonal pelargoniums. The varieties were of the best, as might be expected from this well-known exhibitor from Taunton. Mr. H. Woolman, Shirley, Birmingham, showed early chrysanthemums, which seemed almost too early for such a summer's day, but still were very nice.

Hardy flowers shown by Mr. Maurice Prichard, Christchurch, contained many things of interest, the gladioli, kniphofias, and the exquisite flowers of Crinum Powelli album being about the most attractive things. Mr. A. W. Thorpe, Lichfield, showed early chrysanthemums; and Mr. Vernon Hill, Langford, put up alpines on a bank of virgin cork. Messrs. S. R. Compston and Sons, Macclesfield, were large exhibitors of violas, as also was Mr. G. Underwood, Leicester.

From Wordsley, Messrs. E. Webb and Sons, Stourbridge, brought melons, tomatoes, and a wide range of good vegetables, which they set up with sweet peas, petunias, Lilium Melpomene, and L. auratum as furnishing. New Champion Prize leeks were grandly shown, Exhibition runner beans, Green Globe artichoke, and purple kohl rabi being other good dishes.

The group of stove and greenhouse plants exhibited by Messrs. Jas. Veitch and Sons, Lim., Chelsea, teemed with quality and remarkable beauty of form and colour. Crotons and nepenthes were a feature, and a central group of orchids naturally attracted vast numbers of the public, who were profuse in their expressions of delight. Solanum Wendlandi, Ixora Duffi, and batches of Lilium Melpomene added colour among the dracænas, alocasias, and ferns, that were so arranged as to show their individual charm, and at the same time throw into relief the beauty of their neighbours.

Mr. L. R. Russell, Richmond, put up a group of bush ivies in a great many beautiful varieties. The colours in both golden and silver forms were bright and effective. Mr. Jas. Box, Lindfield, Sussex, arranged on the ground a big mass of border flowers and waterside plants. Liatris pycnostachya, montbretias, phloxes and gladioli were represented by big sheaves that made a blaze of colour, and very beautiful were the ferns and other moisture-loving plants surrounding a cool-looking lily pool.

The ferns shown by Messrs. H. B. May and Sons, Dysons Lane Nurseries, Edmonton, N., comprised choice nephrolepis, osmundas, platyceriums, and adiantums, as well as uncommon species and varieties for both warm and cool ferneries. Messrs. Caldwell and Sons, Knutsford, had border flowers of good quality, their Scabiosa caucasica being particularly rich in colour, and Gaillardia Magenta Queen was distinct among other varieties. Messrs. R. P. Ker and Sons, Aigburth, Liverpool, confined themselves to a table of neat, healthy-looking crotons of convenient size for table work. Aigburth Gem was very nice, and Reidi was of good colouring. Golden Chain, too, was elegant in the extreme.

For extent and originality of scheme the exhibit of Messrs. Amos Perry, Enfield, Middlesex, was noteworthy. Great masses of Achillea Perry's White were very fine, and backed up by equally large masses of deep blue delphiniums, the effect of the whole was very striking. Messrs. John Peed and Son, West Norwood, S.E., showed caladiums as only they can. Rufus (with bright red leaves), Sir Henry Irving (white), and King George (with beautifully mottled foliage) were very noticeable. The Craven Nurseries, Clapham, York, had a table of alpine plants in the open, which for the month of August was very gay with quaint, beautiful little gems of the rock garden. Eritrichium nanum, Campanula Zoysi, and other miniature bell flowers were full of bloom, but there were plenty of good plants that limits of space forbid us to mention.

Messrs. Bakers, Wolverhampton, had a large rock and water garden in the open, with herbaceous borders and beds of gladioli; gunneras, and bamboos were planted on the margins of the water, on the surface of which floated nymphæas in choice variety. Astilbes, senecios, and heleniums led on from the water to rocky ledges clothed with suitable plants. Mr. G. W. Miller, Wisbech, brought hardy flowers, among which late-flowered pyrethrums were a feature. Mr. Weaver Price, Ashgrove, Brecon, had an exhibit of violas on moss, good bedding varieties being shown. Sweet peas from Robert Sydenham Limited, Birmingham, were arranged in the well-known rustic decorations, making a very good display.

It has been written before anent exhibits of vegetables staged by Mr. Edwin Beckett, gardener to the Hon. Vicary Gibbs, Aldenham House, Elstree, that the vegetables were as fine a lot as has ever been seen at a flower show. It is difficult to find a truer description of the wonderful exhibit this champion of exhibitors brought to Shrewsbury. Whether one looked at potatoes, onions, beans, peas, or celery, there was nothing but first-class quality to be seen, and so far as uncommon things are concerned, it may be said that, whilst we made our notes, numerous remarks were overheard, implying that spectators did not even know what a great many of the vegetables were. Aubergines, capsicums, yellow turnips, crimson spinach, beet, and Painted Lady beans gave colour to the stand such as one hardly associates with vegetables. Another excellent stand of vegetables was put up by Messrs. Barr and Sons, Covent Garden, London. Their Chilian beet was fine, and Red Cherry tomato, purple aubergines, Alderman peas, and Blood Red onions were a few attractive dishes.

Messrs. Bees, Lim., Liverpool, showed phloxes, Romneya Coulteri, liliums, delphiniums, and a variety of other hardy flowers, and also a good collection of garden roses, among which Juliet, Frau Karl Druschki, Lady Hillingdon, and Liberty were a few very showy things. Another bank of herbaceous flowers was that put up by Messrs. Hewitt and Co., Solihull, Birmingham. The colours were gorgeous, and the arrangement bold and telling. Something of the grandeur of the palmy days of the hollyhock was reflected in the exhibit of these good old flowers, staged by Messrs. Jas. Vert and Sons, Saffron Walden. The spikes of fine double flowers were of great length, and there was a wonderful range of colour. The foliage was good and the size of the individual blooms demonstrative of good culture. Primrose Queen, Lady Bailey, and Oliver Chater were three of the best sorts among many excellent ones.

Flowering shrubs and small alpine plants came from Mr. G. Reuthe, Keston, Kent. Messrs. Rich and Co., Bath, showed hardy flowers in bold masses, among which were some good pentstemons and gaillardias, as well as phloxes. Mr. R. C. Notcutt, Woodbridge, exhibited apples, both dessert and culinary varieties being well represented by first-class specimens.

Royal Horticultural Society of Aberdeen.

AUG. 21, 22, and 23.

The annual exhibition of this society was held in the Duthie Public Park, Aberdeen, once again kindly placed at the disposal of the society by the City Council. Than the setting which this park provides for such a purpose nothing finer could be wished, and not a few visiting strangers declared that the admirable surroundings were alone ample value for the entry money. The long-continued drought militated a little against some of the exhibits, especially fruit, but it was hardly noticeable. Altgether the entries numbered over 1,400—a little less than last year—but the quality was excellent, and all declared the show to be one of the best yet held under the auspices of the society. An uncommonly fine feature was the exquisite displays made for exhibition purposes by nurserymen and florists. These included not only the leading local houses, but they came from Dundee and Edinburgh, and proved a

source of much pleasure and interest. Admirable arrangements were, as usual, made by Mr. J. B. Rennett, the worthy secretary, who left nothing undone to further the attractiveness of the show.

PLANTS.

The display made in the tent devoted to plants was really fine, and the quality in many cases exceptionally good. For best specimen plant in flower the silver medal of the society was worthily won by Mr. Alexander Brebner, gardener to Mr. W. S. Gill, of Dalhebity, Aberdeenshire, and chairman of the society. The winning entry was a capital specimen of Disa grandiflora. Mr. Alexander Duncan, gardener to Lord Provost Maitland, Rubislaw Den House, Aberdeen, was a good second. For best specimen foliage plant a very fine win was made by Mr. John Elder, gardener to Professor Baillie, Norwood, Cults, Aberdeenshire, and he also gained leading honours for four best specimen foliage plants and two specimen palms. They were all admirably grown. Ferns were very fine, and here again Mr. Brebner had a most meritorious first, staging among others a remarkably good specimen of Adiantum gracillimum. Mr. Duncan made a good second, and gained the society's silver medal for six ferns in pots not exceeding six inches. Zonal pelargoniums made a superb display, and those from Mr. Brechin, Ardo, Belhelvie, Aberdeenshire, worthily earned the society's silver medal. For other pelargoniums Mr. Brechin was also first and second with capital entries. Fuchsias were not numerous, but Mr. James Coutts, 45, Sunnybank Place, Aberdeen, worthily obtained premier honours. For six plants for dinner-table decoration, Mr. John Petrie, gardener to Sir Thomas Burnett, Bart., Crathes Castle, Aberdeenshire, won easily. Begonias formed an attractive feature, the specimens being of great size and fine colour. Mr. Alexander Leith, gardener to Mrs. Hunter, Temora, Cults, Aberdeenshire, had matters entirely his own way. Gloxinias were well shown, Mr. Brechin, Ardo, and Mr. Brebner, Dalhebity, sharing the honours.

CUT FLOWERS.

These formed a specially fine feature. The silver challenge cup, presented to the society by Messrs. James Cocker and Sons, Aberdeen, for the best eighteen rose blooms, H.P.'s and H.T.'s, or either, was won in fine style by Mr. James Ireland, Park Place, Brechin; Mr. John Simpson, Panmure Gardens, Carnoustie, being a good second. For the best twelve rose blooms, H.P.'s and H.T.'s, or either, Mr. Alexander Rose, gardener to Mr. Charles Laing, Derncleugh, Cults, Aberdeenshire, obtained the premier award with well-developed blooms of well-known varieties. For decorative roses, and tea or noisette roses, leading places were taken by Mr. Alex. Brebner, Dalhebity, and Mr. J. Ireland, Brechin. Dahlias, pompon, cactus, and collarette, made a charming show. For the former Mr. G. Maclennan, Forres, was first. Cactus dahlias were, however, the most admired, and the fine collection sent in by Mr. William Lockart, Craigiebuckler Cottage, Aberdeenshire, proved highly attractive. Mr. Lockart was also leader for collarette dahlias, the Crathes Castle entry taking second place. The gladioli sent in by Mr. William Smith, gardener to Lord Sempill, Fintray House, Aberdeenshire, worthily gained for him leading place, and Mr. J. W. Brechin, Ardo, was a good second. There was rather keen competition in the class for hardy flowers, and Mr. James Barnett, Summerfield Hospital, obtained premier honours. Mr. Petrie, Crathes Castle, took second place.

TRADE CLASSES.

The nurserymen and florists contributed liberally to the attractions of the exhibition. For the second year in succession Messrs. Cocker and Sons, nurserymen, Springhill, Aberdeen, gained the silver challenge cup offered by the society for the best thirty-six rose blooms, H.P.'s and H.T.'s, or either, with superb flowers. The most notable roses included were fine examples of A. K. Williams, Gladys Harkness, Horace Vernet, Mrs. R. G. S. Crawford, Prince Arthur, Lohengrin, Marie Baumann, Gloire de Chedane Guinoisseau, Bessie Brown, Hugh Dickson, Her Majesty, Helen Keller, Caroline Testout, Frau Karl Druschki, Dean Hole, and Alfred Colomb, etc. Messrs. Adam and Craig, Fernielea Nursery, Aberdeen, were second. For best twenty-four varieties of teas or noisettes, the last-mentioned firm had a fine entry for the first place.

FRUIT.

There was a good display in the fruit classes. For the best collection of hardy fruits, Mr. J. A. Grigor, gardener to Mrs. Dunbar Dunbar, Seapark, Forres, had a good win. Mr. A. Taylor, Inchgarth, Cults, gained similar honours in the class open to market gardeners only. Strawberries were shown in goodly numbers, the leading places in the classes for them being taken by Mr. G. McLennan, Fetteresso Castle, and Mr. Barnett, Summerfield Hospital. Grapes were shown in greater numbers than last year, and the clusters were finely finished. Mr. Petrie, Mr. R. H. Grigor, Dalswinton, Dumfries, and Mr. Smith, Fintray House, were the leading prize-takers. Apples were fairly numerous, and of good quality, Mr. Ferguson, Linton, and Mr. J. A. Grigor, Seapark, taking the leading prizes. Mr. Smith, Fintray House, had a fine entry of plums, while Mr. John Elder, Norwood, had the best tomatoes.

VEGETABLES.

The display here was quite up to the average of past years at Aberdeen. As usual at this show, the outstanding feature in the vegetable section is the magnificent display made by potato growers. The collections of vegetables were not numerous, but Mr. R. A. Grigor, Dumfries, had the best, Springhill and Fintray House coming next in order. Mr. William Scorgie, Springhill, was first for basket of salad, and other prominent prize-winners were: Mr. William Reith, Fernbank, Crathes; Mr. J. McC. Brown, Park House, Aberdeen; Messrs. J. and D. Mackenzie, Lower Bucksburn, Aberdeenshire. The great feature was the large show of potatoes. Nothing finer has ever been seen in Aberdeen than the tubers sent by Mr. W. Lawson, Cornhill Road, Aberdeen; Mr. Grigor, Forres; Mr. Brebner, Dalhebity; Mr. G. Brown, Hazelhead, Aberdeen; and Mr. W. Webster, Muiresk Gardens, Turriff.

AMATEUR DIVISION.

Capital products were shown by the amateurs in all the sections. Mr. D. S. Fraser, Woodside, was very successful in the pot plant section with his ferns and begonias; and Mr. John Davidson, 323, Hardgate, Aberdeen, and Mr. W. B. Cormack, Gordon Terrace, Dyce, Aberdeenshire, had capital wins for pelargoniums, petunias, and begonias. In the cut flower section a most notable success was achieved by Mr. George Maclennan, Longley, Forres, who was awarded seventeen first prizes.

Broughty Ferry Horticultural Association.

The sweet pea show held on the 13th inst. by this association was an unqualified success, the quality of the flowers being on an average better than last year. Mr. J. McOrnish, nurseryman, Crieff, and the President, Mr. James Bethel, The Grange Gardens, again competed for the display on tables. The first-named again carried off the gold medal with a bright display of first-rate flowers, while Mr. Bethel made a better effect with flowers not so high in quality. Mr. George Masson, Aystre Gardens, again won the silver medal for twelve vases, and Mr. John Campbell, Forbes Court Gardens, secured first for eight vases in keen competition with Mr. James Staward, St. Fort Gardens, the blooms being throughout of much merit.

In other classes Dr. Sinclair, Forfar; Mr. James Duthie, Claverhouse; and Mr. J. Fraser, Cairneyhill, Arbroath, were well to the front with flowers of surpassing quality. In fact, the first-named obtained the distinction of having the finest flowers in the hall. Other prominent winners were Messrs. Brown, Cambustay; Fairweather, Airlie Park; Meston, The Lodge; and the President.

The best and most frequently-shown varieties were: Melba, Dorothy, Agricola, Hercules, Thos. Stevenson, Chas. Foster, Dobbies' Cream, Rosabella, Nubian, R. F. Felton, Maud Holmes, Elfrida Pearson, Queen of Norway, White Queen, Bertrand Deal, St. George, Mrs. Cuthbertson, Pedestal, and King Manuel. Messrs. Laird and Sinclair and Messrs. D. and W. Croll, Dalhousie Nur. series put up excellent displays. The latter-mentioned firm, as is their wont, excelled in their display of roses in upwards of a hundred varieties, backed up with about fifty varieties of sweet peas, all well grown. Amongst the roses, George Dickson had many admirers, and was reckoned amongst the best "darks."

Mr. James Slater, Panmure Villa Gardens, made an efficient secretary, and to him is mainly due the credit of the arrangement of a very pretty exhibition.

The British Pteridological Society.

This society held its annual meeting this year at Totnes, Devon, after a preliminary investigation of the locality as a promising fern-hunting region by the hon. secretary, Mr. Charles T. Druery, and Mr. W. B. Cranfield, the treasurer, who found it all that could be desired as regards abundance of ferns and of species. At the business meeting the balance-sheet and the membership were found to be highly satisfactory, no fewer than 160 members having replaced the original score existing at the time of the, so to speak, reconstruction of the society, and the establishment of the "British Fern Gazette," edited by Mr. Druery, which was at once recognised as deserving of the support of all lovers of British ferns in their beautiful and multiform varietal characters.

The Seven Stars Hotel was fixed as the meeting place, and prior to and after the meeting the members present organised various hunting expeditions to Dartmoor and the surrounding district of South Devon with very satisfactory results, although a two-months' drought had played havoc with all the exposed ferns, which in many places had been killed outright, and in most cases presented a flaccid and shrivelled appearance, which militated seriously against any recognition of varietal features. Notwithstanding, however, this handicap, a number of good varieties fell to the lot of the searchers, showing that Nature was still busy in producing "sports," although one might imagine that the great number of such acquisitions by the coterie of old pioneers, with their sharp eyes, would have practically exhausted the chances of fresh discoveries. A number of very beautiful forms obtained by selective sowing were sent by absent members as a proof that in this direction also much had been done, and was still doing, to improve, if possible, the original wild varieties through their capacity of further variation by their spores. From a patriotic point of view, therefore, the society devoting itself fully to our native ferns, it has proved itself to be well worthy of support, and it is hoped that its membership will continue to increase in view of the fact that the quarterly issue of the "British Fern Gazette," under the editorship of Mr. Charles T. Druery, V.M.H., F.L.S., is well worth the annual subscription. Mr. Druery is also the hon. secretary; his address is 11, Shaa Road, Acton.

Harrison's Musk.—Time was when this musk was very generally grown, both in pots for decorative purposes and for bedding out, but it is not so often met with as formerly. In some cases at least this is a pity, as it is remarkably floriferous, and the large golden-yellow blossoms make a goodly show, which, if the soil is not too dry, is spread over a lengthened period.—T.

THE LARGE LARCH SAW-FLY IN THE LAKE DISTRICT.

Mr. J. Mangan, of the University of Manchester, contributes the following interesting notes to "Nature" on the parasitic enemies of the large larch sawfly:

In the Lake District plantations, and elsewhere throughout the country, those interested in the welfare of the larch have viewed with no little apprehension, for some time past, the yearly ravages of the large larch saw-fly (Nematus erichsoni). As direct methods of control are out of the question over most of the affected areas, interest has been centred upon those natural agencies which in any way tend to limit the indefinite multiplication of this saw-fly, and it has been recognised that the atmospheric conditions, several of the common insectivorous birds, voles, certain insects, and parasitic fungus, are all capable of exercising a considerable if variable influence upon the numbers of the pest. To a combination of forces such as these must be attributed such respite as the trees have gained in certain of the infested areas, and in those cases where accurate observation of the facts was possible it was found that cessation of the saw-fly attack coincided with an overwhelming increase in the numbers of one of its insect enemies, an ichneumon, hitherto unknown to science, Mesoleius tenthredinis, Mor. This parasite, by eventually accounting for more than 70 per cent. of the larvæ within the cocoons, undoubtedly played a very large part in the reduction of the pest.

As M. tenthredinis was known to be present in most of the districts where the larch saw-fly was making itself felt, and as none of the other parasitic hymenoptera or diptera recovered from the cocoons from year to year showed signs of attaining to anything like its efficiency as a parasite, it was felt that the evèntual control of the pest possibly depended largely upon the future activities of this one species.

Shoulthwaite plantation at Thirlmere, the first in that area to suffer from attack, endured during several summers the severest defoliation, until in 1910, owing to the good offices of M. tenthredinis, the ravages of the pest abruptly and almost entirely ceased. In 1911 it was impossible to obtain from there any further cocoons for the purposes of the investigation owing to the scarcity of the saw-fly. In 1912, however, this plantation was invaded by a vast swarm of adult saw-flies, which there was reason to believe came from a badly-infested plantation some three miles away. Owing to a period of very unfavourable weather, and perhaps to other causes, the defoliation that ensued was not at all so extensive as it was feared it would be; however, it was distinctly noticeable, and the consequences of this re-infection of the area were looked forward to with some anxiety. Would the trees, weakened by the old outbreak, have to submit to renewed defoliations, until such time as M. tenthredinis, re-emerged Cincinnatus-like from its obscurity, regained sufficient strength to overcome the progeny of the invaders? An examination of the parasites that have emerged this year from cocoons collected in this area revealed a quite unexpected state of affairs. Scarcely 2 per cent. of the cocoons proved to be parasitised by M. tenthredinis, but some 25 per cent. yielded specimens of an ichneumon which had hitherto played quite an insignificant part as a parasite of the large larch saw-fly (a species of Mesoleius, as yet undetermined). From approximately 24 per cent. emerged tachinids belonging to the species Zenilla pexops, B. and B. (Mr. C. J. Wainwright, who kindly identified it for me, informs me that he knows of but one other record of its having been taken in Britain.) It seems highly probable that both these parasites have followed in the wake of the invading saw-fly, particularly as observation of material from the locality from which it was suspected that the latter had flown has shown that the tachinid at all events is exceedingly abundant there.

ANSWERS TO CORRESPONDENTS.

Editorial Communications should be addressed to the Editor of The Gardeners' Magazine, 148 and 149, Aldersgate Street, E.C.

Secretaries of horticultural societies are invited to send early notification of forthcoming exhibitions and meetings, and are requested to advise us concerning changes of dates.

Specimens of plants, flowers, and fruits for naming or opinion should be sent to the Editor of The Gardeners' Magazine, "Endsleigh," Priory Park, Kew, Surrey, and as early in the week as possible. All parcels must be sufficiently prepaid.

The Editor will be glad to receive photographs of gardens, plants, flowers, trees, fruits, etc., for reproduction in The Gardeners' Magazine. He will also be greatly obliged by correspondents sending early intimation of interesting local events relating to horticulture. In sending newspapers containing matter to which they wish to draw attention, correspondents are requested to distinctly mark the paragraph.

———

ALYSSUM SAXATILE.—K. M., Rutland: I have raised a considerable stock of Alyssum saxatile, and its citron-coloured variety, from cuttings during the present summer, and I should like to know whether the plants should remain in the beds in which they have been raised, or be planted in nursery beds.—It would be a decided advantage to carefully lift the plants and put them in nursery beds, where they can remain until October. Lift them carefully and replant as expeditiously as possible, six inches apart in rows with twelve-inch spaces between them. If the soil is very dry, thoroughly water it one or two days before planting, and well water the plants when the operation has been completed. It is most important to avoid any serious check at this stage.

THOMAS TUSSER.—T. S., Suffolk: I have on several occasions heard of Thomas Tusser, and now and then I have read extracts from his "A Hundreth Good Pointes of Husbandrie." These have much interested me, and I should like to know something about this interesting writer who, I assume, was engaged in horticultural pursuits. — Thomas Tusser, who was born in 1583, and died in his 65th year, was not a horticulturist or gardener, but was a farmer. His poem "A Hundreth Good Pointes of Husbandrie" was published "in Flete Strete within Temple Barre at the syne of the Hand and Starre, by Richard Totell, in the year 1577." Written in the infancy of farming in this country, it is of much interest; the poem shows that he was well acquainted with the practices that obtained during the time of Mary and Elizabeth, and recognised the possibility of making considerable improvements in methods of tillage. He appears not, however, to have derived any material advantage from his advanced views, for his life appears to have been a series of misfortunes, and to have died poor. He is buried in St. Mildred's Church in the Poultry, and his epitaph which is assumed to have been written by himself, is preserved in "Stowe's Survey of London." His poem is written in familiar verse, and abounds in many curious particulars, that bespeak the manners, the customs, and the modes of living during the first half of the 16th century, and is of value as a picture of the state of agriculture in that period, and for the glimpses it gives of gardening practice. You should obtain a copy of the poem, which may be done by enquiry among the second-hand booksellers. The black-letter copies are rather expensive, but the others are quite cheap.

WALL GARDENING.—J. M., Norfolk: We are not acquainted with any book on this subject that is superior to the one you mention.

BOTTLING PLUMS.—H. B., Lancashire: I am desirous of bottling some Victoria plums, and shall appreciate your informing me whether the procedure essential to obtaining good results is troublesome or expensive.—The preservation of plums by the procedure known as bottling is quite simple and inexpensive, and you should not experience any difficulty in obtaining good results. All that is necessary are an iron pot large enough to hold six, seven, or eight 2lb. bottles, and a supply of bottles proportionate to the quantity of fruit available. Bottles fitted with glass caps and screw tops, and costing about four shillings per dozen, are preferable, but any with a rather wide mouth will be suitable, as the air can be readily excluded by pouring melted mutton fat into the neck of each bottle after the fruit has been sterilised and become cold. Select perfectly sound fruits that are commencing to ripen, and pack them closely in the bottles and fill to the upper part of the neck with cold water. Make a light framework with a few laths or strips of wood to place in the bottom

Robinsons' Guaranteed Gardenalities

Always pay their way and make up their cost, time and time over again. What they claim to do is always achieved—hence they are used by experts everywhere. Try them this year, and note results. You will be delighted, for they never fail to do good work.

"CARMONA" FERTILIZERS ARE INDISPENSABLE.

Here you have the finest fertilizer which science can offer. It imparts full vitality to your plants and trees. Makes them strong and vigorous, gives them productive power, and this is what you want.

Robinson's cater for all fertilization needs, and make up many varieties. Whatever you want in this direction they can supply.

Sweet Pea Culture is so popular that they draw special attention to their **"Carmona" Sweet Pea Fertilizer.** This should be used by all growers and exhibitors.

"Carmona" Fertilizers are sold in all quantities. Note bulks and prices:—
1cwt., **20/-**; ½cwt., **12/6**; 28lb., **7/6**; 14lb., **4/6**; 7lb., **2/6**; **1/-** and **6d. Tins.**

Of all Seedsmen and Agents, or write direct.

INSECT ABOMINATIONS.

These are detested by every gardener, for they ruin one's best efforts. Half-hearted measures are no good. Don't play with insects, but **get rid** of them. You can exterminate them all, if you are wise enough to use the finest Insecticide on the market, **CLIFT'S FLUID INSECTICIDE.** Give your plants freedom from insects, it makes for success. Bulks and prices as follows:—
40 galls., **4/6** per gall.; 20 galls., **5/-** per gall.; 10 galls., **5/3** per gall.; 5 galls., **5/6** per gall.; 1 gall., **6/-**; ½ gall., **3/6**; 1 pint, **1/-**.

Of all Seedsmen and Agents, or write direct.

OTHER USEFUL GARDENALITIES.

Note these, for you may want them. **"Eradiweed"** guaranteed cent. per cent. **Weed Killer.** Sure and certain. **"Velvas" Lawn Sand**—just the sand needed. Robinson's send on all details, lists, etc., free of charge, and also include as a gift two valuable gardening books, which you will appreciate. (1) Robinson's "Guaranteed Gardenalities Booklet," and (2) Robinson's "Garden Enemies" Booklet. These are brimming over with serviceable gardening hints and advice. Address your p.c. or letter to:—

ROBINSON BROS., LTD., WEST BROMWICH, STAFFS.

of the pot for the bottles to stand upon. If the latter are fitted with glass caps and screw tops, place caps and tops in position and screw them down rather lightly, place in the pot, and fill with water to the neck. Heat the water slowly until it reaches a temperature of 160 degrees, and keep it at that point for about 50 minutes, when the bottles should be removed from the water and be screwed quite tight. If the bottles have no caps, fill as advised, and when sterilisation is effected stand them on one side, and when the contents have cooled down pour enough melted mutton fat into the neck of each to form a half-inch layer.

ANTIRRHINUMS.—W. W. H., Bournemouth: I have recently seen some remarkably fine displays of antirrhinums, both in private gardens and public gardens, that I have visited in the course of my holiday, and you will render me a service that will be much appreciated if you can tell me the course of procedure by which such good results are obtained.—The most simple and, in the case of those who have not much glass accommodation, the best practice is to sow the seed in June, or early in June prick out on a nursery bed, and plant in the beds and borders in the following spring. The soil in the nursery bed should not be very rich, as a firm, short-jointed growth is preferable, and the plants be put about six inches apart in rows with a sufficient space between them to allow the hoe to be freely used. The various shades of colour belonging to the intermediate section are the most useful.

SUMMER FLOWERS IN LONDON PARKS.—Young Gardener: I am about to make a short stay in London, and I should like to visit a few of the public parks and gardens wherein the bedding arrangements are well done.—Summer flowers are now so successfully utilised in the principal metropolitan parks, that all may be visited with profit and pleasure. If your time is not sufficient to allow you to see more than a few, we suggest that you make a point of visiting the Royal Gardens, Kew and Hampton Court, Hyde Park, and Regent's Park, Finsbury Park and Victoria Park, and Battersea Park and Dulwich Park. Take them in the order in which they are here placed, and you will have no difficulty in inspecting either two in one day. By commencing early you might include more than two in each day's programme, except that a whole day should be devoted to Kew and Hampton Court.

MEALY BUG ON GRAPE VINES.—Perplexed: This is, perhaps, the most vexatious of the pests with which the cultivator of fruits and plants under glass has to contend, for it is difficult to eradicate, and we are not surprised you should be perplexed. During the summer months you should dislodge the colonies as they make their appearance with a small brush that has been dipped in some approved insecticide. At the winter dressing, vines that are infested should have the loose bark removed, and be thoroughly washed with warm water, the brush being occasionally drawn across a lump of soft soap as the work proceeds. After the vines have been washed dress them with some suitable insecticide, such as a solution of a nicotine compound, the strength to be in accordance with the directions given with the preparations. Perseverance is an important point in the eradication of mealy bug in the vinery.

VIOLAS FOR BEDDING.—W. B., Leicester: I shall be much obliged by your giving me a short list of the best violas for bedding purposes.—We advise you to grow only the varieties that can be depended upon to pass safely through the winter, and of these the following can be specially recommended: Ardwell Gem, primrose; Ariel, lavender; Bullion, yellow; Blue Cloud, fancy; Blue Duchess, light blue; Christiana, white with yellow centre; Duchess of York, white; Jubilee, dark blue; Kingcup, yellow; Klondyke, yellow; Lilacina, light blue; Primrose Dame, primrose; Pentcaitland, white with yellow centre; Redbraes Yellow, bright yellow, Redbraes White, white; Royal Scot, dark blue; Snowflake, white; Sulphurea, light yellow; Sylvia, cream colour; William Neil, bright rose; and White Duchess, fancy.

SEEDLING CARNATIONS.—W. F. H., Essex: A friend of mine who is much interested in the cultivation of border carnations for the production of flowers for decorative purposes in a cut state, tells me that he finds seedlings of much value because of their robust habit, and the freedom with which they bloom. I have seen some beds of seedlings in his kitchen garden, and the plants are certainly very free-flowering. I should like to act upon his suggestion and grow a hundred plants or so. I shall therefore be greatly obliged by your informing me when to sow the seed. Is it too late to raise a stock of plants from seed for flowering next summer?—Plants of border carnations raised from seed saved from a really good collection of varieties are, as you have been advised, most useful for the supply of cut flowers, and you will do well to have a bed of them in your kitchen garden. It is now too late to sow seeds for the purpose of obtaining plants that will bloom in the course of next season. The seedlings should be raised under glass in April or May, and be pricked off into boxes containing light and moderately rich soil, and be transferred to the beds during June. They will then become well furnished with growths by the autumn, and produce sheaves of flowers in the summer of 1914. You can purchase seedling carnations of high quality from the leading growers, and if these are planted in their permanent quarters in the course of September they will be in every way satisfactory.

CARBON BISULPHIDE.—W. B., Sussex: I shall be much obliged by your stating whether carbon bisulphide, which is now being used as a vaporiser in combating insect pests and injurious fungi, requires special care in its use.—Carbon bisulphide is one of the most dangerous of the various materials used for the protection of plants from the attacks of injurious insects, and should be used with the greatest care. Carbon bisulphide is a colourless and mobile liquid which boils at 123 degrees, and vaporises with great rapidity when in an open vessel. The vapours form in combination with air mixtures that explode on coming into contact with flame. Owing to its inflammability the manipulation of carbon bisulphide should, as far as practicable, be carried out in the open air, and away from heat or flame, smoking being wholly forbidden. It diffuses very rapidly through the soil, and is most destructive to insect life, and, according to Dr. Bourcart, when injected into the soil at the rate of 1oz. per square yard and four inches deep, it will kill the insects in that depth. As you have not had any experience with carbon bisulphide, we advise you not to use it until you have had an opportunity of becoming acquainted with its properties under the direction of someone well acquainted with them.

NOTICE.

READERS experiencing difficulty in obtaining "THE GARDENERS' MAGAZINE" at any bookstall or newsagent should write to the

PUBLISHING MANAGER,
148-9, Aldersgate Street,
London, E.C.,

who will give the matter immediate attention.

VOL. LVI.—No. 3,123. SATURDAY, SEPTEMBER 6, 1913.

THE GARDENERS' MAGAZINE

NOTE OF THE WEEK.

Drought.

The abnormally-prolonged drought which prevailed for some months over most of England, Wales, and Scotland, but which has now been broken up by copious rains, became a very serious handicap to all vegetative growth in a country where, normally, there is a sufficient rainfall distributed throughout the year to meet the demands of indigenous and acclimatised plants of all kinds. Happily, the effects of this drought have been generally modified by cloudy conditions, instead of being aggravated by scorching sunshine, which inevitably increases the draught of vegetation upon what little moisture may still be retained in the soil. Nevertheless, the effect is clearly visible in the early shedding of the foliage of many trees, whose leaves have long since become brown, and more or less shrivelled, owing to the incapacity of their root-systems to obtain an aqueous supply adequate for their maintenance in a green and flourishing condition. When, indeed, we consider the requirements of a large tree, with a vast area of its myriad leaves, each of which, if it lives at all, is bound to be transpiring a given amount of water all the day long, it strikes us as truly wonderful that for weeks, and even months, at a stretch, a vast root-system of myriads upon myriads of absorbing fibrils can continue to find any water at all within the limited area available for their extension. We know that Nature has provided for a check upon the transpiration of the foliage in dry periods by enabling the innumerable transpiration pores, or "stomata," common to all leaves, to contract and all but close, but there is a limit to this, and, in any case, the amount of water needed is very large. Xerophytic, or drought-loving plants, introduced from dry regions of the earth, are, of course, not only quite at home under what are here abnormally dry conditions, but even benefit by a change to, to them, normal ones, but native plants, and particularly those with large foliage of a soft and succulent nature, are sorely put to it, and will die outright unless a supply is artificially provided, and in sufficient abundance. Here, however, the words "sufficient abundance" indicate the crux of the position. Given a long, dry period, the soil, deprived of its superficial moisture, shrinks and shrinks until it is penetrated by very deep cracks. Through these the moisture remaining lower down also evaporates until the cracks become so deep as to pass the limits of the root penetration of many non-tap-rooting plants. Hence, when an artificial supply is given by spraying or flooding, it is only the very surface which is moistened, the great bulk of the supply running directly down these cracks, or channels, and thus being of no service whatever to the plants it is intended to aid. The superficial moisture, indeed, probably does more harm than good. For the moment it may stimulate into activity the roots near the surface, and cause them to extend upwards towards the welcome moisture, but only with the result that before another watering on like lines a burst of hot sunshine may parch the soil and destroy them, while the wetted foliage has its transpiration pores opened, and increases the draught upon the root-system, the result being, possibly, an entire collapse instead of a resuscitation. If we investigate the plants in our gardens during extended periods of dry weather it is extraordinary to what extent many plants, even if not xerophytic, can live and retain their freshness when the soil, to all appearance, is as dry as dust. On the other hand there are many which, while apparently yielding to the strain on their tissues, seem to be irrecoverably shrivelled and dead, will, when the welcome rain comes, absorb it, and gradually resume their pristine verdure as if nothing had happened. There are many plants so constituted, especially those whose habitats are in regions where the seasons are divided into "dry" and "wet" ones, which, like the well-known resurrection plant of the American prairies (Selaginella lepidophylla) may be kept absolutely dry for many months together, but will become perfectly green and fresh, and in growing condition, after a few hours' soaking in water. It is this capacity, in a greater or less degree, in many of our native plants, to which we are doubtless indebted for innumerable survivals of our garden plants after the infliction of such a "drought" as that to which vegetation generally has been recently subjected.

MR. A. F. DUTTON.

Mr. A. F. Dutton, who may be regarded as one of the pioneers of the cultivation of the perpetual-flowering carnations in this country, has rendered such substantial service in popularising their exquisite beauty for decorative purposes, and developing the commercial side of

their culture, as to fully justify the high position he occupies among the leading trade growers. Comparatively few of the earlier perpetual-flowering varieties that were received from America were introduced when Mr. Dutton recognised their merits, and entered on their cultivation with his customary zeal, and we remember with pleasure several beautiful collections that he contributed to the Temple Shows before these carnations had made their way to any considerable number of private gardens. The position as a cultivator and exhibitor that was taken up by Mr. Dutton at the beginning has been fully maintained until the present time, notwithstanding the enormous development which the carnation industry has undergone, and the severity of the competition that has to be met. Of Mr. Dutton's taste and judgment in presenting carnations to public notice we had a fine example at the meeting of the Royal Horticultural Society on August 26, when he exhibited several hundred blooms of his exceedingly beautiful new rose-pink variety, Mrs. A. F. Dutton, of which an illustration was given in our issue of June 28 last. In the same issue we gave an account of some of the more salient features of the establishment Mr. Dutton has established at Iver, Bucks, which may well be regarded as a model of its kind, and to this we refer our readers for particulars of the extent to which the growth of carnations is carried on there.

Vacant Lectureships at Aberdeen University.—For the posts of Lecturer in Forestry and Lecturer in Horticulture, now vacant at the Aberdeen and North of Scotland College of Agriculture, many candidates have come forward. For the first-named post there are seven applicants, these being resident in England, Scotland, Ireland, or Wales. Twelve candidates have entered for the Lectureship in Horticulture, and these also come from all quarters of the United Kingdom. A meeting of the committee entrusted with the making of selections, which will be submitted to the Governors of the college, will be held at an early date.

Mr. George MacKinlay, of Pine View, Flitwick, Beds, who was head gardener at Wrest Park for upwards of seventeen years, serving during this period the late Earl Cowper, Lord Lucas, and the late American Ambassador, and previously in the employ of Sir Charles Isham, in Northamptonshire, left estate valued at £2,279 gross, with net personalty £2,258.
